department of the National City Bank showed no profit. Only greater volume held promise of profit, but few banks could hope to develop greater volume than this. From the banker's standpoint the merits of the system lie in the opportunity it affords for acquiring new savings accounts and the means it provides of eliminating small, slow paying loans from the regular loan departments.

The future of the small loan business in the United States remains obscure. Its tremendous expansion in the post-war years may be a phenomenon of a highly individualized society seeking a market for its rapidly increasing stock of consumers' goods. Certainly the industrial depression which began in 1929 has worked hardship on the lenders by contracting their market and weakening the credit of their borrowers and prospective borrowers. Even if these specific industrial ills are only temporary and the average consumer regains adequate property and wages to seek loans, a prolonged depression may lead to the socialization of various functions and thus destroy parts of the small loan business. Health insurance on a national scale or expansion of the public health program tends to cut down the demand for loans to finance illness. Unemployment insurance minimizes the periodic need for outside financial assistance. Change in the economic or legal aspect of instalment selling would seriously affect the market for small loans. Unless and until such external influences affect small loan enterprise, however, it may gain in popularity by policing itself from within. It would thereby become a more attractive investment for funds which could in turn be lent at reduced rates of interest.

SMART, WILLIAM (1853-1915), British economist. Smart was a successful manufacturer before he became a teacher; he was appointed lecturer at University College, Dundee, and at Queen Margaret College, Glasgow, in 1886 and professor at the University of Glasgow in 1896. He was deeply impressed by Carlyle and Ruskin and above all by Edward Caird, at whose instigation he undertook to introduce to English readers the works of the Austrian school on interest and value. His translations of the

writings of Bohm-Bawerk and Wieser are models of their kind, and the introductions provided by Smart contain masterly analyses. The influence of the Austrian doctrine of marginal utility as the open sesame to economic mysteries was intensified by Smart's study of Marshall's work, and many of his lectures were devoted to expounding the theory of value as set out in Marshall's *Principles of Economics*. But Smart's business experience and the fact that he taught in a thriving industrial city kept him from losing himself in abstractions. His books deal with the urgent problems of the day and especially with socialist criticism of the unequal distribution of income inherent in a capitalist society. He reiterated the teaching of Carlyle as to the high function of the captains of industry, and the transformation of trades into professions was one of his abiding aspirations. He defended competition as cooperation disguised, and he sought economic salvation in the adoption of mutual service as a conscious motive. He was apprehensive of drastic remedies for social ills and frequently stressed the favorable rise in the standard of living gradually attained by the common people in England between 1800 and 1900. In 1905 he was appointed a member of the Royal Commission on Poor Laws and Relief of Distress, which involved four years of strenuous work. He was chairman of the Documents Committee and he wrote a number of valuable historical memoranda, which are included in the report published in 1909. He then embarked on the task, stupendous for a man of his age, of writing the *Economic Annals of the Nineteenth Century*; he had completed two volumes at the time of his sudden death.

SMELTING. *See* METALS; IRON AND STEEL INDUSTRY.

SMILES, SAMUEL (1812-1904), English popular author. Smiles was editor of the *Leeds Times* and later a railway official. As a journalist

active in radical politics in the north of England. Smiles was an exponent of middle class, individualistic radicalism and, although an ardent supporter of many measures in the interest of the working classes, he energetically opposed Chartism and later socialism. After the initial success of his *Life of George Stephenson* (London 1857, rev. ed. 1864) he wrote biographies of many of the inventors and business men of early English industrialism, in which he emphasized the personal qualities that had led to their attainments. His works of popular edification were very widely read, notably *Self Help* (London 1859, new ed. 1860), which sold about 300,000 copies and was translated into many languages.

Smiles' immediate forbears were of the radical wing of Scotch Calvinism, and his own views were largely the secularized expression of this religious background. Despite their facile optimism his teachings reflect the moral rigor that lay behind Victorian economic individualism. With all shades of radicalism he shared a general hostility to privilege of birth or inherited wealth, but his primary emphasis was on individualistic economic virtues as ends in themselves. His writings comprise not merely a series of precepts for success but a definite ethical doctrine. The necessity of labor is no longer portrayed as the curse of Adam but as a positive blessing; knowledge and education are valuable but only when combined with a worthy and generally practical purpose. Smiles held that the careful utilization of time is of paramount importance; that honesty and uprightness, industry and perseverance, always triumph over difficult external circumstances; and that for the most part people have only their own neglect, mismanagement and improvidence to blame for their misfortunes. Smiles thus saw in individual economy and providence the only salvation of the working classes. Although he praised the same ethical qualities in all walks of life, he regarded business as by far the most favorable calling for the exercise of virtue and the development of character.

TALCOTT PARSONS

Other important works: *Lives of the Engineers*, 3 vols. (London 1861-62; new ed., 5 vols., 1874); *Life and Labour* (London 1887), *Autobiography*, ed. by Thomas Mackay (London 1905).

SMITH, ADAM (1723-90), Scottish economist and moralist. Smith was the pioneer formulator of English classical economics and with Ricardo the chief formative influence in the classical tra-

dition. He was born at Kirkcaldy, studied at Glasgow University, where he was a pupil of Francis Hutcheson, from 1737 to 1740 and at Oxford from 1740 to 1746; lectured at Edinburgh from 1748 to 1751; became professor of logic at Glasgow in 1751 and was professor of moral philosophy there from 1752 to 1763. His *The Theory of Moral Sentiments* appeared in 1759. From 1764 to 1766 he traveled, chiefly in France, as tutor of the young duke of Buccleuch, becoming acquainted with Voltaire, Turgot, Quesnay and other leading thinkers. His chief work, *The Wealth of Nations*, was published in 1776; and two years afterward he was made a commissioner of customs at Edinburgh, where he lived until his death.

Smith was a friend of Hume as well as a pupil of Hutcheson and early absorbed the idea, then becoming prevalent among philosophers, of an order of nature in human affairs, operating through the principles of human nature as its medium. For him, however, rational self-interest was neither a mechanically perfect guide, as it was for Bentham and his followers, nor supreme in all realms of life. Sympathy rather than utility or enlightened self-interest is the basis of Smith's *Moral Sentiments*, and he seems to have marked off the economic realm as the appropriate field of the latter motives. Smith's belief in the beneficence of free enterprise is more than a mere assumption, for it is supported by a wealth of fact and analysis of economic processes. But neither is this belief a conclusion dictated solely by scientific reasoning—viewed from this standpoint the chain of deduction has conspicuously weak links. The natural inference is that he absorbed from the philosophy of the time a predisposition in favor of a beneficent order of liberty; that further he found the world suffering from misguided forms of control; and that to him liberty meant primarily freedom from these particular kinds of restrictions and not, for example, from modern social legislation.

To Smith the doctrine of liberty could not be a scientific analysis of an actual economic system, since the order of liberty did not then exist. Free exchange had developed to a point where it furnished a background of imperfectly fulfilled tendencies from which prevailing restrictions might be appraised. More fundamentally perhaps humanitarian and potentially democratic ideals could similarly furnish a standpoint from which might be viewed the system of eighteenth century nationalism with

its callous, militaristic, dynastic and aristocratic scheme of values.

The economic system of Smith's time was that of mercantilism; there were survivals of earlier guild and local restrictions; the factory system was in its infancy, but steam power was yet to be applied to industry. Private enterprise had advanced productive efficiency in both agriculture and manufacturing; and, in England at least, capital flowed from private sources in amounts which, while not superabundant, were adequate to the exploitation of existing techniques. In contrast political government was not only conspicuously inefficient but mainly an instrument of class aims and privileges such as competitive private enterprise tended to break down. In harmony with this situation Smith found that the general dogma of liberty embodied the most central and vital truth; but his realism qualified it with exceptions, and he fell back at critical points on the position not that liberty worked flawlessly but that the worst evils resulted from wrong governmental policies.

Along with this theme, although only imperfectly integrated with it, Smith presented an analysis of the natural tendencies of what is nowadays called the price system, which furnished the point of departure for the subsequent development of "economic theory." For most of his specific points of doctrine he could probably not claim priority. Professor Hollander has noted as his chief contribution the setting up of a standard of appraisal based on amount of goods produced for the consumption of the people at large.

Smith's analysis starts with the division of labor, limited by the extent of the market, and proceeds to a study of value and price and of the "natural levels" of the shares in distribution ("component parts of price") For Smith the labor a thing will buy is an absolute measure of its value, for instance, in relation to deferred payments and other changes in time, but labor cost does not alone determine exchange values. He speaks of wealth as the product of labor and of profits and rent as deductions from that product; but the subsequent Marxian theory of exploitation was built not on this view but on the more sophisticated labor-cost value theory of Ricardo. Wages, according to Smith, can be sustained above a subsistence level only by continued progress in productive efficiency. Rent does not determine price but is rather determined by it.

Smith proceeds to discuss the natural order of

development of different forms of production, the historical order supposedly paralleling the order of superior productivity as gauged by the amount of productive labor a given capital sets in motion. The superiority he accords to agriculture by this standard suggests physiocratic leanings, although he rejects the dogma of the sole productivity of agriculture. The alleged superiority of domestic to foreign trade (not convincingly demonstrated) contributes to the case against mercantilism. He sets up canons of taxation consistent with his general standpoint and hence neither mercantilistic nor physiocratic, but neutral in their effects on "natural" economic development. His treatment of public expenditures brings out interesting views on the economic and social functions of government and some surprising applications of individualism to justice, education and religion.

Discussing systems of economics he defines mercantilism in terms of its identification of wealth with money and on that basis condemns it utterly, although on a broader view which identifies mercantilism as one form of economic nationalism he approves certain elements in the system, as, for example, the navigation acts. In cases at least he maintains consistency by regarding such measures as involving a sacrifice of opulence, which may nevertheless be justified by a superior value of a different sort: that of national defense.

His views had immediate and immense influence and a success which he himself did not anticipate. Running counter as they did to powerful vested interests, he did not expect them to emerge victorious. The free trade revolution in England which followed in a later generation is probably to be explained by the rise to political power of industrial interests desirous of cheap food for the workers and so opposed to the corn laws, while the manufacturing supremacy which England gained by taking the lead in the industrial revolution called for no protection but was best served by freedom of trade. The industrial revolution also broke down the craft interests benefiting by the survivals of guild restrictions. In Germany, with its different economic situation and political system, the success of Smith's economics came later, and its supremacy was short lived. Other countries adopted much of Smith's ideology while remaining protectionistic, and the later course of the classical tradition was on the whole more influenced by Ricardo than by Smith.

The validity of Smith's doctrines for a much

later age is perhaps mainly a matter of academic interest. It may possibly be said that, so far as economic behavior is still a matter of free individual choice, much truth remains, although it all needs to be rethought in terms of modern conditions and knowledge, especially of the forces conditioning such free choices. In some respects Smith may be closer to fact than the later utilitarian logic or its Austrian development. In his time as now the world was far from following a "system of natural liberty"; but then it was moving toward it, while now it is moving away. From an expression of things in process of becoming the doctrine became in the mid-nineteenth century a bulwark of things existing; from an attack on outstanding vested interests of its day it became a defense of those of a later day (often applied in ways foreign to Smith's own thought). And now it seems a refuge of "historic homesickness."

The trade barriers established since the World War are in the class of restrictions against which Smith's system properly applies and might give it renewed validity, save for the apparent impossibility of moving in the Smithian direction. In other fields this impossibility seems even clearer. An incipient impasse between the order of competitive liberty and the tendency of entrepreneurs and others to combined action, seen but passed over by Smith, has now become a dominant fact. An economy of large corporations is not individualism in the Smithian sense, which referred to actual individuals. The modern business cycle is clearly a different thing from the trade fluctuations reflected in Smith's writings; and the recognition of insecurities arising from human arrangements but beyond the power of individuals to meet successfully has altered one of the bases of individualist philosophy. The "natural order" can no longer be called natural in contrast to opposing forces, not even in the sense of an all sufficient ideal. The principle of free choice and free exchange remains an element in the present economic order and doubtless has a proper place and scope; but these are yet to be determined, one possibility being a closer approximation to the results of the (ideal) system of liberty but by methods of conscious direction.

The most valid element in Smith's work was his prescience in selecting for the emphasis accorded by a central formula those elements demanding fuller expression than the time accorded, and whose achievement of that fuller expression was destined to be the outstanding

fact of a coming generation. But an ideology that shall have the same measure of pragmatic validity in relation to the forces of the twentieth century must include new elements and must combine its elements with a very different balance of emphasis.

SMITH, EDMUND MUNROE (1854-1926), American jurist and political scientist. Munroe Smith graduated from Amherst College in 1874 and received his law degree from Columbia College three years later. His studies in civil law and legal history at various European universities from 1877 to 1880 brought him into contact with the leading jurists of the time, including Bruns, Windscheid, Jhering and Gneist, to whom he later devoted an extensive series of articles in the *Political Science Quarterly*. After obtaining the degree of doctor of jurisprudence

from Göttingen University, Munroe Smith became a member of the faculty of Columbia University, a connection which lasted from 1880 until his retirement in 1924. Appointed professor of history and political science in 1883, he was given the chair of Roman law and comparative jurisprudence in 1891, while in 1922 he became professor of European legal history. Munroe Smith was influential in transforming Columbia from a college into a university with wide facilities for graduate study and was one of the group led by Burgess which established the first school of political science in the United States. As managing editor of the *Political Science Quarterly* from its foundation in 1886 to 1893, during 1898 and from 1904 to 1913 Munroe Smith obtained the collaboration of European as well as American scholars and established the journal's reputation. He served as president of the American Political Science Association in 1917.

His profound knowledge of foreign as well as of Anglo-American law and his rare insight into the relations of law to history and the other social sciences gave Munroe Smith for more than a generation a unique position in the fields of historical and comparative jurisprudence, which enabled him to contribute materially to the liberalization of legal education in the United States. In his lectures and writings his critical appreciations of detailed legal phenomena are synthesized by the notable conception that European legal history had a common, cultural evolution and did not consist merely of narrow, national developments. Munroe Smith's principal works include *Bismarck and German Unity; a Historical Outline* (New York 1898, 3rd ed. 1923), a classic interpretation of Bismarck's life and works, and two studies relating to the crisis of 1914, *Out of Their Own Mouths* (New York 1917) and *Militarism and Statecraft* (New York 1918). The latter was translated into many foreign languages. His other leading books are *A General View of European Legal History and Other Papers* (New York 1927), which is a collection of his most important articles; and *The Development of European Law* (New York 1928), a posthumous edition of his comprehensive lectures on European legal history. His dissertation, "The Law of Citizenship from the International Point of View," was published in condensed form in Lalor's *Cyclopedia of Political Science* (vol. ii, Chicago 1883, p. 941-56). A complete list of his writings is to be found in *A Bibliography of the Faculty of Political Science*

of Columbia University, 1880-1930 (New York 1931, p. 12-18).

SMITH, GOLDWIN (1823-1910), Anglo-Canadian historian and publicist. In 1868 Smith, an Englishman by birth and education, emigrated to the New World, where he spent the remainder of his life. He was in the United States at the time when Cornell University was being organized and became one of the small and distinguished group of its first professors. He married a wealthy lady in Toronto in 1871 and subsequently lived in that city. Although he was regius professor of modern history at Oxford from 1858 to 1866, professor of English and constitutional history at Cornell from 1868 to 1894, president of the American Historical Association in 1904 and author of outline histories of Great Britain and the United States, Smith's work as a historian is of minor significance. He had neither gifts nor serious respect for research and only a superficial historical knowledge. But as speaker, writer and controversialist on all contemporary questions he was equipped with positive convictions, a vigorous epigrammatic style and an unflinching interest and literary activity. A lifelong adherent of the Manchester school of economics he became in his later years a staunch opponent of imperialism. He urged not only the complete independence of Canada from Great Britain but also the removal of tariff barriers between Canada and the United States as a preliminary to annexation by the larger republic. His advocacy of such a policy aroused great antagonism, but his activities on behalf of less controversial local interests caused him ultimately to be accepted as one of Canada's most distinguished citizens. Both in England and in Canada his views were almost always those of a minority. He opposed the Boer War. He disliked Cecil Rhodes and regretted his bequest to Oxford. He deprecated the successive imperial conferences in London, maintaining that the dominions and even India should be encouraged to set up for themselves. Inconsistently he opposed home rule for Ireland, believing the Irish race incapable of self-government, broke with Gladstone on the subject and joined the Unionists, although he hated their imperialist views and distrusted Chamberlain. Smith disapproved of

the Spanish-American War and he wrote against the growing American imperialism.

SMITH, JAMES ALLEN (1860–1924), American political scientist. Smith was born in Missouri and was educated first at the University of Missouri and then at the University of Michigan, where he received his doctorate. He became professor of political science at the University of Washington, where he taught from 1897 to 1920. A colleague and friend of Smith's at the latter university was Vernon Louis Parrington, whose seminal history of American literature owed much to the contact. Because of the unorthodox views which he held Smith did not experience a rapid advance in his academic career.

Smith set in motion the economic interpretation of the American constitution. His *The Spirit of American Government* (New York 1907) was a pioneering work. Contemporary American jurists and political scientists regarded the constitution as a more or less divinely inspired instrument of government whose inner truths could readily be grasped by exegesis. The result of this constitution worship was a highly uncritical and static constitutional logomachy. Observing the frustration of democratic government in his own time, Smith was led to inquire into the origins of the constitution. The decades after the Civil War had amply demonstrated "the cohesive power of public plunder" in American life. If the government could be exploited for private economic ends at one time, it was logical to believe that the phenomenon was not unprecedented and might have existed also in the patristic period.

Smith was the first to demonstrate that the constitution was actually "a reactionary document." Its mechanisms were intended to make majority rule impossible while preserving its external forms. This end the Fathers had accomplished not only by means of the judicial

veto and the adoption of an exceedingly rigid amending process but by working out a highly intricate system of checks and balances. The constitution as it emerged from the convention was far from welcome to the people at large, and the state ratifying conventions adopted it only as the result of guile and pressure on the part of the conservative business interests whose influence had preponderated in the drafting of the instrument.

It is true that when Smith wrote Turner had already emphasized the importance of economic forces in American historical development, but his method remained to be applied in the arid domain of political science. Smith's approach was historical and realistic, although where direct evidence was lacking he was perhaps too prone to fall back upon the inherent nature of the political mechanisms embodied in the constitution. In certain respects he was perhaps too Machiavellian, but his fundamental thesis remains unshakable. Beard's *An Economic Interpretation of the Constitution of the United States*, published six years later, has achieved more fame than Smith's work; but it was hardly more than a documentation of Smith's general conclusions.

Smith's ideas were an important influence in launching the Progressive movement, furnishing much of its ideological basis, although his book would have caused an even greater stir if it had been published a few years later. Despite the continuous perversion of democratic government by economic interests which Smith observed he remained nevertheless a good Jeffersonian democrat in his fundamental outlook. This factor no doubt deprives his second work, the posthumously published *The Growth and Decadence of Constitutional Government* (New York 1930), of most of its interest and value; in fact it adds little to what Smith had already said despite its attempt to cope with more recent developments. Smith had been left behind by the march of the times. The work of many disciples had reduced his later work to the level of commonplace.

SMITH, JOHN PRINCE. See PRINCE-SMITH, JOHN.

SMITH, JOSEPH (1805-44), American religious leader. Smith came of a family of mystics and grew up in an illiterate and poverty stricken atmosphere charged with religious revivalism. In his fifteenth year, while living at Manchester in central New York, Smith claimed that he had been visited by two angels, one of whom told him to remain aloof from the conflict between various religious groups in the town. According to Smith there were subsequent visitations from the angel, who revealed to him the golden plates which had purportedly been buried in a nearby hill by Mormon in 385 A.D. Smith stated that these contained records written in "reformed Egyptian"; they were in fact a meaningless collection of Greek and Hebraic characters mingled with Indian symbols. Smith translated the tablets with the aid of magic spectacles discovered near the plates; the latter were levitated after their translation.

This *Book of Mormon*, which was published in Palmyra in 1830 (new ed. Salt Lake City 1920), was intended to supplement the Bible. It relates the story of the settlement of America by a group of people who left Jerusalem after the confusion of tongues at the Tower of Babel. Although the work repeats many of the statements of the Holy Scriptures, it also contains a curious medley of Protestant dogma and native superstition and appears to have been influenced by the current anti-Catholic and anti-Masonic movements. In later years Smith announced other revelations dealing primarily with the doctrines and organization of The Church of Jesus Christ of Latter-day Saints, which he founded in 1830. Among them were *A Book of Commandments* (Zion, Mo. 1833) and *Doctrine and Covenants* (Kirtland 1835, new ed. Salt Lake City 1921).

The hostility of their neighbors in the east led the Mormons under Smith to establish a colony in Kirtland, Ohio. In 1837, forced to leave Kirtland, they settled in western Missouri. There as well as in Ohio the prophet started the United Order, a form of communism of property; he failed in both attempts, however, and substituted the principle of tithing. Mob attacks forced the Mormons to leave Missouri for Illinois, where Smith reached the height of his power. He was mayor of Nauvoo, a Mormon city of fifteen thousand inhabitants, and a power in state politics. He headed the Nauvoo Legion of six thousand uniformed men and announced himself a candidate for the presidency of the United States. A factional quarrel within the city, however, excited the ever ready suspicions

of the Gentiles and Smith was attacked and slain.

Present day Mormonism (*q.v.*) still consists largely of the doctrines propounded by its founder, who also instituted its widespread missionary system. He introduced polygamy on the basis of a revelation subsequent to the *Book*, but during his lifetime it was practised secretly only by the leaders. Although he was admired by his followers, Smith failed in the practical tests of leadership. He was always in controversy with his aids, and hundreds of his converts became apostates. Thousands, however, took their places. At his death several factions contended for control of the church, but the main body followed Brigham Young.

SMITH, SIR THOMAS (c. 1513-77), English statesman and scholar. Smith came of a family of wealth and social position. He entered Cambridge in his fourteenth year, became a fellow of Queen's College in 1530 and public orator to the university when only twenty-five. In 1540, having become interested in the controversies raised by the Reformation concerning the relations of church and state, Smith went to the continent to study civil and canon law. He returned to Cambridge in 1542 with strong leanings toward Protestantism and Erastianism. In 1544 the king appointed him first regius professor of civil law at Cambridge.

On the accession of Edward VI and under the patronage of Protector Somerset, apparently a distant relative, he was drawn into politics, holding a number of public offices including one of the two principal secretaryships of state. On the fall of Somerset he suffered eclipse, being deprived of most of his offices, imprisoned for a time and heavily fined. He suffered still more during Mary's reactionary reign. That, as a Protestant, he escaped more serious penalties was due mainly to the personal influence of Bishop Gardiner, for whom Smith had earlier interceded. Under Elizabeth he again emerged as a man of power. He entered Parliament in 1559 and took a prominent part in framing both the Act of Uniformity of that year and the revised prayer book. From 1562 to 1566 he was

ambassador to France, establishing an Anglo-French entente which, on a second embassy in 1572, he was able to consummate in a defensive alliance. For this achievement Elizabeth made him principal secretary of state. His main work, however, was done.

Smith's most notable work as a publicist was *De republica Anglorum* (published posthumously in 1583, latest and best ed. by L. Alston, London 1906). Composed in Paris about 1565 but written in English, it presents an invaluable picture of the actual working of the English constitution, including the administration of justice, in the middle Tudor period. As a diplomat he penned over three hundred letters from France, which are calendared in the Elizabethan state papers. He also wrote learned works on Greek pronunciation and English style. Smith is recognized as one of the ablest and most honorable of the great men of Tudor England.

SMITH, WILLIAM ROBERTSON (1846-94), Scottish philologist, Biblical and Semitic scholar. Educated at Aberdeen and Edinburgh, Smith achieved distinction in mathematics, physical science and natural philosophy as well as in his chosen field of theology and Semitic languages. His scientific mind responded to the critical work of Kuenen and Wellhausen, so that he early became the leading British exponent of the higher criticism. While professor of oriental languages and Old Testament exegesis at Free Church College he embodied his scientific findings in the article "Bible" contributed to the ninth edition of the *Encyclopaedia Britannica*. Orthodoxy was disturbed. Smith was inducted before the General Assembly and, although he lost his chair, won the battle for freedom by vindicating the right of a member of the Free Church to accept the results of scientific scholarship and to believe in the progressive development of vital religion and theology.

In 1881 Smith became joint editor of the *Encyclopaedia Britannica* and later as editor in chief carried that work to its conclusion. He was made Lord Almoner's professor of Arabic at Cambridge (1883), university librarian (1886) and Adams professor of Arabic (1889). During this period his interest turned from purely Bibli-

cal studies to the interpretation of the origin and development of Semitic religion. At that time the search for religious origins and for the law of religious evolution was capturing advanced scholars in many fields. Unlike most of the others, Smith did not center his research upon the origin of ideas. He was the first to maintain that in primitive religions the rites, institutions and practises were primary and not belief or myth. Religion was social, integral to the group, a way of securing and preserving the values of community life. The earliest religious group was composed of kinsmen bound together by blood relationship. Groups, however, included in the blood bond not only men but animals and gods who were originally totems. This relationship accounts for the basic form of ancient sacrifice—a communion meal which removed elements of discord and danger and renewed the bond between the god and his kinsmen by the communication of divine life. From this beginning, under the influence of new cultural conditions, the development of property rights and the elaboration of the idea of tabu, all other forms of sacrifice evolved.

A better understanding of totemism has discredited this theory of origins, and it is now generally agreed that it is impossible to weave all forms of sacrifice into a genetic development. Nevertheless, Smith holds a secure place in the history of comparative religion for his insistence on the social and practical nature of religion, his realization that gods are rooted in the social life of their people and by the intimations he gave, long unheeded by scholars, of the purely artificial distinction between magic and religion.

SMITH, ZILPHA DREW (1852-1926), American social worker. Miss Smith in 1879 became head of the small office staff of the newly

formed Associated Charities of Boston, then among the pioneer societies for organizing charity. In 1886 she was made general secretary. She and a group of outstanding citizens, managers of the society, made themselves familiar with the accomplishments of the London society and pushed on experimentally with development in the use of volunteers, especially as family visitors, and in the systematic training of staff workers. Her classes for training field secretaries, begun in 1891, were the forerunners of the modern schools for teaching social case work; and the Boston Monday Evening Club founded by her and a few friends in 1888 was the first discussion group of social workers in the United States. Miss Smith helped also to bring about the establishment of the first public playground in Boston. Because of poor health she resigned from her post in 1903 and the following year she became associate director of the newly formed Boston School of Social Work, later known as the Simmons College School of Social Work; she retained this position until illness compelled her to retire in 1918.

In her teaching, which was notably skilful, she emphasized particularly the careful placement of students in field work and the correlation of that work with studies. Throughout her career as organizer and teacher and in the few published works which she found time to write, Miss Smith insisted that the main function of charity organizations and the test of their value lay in the strengthening of family life. Despite her strong feeling that the state was to be resorted to only after all attempts to build up family morale had been made by private relief agencies, yet she took part in framing wisely the mothers' aid law in Massachusetts.

As a pioneer in the new calling of social work, she enjoyed the respect and friendship of the most outstanding of her contemporaries—including Mary E. Richmond in the United States and Charles S. Loch, head of the London society.

SMUGGLING is the illegal transportation of things or persons into or out of a country in avoidance of payment of an impost or in viola-

tion of an absolute prohibition. Probably there has always been smuggling whenever the profits seemed to offset the risks. Internal smuggling persisted in France, with its provincial inequalities, until the French Revolution; but smuggling on the whole has been concerned with national frontiers. The practise came into particular prominence in early modern times, when mercantilistic doctrines led to national customs duties and commercial prohibitions in place of the earlier local tolls. Occasionally smuggling has been a matter of sneaking things out of a country; violations, for instance, of the edicts forbidding the exportation of white elephants from Siam, merino sheep from Spain and machinery from England in the early days of the industrial revolution. The vast bulk of smuggling operations, however, has consisted of importations.

Probably the longest continuous smuggling activity was that which centered on the south coast of England for some five centuries. At the outset, in the fourteenth century, exports were smuggled. The effort to encourage a domestic woolen industry by imposing heavy export duties upon raw wool or by prohibiting its exportation entirely led, by reason of the great demand in Flanders for England's chief commercial offering, to the prolonged success of smuggling bands, known as "owlers" because they worked at night. The center of their activity was Romney Marsh, where the men of the Cinque Ports welcomed smuggling, like piracy and privateering, as a relief from the tedium of regular commerce. A marked change came when England tried to pay part of the cost of its long series of French wars (1689-1815) by means of high customs duties. By 1700 the English smugglers were shifting from exports to imports. For a century and a half they brought great quantities of brandy, tobacco, tea and other highly taxed commodities into England. There was some activity on the eastern coast and around the Isle of Man, but the old region of Kent, Sussex and Hampshire remained the center of operations.

During the eighteenth century some of the continental nations had trouble with overland smuggling. Through remote passes in the Pyrenees contraband moved both ways between France and Spain. France, where Colbert had developed an elaborate system of commercial restrictions in the previous century, was also flooded with tobacco and other things from Savoy, Switzerland, Germany and the Netherlands.

As Europe expanded overseas, the extension of monopolistic mercantilistic measures to the colonies was an invitation to persistent and widespread smuggling. This was most prevalent in the Spanish and English colonies. Holland rigidly repressed it in the East Indies but abetted it in America.

Spain neglected the normal commercial needs and desires of its American colonists but at the same time strictly proscribed all intercourse with other nations. This vast potential market was a chronic temptation to Anglo-Saxon traders. English or American smugglers violated the Spanish regulations from the time when Hawkins sold slaves at the cannon's mouth in Elizabeth's day down to the gun running in the last days of Spanish rule in Cuba four centuries later. The legal loophole of a ship a year, granted to England by Spain in the Asiento at Utrecht in 1713, was shamelessly exploited by smugglers from England and its American colonies. Spanish efforts to check the practise led to the War of Jenkins's Ear in 1739. As the wars of Latin American independence approached, shortly after 1800, the English and Americans became still bolder in their smuggling, which included the practise of gun running. This smuggling of arms has been associated ever since with revolutionary movements in those regions.

While the Spanish colonists let the Anglo-Saxons smuggle for them, England's American colonists ran a flourishing smuggling business on their own account. Their defiance of the Navigation Acts and other commercial laws became so prevalent that for a long time they were not forced to resort to the usual clandestine practises of smugglers. Tobacco, indigo, masts and other "enumerated" articles were to be shipped only to England, but many colonial cargoes went direct to continental ports when higher prices could be obtained there. Tea, textiles and other oversea products were to be purchased only in England, but large amounts came direct from Holland and other parts of Europe. The American colonists furnished food and naval materials to the French and Spanish colonies even when the mother countries were at war with England. The most important, and probably the most justifiable branch of colonial smuggling, was the trade with the French and to a lesser extent with the Spanish sugar islands of the West Indies. In 1733 the planters of Jamaica and the other British islands secured the passage of a Molasses Act (or Sugar Act), laying a prohibitive duty on the bringing of sugar, rum

and molasses into the mainland colonies from the foreign islands. The British islands, however, could not absorb all the lumber, fish, flour and beef which the Yankees produced. Those articles at the same time were in heavy demand in the French and Spanish islands, which needed an outlet for their surplus sugar and molasses. The Act of 1733 became virtually a dead letter. Governor Bernard of Massachusetts estimated that of some 15,000 hogsheads of rum brought into that colony in one year, fewer than 500 came legally from the British islands. Grenville tried to stop these colonial irregularities in 1763, only to precipitate much more serious trouble.

In the early years of the nineteenth century the Napoleonic wars brought on one of the greatest epidemics of smuggling in history. Napoleon issued his Berlin and Milan decrees, closing the ports of the whole continent to English trade. Had the regulations of this continental system been enforced at their face value, Europe would have gone for several years without tea, coffee, chocolate, sugar and other colonial wares and would in addition have suffered a shortage of British textiles and hardware. With millions desiring such articles and with England in constant quest of markets it is not surprising that large quantities of contraband seeped into Europe. Heligoland, in the North Sea, became a lively center for regular smuggling operations; while the abnormal use of licenses and neutral flags together with the venality of port officials made possible further extensive operations which may also be classed as smuggling. At the same period the Embargo and Non-Intercourse acts in the United States also led to smuggling, particularly along the St. Croix River on the New Brunswick frontier and through Ameiia Island on the edge of Spanish Florida.

For a century thereafter there were no important new outbreaks except in connection with the slave trade. This was declared illegal by England in 1807 and by the United States in 1808, while England secured the agreement of the other powers to the principle in the Treaty of Vienna in 1815. There was still a strong demand for slaves, however, in the United States and in Cuba. Despite the vigilance of British and American cruisers illicit slave trading continued at least until the American Civil War. In the United States the "underground railroad," by which northerners helped many slaves to escape to Canada, might be called a form of export smuggling.

Smuggling was suddenly revived on a grand scale in the United States soon after the World War. It resulted principally from the legislation which prohibited the liquor traffic and radically curtailed immigration from Europe in addition to extending the earlier exclusion of orientals. Liquor and aliens together with narcotics were smuggled into the country in great quantities. There was a "Rum Row" anchored just outside the legal limit near New York. Swift motor boats brought to Florida aliens from Cuba and liquor from Bimini. Aliens were smuggled also across the Rio Grande and up the Pacific coast from Ensenada in Mexico. Many of the thousand roads crossing the Canadian border were the scene of nocturnal smuggling operations. It was estimated that the number of smuggled aliens was almost equal to the number legally admitted on quota, while liquor and drugs seem to have been available in adequate quantities for all who would pay the price.

From the economic standpoint conventional, commercial smuggling may be regarded as an effort to bring business into normal channels, from which it had been diverted by arbitrary laws. As a rough attempt to secure *laissez faire* it received sympathetic treatment from the economist Adam Smith, who defined a smuggler as "a person who, though no doubt highly blamable for violating the laws of his country, is frequently incapable of violating those of natural justice, and would have been, in every respect, an excellent citizen had not the laws of his country made that a crime which nature never meant to be so" (*Wealth of Nations*, Everyman ed., 2 vols., London 1910, vol. ii, p. 379). The smuggler in consequence ordinarily met with "public indulgence" and was even regarded as a friend of the people because he made available a supply of desirable articles at reasonable prices. It was often difficult to secure a conviction for smuggling from an English or American jury. In the American colonies this feeling had political as well as economic consequences. The trade with the foreign sugar islands was of such obvious benefit to both parties that when efforts were finally made to enforce the Act of 1733 the American revolutionary movement received a great stimulus. The Americans in fact acted as though the protracted tolerated smuggling had given them an inherent right to the prohibited trade. Widespread smuggling at a time of high duties penalized the "fair trader" who tried to sell goods which had legally passed the customs. At a time when tea sold for 7d in Holland and

from 3s 6d to 5s a pound in England the smuggler could make a generous profit and still undersell the legitimate merchant. Even today the diamond merchants of New York are complaining of the difficulty of meeting the competition of smuggled wares.

Smuggling operations have ordinarily required a fairly elaborate organization. An individual may sneak diamonds or drugs past a customs inspector in a fountain pen barrel or hollow heels, but the bulk of smuggling has been a regular business for gangs. Maritime smuggling, for instance, called for considerable division of labor, with separate groups or individuals for purchasing, sea transport, landing, inland carriage and final sale of the smuggled wares. A gang which smuggled aliens, and which was prosecuted in the United States in 1931, was reputed to have made profits of \$20,000,000 and to have operated with all the efficiency of a chain store system, adding subsequent blackmail to the actual running of the aliens. The financial backers of smuggling operations have usually concealed their identity, although John Hancock received ample publicity in this connection.

Popular imagination associates smuggling with the nocturnal landing of contraband in some remote cove. In the old days the fast sailing smuggling vessel would "hover" off the prearranged spot with the contraband broken up into small packages to facilitate speedy handling. When contact was established, the cargo would be carried ashore in rowboats and delivered to the "shore gang," whose pack horses would take it for storage to a house or even a church until it was ready for final distribution. Modern maritime smuggling follows these general lines, but the use of steamships, wireless, motor boats, seaplanes and automobiles has given the smugglers increased mobility and facility of communication. There were, however, many other methods of running contraband. The old English smuggling craft often transferred their contraband to coasting colliers, which were not normally examined by customs officers; while valuable articles are still smuggled through the customs concealed in bales or boxes of commodities subject to lower duties. American colonial smuggling was probably as brazen as any, for the complaisance of the customs officials usually made clandestine operations unnecessary. In early land smuggling pack horses were used to transport contraband over remote trails. Today the automobile and the airplane have greatly facilitated such work, while even carrier

pigeons and dogs are used across land frontiers, which have become much more numerous in Europe since the World War. Smuggling methods are naturally affected by the size of the objects to be smuggled and also by geographical factors. A coast line indented with numerous coves and inlets is much more favorable than long, inhospitable sandy stretches; while land frontiers marked by high mountains or broad rivers are easier to protect than arbitrary lines on the map.

The smuggling gangs were frequently guilty of desperate lawlessness. Capture meant not only confiscation of property but also at times long imprisonment or even death. The gangs on the south coast of England maintained a virtual reign of terror in the adjacent countryside and at one time enforced the rule that all inhabitants should turn their faces to the wall when smugglers passed, so that they might not be recognized. Kipling described this well in his "Smugglers' Song" in *Puck of Pook's Hill*. The notorious Hawkshurst gang barbarously murdered a customs officer and an informer, and the customs forces were frequently unable or unwilling to attempt seizures. The destruction of the *Gaspee* near Providence in 1772 may be classed as either patriotism or smuggling violence according to the point of view. More than two hundred American officials were beaten or murdered during the recent smuggling epidemic, which also developed the piratical hijacker who stole by force from the "legitimate" smuggler.

To check smuggling governments have not only imposed criminal penalties but employed such devices as armed coast guards and frontier patrols. The early English threats of death penalties failed to check the owlers, and by 1700 Parliament had established armed customs "preventive" forces on and offshore, supplementing them with the regular army and navy. In the eighteenth century Parliament passed act after act in an attempt to meet every new evasion of the smugglers, gradually extending the authority of the preventive forces as the smugglers were pushed farther offshore. This legislation was effectively coordinated in 1825. Spain developed an elaborate system of *guardacostas* to protect its colonial monopoly, while eighteenth century France used regular troops in addition to its customs officers. One of the first acts of the new United States government was the establishment of a revenue cutter service, part of the present Coast Guard. In the wave of smuggling after the World War this was greatly augmented

by the transfer of destroyers from the navy and the building of small, fast "rum chasers." In addition to the regular customs service the United States also established separate border patrols under the prohibition, immigration and narcotics services. It has also attempted to check smuggling through the customs by offering to informers a generous share of the condemnation proceeds.

One of the main difficulties in checking smuggling has been the corruption of the preventive services. The officials, seldom overpaid, have frequently yielded to the temptation of securing easy money in the place of performing a thankless if not dangerous duty. Charges of such corruption did not die with the eighteenth century. Even since the World War they have been leveled against members of the United States Coast Guard and against the Canadian customs service, in which, it was charged, one of the most prominent officials was connected with a powerful smuggling gang.

As Adam Smith implied, perhaps the most effective way to prevent smuggling is to avoid excessive customs duties, which too often defeat their purpose of increasing the revenue. To be effective repressive measures would seem to require international cooperation to make possible the seizure of contraband at the source, so that the smuggler would have to face the preventive machinery of at least two nations. Much progress has been made in this direction in the recent post-war period. Between 1924 and 1928 the United States negotiated eleven treaties with maritime powers to check smuggling. These raised the disputed question of jurisdiction in marginal seas and permitted, for the checking of smuggling, the pursuit and seizure of craft beyond the three-mile territorial limits. In 1925 the Baltic and Scandinavian nations joined in a similar pact to check liquor smuggling. Even more comprehensive arrangements have been made between the United States and Canada. Certain questions of jurisdiction have been referred to the League of Nations, which had already been dealing with the smuggling of narcotics, slaves and "white slaves." It seems possible that the American smuggling orgy following the World War has paved the way for methods which will radically check the practise.

SNELLMAN, JOHAN VILHELM (1806-81), Finnish philosopher and statesman. Snellman was born in Stockholm of Swedish-Finnish family. He taught philosophy at the University of Helsingfors, was minister of finance in the Finnish cabinet from 1863 to 1868 and director of the Finnish land mortgage society from 1869 to 1881.

Snellman early came under the influence of the Hegelian school, and in his *Versuch einer spekulativen Entwicklung der Idee der Persönlichkeit* (Tubingen 1841) and *Laran om staten* (Theory of the state, Stockholm 1842; new ed. Helsingfors 1892) he stressed the importance of the "national spirit." After traveling in Germany and Sweden he returned to Finland in 1842 and became the leading spirit in the Finnish national movement. Because of the country's union with Sweden, Swedish was until 1809 the language of the educated classes. In 1844 Snellman founded the weekly paper *Sama*, in which he appealed to the Swedish speaking groups in Finland to support Finnish nationalism. When this paper was suppressed at the instigation of the Russian governor general in 1847, he established the *Litteraturblad för allman medborgerlig bildning*, in which he continued to express his views. In Snellman's opinion all national cultural and political efforts were vain unless the language of the majority of the people, Finnish, was cultivated and accepted as the official language of the country.

As minister of finance as well as in his brilliant journalistic work Snellman, influenced particularly by Friedrich List, took a great

interest in economic questions, manifesting deep theoretical understanding and unusual vision. He devoted considerable attention to the utilization of the Finnish forests, promoted the building of railways and in spite of accumulated difficulties carried through a policy of monetary reform (1865) whereby the Finnish currency was separated from the fluctuating Russian paper money and based on the silver standard.

SOCIAL CASE WORK. See SOCIAL WORK, section on SOCIAL CASE WORK.

SOCIAL CHANGE. See CHANGE, SOCIAL.

SOCIAL CHRISTIAN MOVEMENTS. Social Christian movements represent one of the forms of reaction to the social question raised by the development of modern capitalism and industrialism. All social Christian movements are grounded in traditional social idea and the ethical and social forces found in Christianity and are inspired by the belief that Christianity, with its ideas, values, ethical duties and institutions, is a decisive, if not the most decisive, factor in the struggle against the social and economic evils of society. Setting up a transcendentalism in opposition to the secularism of capitalism, they find that social evil arises from the secularization of social and economic life divorced from the ethical and social values of Christianity.

Social Christian movements have developed in all industrialized countries since the inception of the capitalist era. Their relative strength or weakness has depended on the degree of industrialization and the corresponding proletarianization of the wage earning masses; their scope and significance have varied with the degree of intensity and vitality of Christian ideas. Those Christian denominations which aspire to an influential position in private and public life have been more open to social Christian currents than those which do not make such claims. In general, however, manifestations of this sort have developed in both Catholicism and Protestantism. The first important social Christian movements had their origin in Great Britain (see CHRISTIAN SOCIALISM), but France and Germany soon

followed suit. In France the earlier attempts of Lammenais and Lacordaire, Villeneuve-Bargemont and Ozanam to adjust Catholic social theory and practise to the new conditions of industrialization were carried on and elaborated by Charles Perrin and culminated in the very active social Catholic movement of Count Albert de Mun, Count René de La Tour du Pin and the Action Libérale Populaire. In Germany the beginnings of social Catholicism go back to the work of Baader, Gorres and Dollinger and above all to the powerful influence of Bishop Ketteler. Under the leadership of Franz Hitze, Heinrich Pesch and Franz Brandts the Volksverein für das Katholische Deutschland was founded and the political aims of the social Catholic movement were realized in the German Center party. A tremendous spur to the growth of social Catholicism was supplied by the encyclical *Rerum novarum* issued by Pope Leo XIII on May 15, 1891, and similar movements took shape in other European countries.

Simultaneously with these developments in Catholicism a social Christian movement grew up within German Protestantism. Wichern, the great organizer of the home mission, was followed by Victor Aimé Huber, Rudolf Todt and Adolf Stocker. In 1878 Stocker founded the *Christlichsozialer Arbeiterpartei* in order to win the Christian workers away from Social Democratic organizations, and in 1890 with Ludwig Weber, A. Hainach and A. Wagner he established the Evangelisch-Sozialer Kongress, which called upon theologians and economists to cooperate in the elaboration of a social Christian program. The radical wing of this movement, under the leadership of Friedrich Naumann, later broke away and joined forces with the more secular democratic groups in Germany. With the tremendous growth of the Social Democratic party in Germany, especially during the period following the World War, numerous groups of religious socialists were formed. These groups, while rejecting the materialistic philosophy of Marxism, experienced no conflict between their Christian principles and active participation in the socialist movement. The circle of Theodor Steinbüchel and Heinrich Mertens among the Catholics and the Tillich and Mennicke groups among the Protestants have been the most conspicuous of the religious socialist groups.

These varying tendencies and currents may be classified roughly into three groups. The first affirms the existence of an objective social and economic order derived from Christian doctrine

and distinct from the present order of society. The second holds that the existing economic and social order may be reformed by the force and spirit of Christianity and that the infusion of Christian feeling and Christian ethics into social life will alleviate social distress. The third group seeks merely to distinguish the Christian movement from un-Christian or anti-Christian manifestations of the social movement. Such currents are found where the existing tendencies have assumed a strong anti-Christian bias and where Christianity is regarded as a reactionary tool of the ruling class.

Social Christian movements are to be distinguished from the purely charitable institutions developed by Christianity. Whereas charitable welfare organizations are merely institutions fulfilling given functions, the social Christian movements by their dynamic character are forced to take either a positive or a negative stand toward the existing economic and social system and the social problem created by capitalism. They must concern themselves with the causes of the social problem as soon as they become aware of them. Superficially these causes may appear to be due merely to absence of social spirit or to its perverted character. In such circumstances the movement tends to exhaust itself in mere criticism of this spirit and in developing a spirit of reform. A deeper analysis leads to a critique of existing social institutions and to preoccupation with the foundations of the ruling order—with liberalism, individualism and capitalism. The problem of the radicalism of Christian thought as well as its assimilation into the main social currents of the time depends on whether the social Christian movement recognizes the existing economic and social order and seeks merely to reform it from within, or whether it rejects entirely the foundations of the prevailing system. In the latter case there is the alternative of either a spiritual alignment with socialistic form of anticapitalism or propaganda for a new Christian social order to be marked by a corporate structure of society such as existed during the centuries of exclusively Christian domination. The span of the social Christian movement thus lies between the spirit of reform which minimizes the weight of concrete institutions and interests but overestimates the force of attitudes and those currents which look to an actual social transformation.

The first attack of social Christian movements is directed against economic liberalism. There are differences among the various social

Christian groups as to the question of state intervention, its extent, how and when it should occur and whether this intervention is merely subsidiary or primary. In countries like Germany and Austria state intervention is taken for granted more than in France or England. This is due to the prevailing attitude toward the state. In France this very question divides the social Christian movements into two factions—interventionists and non-interventionists. Interventionism has claimed more and more lasting successes, and increasing recognition has been given to the role of the state. Since the *Rerum novarum* this role has been acknowledged, in principle at least, also in the French Catholic movements. The spirit of the times has become opposed to non-interventionism, even in England. The increasing interference of the state in social and economic matters has effectively dispelled all opposition to state intervention within the social Christian movement. There remains, however, the question as to the degree and significance of such intervention. This subject was discussed vigorously during the post-war period under the stimulus of the social policy and welfare activities of the state, and it will probably continue to receive considerable attention in the future as a result of the current tendencies toward social and political monopoly.

The second object of criticism by the social Christian movement is the individualist character of the modern economic and social order with its emphasis on the economic freedom of the individual, his self-responsibility and his self-interest. The individual is considered the final and only criterion of social life. Society becomes degraded to a mere contractual relationship or "to a fictitious body," as Ricardo once said. All responsibility in economic matters rests with the individual. Self-interest becomes the guiding principle of moral activity and the only norm of economic intercourse; free competition is given free rein and there ensues the economic struggle of all against all.

The manysidedness of the social Christian movement is revealed in the attitude toward the principle of individualism. The view of economic society as a mere aggregate of individuals bound by contract and engaged in competitive struggle with one another is scarcely compatible with the social views of any of the groups. Even the groups closest to liberalism also assert the existence of supra-economic obligations operating within the economic sphere. Thus a social ethics comes into conflict with the purely in-

dividualistic ethics of individualism. Such social Christian currents reflect a sort of personalism, according to which the individual lives in a complex of social relationships. They reject, however, the view which holds that the individual is the only reality in a contractually organized system of society. Other groups are so emphatic in their affirmation of the unity of society and its organic parts that they take their point of departure from the community as the true reality, considering the individual—or more precisely the person—as an organic part of a superimposed social whole. Within the social Catholic movement there are groups which look upon society as a part of the *Corpus Christi mysticum* and thus arrive at a complete rejection of individualism. The Protestant social movements, in keeping with their fundamental ideology, are more individualist than those to which Catholicism gives rise. Even in the Protestant movements, however, developments have led to the overhauling of the old individualism and the recognition of the primary character of society and its structure. The idea of occupational organization in particular has never quite died out within the social Christian movement. This had its origin in the attitude of social Christian romanticism during the transition period to individualism. It disappeared as a dominant idea or at least carried on merely an esoteric existence during the period of fully developed individualism. In the post-war period it came to the fore again. It was propagated particularly by the Spann school, by the strictly ecclesiastical Catholic movements inspired by the encyclical *Quadragesimo anno* of 1931 and in the social and political policies of Fascism and National Socialism.

Social Christian criticism is directed, secondly, against the exclusively economic character of individual responsibility. It proceeds from the conviction that large social groups, particularly among wageworkers, are in no position to assert such responsibility. The individualistic watchword—"each for himself"—prevents the individual from becoming rooted in inherited possessions and impairs security of employment. These ideas partake in part of the older patriarchal theories, according to which the employer must care for his workers also during periods of decreasing business, and in part of economic reformist thought, according to which there is to be occupational security of positions of employment. The view has often been expressed, notably in Leo XIII's *Rerum novarum*, that the workers must have a subsidiary source of se-

curity based on possession of property. Many suggestions have also been brought forward to the effect that petty bourgeois forms of existence should be superimposed upon the worker's mode of living. The positive favorable attitude toward trade unions, an attitude which was difficult for the earlier social Christian movements but which has developed generally, has been derived from the concept of security. In Germany this idea has been expressed since the 1890's, particularly by the *Volksverein für das Katholische Deutschland*. There developed also a more friendly attitude toward consumers' cooperatives.

The social Christian movement levels its most severe attack upon the individualist principle of the dominance of self-interest in economic life, which it regards as a repudiation of the ethical principles of Christianity. The principles of justice and love seemed to find no fundamental place here. Society seemed to split up, as a result of the sole domination of self-interest, into a mammonistic large owning class on the one hand and hopeless poverty on the other. Bishop Ketteler was of the opinion that the poverty brought about by the rule of self-interest was so oppressive that the masses could no longer continue to live according to Christian principles, and that capitalism as a form of economic life constituted a threat to the *Depositum fidei* and was therefore to be rejected on moral grounds. Many theorists considered self-interest as the core of the non-Christian character of capitalism and therefore as the real focal point of social ills. At this point the spirit of reform and the reform of economic institutions were invoked. There emerged such typical ideas as the limitation of private gain through state regulation of prices, taxes, wages, hours of work and labor of women and children or through trade unions or enlightened employers' organizations. Profit was attacked as the driving force and regulating principle of capitalist economy. Similarly there was criticism of the market as the only organ of economic intercourse even with regard to labor. Particular stress was placed upon the need of a wage adequate to support a family and to allow for savings. Every social Christian movement has been characterized to a greater or lesser degree by this conception of man as the aim and subject of the economic system. As opposed to the mechanistic view of society there was set up the personalistic and ethical view. Profit as the sole directing force of economic life was rejected, for even in the spheres of economic and social life there is no suspension of ethical principles.

The *justitia fundamentum regnorum* is a frequently repeated formula in social Christian literature. The division of society into classes is cited as evidence of the fact that the free play of economic forces does not allow for justice or for Christian love. These can be restored only with the regeneration of the spirit of reform and with a change of institutions. This emphasis upon justice and love also serves to distinguish social Christianity from Marxism. Marxism is looked upon as a punishment for capitalistic alienation from God and Christianity. The individualistic economic and social outlook is plainly a bourgeois class idea. It originates in the sovereignty of self-interest, and therefore all reform must begin from this point. Reform may be regarded merely as an intellectual attitude; but it may also be looked upon as a reform of institutions, since these guarantee social and ethical good will. In general the latter view has predominated.

Social Christian movements by their very nature must disapprove unrestricted competition, which restricts the play of justice and neighborly love, destroys the unity of social consciousness and gives the strong free rein to suppress the weak. *La liberté du fort c'est l'oppression du faible*—with these words Lacordaire described the social consequences of competition. Competition as such is not rejected. Only that form of competition is rejected which operates without ethical scruples and leads to dangerous social consequences. Thus employers are urged to refrain from taking advantage in an unscrupulous manner of their superior position in the labor market. Wherever it is recognized that the individual employer is subject to the pressure of the questionable ethics of the market and his attitude toward wages is therefore more or less prescribed, demands are made either for state regulation of competition or for an occupational order of society with self-administration of economic life, which in turn would assume the task of regulating competition and making it more ethical. Those elements which are favorably disposed to trade unions look upon these institutions as a potentially restraining influence upon savage competition. Thus it may be said that the fundamental attitude of social Christianity is to forbid privileges to the strong and superior rights to the less scrupulous competitor.

Social Christian opposition to liberalism and individualism emerged in all its vigor with the incursions of fully developed technology and capital under the system of free economy. The earlier social Christian groups were hostile to

industry and capital. They still clung to the economic organizations of the past with its protecting and balancing institutions. With the gradual recognition that it was impossible to reestablish that past, they sought to make the present compatible with the fundamental tenets of Christianity. The conservative framework of social Christianity prevented it from going beyond social reform. Nevertheless, there are groups which consider the dissolution of the existing order as necessary. At this point the movement turns into Christian socialism. The French wing of the movement in 1848 was thoroughly socialistic and considered its socialism as founded in the Bible. At times the idea of early Christian communism has played a significant role among individual thinkers. Often attempts have been made to reduce the origins of Christianity itself to a social movement. Orthodox elements in all denominations have opposed this idea and have insisted that there never was any Christian socialism and that, despite certain isolated instances of voluntary communism among restricted groups, Christianity had come into the world only as a religious and moral force, making no claim to a new social and economic order. There is no "Christian order" of economy and society; there are only Christian principles of social life. Apart from these, society must follow the *facta contingenda*, shaping itself according to the more concrete relationships and conditions.

The social Christian movement has thus remained one among the many social currents, but never the strongest and most outstanding. In many countries, however, as in Austria, it achieved a commanding position. In the latter country it culminated in a political party and often was highly influential in social and political affairs. Thus the Austrian constitution of 1934 prescribes a Christian socialist corporate form of government. Social Christianity also exerted a great influence in Germany through the Center party. At times the movements in Belgium and France have attained significance, particularly the Catholic party of Belgium. The same is true of Holland and of Italy, where the *Partito popolare* at one time had a large following. In a certain sense too it may be said that German National Socialism contains elements of the social Christian movement, particularly in its ideas of a corporate state, its attitude toward the middle class and its hostility to liberalism and individualism.

SOCIAL CONSCIOUSNESS. See CONSCIOUSNESS.

SOCIAL CONTRACT The idea of a social contract as the basis of rights and duties in the state is almost as old as political philosophy itself. It may be found in an unprecise form in Plato and Epicurus, in Cicero and in the *lex regia* of the Roman law. St. Augustine took over the notion of Cicero, and it is built into the systems of some of the more liberal mediaeval thinkers, like Manegold of Lautenbach. As a systematic and coherent formulation, however, the theory of the social contract is the offspring of Reformation politics; and only the situation which developed at that time could have given full substance to the purpose it was intended to serve. The earliest reformers had not unnaturally been insistent upon their respect for the civil power; in that way alone could they have avoided the charge of being the proponents of anarchy. Luther, Tyndale and Calvin all maintained that the power of the prince is of God; and the Scriptural authority for that view, especially the weight lent to it by the *Epistle to the Romans*, was sufficient to make men unwilling to deny the validity of the dogma. It was not until the Counter-Reformation began seriously to disturb the conquests of the reformers that the idea of a social contract became a normal weapon in the armory of political doctrine.

Its advent is wholly intelligible. To preach that the prince's power was of God was to insist upon the subject's duty of passive obedience; and when the prince was prepared to persecute,

the subject who differed from him in religion had seemingly no alternative but to accept the tragic consequences of persecution. He might try to justify revolt, as in France under Charles IX, by arguing that a king who was a minor was misled by evil counselors and that it was only against these counselors that rebellion was intended; but after the Massacre of St. Bartholomew in 1572 such an argument could no longer be resorted to. The revived authority of Rome made necessary a doctrinal counterbalance to the theory of the divine right of kings. It was important to discover some way in which subjects who felt that their treatment by the prince was unendurable could justify their resistance to what they deemed his evil conduct. The doctrine of a social contract provided exactly the weapon needed for this end.

In its modern form this doctrine was shaped primarily by those controversialists of the sixteenth century who were collectively known as the monarchomachs. Their problem was to explain precisely how far obedience was due from the Christian when the prince acted as a tyrant by commanding what was contrary to the law of God, it being assumed of course that the law of God embodied the beliefs of the particular group which was oppressed. In the first stages of resistance, as with Knox in Scotland and Goodman and Ponet in England, it was argued that resistance to a tyrant was justified merely by reason of his tyranny; but the theoretical inadequacy of this view is evident from its relative infrequency. It was not until the Massacre of St. Bartholomew made resistance seem a duty as well as a right that it was founded, as in the hands of Buchanan and the author (probably Duplessis-Mornay) of the *Vindiciae contra tyrannos*, upon the basis of the contract idea. Thenceforward almost to the close of the eighteenth century this idea was the chief weapon against the despotic use of power.

The author of the *Vindiciae* sets out to answer four questions. Is it the duty of subjects to obey their prince if he commands that which is contrary to the law of God? Is it lawful to resist such a prince, especially if he seek to ruin the church; if so, who should resist him, by what means and to what extent? Similarly, what should be done if he seek the ruin of the state? What, finally, is the duty of neighboring princes in such circumstances? The answer of the author is built upon the notion of a double contract. The earth, he argues, belongs to God, and kings reign only by His permission. The king therefore is entitled

to obedience only to the degree that he obeys the command of God. He is thus a vassal like any other vassal, and when he breaks divine command he may be expelled. There is a twofold contract—one between God and the people by which the latter is bound to respect the will of God, and one between king and people by which the former is entitled to obedience so long as this will is observed. In considering the question as to when resistance becomes an obligation the author of the *Vindiciae*, being a Huguenot noble, is careful to confine such a duty to men of birth and position; the common people must follow and not lead their natural masters. But clearly the whole conception justifies the French wars of religion by assuming that a king who persecutes religious truth, which is patently a Huguenot possession, may be lawfully resisted because he has broken the contract with God and the people. To resist is an obligation owed by the people to their divine ruler.

So long as a Catholic monarch sat on the throne, this was the typical Huguenot outlook; when with the accession of Henry IV a Protestant succeeded, the Huguenots had no difficulty in going back to a belief in the divine right of kings and legitimacy. It was then the turn of the Catholics to preach the doctrine. Men so different as Suárez and Bellarmine among the Jesuits, Bouche and Rossaeus among the Ligueurs, and Parsons among the English opponents of Elizabeth, all used the idea of contract as a means of defending the papal claims.

Its best general expression is found in Suárez, perhaps the greatest representative of the famous Spanish school of political theologians. He assumes that the state expresses the natural tendency of men to a social life. He agrees that monarchy is the best form of government. But viewing power as a trust held on behalf of the people, he believes that princely authority is the result of a contract between monarch and people in which the former is bound to good behavior. Where he acts the tyrant, the contract is broken; and the people therefore may in suitable circumstances revoke the authority they have conferred. He argues that "suitable circumstances" mean a rule incompatible with the good life; this is the life set by the true religion, and the true religion is that of Rome. In the end therefore the social contract gives the people the right to resist when called upon by the pope to do so. From this angle the pope becomes, if indirectly, the judge of the behavior of princes; and with remarkable ingenuity contract and popular

sovereignty combine to make the Roman pontiff, as in the Middle Ages, the master of secular power.

Althusius, a German Protestant, was for many years a professor of law in Holland; and his *Politica methodice digesta* (1603) expresses the doctrinal experience of the Dutch revolutionists among whom he lived. He assumes the sovereignty of the people and argues that the relation between it and the magistracy is twofold in character. By the first operation certain fundamental conditions are postulated as governing the exercise of authority by the ruler; by the second the people swear allegiance to the ruler provided that these conditions are obeyed. Althusius assumes that a failure to observe the conditions entitles the people to break the contract; the prince or ruling body becomes a tyrant who may be deposed. Althusius' scheme constituted an admirable defense of both the Dutch revolution and the system of government it brought into being. Here, as with his predecessors, the pragmatic character of all contractual theory is set by the obvious historical activities it is intended in each instance to justify.

The seventeenth century abounds in contracts. With Grotius contract is the basis at once of the right to private property and of the sovereign power of the ruler. The latter, for him, rests upon a *pactum subjectionis* and becomes accordingly the basis of absolutism, although he admits that the ruler is bound by the natural law. The idea of contract underlies the whole case for the resistance by Parliament to the claims of James and Charles. "To know what obedience is due to the prince," wrote Selden, "you must look into the contract betwixt him and his people. When the contract is broken, the decision is by arms." Such was the view of Henry Parker, the most authoritative spokesman of the parliamentary party, of moderates like Prynne and of extremists like Lilburne and the Levellers. Once the idea was accepted of a people as a body of persons entitled to certain rights, whether historic or natural, the notion of their denial by a ruling authority at once gave birth to the idea of power as a trust, with the inference that when the rulers broke the trust their title to allegiance disappeared. On the parliamentary side during the English civil war the idea of contract, expressed or implied, was the fundamental doctrinal instrument of the rebels.

But the two most significant statements of the idea of contract in the seventeenth century are those of Hobbes and Locke. In the midst of

civil war Hobbes was anxious to find the supreme remedy against disorder; and his *Leviathan* (1651) is but the supreme expression of an effort to discover a way of peace by insisting on the duty of obedience to a de facto sovereign. For him the contractual doctrine is logical rather than historic in character. Granted a state of nature characterized by barbarism and insecurity, he seeks to find the terms upon which men may be assured of that order which, for him, is the highest good. He finds it in a contract by which men create civil society in handing over all the rights they enjoy in the precivil state to a sovereign who is not himself under any obligation to them. Their rights then become those modes of behavior which he permits them to carry out; law is simply the body of commands which express his will; and despite certain rhetorical phrases to the contrary Hobbes sees no limits to the sovereign's authority save the power to secure obedience.

A more immediately influential answer to the question regarding the limits of obedience was provided, again in contractual terms, in the theory of the social contract advanced by John Locke, the most outstanding of a large number of thinkers who followed the same general approach. Locke's real task, as he himself said, was to justify the Revolution of 1688; and his second *Treatise of Civil Government* (1690) may be regarded as the best expression on the one hand of the case against Hobbes, to whose book it is implicitly an answer, and on the other of the case for the limitation of royal power in the interest of the taxpayer and the nonconformist, who were the victims of its abuse. Like Hobbes, Locke assumes a state of nature; but he argues that it is broadly a peaceful condition vitiated only by that uncertainty which arises from the absence of a definite interpreter of natural law. For this reason men contract to form a civil society; but the form it assumes is an obligation mutually undertaken to secure the definite object of preserving life, liberty and property. The power of government is not sovereign but specifically limited to objects embraced by these boundaries. All authority may be resisted which steps beyond them; and although Locke suggests that resistance is most usefully limited to cases where a majority favors it, it is inherent in his view, from the atomic approach to society upon which he insisted, that the individual has the right of resistance. He gives examples of the cases which, he holds, would justify refusal of obedience; and it is significant that all of them

are drawn from the practises of James II. The whole scheme of government which Locke set forth is in fact simply a philosophical defense of the English compromise which endured from 1688 until 1832. It is not an exaggeration to say that he presented the liberal philosophy of politics no less fundamentally than Adam Smith set out its economic philosophy.

After Locke there was little fundamental thinking about politics in England until the time of Burke. Apart from that of Hume the best known English doctrine is little more than a full (as with Hoadley) or a partial (as with Thomas Gordon) restatement of Locke's ideas, and even after Hume had decisively exposed the weakness of the whole notion of contract in one of the most brilliant of his essays, it still lived on in men like Priestley and Price and to some extent in Paine. The notion exercised much influence moreover in the American colonies, where it was the conventional basis of many of the constitutions. Forty years before Locke it had been effectively expounded by Thomas Hooker; and Jefferson, while holding that constitutions should be revised periodically, nevertheless argued that a social contract was their energizing principle. Indeed it may be said that not until the time of Justice Story (*Commentaries on the Constitution of the United States*, 3 vols., Boston 1833, sect. 327) did it cease to play an important part in American political theory. That was natural enough in a civilization whose political institutions could be traced so definitely to the deliberate invention of particular men.

After Hume, however, the contract theory had its chief influence on the continent of Europe rather than in England; it was expressed by Rousseau and his followers in France and, through Rousseau's influence, by Kant and his immediate disciples in Germany. Yet although Rousseau makes the idea of contract the formal basis of his system, it is with equality rather than with contract itself that he is concerned. Civil society is based upon an agreement in which all men surrender to the state the rights they possessed before its creation; but once the agreement has been made, Rousseau is interested far more in the technique of preserving the equality which, for him, is the indispensable condition of the good life than in the justification of the origins of the state. As with Hobbes, his contract is no more than a logical preliminary, a way of insisting that all men are bound to the realization of that equality without which politics and justice are contradictory terms. When he

began to write the *Contrat social* ten years or so before its actual publication (1762), the influence of Locke still made it fashionable to start a political philosophy with the notion of contract; and Rousseau's analysis, which does not need the notion for its results, could have dispensed with it without fundamental injury to his system. His essential discovery was the idea of the general will, which does not in reality require the idea of contract for its support. This was shown later by Hegel when he found the justification of the general will in an idealist and evolutionary philosophy.

The influence of Rousseau on Kant was profound. For Kant, as for his master, the idea of a contract is the basis of the state; but here again the idea of contract has been whittled down to a way of making the power of the state a function of settled rule rather than an arbitrary discretion. The contract is the means whereby one man is so related to another in society that the due liberty of each becomes compatible with the liberty of all. The contract is postulated a priori as a social imperative imposed on sovereigns and subjects alike as a statement of the conditions without which the good life cannot be obtained in civil society. From being, as with the *Vindictiae*, a technique of action, the contract had become by the end of the eighteenth century little more than a metaphysical norm.

The later history of the idea of contract is unimpressive. It found an unimportant place in the system of Fichte, less because it was necessary to his ideas than as a tribute to the influence of Kant. After Hegel it exercised no serious influence in Germany. Nor after Bentham was it an effective doctrine in England, with the decline of Benthamism English political philosophy was impressed by streams of thought which, as with the idealists and the socialists, were derived from different sources. In France its influence persisted longer. The social philosophy of Renouvier has direct affiliation with it; and the doctrine of *solidarité*, which was fashionable in the first decade of the twentieth century, sought to build the state upon a "quasi-contractual" basis. But in both schools it had become the pale shadow of a once vigorous self. It had ceased to be historically respectable; its psychological foundations were insecure; and the end it sought to serve could be obtained more usefully in other ways. As a doctrine it fulfilled the important purpose of directing attention to the place of consent in any system of political philosophy. It served as a lever of action which by justifying

resistance to tyranny enabled the foundations of politics to be more clearly understood. Its real value lay in the means it provided between 1572 and 1690 for the emergence of a political creed which justified the constitutional liberalism then slowly emerging. Once that task was performed its bankruptcy as a satisfactory explanation of the problem of obedience was obvious.

SOCIAL CONTROL. See CONTROL, SOCIAL.

SOCIAL DEMOCRATIC PARTY. See SOCIALIST PARTIES.

SOCIAL DISCRIMINATION. The term social discrimination may be tentatively defined as unequal treatment of equals, either by the be-

stowal of favors or the imposition of burdens. This definition applies not merely to persons but also to things and localities, as in discriminatory tariffs or railway rates. Personal discrimination is exercised when two individuals who occupy the same social status, that is, belong to the same category, are treated differently by any person or agency occupying the same relationship toward them. The differential treatment of persons of different rank, as of professor and instructor by a college president or board of trustees, is not discriminatory so long as those of the same rank are treated similarly. Differential treatment of persons of different sex, age or race by a college board of admissions may or may not be discriminatory, depending on their status. Every private social group and institution functions for a special category of persons and avoids discrimination so long as it does not draw arbitrary lines of distinction among such persons. A state university, by virtue of its special character, includes in its clientele categories of persons sometimes excluded from private institutions but nevertheless draws lines of exclusion and differentiation, as between residents and non-residents of the state. Some states establish different institutions for males and females, whites and Negroes, if, however, a state has declared both sexes and both races equal before the law and nevertheless provides unequal facilities for them, it is guilty of arbitrary discrimination among its citizens.

Discrimination should not be identified or confused with differentiation or distinction. Individuals differ from one another, not merely in race, sex, age and various aptitudes and abilities but also in training and experience. Almost an infinite number of lines of demarcation may be drawn among them on the basis of the most varied marks of similarity and dissimilarity, and groups are formed through selective inclusion and exclusion. Because of the complexity of the human personality and the multiplicity of human relationships every individual is classified in a great many different categories. Theoretically no individual is subject to discrimination when excluded from a group some of whose marks of differentiation he does not possess. Feelings of discrimination, however, often arise when exclusion from the in-group is based on what are considered, at least by those excluded, as minor differences, while major similarities are ignored, as in the exclusion of a college student from a team or honor because of his race or personal idiosyncrasy; or when exclusion is based on dif-

ferences at one time considered important but which are breaking down under the impact of new knowledge or the changing scheme of social valuations, as in the exclusion of women from certain professional schools. Moreover discrimination may be said to exist when the differences in treatment accorded various categories of persons are disproportionate to the importance of marks of differentiation. All these situations permit the operation of prejudices or differential emotional reactions toward individuals because of differences in race, sex, age, wealth, language, religion, nationality, occupation, politics or other traits.

Discrimination carries with it the idea of unfairness. Those receiving a favor are given an advantage, while those upon whom restriction is imposed are placed at a disadvantage in comparison with other persons of the same category. There is thus contained in social discrimination an alteration in competitive power of those presumed to possess a freely competitive status. To discriminate is to impose a handicap. Here again, however, there is encountered the central difficulty in the concept; namely, that handicaps may be granted or imposed in order to increase equality in competitive power among persons of equal status or right but who differ in some secondary respect. A large part of modern labor legislation is of this type. Such legislation is often imbued with a humanitarian motive and is designed either to strengthen the competitive position of the weaker elements or to safeguard social values affected by differences in self-dependency. Favors not permitted to the self-dependent are granted the blind, deaf and dumb, feeble-minded, widowed, orphaned and others. The public school was once looked upon as discriminatory in that it taxed all for the benefit of those with children. A special tax on bachelors, income tax exemptions for minor children and progressive income and inheritance taxes have all been viewed as discriminatory until their establishment in the mores. Opinion has changed so rapidly that it is now not held discriminatory in some countries to deprive an individual of his powers of reproduction. Discrimination may, however, arise in the administration of such laws and services if applied unequally to persons on account of race, religion, politics or other differentiating trait, when the persons thus differentiated are given by law an equal citizenship status under the government administering them.

The foregoing definition does not warrant

the assertion that the various differentiations and gradations in societies, whether primitive or modern, are necessarily discriminatory. No doubt discriminatory actions, both public and private, occur in all societies, because of differential personal reactions to individuals of the same class or category. The stable and sanctioned distinctions on the basis of such marks as sex, age or totem are not, however, discriminatory; and even the differences of rights and privileges of hereditary social classes may not be so considered. A slave does not feel discriminated against because he does not possess the rights of a freeman, provided he lives in a society where slavery is accepted as the customary lot of his kind. If races, classes and sexes are considered unequal by nature and divine dispensation and if this dogma is accepted by both superior and inferior, it cannot be said that there is social discrimination when they are treated unequally, unless a scheme of values alien to such a culture is used as a criterion. On the other hand, the diffusion into a caste society of democratic ideals of equality gives rise to feelings of discrimination and to agitation for equalization of rights. Doubt arises as to the essential validity of categories of differentiation previously endowed by the mores with an implicit rightness. Subjectively the sense of discrimination is a correlate of the sense of equality of worth or status.

What constitutes discrimination therefore depends on the scheme of social values used as a basis in pronouncing judgment. Democracy asserts the somewhat contradictory doctrines that all men are equal and that each should be rewarded according to merit. Aristocracy sanctifies differential treatment on the basis of birth. Some communists and Christians would sanctify differential treatment on the basis of need. The mores can make almost any differentiation among persons or objects either discriminatory or non-discriminatory. The tabus surrounding the rights, duties and activities of women in various societies, primitive, ancient and modern, may appear to the emancipated woman as overt discriminations on the basis of sex, but many of these tabus may be so thoroughly grounded in custom and sentiment as to be regarded as inviolate; even the sex which appears to suffer from them in some instances may defend them. Moreover what is tabu for women in one area may be tabu for men in another.

In a democratic society the state presumably must treat all citizens alike; but the force of

tradition, the partisan character and the weaknesses or dishonesty of officials and the variations in social pressures bring about inequalities of treatment. As between races, classes and sexes such discrimination varies inversely with power of resistance, which in actual practise often becomes synonymous with power to inflict injury or mete out punishment to the discriminators. From this viewpoint discrimination is closely bound up with toleration, which is a state of suspended animosity, arising either from recognition that the gains from discrimination scarcely offset the losses from retaliation or from the growth of emotional indifference toward the category of differentiation, as in the case of religious toleration. Discriminatory treatment of a group intensifies its sense of solidarity, particularly when the basis of discrimination is a social value of sacred quality, as race or religion.

A social group, whether an integral or a constituent society, necessarily exercises discrimination against opposed groups or individuals in efforts to maintain itself or achieve its purposes; witness the discriminatory action against bourgeois individuals, practises and ideas in Bolshevik Russia or against the members and aims of the working classes in Fascist Italy, Hitlerite Germany or democratic United States. The intensity of the discrimination is conditioned by the intensity of the will to achieve or dominate or by the violence of the emotions aroused by the objects of discrimination. There is often a conflict of social values; there is also a hierarchy of such values. Complete toleration is a contradiction in terms, for it implies toleration of the intolerant and thus becomes synonymous with pure negativism or complete indifference to all social values, including toleration itself.

The Thirteenth, Fourteenth and Fifteenth amendments to the Constitution of the United States, designed to prevent discriminatory legislation on the basis of race, have given rise to a multitude of judicial decisions which sustain or condemn differential treatment of designated categories of persons. The courts, however, grant to the legislators a reasonably wide discretion in classifying the subjects of legislative regulation, differentiations which favor the upholding of a certain class of persons, places or objects when the classification is founded on a "reasonable principle" rather than an "arbitrary distinction." The considerations back of the classification may often be of a purely practical character. Thus American law distinguishes insane persons, infants, school pupils, dependent and de-

linquent children, absentee voters, convicts, migrants, attorneys, physicians, veterans, stockholders in fiduciary corporations, persons of certain age groups and many others. As the guardian of marriage and of the family the state may grant pensions to widows with children but deny them to widows of common law unions; it may differentiate between sexes in qualifications for marriage. Labor laws may differentiate between men and women, adults and minors and persons engaged in different occupations. Men alone are subject to a poll tax, and only after they are twenty-one years of age. Any differentiation can be rationalized and approved as non-discrimination or, with a change of the social setting, condemned as a violation of ideals of equality. Moreover in practise laws designed to prevent discrimination or, on the contrary, to set up a legal differentiation among persons may affect the form but not the substance of social relations, according to the intensity of emotional attitudes in the communities affected.

The question whether discriminatory attitudes, public or private, conscious or unconscious, show any tendency to disappear seems to require a negative answer. Such attitudes undergo change, however, with the succession of generations and the shifting social setting. From the idealistic standpoint of absolute equality there appears to have been little social discrimination in certain American communities where homogeneity of race, religion and economic status and strong attachment to democratic ideals gave rise to an exceptionally free mobility of persons, both socially and geographically. There are signs that this mobility is diminishing and that class lines are deepening on the basis of wealth, education and occupational rank. The regime of freely mobile and competing individuals is giving place to a regime of corporate groups, trade unions, civil servants, professional associations, merchants' associations, veterans and other groups through which the actual rights, privileges, income and social rank of the individual are largely defined.

This multiplication of class differentiae is accompanied by a rapid growth of social integration and a consequent increase in the powers of governmental agencies, especially those remote from the individual citizen. These apparently unavoidable social trends are coupled with an increase in the discretionary powers of police and administrative officers, which involve dangers of discriminatory action. Moreover the integration of social life, which has intensified

national consciousness and the sense of corporate unity, has given rise to new pressures toward conformity, standardization and uniformity. At the same time the increased propaganda power of press and radio makes possible a rapid mobilization of discriminatory emotional attitudes latent in the mores. The Ku Klux Klan, Americanization, fundamentalist and anti-evolution agitations in the United States following the World War and the racial and religious phobias now manifest in Germany make it doubtful whether the growth of scientific knowledge, wealth and popular education have banished the fears, jealousies and irrationalities which supply the subjective basis for those invidious distinctions constituting the essence of social discrimination.

SOCIAL EVOLUTION. See EVOLUTION, SOCIAL.

SOCIAL INSURANCE. This term is used to cover the rather diversified group of governmental measures designed to protect workmen and other groups of the lower or middle economic strata against the ordinary hazards of industrial life. It is applied loosely, usually by way of description rather than as an abstract definition, the social objective being stressed far more than the insurance method. By common agreement the concept embraces industrial accident insurance, workmen's compensation, health insurance, old age, invalidity and unemployment insurance and sometimes also governmental measures of direct relief in which the insurance method is altogether absent, such as old age, mothers', widows' and orphans' pensions or direct unemployment relief. More recently there has been a tendency to extend the term to governmental measures for the guaranty of certain wage minima, such as the so-called family allowances and minimum wage legislation. The French *assurance*, emphasizing purpose or objective, has at times been used in English in preference to the term insurance, which places emphasis on the technique employed. Theoretically social insurance through state action which makes it mandatory and requires distribution of the cost between the employer and employee or

between the state and the employee and sometimes among all three, and the system of direct grants from the public treasury are diametrically opposed in method, theory and philosophy. Yet through many intermediate stages the distinction between them has become considerably less clear. Even where the insurance method is used, as in workmen's compensation, the entire cost may be placed upon the employer. Thus a direct participation in the premium (the cost of insurance) by the insured does not constitute a fundamental principle of social insurance, and it becomes increasingly difficult to draw the line between insurance and mere gratuities. Because of the increasing coverage and variety of methods used, the broad term social insurance has now displaced others formerly used—labor, or workmen's, insurance (*Arbeitsversicherung* or *assurance ouvrière*), state insurance or compulsory insurance—and is preferred to industrial insurance and welfare insurance, which have been proposed as substitutes in the United States.

Although it is usual to ascribe the beginnings of the movement to the first compulsory accident insurance act of 1883 in Germany, which was rapidly followed by others covering sickness and old age, its sources derive from earlier periods. The introduction of these measures by Bismarck represented in concept certain basic notions prevalent in Germany as to the paternalistic role of the state with respect to its citizens. In applying this concept, previously embodied in public poor relief and poor law legislation, to modern industrial society, the legislation owed much to the previous efforts of working men themselves, through their unions or through friendly or mutual aid societies not restricted to working men alone, to provide insurance against many hazards on a purely voluntary basis and without any state cooperation or control. The principle of legal compulsion was not altogether novel in 1883; there had already been enacted governmental pension laws limited to a few select groups, particularly in hazardous employments. The funds furnished protection in case of accident, illness and sometimes old age and occasionally applied to widows and orphans. Even for the most distinctive contribution of modern legislation, whereby part of the burden of cost is placed upon the employer, precedents may be found prior to 1883. A step toward the development of state insurance along somewhat different lines was made by France in 1850 and Italy in 1883 in their establishment of state insurance funds in which participation

was voluntary and individual but which offered to the workman assurance of security on a non-profit basis, the state at times even contributing to the insured workman's premium.

The details of the development of the various branches of social insurance will be found in the articles devoted to these special topics. From Germany the compulsory method spread to countries under German cultural influence. While it met with success in these states, there was considerable resistance to the method of compulsion in the Latin countries of the continent and in Great Britain. The International Congress of Insurance against Industrial Accidents (later the Congress of Social Insurance), which was organized in Paris in connection with the World Exposition in 1889 and which met at frequent intervals until the eve of the World War, witnessed a recurrent battle between the adherents of the principle of compulsion and those who advocated subsidized voluntary insurance. At its session of 1908, however, the victory of the former at least in theory was virtually conceded. Social insurance spread rapidly, first throughout Europe, then to countries of the western hemisphere; and legislation of this character is not unknown in South Africa, Australia and the Far East. The World War effected a temporary halt, but since 1920 such measures have spread more rapidly than in the preceding thirty-seven-year period. In the appendix to her comprehensive study "Insuring the Essentials" Barbara N. Armstrong presents a list of laws now on the statute books of 62 countries and about 120 legislative jurisdictions; she records as many as 235 specific systems, divided as follows: workmen's compensation, 119; health or sickness, 26; old age insurance and pensions, 49; survivors' (widows' and orphans') insurance, 23; unemployment insurance, 19. Workmen's compensation is well nigh universal; and systems of old age insurance or pensions are nearly as widespread, except for a few countries, including, until recently, the United States. Health insurance and survivors' insurance are more or less limited to Europe, North American countries being characterized by a system of straight widows' pensions. Unemployment insurance, the most recent, the most complicated and yet the most important branch of social insurance, is only now beginning to win a place for itself.

In the United States the movement has lagged considerably behind that in European countries, partly because of the higher economic status of

the American wageworker, partly because of the dominant individualistic philosophy extending even to the trade union movement. Only workmen's compensation has been accepted in almost all of the states. The health insurance movement, which for a time gained considerable strength, collapsed in the reaction following the World War. Direct public allowances to widows and orphans in most states took the place of corresponding insurance systems in Europe; within the last five years the growth of the movement for old age pensions has resulted in the enactment of such measures in 27 states and 2 territories, while in Europe contributory compulsory old age insurance is replacing the system of gratuitous pensions. The movement for unemployment insurance has grown only as a result of the great depression beginning in 1929.

So strong has become the general tendency within the social insurance movement toward compulsory systems with contributions from the three parties concerned, the employer, the employee and the state, that very frequently the term is limited to contributory compulsory systems alone. And yet within two fields at least, those of health and unemployment insurance, the voluntary subsidized systems are still quite common in European countries. It is argued, however, that despite the partial success of both health and unemployment insurance on a voluntary basis in countries like Denmark, such voluntary systems have failed, after decades of continuous growth, to include in any country the entire section of the population which is in need of such protection; have placed too large a share of the burden upon workers by, except in Denmark, freeing employers from participation in the cost of insurance; and because of insufficient means have not worked out satisfactorily with regard to the services and aid rendered. Although there is strong resistance to legal compulsion to insure, it is safe to hazard the guess that the method of voluntary subsidy will disappear under pressure of the other two methods—compulsory insurance at one extreme and gratuitous public grants at the other.

Wherever the movement for social insurance gains considerable headway and legislation is proposed or demanded, its merits are fought out over again along lines which by this time are well known. The comparatively simple arguments for compulsory social insurance draw their strength primarily from recognition of the grave hazards confronting the workman and analysis of his economic status. The adverse

effects of direct relief and the worker's inability to protect himself individually through personal savings are pointed out, and reference is made to the obvious advantages of the collective method of protection. It is held that since the cost of private insurance, including profits and excessive overhead, is prohibitive, a public system of insurance must be devised. The expense of such insurance, since the earning capacity of the majority of workmen does not leave a sufficient margin to enable them to pay for all the types, must be borne partially or wholly by other parties, such as the employer or the state. The element of compulsion is necessary with respect to both the employer and the employee, in order that the worker's family may be protected against his own lack of foresight. In addition to these theoretical considerations support is found in the force of example, in the persistent world wide development of the compulsory contributory type of insurance and in the fact that in almost every important country systems of social insurance, once established, have been retained.

Criticisms of social insurance are based on its alleged harmful effects or on its inadequacy to cover the problems involved. Particularly in the United States it is argued by trade unions that a more satisfactory wage level would enable the wage earner to meet these hazards in an individual way. Another argument, adopted by organized capital and sometimes by the larger taxpayers, is that any form of social insurance places an excessive burden upon industry or upon the state or both. The thesis that the security which social insurance methods bring to the wage earning masses must result in demoralization, lack of foresight, destruction of the habit of saving and even deliberate malingering is repeatedly advanced, particularly in opposition to health and unemployment insurance, since it is assumed that illness and unemployment are more easily simulated than industrial accidents, old age or widowhood.

Those theoretical economists who oppose social insurance hold on the one hand that its cost ultimately reverts to the wageworker, forcing down his wages, and on the other that the absolute guaranty of a subsistence minimum provided particularly by unemployment insurance interferes with the natural law of wages and therefore hinders the adjustment of wages to economic conditions. It has frequently been argued that the cost of social insurance proves a very serious impediment to the industry of one country in competing with others in the

international market; but this argument must be self-limiting to the extent that the movement becomes universal. That such difficulties may arise is recognized, however, by the International Labor Office, which is endeavoring to encourage international agreements to equalize conditions and burdens upon industry in the various countries.

Radical and revolutionary critics have maintained that by its offer of a measure of security social insurance is bound to divert the proletariat from its revolutionary goal and to weaken the strength of its own organizations, and have also voiced the economists' argument that the wage earners pay the cost in one form or another.

The gradual disappearance of opposition to social insurance on these grounds among the socialist parties of Europe has resulted in the accusations of the left wing that the social democratic movement has become a mere campaign for social insurance. If the acceptance of the principle of social insurance in the Soviet Union has apparently weakened the force of this argument, it is still maintained that the efficacy of such insurance in that country is quite different from that in capitalist countries, where the increasing hazards resulting from an inherently faulty structure make adequate coverage far too costly. The insistence of communist groups in the United States and elsewhere upon large insurance funds to be financed entirely by the state or the employer or both is based not on belief in the possibility of the enactment of such legislation, but on the propaganda value of demands of this nature.

An entirely different criticism is leveled against the use of the insurance method, on the ground that it complicates unduly the social purpose of achieving security for the wage-working masses. Granted that the state or society owes every citizen either an opportunity of making a living or provision for his support i. e. case of disability or unemployment, the same results might be achieved by a direct system of grants instead of by the present indirect method of placing this obligation upon the employer and industry or upon social capital in general. This mode of attack has become particularly forceful in England and Germany in the field of unemployment insurance, because under the terrific strain of continued mass unemployment insurance systems have been forced to deviate from the insurance principle. The extension of the system of unemployment insurance benefits in England beyond the paying capacity of the in-

insurance organization, with advances from the government treasury, undoubtedly represents partial acknowledgment of the principle of governmental recognition of the right to maintenance, which is only an extension of the principle, advanced by labor and socialist leaders of the early nineteenth century, of the right to work. More recently, however, the British government has been compelled to supplement the insurance scheme with straight relief.

Without some sort of insurance scheme the only alternative in capitalist society, which is not ready to accept the principles of collective responsibility and legal right to maintenance, is the dole, which has recently gained extensive application in the United States at a time when the European unemployment insurance systems were being severely criticized as doles. Although public relief funds, local and national, may provide even larger funds than unemployment insurance schemes, there is a fundamental difference between the two methods which should not be obscured. Relief, whether from private or from public sources, is always a gratuity based upon consideration and evidence of need. The principle that an insurance benefit is a contractual right and obligation and does not require evidence of need—unqualifiedly true of private insurance—is carried over into the field of social insurance (except in systems of straight pensions), with the difference, however, that in social insurance the element of contractual obligation is even more important than that of payment of premium. It is recognized that the "means" test introduced in Great Britain for supplementary benefits and in Germany and Austria for practically the entire unemployment insurance system must be regarded merely as a temporary measure if the entire theoretical foundation of social insurance is not to be wiped out and replaced by a method of relief.

In short, social insurance may be considered as a halfway measure between strictly individualistic methods of voluntary and private insurance and the collectivist or socialist demand of the right to maintenance and support. It rejects the implications of uncorrected individualism, while at the same time it accepts the modern individualistic organization of economic society based upon private property and the wage and profit system. A fair appraisal of its social value must proceed from an honest recognition of this and all other measures of social legislation, not as fundamental principles of economic organization but as temporary methods of adjusting

the existing economic organization to the needs of the people. The use of such measures ever in the Soviet Union suggests that only when the collectivist principle is extended to all economic life will insurance, including social insurance, become unnecessary.

SOCIAL LEGISLATION. See LABOR LEGISLATION AND LAW; PUBLIC WELFARE; SOCIAL INSURANCE.

SOCIAL ORGANISM. Although the fiction of the social organism was first systematically developed in the course of rationalizing the political and social relationships of the modern nation state, anthropomorphic analogies between the realms of natural and social life may be traced to much older philosophies and religions. Aristotle and Plato, for example, in articulating the ethical views of the Greeks as to the ideal interrelationship between the individual human being and the collectivity represented by the *polis* emphasized the organismic character of the political unit and took for granted the harmonious interworking of the elements which composed it. The characteristic premise of later social organismic theories that the individual finds his freedom by participation in a larger integrated collectivity was foreshadowed in the Catholic formula of the *corpus mysticum* of Christ, conceived as a living ecclesiastical body organically composed of mutually interrelated members. When subsequently, as in the writings of the Calvinist Althusius, the traditional *corpus mysticum* was replaced by the *corpus symbioticum*, emphasis was shifted to a conception of society itself as an organismic, autonomous entity composed of interdependent, individual members.

The analogy between the natural and social realms was given a more secularized and materialistic expression by certain political theorists of the Renaissance, who, like Hobbes, sought to proceed from the scientific laws of physics to a rational, juristic analysis of state and society. By way of illustrating his central premise that the

state never becomes adequately regulated until all of its members are subjected to the force of law and that furthermore no particular estate is qualified to act as representative of the whole, Hobbes decorated the title page of the original edition of his *Leviathan* with the sketch of a giant, composed of innumerable smaller human figures. This hypothetical being, he argued in contrast to the philosophers of antiquity, is not a harmonious and living unity nor necessarily well integrated. Harmony and unity must be promoted artificially by an enlightened autocrat in whom is vested unlimited control over the individual members constituting the body politic. With the further spread in the eighteenth century of a natural scientific approach to the study of political and social problems the analogy of the social organism, in Althusian rather than Hobbesian terms, was applied both to society as a whole and to the individual citizen. In political economy, where the analogy gained the widest currency, the state was regarded as an artificial superstructure imposed upon the natural economic organism. The hypothesis that the economic process functions according to natural laws in a manner analogous to the circulation of the blood was adduced as argument against any interference on the part of the state with the free working of the individual forces which make up the economic totality.

The leaders of the German romantic movement, although reacting sharply against the rationalistic conception of nature, economics and the state, took over the idea of the organism and after altering its connotations to suit their purposes gave it a central place in their *Weltanschauung*. Preoccupied with problems of aesthetics, the romantics were inclined to regard both state and economy as artistic creations; and instead of analyzing causal relationships, as in the natural sciences, they placed their major emphasis upon teleology. Man they regarded as *homo faber*, creating for his own use tools analogous to the organs of the body. The analogy between tool and organ, as found, for example, in Carus and Kapp, reduced the individual to the role of a passive instrument in a vital process controlled by higher laws. Whereas the eighteenth century rationalists had repeatedly compared the social order to the machinery of the clock and the forces at work in the political process to the balancing of the scales, the numerous disciples of Burke and Herder, repudiating this static and mechanistic notion with its implications that order had been preestab-

lished by external plans, developed in a variety of forms the idea of an organism which unfolds and evolves according to the autonomous laws of its own inner being. Although the natural scientists from the time of Buffon had made use of the concept of adaptation, the generation of Schelling was the first to think of the physical and social organism in terms of a dynamic process of becoming.

The romantic conception of the social organism, with its emphasis on tradition and continuity, was advanced in conscious reaction against the static doctrines of natural law and the social contract. In the political and social theory of such thinkers as Novalis, Muller and the other mediaevalists as well as in the jurisprudence of Savigny the essential force in society was conceived to be not the reasoning individual but the collectivity, a dynamic entity moved by irrational forces: a unity which although superindividual nevertheless displays the spiritual qualities of the human being and can thus be regarded as endowed with personality. Where the theorists of the French revolutionary movement had traced the origin of the state to a voluntary act of creation on the part of the individual members, the German romantics, in the spirit of Burke and the French traditionalists (see TRADITIONALISM), portrayed it as a preexistent organic force antedating human contrivance. As has happened so frequently in the history of the organismic concept, they tended to confuse fiction with reality and as a result accepted the primacy of society and state as a necessary postulate of all social and political speculation. The priority of the state and its independence of the will and consciousness of its members find clearest expression in Hegel's philosophy of history, which brought together in a new synthesis the rationalism of the Enlightenment and the historicism of his romantic forerunners.

The various attempts of the romantics to define the social organism were in the last analysis verbal exercises. The organismic method is differentiated from the mechanistic chiefly by the emphasis it places on the teleological element, but in any exact and empirical science the organismic and teleological processes must be reduced to mechanical and causal processes. Only from a metaphysical point of view can a real substance be accepted as a functional entity or as partaking of the nature of body or soul. Such anthropomorphic views of the state overlook the fact that social and political groups lack the

full cohesion and integration characteristic of the human body. They would have to explain the renewal of the group by the rise of new generations; and, even though it is true that societies undergo a process of growth and flowering, it is quite impossible to say that they are capable of reproducing themselves. The large social and political groups, with none of the organic properties of the family, are merely the products of conscious association and organization.

While the concept of the organism was first widely popularized by political and economic philosophers, it experienced a recrudescence at the hands of nineteenth century sociologists (see SOCIOLOGY), who found in it a convenient hypothesis enabling them to treat society as an autonomous natural order, susceptible of the same type of empirical investigation as natural phenomena. The physiocratic comparison of the economic process with the functioning of the circulatory system and, less explicitly, Adam Smith's theory of the division of labor had helped prepare the way for an analogy between the social sphere and physiology. The more direct forerunners of positivistic sociology from d'Alembert to Saint-Simon had developed the outlines of the hierarchical classification of the sciences which Comte used as the basis for his assumption that sociology was to be built directly upon biology. It was natural therefore that the founder of positivism, proceeding from this hypothesis, should transfer the idea of the organism from the biological to the social sphere. Furthermore Comte and many of his successors were directly influenced in their organismic formulations by contemporary physiologists: Comte by Bichat; Spencer by Milne-Edwards and the embryologist von Baer, who propounded the biologic law of the evolution from homogeneous to heterogeneous; Schäffle by the founders of cytology, Schleiden and Schwann. It was the Darwinian theory of evolution, however, which provided the most powerful stimulus for the application of biological concepts to the study of society and which enabled the sociologists to treat the historical as opposed to the static aspects of the social organism according to the methods of natural science.

Under the influence of Spencer's evolutionism it came to be assumed that the unfolding of the social process is essentially the same as the evolution of the organic, since both evolve by means of differentiation of organs and functions. In emphasizing the similarity of animal and human societies Spencer declared that the

antimony between society and individual is to be explained in organic terms as the relationship of the constituent members to an integrated whole. In the sociology of Comte the individual had been an abstraction; but according to the new thesis, as systematized, for example, by Novikov, the individual derives significance from his role as a freely moving member within the social order. Whereas Comte had represented all of mankind as a single organism, the new school of sociologists identified the harmoniously and permanently integrated social organism with a particular society or nation. For in reality these later schools of organic theory represented attempts to rationalize nationalism and nationalistic institutions in terms of the laws of biology rather than of the laws of physics which underlay the prerevolutionary theories of political liberty. Sociology was forged in the course of the movements which developed in opposition to the principles of the French Revolution. Under the influence of the traditionalism of Bonald, Comte set out to harmonize order and liberty. Civil society came to be explained as the natural order, and this order was said to be characterized by the division of labor and mutual interdependence. By emphasizing the analogy between the social and the biological organism the apologists of the nation state were able to portray society as a closely knit unity in which each individual member, by performing his specified function in the interdependent economy, enjoyed his share of both security and freedom.

In proclaiming this theory of a harmonious society built upon consensus and solidarity the great majority of the liberal social theorists in France came to place less and less emphasis on the strictly biological and physiological aspects of the organismic analogy; Fouillée, for example, in his attempt to combine the organismic formula with the older theory of social contract introduced the concept of a "mental," or "contractual," organism as a means of bridging the gap between the natural and the moral order. Shortly, however, even this intermediate position was in the main abandoned and *solidarité* came to be defended without recourse to naturalistic analogies of any sort. In certain other quarters, however, even among French sociologists, the conception of society as a real organism continued to be expounded. According to the Russian statesman Paul von Lilienfeld, the cellular division into entoderm, mesoderm and ectoderm is the counterpart of the division of the social organism into classes. Moreover, accord-

ing to Lilienfeld, every human society consists of a nervous system, which corresponds to the organic, and of intercellular substance. Deviations from the norms of progressive evolution are to be understood as a disease of the cells, and the anomalies of the intercellular substance, that is, nutrition, represent disturbances of the economic circulation. In such a system, however, the entire sphere of consciousness as well as nerve tissue, which according to the German scholar and politician Albert Schaffle is the equivalent of spiritual organs, is neglected.

Although American sociologists under the influence of Spencer continued to employ biological terminology and occasionally used the formula of society as an organism, it came to be generally recognized among them that such a social organism moves in accordance with its own peculiar laws and that while there are certain analogies with physiological functions, social life is essentially psychical rather than biological. With the turn of the century the concept of the organism began to be regarded as merely a methodological hypothesis for the investigation of social interrelationships. In the course of the concentrated attack on the older theories of the social organism it was pointed out clearly that the element of consciousness which is present in social units is absent in biological and that whereas society is composed of free individuals, the body is made up of fixed cells. The overelaborated biological analogies of Lilienfeld, Novikov and Worms have come to be generally repudiated. Among recent sociologists and social theorists there is almost unanimous agreement that individual man is no more to be understood in terms of the evolution of the animal world than is society in terms of the building of cells.

But although the theory of the social organism has been rejected by natural and social scientists, it has been perpetuated by certain authoritarian groups as a rationalization of their policy of domination. The widely influential Darwinian theories of the struggle for existence and the survival of the fittest were shrewdly transposed by the spokesmen of the dominant classes to the social process. Although Huxley had repeatedly warned against the identification of biological and political laws, the opposition to social and humanitarian legislation produced a brand of social Darwinism which glorified the right of the strong; while in the theories of publicists, such as Lea and Mahan, there developed also a militaristic variant of the theory of selection. In

the subsequent period political organizations, erected in accordance with functional rather than ethical standards, have frequently made use of the organismic analogy as a means of justifying their policy of suppression. Since such a fiction is convenient, in conjunction with geopolitical formulae, for glossing a traditionalistic *Machtpolitik*, the terms organism and organismic have come into new prominence in recent fascist apologetics.

SOCIAL ORGANIZATION. Every human group is organized; its individual components do not behave independently of one another but are linked by bonds, the nature of which determines the types of social unit. Kinship, sex, age, coresidence, matrimonial status, community of religious or social interests, are among the unifying agencies; and in stratified societies members of the same level form a definite class.

Maine, who introduced the valid distinction between kinship and territorial ties, incorrectly denied the existence of the latter in ruder societies; this position was popularized by Lewis H. Morgan. Both ignored phenomena anticipating the state of civilized countries, a deficiency partly supplied by Schurtz' theory of associations. Primitive communities do not conform to the simple pattern conceived by earlier writers but are often segmented according to several coexisting principles. To determine the comparative influence of the several resulting loyalties is one of the most important problems of social organization.

The societies of the ruder hunting peoples, as exemplified by the Bushmen of South Africa, the Andamanese or the Washo of Nevada and California, lack centralized authority and hereditary class distinctions. This does not preclude the dominance of powerful personalities or the control of the community by leaders for a definite purpose, as when a Washo of recognized competence superintends a rabbit hunt. As a rule, however, the headman of these tribes exercises no special authority, since authority is vested in the totality of adult males. In parts of Australia this situation involves a gerontocracy, the fully initiated elders assuming the reins of government and even reserving to themselves the choicest food; thus age status determines government relations. Other hunting communities, such as the northwest Californians, define influence in terms of wealth, a factor likewise prominent among the pastoral nomads of the Old World. Inasmuch, however, as the size of herds and flocks is subject to great vicissitudes, these peoples rarely develop hereditary castes. Such castes evolved in Polynesia and Micronesia, where loftiness of rank depended theoretically on directness of descent from the gods. These differences in rank may or may not be coupled with distinctions as to political power; in Hawaii the supreme ruler was likewise the highest in rank, while in Tonga the *tuitonga*, although regarded as spiritually and socially superior, was overshadowed in the affairs of state by a secular chief.

The Polynesian states were miniature kingdoms even where, as in New Zealand, geographical conditions did not hinder expansion. On the other hand, enormous African Negro populations have repeatedly been united under a single despot. Although this development was fostered by Mohammedanism, it long antedated Islam and occurred independently of it.

range, as in the case of Chaka, who made the Zulu, once a petty tribe, into the dominant people of south Africa. Among the Bakuba of the southwestern Congo the king became a slave to court etiquette and a puppet in the hands of his ministers. On the west coast of Africa the ruler may either encounter a check from an independent secret society or enhance his prerogatives by gaining control of that organization. In some of the African kingdoms autocracy precludes aristocracy; the king was the only blue blood of Uganda and even the most powerful officials acted only by delegated authority. A different condition is found in Ruanda, where the subjugation of peasant tribes by cattle breeders has resulted in the dominance of a privileged pastoral aristocracy over the agricultural commoners, who in turn despise the roving pygmoid hunters of the area. On a higher level the Bedouins have subjugated the Arabian peasantry as their nomadic ancestors subjected the agricultural civilizations of the Near Orient.

African kingdoms refute the view that primitive groups are built on the exclusive basis of kinship, that the territorial tie is an extremely recent peculiarity of literate societies. In Uganda the kinship grouping by clans remained, yet government rested on the supremacy of the king and the realm was divided into minor regional units. Wherever a gifted primitive despot ruled by divine right, whether in Polynesia or in Africa, in theory he approached closely the modern ideal of a totalitarian state. In the New World authentic instances of such processes are rare. At the time of the Spanish conquest the Incas of Peru, claiming descent from the sun god, had achieved a state socialism which regulated economic organization in all its details.

Even in ruder societies the concept of a territorial unit is dimly foreshadowed. The Ifugao of Luzon have been described as anarchists who regulate all social relations in terms of kindred. Were this so, two bodies of kinsmen would treat one another as do two autonomous civilized states; but there is no such independence. Fellow residents recognize definite obligations not to embroil one another in feuds with outsiders; while the thief from another settlement is killed outright, larceny within the village is merely punished by a fixed fine. Among Plains Indians also a nascent clan feud was not a matter of indifference to the rest of the community. The neutrals realized that the result of such dissen-

sion would be the inevitable weakening of the tribe and made every effort to restrain the warring kindreds. There is here no lack of local ties but rather an absence of coercive authority within the local unit; persuasion takes the place of authority. In Luzon a go-between unofficially attempts to mediate. In case of a Plains Indian murder the police society merely urged a peace pipe on the victim's kin and conveyed the indemnity offered by the culprit's family.

Although local contiguity creates union among preliterate peoples, the tie of kinship unquestionably eclipses it. It precipitates two group forms, the family and several types of unilateral segment. The family consists of a father, a mother and their children, the latter not being always biological offspring but sometimes merely reckoned as such by legal fiction. In such a group the children's relations are bilateral; that is, they are linked to both parents. This is not true in the series represented by the lineage, clan and phratry, in which the children, for certain purposes, are related to only one parent, the rule of descent varying in different tribes and areas. Theoretically a clan (sib) embraces the descendants of a single ancestor or ancestress, the sense of common descent leading to the rule of exogamy. Actually it is often impossible to prove common derivation; at times the clans folk are demonstrably constituted of several distinct bodies of kin. It is also certain, as Parsons has shown among the Pueblos and Goldenweiser among the Iroquois Indians, that succession to office, loosely described by earlier writers as following clan lines, really follows in a line of blood relatives. It has thus become necessary to distinguish with Gifford the lineage, that is, the body of persons unilaterally related by blood, from the clan composed of two or more lineages. The Hopi of Arizona present the case of a tribe subdivided into roughly equivalent matrilineal units, some of which are mere lineages while others, not necessarily larger, comprise more than one lineage. In the Pueblo area groups of diminished membership attach themselves to those in a more flourishing condition, thus furnishing historical instances of how originally distinct unilateral groups may fuse.

Clans often become associated through common social or ceremonial interests into major units, called phratries, or brotherhoods of clans. The bond within the phratry may be relatively loose; that is, the association may not imply more than an informal feeling of preferential friendship. On the other hand, the phratry may be

charged with the most important functions. The phratry becomes a moiety (French *moitié*) when each clan is recognized as part of one of two major units; but moieties also occur without any subdivision, that is, the entire tribe may consist of two clans.

The moiety, or dual organization, appears typically in Australia, Melanesia and North America and is strangely lacking in Africa. In its typical form the moiety is a clan of major extent, whence follows the rule of exogamy. The moieties are complementary halves charged with reciprocal duties and privileges, a phenomenon which is important in conjunction with kinship rules. Given two exogamous halves, an individual's father is in one and his mother in the other; hence he connects with one moiety the rules regulating his behavior to maternal kin and with the complementary moiety the conduct he owes to his paternal relatives. Since etymologically moiety means merely a half, it may properly be used whenever a tribe is correspondingly divided into groups other than clans. Thus the Pawnee and eastern Pueblos have ceremonial moieties not connected with exogamy; and the Todas of India have endogamous moieties.

The looser form of phratry is clearly but a secondary combination of clans. But when the phratry or the exogamous moiety has definite functions, the problem arises whether it may not be the primary unit from which clans arose by segmentation. The alternative is to postulate a later association of clans into a few major units. Both processes have occurred at different times. In some parts of the world overgrown clans split into seceding bodies; yet so long as a sense of kinship persists, the parent group and its offshoots continue to form a larger functional unit. On the other hand, distinct clans have merged into a larger body, as in the fusion of two or more lineages among the Hopi.

Lewis H. Morgan was so much impressed with the intrinsic oddity of a unilateral alignment of kin that he postulated a single origin for the idea—in striking contravention of his general evolutionistic philosophy, which favored the multiplication of similar phenomena in diverse regions through some immanent social law. Morgan's theory as to the clan, which he called gens, implied several ideas. The family, he believed, was a recent development from a primeval state of promiscuity progressively tempered by reformatory steps. One of the major reforms was the institution of the exogamous clan, which barred marriage of siblings and also

of more remote kindred within the clan. Finally, Morgan accepted the popular belief in the biological harmfulness of consanguine marriages; he contended that a tribe which eliminated this possibility by a clan system ipso facto would have a better chance of survival than its rivals, and that the advantages accruing from it would lead to its rapid dissemination. He and his followers assumed the priority of the clan over the family, although they did not put the clan at the beginning of social evolution. Among the arguments adduced were the kinship terminologies of various peoples, which were said to be explicable solely on the basis of the supposed sequence.

The distribution of unilateral systems does not bear out these hypotheses. The clan is a widespread but far from universal phenomenon and is absent from some of the rudest marginal peoples, such as the Andamanese pygmies, the Ona and Yahgan of southernmost America, the unequivocally simple peoples of the Mackenzie area, of Washington, Oregon, Nevada and Utah. On the other hand, the family is of virtually universal significance: whether the father is the putative or actual progenitor, socially there is always a male provider for the household, a differential tie between this functional father, his spouse or spouses, and her or their offspring. A possible exception is found in some Oceanian islands, where the hypertrophied practise of adoption sometimes leads to doubt as to whether a child belongs socially to one or the other set of parents; whatever the ultimate interpretation of these facts may be, they are extremely rare and appear in communities far too complex to be regarded as samples of primeval mankind. In the large and culturally diversified area, such as America north of Mexico, the rudest peoples lack clans; unilateral systems are generally associated with farming tribes and exceptionally complex societies of hunters, such as the Tlingit of northern British Columbia. In Siberia equivalent findings appear; the simple Chukchi and Koryak are clanless and have kinship terminologies which in no way suggest a pristine unilateralism; but the Yakut and other Turkic peoples, the felt making, iron smelting pastoral nomads of the area, are organized into rigid patrilineal clans and phratries. On both continents unilateral systems appear as later grafts on an earlier family organization.

In Australia, where clans generally coexist with the family, the same conclusion emerges from another line of argument. All individuals

are here ranged in classes whose social behavior toward one another is fixed. A man treats the entire group of his real and potential fathers-in-law according to the same pattern determined by the kinship term he applies to all of them indiscriminately. Apparently such classificatory usage militates against the family principle. But social conduct maintains distinctions ignored in nomenclature. A man owes duties of the same kind to all his fathers-in-law, but the husband of his wife's own mother may claim differential treatment; the man is potential mate to a bevy of mothers' brothers' daughters, but if possible he espouses the daughter of his own mother's own brother. A distinction is thus systematically drawn between the next of kin and those more remotely related, and the true family is segregated from the rest of the camp. The most important unit in daily life is that composed of a woman, her husband and the offspring he has fathered: it is the primary economic group and is likewise the one with the strongest sentimental bonds (Malinowski, Radcliffe-Brown, Warner).

The question of how the clan came to supplement the earlier family system may be answered conjecturally from a survey of clanless tribes, with attention directed toward potential germs of unilateral alignment. Such factors may be detected in the rules of residence, as described by Tylor, and of inheritance. Newly married couples reside either with the husband's or with the wife's parents or wherever they please. Simple clanless tribes like the Yurok of northwestern California practise local exogamy from a sense that all fellow villagers are likely ultimately to be blood kindred, and the residence is theoretically patrilineal. The men therefore bring wives from other villages, thus creating the core of what under favorable conditions might blossom into a full fledged paternal lineage; and two or more such unilateral groups would form a typical clan. The Yurok never attained that condition because of two contradictory features. Residence was not absolutely patrilineal; if a man failed to pay an adequate bride price, he had to serve for his wife in her village and was thus lost to his own potential lineage. Equally significant was the lack of a unifying designation for the nascent lineage. The family is an intrinsically loose unit, because as the children grow up they inevitably found new families; and although in the agricultural communities of the Old World there are extended families formed of blood brothers with their wives and descendants, the girls are inevitably

lost to their family on marriage. The lineage or clan, however, operates on the principle of once a member always a member, usually by affixing to each member an unmistakable and permanent badge in the form of a name. Hence these unilateral groups never lose their constituents, ticketed as they are by their group name. Even in China persons with similar surnames do not marry, a phenomenon plausibly interpreted as a survival of clan exogamy.

Matrilocal residence would correspondingly create a core of a maternal kin. Where, as among the Hopi, all women bring their husbands to the bride's mother's home, a woman is united with her sisters, her and their daughters and the offspring of these daughters. If such coresidents affix a common label to all the children born in such a household, irrespective of sex, a maternal lineage is at once set off from the rest of the community.

Not merely coresidence but common property interests may be invoked in this connection. As soon as property of a certain type is highly valued, its transmission tends to become regulated in a definite way. Even simple hunting populations recognize such exclusive claims; for example, Washo families own clumps of pine nut trees and Veddas reserve to themselves special tracts of land. Here the auxiliary principle of the sexual division of labor helps to segregate the core of a lineage. Since women are responsible for the garnering of wild vegetable food, a woman claiming a patch for exclusive use will exploit it with her daughters, who automatically become her heiresses. Correspondingly the male core of a paternal lineage is segregated by the phenomenon observed by Speck among the northeastern Algonquin, the prerogative of hunting in a delimited tract. A common name for the children, male and female, who are associated with such a territory would define a true lineage.

Since these processes are common even among very simple peoples, the origin of the unilateral principle presents no such difficulty as Morgan and more recently Olson have assumed. If it were a matter of whimsically assigning some dozens of kinsfolk to one's own group to the exclusion of others, the arrangement might well appear unique and its precise duplication in diverse regions would be explicable only by diffusion from one center. Fixed residence rules, however, bring about in the most natural manner the characteristic unilateral alignment of kin, although only those of one sex. Hence the re-

peated formation of unilateral groups independently of one another is highly probable. Each and every clan system has not of course evolved by itself. Clan systems have assuredly often been transmitted; but in order that such a conclusion may be proved in any concrete case, far more is required than the bald fact of unilateral reckoning. Only if this abstraction is coupled with the same concomitants has the argument for a common historical origin claim to consideration. Thus not merely are the majority of tribes in the eastern United States organized into clans, but the clans bear the names of animals and often of the same species; frequently they are grouped into moieties, which generally provide a line of cleavage in athletic games, and sets of individual names are owned by the clans but restricted to members. There follows from these coincidences at least extensive borrowing of traits, and in so far as the systems are all either patrilineal or matrilineal they may be accepted as having a single center of origin. Among the tribes of British Columbia, the plains or the southwest, however, the associations with the clan principle are too different to permit such a conclusion, especially for such discontinuous areas.

This question leads directly to the problem of the relationship between matrilineal and patrilineal descent. Lowie and Schmidt, who derives the maternal clans from the horticultural activities of women, treat paternal and maternal clans as having a distinct origin. Kroeber and Olson, on the other hand, do not postulate any necessary sequence of the two but see no difficulty in the change from one form of descent to the other. To earlier anthropologists the priority of "mother right" was a foregone conclusion; in the irregular conditions imputed to early cultures paternity would be unknowable, while the bond between mother and child could never be ignored. But primitives are often not at all interested in knowing who is the begetter of a child. Thus in south Africa the purchaser of a bride ipso facto becomes the social father of her future children, whether these are conceived out of wedlock or not, and among the Todas of India legal paternity is determined by a purely conventional ritualistic act.

Likewise among patrilineal peoples the avunculate, that is, the assignment of significant functions to the maternal uncle, who may exercise parental authority, is interpreted by the earlier anthropologists as a survival from an earlier matrilineal condition. But such avuncular

privileges can be interpreted in several ways involving no such assumption. The specific powers of a maternal uncle are often balanced by those of the paternal aunt; and when paternal kin are charged with special functions in a matrilineal people, as, for example, among the Crows or Hopi, an earlier patrilineal reckoning could just as plausibly be invoked to explain the facts. Moreover the avunculate may often be the effect not of maternal descent but of matrilocal residence which has never ripened into a full fledged maternal clan organization.

No uniform sequence has ever been proved in either direction, and it is hard to imagine how and why a thoroughgoing paternal or maternal clan system would alter its basic constitution. It seems far simpler to regard both systems as springing independently from a loose type of organization and influencing each other merely in such relatively extrinsic matters as the type of clan names.

The functions of unilateral bodies vary considerably. The lineage or clan not merely regulates marriage and axiomatically prescribes mutual helpfulness in the routine of daily life but also imposes solidarity in legal and political situations. In contrast to the brittle and at best minute family, the unilateral grouping unites fairly large numbers in a common cause and thus looms as the forerunner of major cooperative effort. On the other hand, one-sided emphasis on clan loyalty is a separatistic factor, precluding the development of still larger territorial aggregates.

The clan, although sometimes a wholly secular institution, may be strongly charged with religious values. Thus according to Laufer the older form of Chinese ancestor worship probably consisted in the adoration of the heroic founder of a clan, who was supposed to watch over his descendants. Primitive peoples frequently have totemic names for their clans, and while emotional associations with the plant or animal eponym may be tenuous, they often assume deeper significance; in Australia some of the most serious rituals are linked with the clan.

The unilateral system rarely occurs on the lowest levels but makes its first appearance in somewhat more complex cultures, persisting in pre-Columbian Peru with a definite political organization and in the backward portions of Europe, such as the Balkans, in the most recent period. Founded on kinship, like the family, but capable of marshaling far greater forces, it made for enhanced cohesiveness until it came into

opposition with the potentially still wider principle of local contiguity.

Associations in a measure paved the way for recognition of the principle of local contiguity. In simpler cultures individuals are not ranged solely according to either kinship or local ties; as Schurtz first pointed out, they unite in associations according to sex, age and religious and social interests. An Australian boy is not merely a member of his family and totemic clan; he joins, possibly at about seven years of age, the group of bachelors, who dwell apart from the rest of the camp and whose example exerts henceforth a deep influence on his behavior. As he grows older he advances to higher status by a series of initiation rites, in some tribes automatically becoming with age a member of the gerontocracy. The importance most primitive tribes attach to the notion of seniority appears in the widespread distinction drawn between elder and younger brother and sister, which is not a purely terminological difference but reflects differences in attitude and conduct. Thus the levirate is a common custom, but often it is only the younger brother who is allowed to wed his elder's widow. Among the Yakut of Siberia a woman is forbidden to show herself before her father-in-law and all her husband's elder kinsmen. Relative age, in other words, determines status and so does sex. In a Yakut hut definite spaces are apportioned to the male and to the female inmates. Among the Andaman Islanders a double form of segregation appears; married couples live apart from the unmarried camp mates, who are divided into a bachelors' and a spinsters' group at opposite ends of the settlement.

The Masai of east Africa demonstrate in the most striking fashion the inadequacy of the older view that primitive communities are made up solely of clans. At least as important as their clan system, even in the regulation of sex life, is associational alignment. Every male individual is either an uncircumcised boy, an unmarried warrior or a married man, and equivalent grades divide the women. The bachelors occupy a separate kraal with the single girls. What is more, the individuals jointly initiated by circumcision form lifelong groups with fixed mutual obligations and rights. North American tribes outside the Mackenzie, plateau and basin areas exhibit an almost infinite variety of organization. There are societies of rain makers and doctors in the southwest; the Plains have military organizations, which in some tribes are

divided into age companies as well as all sorts of ceremonial fraternities; in the northwest common hereditary guardian spirits lead to a re-grouping of individuals during the season of the winter festival. Melanesia has ghost societies and men's clubs, and Africa, especially in the west, is honeycombed with age classes, men's and women's societies and secret fraternities dispensing justice and sometimes controlling all public life. Among more advanced peoples the Chinese are conspicuous for the inordinate number of their organizations; there are religious and political societies, trade unions, merchant guilds which have perfected the code of business life, mutual benefit associations for policing the crops of a village or for organizing a hare hunt.

The associations of ruder peoples differ not only as to function but also as to the basis of admission. Some demand exorbitant entrance fees; others are joined because of a common visionary experience; still others separate all initiated men from uninitiated boys and women, who are debarred from the mysteries celebrated on pain of instant death. Schurtz ascribed to the men's organizations political potency, inasmuch as the physically most active members of the community were thus combined into aggregates of greater size than was consistent with the kinship principle. Associations certainly succeed in bringing together unrelated men, and in some instances, as in the case of the Melanesian ghost festivals, even members of normally distinct local units are brought into effective collaboration; thus associations of various kinds can foster unions which would be impossible in societies organized on the sole basis of kinship. Yet some associations are as particularistic as the clans. Among Plains Indians the active rivalry of military societies was quite as capable of precipitating internecine feuds as the disagreement of clans. Associations are then potential means for novel combinations rather than uniform realizations of major units.

Although associations, territorial aggregates, families and clans have been treated largely as separate entities, they are often intricately and intimately interlocked. Hopi fraternities are in a sense religious associations; yet the higher offices in them descend preferentially in a maternal lineage, which thus constitutes the core of the group. Similarly, although Crow military clubs barred no one on principle, men tended to affiliate themselves with a society previously joined by some kinsmen. The Masai blacksmiths form a spatially and socially segregated

pariah caste into which no Masai of ordinary standing will marry; they thus represent an inferior occupational subdivision, but affiliation may not be escaped by giving up the trade—the group is a hereditary class of outcasts over and above its association with a despised calling. Such occupational castes are relatively common in east Africa, blacksmiths and tanners usually ranking as the lowest. Considering the absolute dependence of the natives on their metallurgists for tools and weapons, this position of the smiths, who in Siberia are treated with the utmost esteem, is puzzling. It may be explained by the fact that useful arts are often practised by peaceful folk who readily fall prey to more warlike tribes and are then degraded to a lower level. For example, when the cattle breeding aristocracy of Ruanda, interested in no useful occupation except animal husbandry, looks with contempt on the older farming populations, which perform all the other necessary labors, it links occupational classes with fixed hereditary differences in rank. Among the Masai the warriors form simultaneously a standing army and a status class.

There are infinitely varied ways in which a society may combine units of different types. The coordination or subordination is achieved with varying degrees of elegance, which can be appraised, however, only by the assumption of an arbitrary subjective standard. An individual who belongs simultaneously to two units may be confronted with a conflict of loyalties. In primitive matrilineal societies lineage and family affiliation are likely to clash. A Trobriander or a Tsimshian is legally bound to transmit his most valued possessions to a uterine nephew, yet attachment to his own sons, in a social if not in a physiological sense, impels him to favor them to the detriment of his matrilineal kinsmen. As Malinowski has shown, such conflicts between love and duty may precipitate tragedy among simpler peoples. On higher levels the possibilities for antagonism do not disappear. Attachment to a religious body, an economic class, an idealistic fraternity, may even evoke revolt against the state itself, as is illustrated by the attitude of a patriotic German Catholic during Bismarck's Kulturkampf, of the I. W. W. in the United States and of conscientious objectors to war in any militaristic country.

As Vinogradoff has pointed out, the claim of the modern state to absolute sovereignty within its territorial limits is comparatively recent in Europe. A new Scandinavian king traveled from

province to province in order to gain the support of local groups. The Althing, the assembly of Iceland, passed laws but was impotent to enforce them. On the continent compulsory arbitration, self-help and outlawry preceded coercive measures. Under Charlemagne the crown executed its own decrees only in specific cases. In recent times the absolute supremacy of the state has become a favorite dogma, but practice often fails to tally with ideology. The constitutional rights of Negroes do not become realities in Mississippi any more than the Eighteenth Amendment achieved automatic recognition through the sovereign federal government. The contrast appeared more glaringly in imperial China. The emperor was in theory the vice regent of Heaven, hence the source of all power and the rightful claimant to implicit obedience. Actually the viceroys of provinces were virtually independent monarchs; the emperor was hedged in by the codified law, and his official acts were subject to criticism by a board of censors, so that imposition of new taxes was likely to meet with determined opposition.

There are many parallel forms of social structure but few instances of far reaching duplication through stage after stage in diverse areas; there is little evidence of complex laws of sequence. Economic conditions limit the character of developments; highly organized states, for example, are hardly consistent with the life of hunters, and modern individualism tends to destroy the traditional bonds of the clan or the family, but beyond this it is difficult to generalize. The clan has been thought of as a necessary intermediate state between the simple looser organizations and the politically organized peoples, yet this is not at all a certain conclusion. Thus according to this view the Aztecs of southern Mexico ought to have passed at one time through a clan stage prior to achieving a firmer centralized government; yet the more critical recent authorities fail to be convinced that the units recorded by Spanish chroniclers are the equivalents of exogamous unilateral groups. Tropical South America teems with horticultural tribes which by analogy with peoples of similar level would be credited with clans; but according to Kirchhoff's classical researches few of them were so organized, the majority having as a substitute a local unit, the extended family (*Grossfamilie*), composed of the core of a lineage plus coresidents from without. This unit may often have served instead of the clan as an intermediary between the minia-

ture family and the major social aggregate. The data on associations are still more striking. That societies should dichotomize on the basis of sex or split up into lesser bodies of uninitiated and initiated bachelors and married elders seems a priori plausible, and abstract psychological arguments have been adduced to show how natural it is to form secret societies. Siberian tribes seem to have been predisposed to such developments. There women were generally rated as inferior, had disabilities as to property rights and were even spatially set off in the household; notwithstanding their lower legal status, however, they were not excluded from public and ceremonial festivities, like their Australian and Melanesian sisters, but took an active part in them. Among the Yakuts, for example, female shamans ranked higher than male shamans; and in the great kummiss festivals women participated freely. Siberia is preeminently the land of shamanism, which has elsewhere led to the formation of secret societies; yet no such developments occur throughout this vast area. The only safe inference is that social phenomena pursue no fixed sequences, or at least that their sequences are so intricate as to elude perception.

SOCIAL PROCESS. The history of the social process concept is closely tied up with the history of the emergence of sociology as an autonomous study. Small wrote that "all sociologists since Comte have more or less consciously assumed this concept as their major premise." And it was Cooley's opinion that "the first requisite in the making of a sociologist is that he learn to see things habitually in this way."

The influence of the concept on the American sociological tradition has been enormous. Small, in seeking to clarify the concepts by which an adequate foundation could be built for sociology as an architectonic science, selected social process as the basis for his construction and embodied an analysis of it in his book *General Sociology* (1905), which he afterward described as "a treatise on the category 'social process.'" Earlier in the same year E. A. Ross had analyzed the concept at some length in his *Foundations of Sociology*, which Small described as "the first [book] in English to put much stress on the term 'process' as a scientific social category." He added, however, that "Ratzenhofer had anticipated both books, and the term 'social process' has been used in a semi-unconscious and amateurish way by a great many people." Small's influence was important, since he was principally a student of the history of ideas and brought to the attention of the American group an account

of the sociological tradition from the time of Montesquieu and Savigny which ran principally in terms of the making of social process theory. The theory had a marked effect upon the thinking of Ward, Giddings, Bentley, Ellwood, Dewey, Mead and Thomas in America and of Simmel, Oppenheimer and von Wiese in Germany. But after Small the most important name in its development was that of C. H. Cooley, whose *Social Process* (1918) summed up the state of thought on the concept which American sociology had reached in its maturity. Since then there has been a tendency to carry it to an extreme, notably in the "Chicago school," where it became the central conception of sociology and the principal instrument of analysis. Society came to be viewed not only and primarily as process but as a network of innumerable processes.

Negatively the concept of social process represents an important reaction against static theory. It is characteristically opposed to the conception of society as structure, or society as a formal or static arrangement of blocks of material. As such it is closely tied up in the history of ideas with evolutionary thought, which did for the whole of social thinking what the philosophers of history had succeeded in doing for themselves only by a gigantic intellectual effort: it shaped social thought in a temporal perspective. It thrust into the foreground of the philosophic consciousness the notion of society as a developing organism achieving its continuity through some sort of selective process related to the performance of function. The study of the formal and the logical gave way to the study of development and activity.

Where evolutionary thought was not completely triumphant a literature of reconciliation arose, well illustrated in English thought by the writings of Bagehot, Ritchie and Caird. It is on the whole quite easily explainable that the idea of process should have flourished in the intellectual climate of an age of rapid movement in inventions, of rapid social change, an age with its codes and standards in flux. To this historical reason must be added a more strictly psychological one, indicated by Bergson's remark: "The consciousness we have of our own self in continual flux introduces us to the interior of a reality, on the model of which we must represent other realities." Similarly G. H. Mead, in a shrewd essay on Cooley, says that he discovered his society "from the inside. . . . Finding it in living, it was a process."

At the core of social process theory is thus the notion of movement, change, flux—of society as a continual becoming. "Society," writes MacIver, "exists only as a time-sequence. It is a becoming, not a being; a process, not a product Society . . . lives on only as a changing equilibrium of present relationships." Georg Simmel in fact took the position that since society is never a product but only a process, one should not speak of society at all but only of socialization. And Ross called the social process primordial, since it not only constituted society but logically preceded it. But apart from the negative value of furnishing an antidote against an undue structural emphasis in social thought, there is little in process theory itself that makes it a valuable instrument of analysis. The mere flux, continuity, becoming, finally emerge as ends in themselves, and they tend to inhibit questions of the purposes or direction of the process or of differences of value in it. Social process theory thus becomes a species of raw vitalism, in which the stuff of social experience is set up as the supreme and unquestioned value and as the final term in explaining itself.

But this does not exhaust the importance of the idea. It must be seen as the center of a whole configuration of concepts ranged around it which are both historically related to it and logically implicit in it. These are: first, the concept of process itself; second, the concept of social interaction, or of society as a flow of relations between individuals; third, the concept of historical and social continuity; fourth, the concept of the organic connection between the individual and society; fifth, the concept of the social heritage; sixth, the concept of society as an organic unity; seventh, the concept of multiple factors and the rejection, in the problem of social causation, of any particularist or determinist elements.

The conception of society as an organic whole of interrelated parts goes back to Montesquieu, whose *esprit des lois* arose from the relation that the laws themselves bore to the whole of the social order, that whole constituting the *esprit général*. But it received its classic expression in Hegel, with his sense of society as an organic whole. In Hegel's thought this theory of organic unity was combined with a theory of historical dialectic which emphasized the continuity of history. A similar emphasis is to be found among the traditionalists, notably Burke and de Maistre, who counted upon the ordered continuity of religion and tradition to knit together the social fabric and who insisted upon the organic con-

nection of the individual and society. Comte, whose formative thinking was not very far removed from the shadow of the European revolutions, followed the traditionalists in their appreciation of the unity of society and the continuity of history. Comte saw history as development, although after a hierarchical fashion that was his own contribution; and he saw society and the realm of thought itself as organic wholes.

To the influence of Hegel, Comte and later Darwin in forming social process theory there were added in the nineteenth century Marxian thought and the repercussions it aroused. This gave rise to a polemical struggle which revolved about two axes: the validity of what was primarily a conflict theory in the interpretation of social change and the validity of the materialist interpretation of history with its selection of a single set of factors as constituting the dynamic of historic change. In sociology the conflict theory was represented by Gumpłowicz and Ratzel. While not in the main line of the Marxian tradition, they were largely inspired by the doctrine of the class struggle and extended a similar analysis to the sociology of racial and national conflict. They had considerable influence upon American sociology, principally through Small and Ward. The problem of the materialist interpretation, however, even more than the theory of conflict, became the storm center of European sociology in the last quarter of the nineteenth century. The counterstatement to the Marxian position found much support by reverting to Eichhorn's theory of the complexity of society and the multiplicity of factors that must be invoked to explain the movement of events. Multiple causation became the rallying cry of those who opposed or feared Marxian thought. This counterstatement took extreme form among the Russian liberal sociologists, like Lavrov, Mikhailovsky and Kareyev, and among the French solidarists; both set out to defend the theory of multiple causation in the interests of libertarian democracy. Representing the middle ground between Marxism and traditionalism, they sought in historic continuity for the laws of progress which would justify and fortify their libertarian efforts. They debated incontinently the question of the relation between the personal and the impersonal factors in the historic process and of the relation between the individual and society in the social process. The prevailing point of view was that of the organic unity between the two. This is represented in German

thought also in the work of Stammler, Simmel and Dilthey, and the basic preoccupation is perhaps best expressed in Dilthey's phrase, the *Strukturzusammenhang*, or inner unity, between the individual and society.

It is significant that Cooley's *Social Process*, which stands at the end of this whole historical sequence in the sociological tradition, includes under its title the entire configuration of elements in social process theory. Indeed the logical connection between them is clear. If society is a process and not a product or an agglomeration, it follows that it can be only a flow of relations or interactions between individuals. Von Wiese's definition is helpful: "We are all 'relatives' in the old, now obsolete, meaning of the word—that is, we are all persons relative to, connected with, or dependent on others. . . . Social process . . . is the dynamic aspect of any given social relation." And if society is a flow of relationships, it follows that history is an unbroken continuity of such relationships—an evolutionary process in which, as in the organic world, nature makes no leaps and in which the most catastrophic act is the attempt to break with the past. For the individual by himself is helpless; he lives only through his relations with other individuals around him and even more through his relations with the individuals who have preceded him: it is the social heritage that they pass on to him, in the form of accumulated knowledge and crystallized institutions and vested interests, which enables him to muster the requisite skill and order through which he may survive. Thus in such a train of reasoning the question of the individual versus society becomes pointless, as social process theorists are careful to point out: the individual lives only through society. This organic connection obtains, however, not only for any individual and the society of which he is a part but for the society as a whole; the primary note here is the Hegelian "altogetherness of everything." Not merely history but society itself is a seamless web which the thinker can break only at his own peril. The Marxian theory, borrowing as it does from Hegel, is also an organic theory; but in it the dialectic of history is moved by a set of particular causes: the organization of production is so bound up with the other social manifestations that changes in it produce corresponding changes in them. But the main line of social process theory is organic in a quite different sense. It does not admit of any particularist emphases, and it sees a qualitative homogeneity

in the entire social process. The problem of social causation becomes thus infinitely complex, permitting no simplification. A change in any part of the social process is to be accounted for only in terms of changes (which are both cause and effect) in a multiplicity of factors in the rest of the social process and, by ultimate logic, in the whole of it.

The implications of this entire complex of theory for social change and its consequences for social action are far reaching. By stressing the unbroken continuity of history and society it tends to bolster the status quo and to inhibit revolutionary action which might break with the past and endanger the fragile social heritage. The change that the theory envisages is in reality only that of continuity and not radical or revolutionary change. By positing the organic relation of society and the individual it places the locus of the social process and the locus of change in the mind of the individual, denying society as an objective reality and denying also the sweep of impersonal forces in history.

On the whole social process theory represents the liberalism of the realm of sociology. It has furnished the foundation for progressivism in political and educational movements and for an entire program of social work and social reform. Sociologists have for the most part followed Cooley's injunction and adopted it as their fundamental intellectual attitude. But its very indecisiveness has done much toward preventing the achievement of an adequate theory of social change or social causation. And through its function of rationalizing the adherence to the status quo and the fear of revolutionary action the theory has in the movement of events carried implications of a definitely antiliberal character.

SOCIAL PSYCHOLOGY stands midway between general psychology and the social sciences and is claimed as a sub-division by both psychology and sociology. Besides its treatment as a division of sociology, sometimes being called psychological sociology or folk psychology, it is intimately related to political science as political, crowd, mass or mob psychology and as collective psychology. It is closely connected with economics through the psychology of advertising and propaganda as well as through the fundamentals of economic motivation; with religion through the psychology of religion; with education through certain aspects of educational psychology; with anthropology through folk psychology; with jurisprudence through crowd psychology; and with ethics, art and literature through both folk and mass psychology. On the other hand, general psychology since the time of William James has been moving rather definitely away from the metaphysics and even the physiology and psychology of individual behavior toward social psychology. Even physiological psychology makes a considerable contribution to social psychology through its analysis of the effects of the endocrines upon responses of individuals in social situations. Neurological psychology is important to social psychology through its study of the instincts and the methods of conditioning responses to social stimuli. Abnormal psychology and social psychiatry are related to crowd psychology and other phases of social psychology on many counts, but particularly through the phenomena of suggestibility, imitation, fixations, censorship, compensation, rationalization and personality types.

Social psychology, considered as a branch of psychology, is the study of individual responses as conditioned by stimuli arising from social or collective situations; considered as a branch of sociology or as collective psychology, it is the study of collective responses or of the behavior of groups and other collectivities. Social psychology, however, no longer is regarded by the students of the subject as merely a branch of

either general psychology or general sociology. It possesses largely an independent line of development and it is not, historically speaking, primarily an outgrowth of either of these two disciplines, although it has always been closely connected with them.

Although social psychology as a recognized social science dates from the last decade of the nineteenth century, it had previously undergone a number of advances toward integration while it was still a nameless discipline. The Greek sophists of the fifth century B.C. had observed and named some of the psycho-social processes. Protagoras, for instance, had announced the fact that not natural law, but public opinion, determines what men consider right. He had the very modern notion also that this ruling public opinion should be made enlightened through science or knowledge and should be controlled by means of education. The sophists were perhaps the first to grasp clearly the abstract fact of custom and tradition as intangible but powerful factors in the lives of men, and thus to rob the gods and nature of the honor of bringing order and continuity into human collective behavior. Other implications of a social psychology in ancient times are found in Plato's idea of organizing human society on the basis of personality types; Aristotle's theory of the four fundamental human relationships and the original social nature of man; the stoic emphasis upon the psychic communion of mankind; the Epicurean anticipation of the theory of social contract; and the Christian dogma that man is not born social but antisocial (original sin) and must be socialized (born again).

The next great contribution to the unnamed field of social psychology was made by G. B. Vico, in his *Scienza nuova* (1725), as the result of his examination of the whole of classical literature then available in order that he might ascertain, as he said, how the mind of God had expressed itself in history or in the behavior and thought of men. He came to the conclusion that the mental life and development of all peoples had been essentially the same. He attempted to state these laws of mental and cultural development under three general periods: the age of the gods, of the heroes and of men. After Vico, Condorcet developed the thesis that an era of planned civilization directed by scientific opinion was dawning. Herder saw mankind evolving from insensate matter into a moral world controlled by the ideal of a perfect humanitarianism. Adam Ferguson pictured the

conflict between the collective ideals of civic self-sufficiency and paternalism. Hegel perceived a world soul developing and dominating collective thinking in the direction of universal liberty under the guiding restraints of collective constitutional action. Saint-Simon and Comte planned a system of psycho-religious controls which would marshal the benevolent emotions of man in the service of collective welfare and mutual aid.

All of the above thinkers were working toward a collective psychology. But there were contemporaries who were laying the foundations of a social psychology from the standpoint of individual responses as conditioned by social stimuli. The early moral philosophers of the seventeenth and eighteenth centuries—and especially men like Hooker, Shaftesbury, Bishop Butler, Hutcheson, Price and Adam Smith—were developing the theory of moral sentiments, such as conscience, benevolence and sympathy. The psychologists Hartley and Helvétius added the weight of their analyses. At first these men regarded the moral sentiments as inherent in the original nature of man or as having been implanted in the soul by an act of divinity, which the metaphysical deism of the eighteenth century transformed into heredity. But the influence of the philosophy of history school and the environmentalism and rationalism of the French *encyclopédistes* began to transform the hereditary explanation of social attitudes into a theory of acquired dispositions collectively or socially conditioned. Helvétius, who came closest to being a collective psychologist, and Godwin, who might appropriately be considered the first political psychologist, added greatly to the vogue of the theory of acquired social attitudes. They were true and able forerunners of the mass psychologists of the late nineteenth century in France and England and later in the United States. In a similar way Adam Smith served as the most prolific and stimulating transmitter of the theories of moral sentiments to the nineteenth century social psychologists of the individual type, especially in the United States and England. Thomas C. Upham was the outstanding early example among the disciples of Smith in the United States. For a while this approach to social psychology lapsed, but it reappeared toward the end of the century especially in the writings of J. M. Baldwin and C. H. Cooley. In England this viewpoint served its apprenticeship in the theories and practical proposals of Bentham, the Mills, Spencer, Leslie Stephen

and other utilitarians. Through these men and Bain and the Scotch school generally they re-enforced the thinking of Baldwin and Cooley.

Such, in the briefest outline, was the very important development of social psychology before it acquired a name. The first phase of social psychology to achieve distinct recognition was folk psychology. In 1860 Lazarus and Steinthal, following the immediate lead of Herbart and Hegel and of that branch of the philosophy of history which had turned toward ethnology, established their *Zeitschrift für Völkerpsychologie und Sprachwissenschaft*. During the next thirty years they published also several monographs in this general field. They selected language and ethnology as the source from which to draw the data of social psychology, apparently because these subjects had already been largely developed on the psychological side in Germany and were in process of such development in other countries. Their data were much more objective than those available to the English, Scotch and French schools of moral philosophy and therefore more capable of integration into a science. Folk psychology was by no means the invention of Lazarus and Steinthal, who might rather be characterized as the formulators and promoters of the new subject rather than its discoverers, and even they remained too close to the Hegelian metaphysical concept of the oversoul to make of their subject a true science.

Wundt went further and attempted a true science of folk psychology which, as Karpf points out, was intended to present, first, a psychological history of culture; second, the theory of collective mind; and, third, the origins of collective behavior. For the most part he dropped the metaphysical assumptions of Vico, Herder, Condorcet and Hegel and like Spencer attempted to derive his conclusions from the inductive study of ethnological materials. He went beyond Spencer in the study of social origins and found his most enthusiastic but largely independent follower in W. I. Thomas in his Chicago period. Other social psychologists in the United States influenced largely by Wundt were Baldwin, Dewey, Cooley, Judd and Mead, although they were perhaps even more stimulated by neo-Hegelian concepts of collective behavior and opinion. The inadequacy of ethnology as a basis for either a modern social psychology or a modern sociology began to be made clear in the 1890's as the result of the growing complexity of a society which compelled both of these social sciences to seek their data from and to make

their descriptions of contemporaneous social and psycho-social processes. Folk psychology therefore declined rapidly in importance; and the struggling race psychology, which had obtained a place in university catalogues, remained still-born, mainly because of the discovery that social instincts were a myth and that race was a sociological and anthropological rather than a psychological concept.

The new brand of social psychology which had most to do with the retirement of folk psychology from the center of the stage in the last decade of the nineteenth century has been variously denominated crowd psychology, mass psychology, mob psychology and even collective psychology, although this last term might also be applied to other aspects of social psychology. Adam Smith devoted extensive passages to custom, fashion, opinion and other aspects of collective behavior. But it was Walter Bagehot and Gabriel Tarde who first carefully observed what E. A. Ross later called the social planes and currents in collective behavior and attempted to reduce them to definite and schematic formulation. It has long been recognized that Tarde overworked the concept of imitation, but it is equally true that the recent attempt to deny any significance to this concept is unjustified. Tarde's formula of repetition, opposition, adaptation, harks back to the Hegelian dialectic and pre-figures the dialectic of social growth of Baldwin, so important in the United States around 1900. Tarde was the first social psychologist to give adequate attention to invention, but he failed to find a naturalistic basis for it in the process of the conditioning of responses. Closely supplementary to the work of Tarde was that of Gustave Le Bon and Scipio Sighele; they more than Tarde took over the ideas of the French abnormal psychologists, particularly of Bernheim and Janet, and applied their theories of suggestion, hysteria and hypnotism to the analysis of crowd and mob phenomena. This line of attack has been extended even further by E. D. Martin to include theories of paranoiac motivations and obsessions. E. A. Ross consolidated the findings of Tarde, Le Bon and Bagehot and introduced them into the United States, first in his *Social Control* (New York 1901) and later in the first work ever published under the title *Social Psychology* (New York 1908). Ross also is credited with having given the first course by this title ever offered in a university, at Stanford in 1899. This phase of social psychology, which had such wide vogue from about 1890 to about

1910, has in its turn fallen into relative disfavor. But its importance is perhaps greater than is usually recognized, partly because of its aid in objectifying psycho-social situations and in making them subject to symbolic control and practical manipulation, but also because of the large contribution it has made to political psychology, the psychology of religion and the psychology of the mores. Émile Durkheim and Lucien Lévy-Bruhl have made an interesting combination of the neo-Hegelian theories of the oversoul, of folk psychology and of the French-English crowd psychology. In Durkheim's hands the oversoul is reduced to collective representations. These appear to be general concepts and emotions which acquire a symbolic detachment and objectivity, enabling them to be communicated in the psycho-social environment and thus to become dominant factors in collective responses. Lévy-Bruhl, even more than Durkheim, has gone to the field of ethnology for his most telling illustrations of the operation of these collective representations and in addition has made some excellent criticisms of the psycho-social assumptions of the ethnologists, while he himself has displayed an inadequate grasp of modern psychology. The Durkheim school generally has been closer to anthropology than to sociology, although several investigators have attempted to make applications to the fields of religion, economics, sociology, political science and education.

About 1910 the chief emphasis in social psychology began to shift definitely toward personality analysis. Perhaps this movement really had begun earlier in the works of Baldwin and Cooley. Three major lines of attack upon this theme developed: the instinctivist social psychology, the psychoanalytic approach and the environmentalist approach. The instinctivists, led by William McDougall, had a long line of antecedents among the Scotch metaphysicians and the German child psychologists and another in William James. It was the naive atomistic theory of this group that personality is a bundle of inherited behavior patterns which may be manipulated by the educator or by social directors and institutions somewhat as the typist operates a typewriter to produce an intelligible manuscript; that is, by releasing the keys which are the instincts. By 1920 this mode of personality analysis was under fire and by 1925 it was in rapid retreat, although it still has standing in other countries where social psychology is less well developed. The psychoanalytic approach to

personality analysis also started with an instinct theory—one which was more crude than that of the instinctivists themselves—and attempted at first to interpret all personality in terms of the conflict of an all powerful "sex" instinct with an "egoistic" instinct, but later brought in something like a "herd" instinct, in the form of the super-ego, to make room for an alignment of the two former so-called instincts against social disapproval. This phase of psychoanalytic social psychology is now without adherents except among the "faithful," and the theory of personality conflict which they brought to the fore but did not originate has now been reduced to a theory of conflict of acquired interests and of socially conditioned attitudes and impulses with native appetites. Nevertheless, the psychoanalysts did help to emphasize some categories of interpretation taken over mainly from the abnormal psychologists—wishes, compensation, rationalization, fantasy, neuroses—which have been widely adopted by such social and political psychologists as Graham Wallas, W. I. Thomas, F. H. Allport, L. L. Bernard, Kimball Young, J. K. Folsom, E. D. Martin and H. D. Lasswell. The environmentalist school of personality analysis among the social psychologists, beginning with Adam Smith and other eighteenth century writers already mentioned, came to be recognized as a leading branch of social psychology through Baldwin and Cooley and was reinforced and extended by the work of such men as Wallas, Thomas, Allport, Bernard and Young in particular. In this modern form the old ethical emphasis of Adam Smith and his confrères has given way to a purely objective analysis of personality. Ellwood, Bogardus, Kantor and most of the recent French and German social psychologists belong primarily to the collective or crowd and folk psychology rather than to the environmentalist school of personality analysis, although all of those mentioned have been definitely concerned with the latter. This field of study and investigation developed within social psychology in response to a definite demand from educators, advertisers, propagandists, ministers, club directors and other leaders for definite knowledge of the personality mechanisms which must be manipulated in the processes of character formation and social control. With the discarding of the social instincts theory there has been a consequent return in this connection to the theory of the conditioning of responses which John Locke so ably and clearly set forth in his *Essay concerning Human Understanding*

(London 1690; ed. by A. C. Fraser, 2 vols., Oxford 1894), and which Pavlov has recently renewed.

The newest and at present the dominant emphasis in social psychology—the behavioristic viewpoint—is built upon and refines and reorients the environmentalist school. Modern behaviorism in social psychology may be said to have originated, or at least to have been foreshadowed, by August Comte; but the comparative psychologists, especially John B. Watson, were responsible for popularizing the principles of behaviorism and for giving it its name. These men, however, with a few exceptions, have not worked in the field of social psychology. Behavioristic social psychology of the present day is primarily the product of the United States and its chief sponsors have been Allport, Bernard and Kimball Young, although it has now been adopted by most of the writers in the field. It places the chief emphasis in social psychology upon the constructive adjustment of the personality to environment, and it accordingly makes extensive use of the theory of the conditioning of responses and of the environmentalist analysis of personality. Through this behaviorist, or functional, adjustment orientation social psychology is allied intimately with all the social sciences concerned with collective behavior in the fields of politics, business, religion, recreation, art, literature, language, delinquency, mental hygiene, education, vocational guidance and the like. All of these subjects are essentially behavioristic in content and outlook and they find in a behavioristic social psychology aids to the interpretation of their own problems of group and individual behavior which could not be found in the old metaphysical theories of free will, rational choice, instinctive domination and so on. All of them are becoming “institutionalized,” under the molding influence of social and folk psychology. Individual motivations are now traced back to social origins and both individual and collective behavior, even in language, literature and art, are being explained in terms of the social conditioning of responses. Such a behavioristic interpretation in the social sciences opens the way for an objective analysis of the conditioning factors in behavior and therefore to productive research in all phases of social control.

At present social psychologists and social scientists generally are not greatly interested in schools of social psychology. The chief immediate concern is in the development of quantita-

tative testing and measurement technique. This emphasis upon psycho-social research has been reached only after several decades of effort. The German research approach in social psychology, as represented by Lazarus, Steinthal, Wundt, Vierkandt, Thurnwald and Simmel, has been mainly cultural and institutional. Good work has also been done in child psychology and personality development, especially by Pestalozzi, Herbart, Preyer, Stern and Buhler. In France Le Bon, Tarde, Durkheim and Lévy-Bruhl have emphasized the mass-cultural-institutional approach and Le Bon and Tarde the analogical method. The recent British development began with the cultural-institutional-historical approach of Bagehot and Graham Wallas, but its chief contemporary emphasis is upon the analogical (instinctive) interpretation of Shand, McDougall, Dreyer and Thouless. The social psychologists of the United States have led in quantitative research in social psychology in recent years.

During the latter half of the nineteenth century there was a constantly growing tendency among social psychologists toward stating their investigational problems in such a manner that they could be answered by means of the application of statistical techniques. Quetelet, Buckle and Tarde were ardent advocates and practitioners of the application of statistics to the disclosure and interpretation of psycho-social uniformities. It was not, however, until after Galton's invention of the method of correlation in 1888 that adequate methods for the measurement of these phenomena were developed, and they were not experimented with extensively until the present century. Recently measurement in social psychology has been applied both to mass behavior, as in the studies of Ogburn, Rice, Willey and Lundberg in the fields of voting, conservatism and radicalism, and leadership and to personality, as in the measurement of social attitudes, fairmindedness, honesty, social intelligence, temperament and the like. Methods of personality measurement have progressed more than general statistical measurement of collective phenomena. In 1904 Thorndike published his *Introduction to the Theory of Mental and Social Measurements* (New York, 2nd ed. 1913) and thus gave a marked impetus to the quantitative method. The Binet-Simon scale and its numerous derivatives also have made various contributions of value, although some of them have been greatly overestimated. Much the same may be said of the various stud-

ies of eminence by Galton, Pearson, Cattell and others which led up to the recent heavy emphasis upon the refined analysis and computation of social attitudes by Allport and D. A. Hartman, Thurstone and many others. Much effort has been expended upon the production of measuring scales for the detection, evaluation and prediction of religious, political, domestic and other social attitudes, with the result that large phases of the corresponding social sciences are being transformed by this psycho-social quantitative technique. The emphasis upon scientific labor management, motion study and the like early in the twentieth century together with the growing interest of educators and employers in vocational aptitudes has greatly stimulated the development of a field of industrial psychology which overlaps with social psychology, educational psychology and personality analysis and rating. Methods of rating and ranking of all types of persons and in many fields of social behavior have been for some time actively and widely discussed. Rankings and ratings, however, give way increasingly to standardized tests, such as those developed by Allport, Thurstone and numerous other workers in the field. These techniques have been extended especially to the measurement of such aspects and problems of personality as emotional stability, will temperament, social maturity, fairmindedness, social distance and social attitudes. This phase of measurement promises to become one of the most fruitful in the whole field of science. In 1928 Hartshorne and May began to publish the results of their experiments in extending measuring techniques in the field of character to real life situations, but as yet practically all such tests continue to be of the pencil and paper variety.

SOCIAL REFORM. See REFORMISM.

SOCIAL SANCTIONS. See SANCTION, SOCIAL.

SOCIAL SETTLEMENTS. The term settlement, as used by neighborhood workers, goes back to the origin of the movement when, in 1884, Samuel A. Barnett founded Toynbee Hall in London. Twelve years earlier, as a young clergyman, Barnett had become vicar of St. Jude's in one of the most wretched districts in the East End. His experience convinced him that industrial and urban changes had undermined much of the English parish system, and that charity and mission schools altogether failed to make up for the draining off of parishioners equipped to give civic and educational leadership to such areas. Accordingly he sought some new means of reinforcement, closer to the ground than the rising university extension movement, in which he was active. His concept was reminiscent, on the one hand, of the "principle of locality" hammered out by the Scotch divine, Thomas Chalmers, in rechurching Glasgow in the early nineteenth century and, on the other, of that of Edward Denison, who in the 1860's afforded an example of what a resident layman might do by taking up lodgings in Stepney and, with encouragement from Ruskin and the historian Green, envisaged a colony of young men who would throw in their lot with the dwellers in an underprivileged neighbor-

hood. In the words of Robert A. Woods, historian of the settlement movement, Barnett proposed to bring "some of the nation's chief sources of power" into the vacuum left by the collapse of older forms of community life. At his invitation a group of young Oxford and Cambridge graduates took up their residence in the Whitechapel district of London, naming their quarters in memory of one of their number, Arnold Toynbee, whose career had been cut short by death. The founders of Toynbee Hall and of the other settlements which followed its lead reflected the century long revolt against evils ushered in by the industrial revolution. In the midst of the ferment, however, they held to what the poets, novelists and essayists, the political and religious insurgents of those decades, so often lacked—a practicable approach to the life and problems of the times. Not only did they organize clubs, classes, lectures, concerts and other educational, cultural and recreational activities, but they elected to become a part of the community itself, to study its needs and to participate in its struggles. Toynbee residents were early drawn into the labor conditions underlying the great dockers' strike and into the scheme of social research that issued in Charles Booth's epoch making study, *Life and Labour of the People of London* (2 vols. and appendix, London 1889-91; rev. ed., 17 vols., 1903). Thus from the start, through the interplay of essential human contacts in these centers of residence, the settlements sought to avoid falling into the category of superimposed institutions. Then and since they have been invested with an unspoiled confidence in the contribution which, by a process of give and take, the people of a locality themselves might make. This explains how in England they have counted steadily upon dislodging mind sets at both ends of an old order and how in the United States, where settlements spread even more rapidly, they have revived the spirit of pioneering in decades which have seen the frontier shift to urban centers. Through the subtle understanding and vivid leadership of Jane Addams the more democratic aspects of the movement soon came to be typified in the public imagination in Hull House, opened in 1889 on Halsted Street in Chicago.

In England the example set by Toynbee Hall led within six years to the establishment of six other neighborhood centers: Oxford House in Bethnal Green, the Women's University Settlement in Southwark, Mansfield House in Canning Town, University Hall, Bermondsey

Settlement, founded by Mrs. Humphry Ward, and Newman House. Although Anglican, Unitarian, nonconformist and Catholic auspices were included in these beginnings, and although the settlement movement has repeatedly drawn impulse from religious and ethical sources, Barnett and his associates set the type in consistently rejecting sectarian bias and evangelical intent.

This approach especially appealed to early overseas visitors to Toynbee Hall, who were to become the founders of the first American settlements. In 1886 the Neighborhood Guild, later the University Settlement, was initiated in New York by Stanton Coit and Charles B. Stover. The year 1889 marked the opening not only of Hull House in Chicago by Jane Addams and Ellen Gates Starr but of the College Settlement in New York by Dr. Jane E. Robbins and Jean Fine (Mrs. Charles B. Spahr). The first Boston settlement, Andover House, later South End House, was founded in 1891 by William J. Tucker and Robert A. Woods.

So much has depended on the personality of founders and headworkers that certain other names must be singled out from the list of those who have given distinction to the movement in the United States: in New York, Lillian D. Wald (Henry Street Settlement), Mary K. Simkhovitch (Greenwich House), John Lovejoy Elliott (Hudson Guild) and Gaylord S. White (Union Settlement); in Chicago, Graham Taylor and Lea Taylor (Chicago Commons) and Mary E. McDowell (University of Chicago Settlement), in Cleveland, George A. Bellamy (Hiram House); in Philadelphia, Anna F. Davies (College Settlement); in Pittsburgh, Charles C. Cooper (Kingsley House); in New Orleans, Eleanor McMain (Kingsley House); and in San Francisco, Elizabeth Ashe (Telegraph Hill).

Transplanted to the United States, neighborhood work became more flexible; it broadened out from its academic matrix, employing the term "social settlement" and then discarding qualifying words entirely. Men and women were included in the same household, a departure which would have been impossible at the time in England but was not so difficult in the United States with its coeducational universities. Emphasis shifted from class rapprochement to race relations, assimilation and mutual adventures in community growth. With immigration at its flood, the early American settlements were among the first to introduce classes in English for foreigners and courses in citizenship, to en-

courage and conserve folk arts and to experiment with other branches of adult education.

Starting with an old residence or rooms in a tenement, the early settlement has grown into a cluster of neighboring houses, a quadrangle covering an entire city block or a tall modern building. Clubrooms, clinics, gymnasia, studios, social halls and theaters as well as summer camps outside the city find place in the scheme. Although frequently settlements are regarded as recreation centers, their larger purpose is apparent from the Hull House charter: "to provide a center for a higher civic and social life, to institute and maintain educational and philanthropic enterprises, and to investigate and improve the conditions in the industrial district of Chicago." In the pursuit of such aims American settlement workers gave their attention to all the aspects of neighborhood and community welfare—to conditions of sanitation, health, education, recreation, housing and industrial relations. They struck out against sweatshops, unsanitary workrooms, child labor, low wages, overwork of women and other civic and industrial evils. In some cases their agitation resulted in local improvement, in others they led the way to remedial legislation. First at Hull House and then at Henry Street Florence Kelley, secretary of the National Consumers' League, linked such protests against industrial exploitation with practical proposals which laid the framework for labor laws and factory inspection. The idea of the federal Children's Bureau, a human department in government, was Miss Wald's, and its first two chiefs, Julia C. Lathrop and Grace Abbott, were residents at Hull House. The war and post-war years have witnessed a further extension of settlement interests and strategy into such fields as large scale public housing, city and regional planning, systematized social insurance, internationalism and world peace.

Intrinsically the settlement movement is decentralized, but city, national and international federations have lent it collective strength. In the United States a National Federation of Settlements, formed in 1911, reported in 1930 an enrolment of 160 houses, with 1500 staff members and 7500 volunteer assistants, while a partial census of activities indicated that over 1,000,000 people were reached each year. These figures are exclusive of some 300 church houses of all denominations, and other hybrid organizations which frequently call themselves settlements.

The English settlements likewise have in-

creased in number since 1914; they now total 72 and are organized in two bodies: the British Association of Residential Settlements and the Educational Settlements Association. Recent developments indicative of the vitality of the movement have been the spread of neighborhood houses in the depressed mining areas and experiments in connection with the new housing sections, which, while they afford admirable living conditions, are often lacking in the rudiments of community life. A dozen neighborhood houses in Canada and others in Australia have shared in the impulse from Toynbee Hall.

The extent to which the settlement movement has taken root in continental Europe is apparent from the fact that at the present time France has 59 neighborhood houses; Holland 51; the Scandinavian countries 12. A number of early neighborhood centers sprang up in France quite independently of the British movement and even before its inception. The oldest, L'Union des Familles, was founded soon after the Franco-Prussian War by Madame de Pressensé. Like the Volkshuis of Holland, the French centers were non-residential, and it was not until the turn of the century that residential settlements came into being in France. In 1902 the abbé Viollet opened his L'Oeuvre du Moulin Vert, which recruits its members as families rather than as individuals; and in 1903 several borough settlements in Paris were started under the leadership of Madame le Fer de la Motte. During and after the World War a number of neighborhood centers were established both in the cities and in rural areas, and by 1932, 25 non-sectarian societies were affiliated with the Fédération Française des Centres Sociaux. The federation includes the social centers of the villages of the Chemin de Fer du Nord, where the workmen themselves are the prime movers. The settlement movement in France has from the beginning drawn on the ideology of Saint-Simon, Fourier and Frédéric Le Play in its concern for strengthening the life of the local community.

One of the best known and most successful European settlements, the Soziale Arbeitsgemeinschaft, was founded in Berlin in 1911 by Friedrich Siegmund-Schultze. It emphasized the self-organized activity of the people living in the working class district which it served and also offered a striking example of the interplay between voluntary social service and a system of socialized public administration. The Berlin and the Cologne settlements were among the first to

suffer under the Nazi regime which began in 1933.

The settlement movement has taken root in China, Japan and India or has been spread by missionary leaders. Notably in India the neighborhood house has played an important role in overcoming caste barriers and racial cleavages.

Following the first international Conference of Settlements at Toynbee Hall in London in 1922, subsequent meetings were held in Paris (1926), in Amersfoort, Holland (1929), and in Berlin (1932).

In the United States, where the social settlement has reached its widest and most varied development, volunteers have characteristically played a large part in settlement beginnings and continue to do so even today, when, under modern organization, executive responsibility and specialized activities are commonly assigned to trained, salaried staffs. Similarly the chief source of financial support has been voluntary contributions, raised directly by the board of trustees or directors or as part of the local community chest. Fees paid by members of clubs and classes have met some of the expense, and with the passage of time endowments have accumulated. Settlement boards are usually drawn from the community as a whole, but as a foil to absentee bias they are sometimes balanced by neighborhood leaders and men and women who have themselves come up through the clubs.

The trend has been for each house to enter the field without a preconceived program, to see the work grow out of situations which call now for one type of service, now for another and to keep it plastic. This approach and the decentralized leadership of the movement throw light not only on the variety of forms of neighborhood work but on those disparities in standards and motives between individual houses which have led to criticism of the movement as a whole. Thus on the one hand it has been charged that settlement work is superficial in that it remains on the side lines of the economic struggle, and on the other hand it is held to have become obsolete as a result of the development of social programs by schools and community centers under public auspices. Such charges from the outside have been matched and anticipated by the self-analysis and criticism of settlement workers themselves. Even more the search for realistic promptings in the life about them has done more than anything else to save settlements, although by no means universally, from the pitfalls of patronage, sentimentality and institutionalism and from partaking of what

Miss Addams called "the inevitable flatness of the commonplace" as they have become "part of the established order of things."

Unlike case work agencies and specialized forms of social work which minister to particular needs, neighborhood workers are in a sense general practitioners who emphasize the group as central to their scheme. Beginning with their own household and engaging all the surrounding groups that enter into the social composition of the neighborhood, settlement workers are concerned with the life of the community as a whole. Not only do they carry on a local exchange through which the varied resources of the community can be drawn upon in any case of need, but they bring together generations, races and interests and give effective social expression to the educational, cultural and recreational aims which are at the heart of their program. It is natural therefore that the club should have become the "activity common to all settlements," from the recreational clubs for young people to the adult organizations which often serve as forums for the discussion of social, political and economic problems and as channels of organized and effective protest against neighborhood ills.

In the field of health the American settlements have been at the forefront in initiating health education, medical examinations, convalescent homes, child health centers and such current innovations as habit clinics for small children and heart and nutrition clinics. The visiting nurse service of the Henry Street Settlement gave impetus to similar services the world over and led to the introduction of school and city nurses. In originating the term "public health nursing" Miss Wald saw the potentialities for the community of the nurse who is also a social worker.

In education the settlements introduced or demonstrated many of the developments which have enriched the public schools—playgrounds, kindergartens, nursery schools, classes in home economics and manual training, vocational bureaus, junior employment services, visiting teaching, study rooms and ungraded classes. In adult education the settlement class for immigrants was the forerunner of comprehensive schemes developed and expanded under municipal or state auspices.

In a decade which is confronted with increased leisure, whether through unemployment or through shorter working hours, the activity of neighborhood workers in sponsoring cultural, aesthetic and intellectual pursuits has taken on

new significance. In this field Albert J. Kennedy, for many years secretary of the National Federation, has given distinguished leadership to the American development. There are twenty settlement music schools, apart from some fifty music departments. Through experiments in group singing and playing and through concerts, recitals and choruses an effort is made to stimulate wider appreciation of music. Historically settlements have taken a leading part in reviving native festivals, dances and folk arts. Needle craft shops have long encouraged foreign born women to preserve their native skills not merely for their inherent value but as part of the effort to awaken in American reared children a pride in handicraft. Today settlement art schools, children's art museums, classes in pottery, modeling, painting, drawing, metal work, woodcarving, basketry and weaving as well as dancing and dramatic departments give play to the creative instinct. The little theater movement in the United States has drawn inspiration from the Hull House Players and the Neighborhood Playhouse of the Henry Street Settlement.

From the outset the residence of settlement workers in congested areas and their first hand contact with problems resulting from industrialization gave rise to distinctive social and economic studies. Beginning with *Hull-House Maps and Papers* (Chicago 1895), the South End House studies, *The City Wilderness* (Boston 1898) and *Americans in Process* (Boston 1902), the American settlements have contributed a valuable group of findings in the field of social research. Kingsley House under William H. Matthews helped initiate the Pittsburgh Survey (*Findings*, 6 vols., New York 1909-14), which assayed life and labor in the American steel district. In 1926, at a time when no governmental agency or responsible private foundation had ventured to appraise the experiment, the National Federation of Settlements appointed a committee, with Miss Wald as chairman, to gather evidence as to the social effects of prohibition. The results of this study were published under the title *Does Prohibition Work?*, by Martha Bensley Bruère (New York 1927). The fissure of unemployment which was showing through the crust of post-war prosperity, but of which the public was unconscious, next presented a telling opportunity to settlement workers. At the National Settlement conference in 1928, eighteen months before the stock market crash which ushered in the depression, a committee on unemployment was appointed under

the chairmanship of Helen Hall, then director of University House, Philadelphia, and later of Henry Street, New York. More than a hundred settlements cooperated in inquiries carried on over a period of five years. A popular version of the study *Some Folks Won't Work*, by Clinch Calkins (New York 1930), ran into four editions, while the comprehensive findings, *Case Studies of Unemployment* (Philadelphia 1931), provided one of the first source books for the student of unemployment. Subsequent inquiries dealt with the effect upon families of mass unemployment and mass relief, and Miss Hall carried out a study of the effectiveness of the British system of unemployment insurance as contrasted with American makeshift emergency measures. The settlements sent the first group of social workers to present testimony at hearings in Washington calling for the exercise of federal responsibility toward unemployment. They have been active in urging a threefold program of employment stabilization, employment services and unemployment insurance. It is in areas of change and growth, where new situations must be met and new knowledge applied, that neighborhood workers thus link insight with instigative energy.

Today roughly 600 settlements on four continents have their prototype in the original household at Toynbee Hall in 1884. The neighborhood house, with a resident group as the core of its work, is one of the few general social institutions originated within the past half century. This is a brief span in such a process of evolution, but it is long enough to invalidate any definition of the settlement in terms of particular activities and to disclose its enduring character as a nucleus for social discovery and initiative.

The propensity of neighborhood workers to be forerunners, encouraging the public to take over what they have proved workable, has given currency to the notion that the settlements have been putting themselves out of business. Yet their usefulness can scarcely be ended with the adoption by the community of the things they have discovered, for their primary function, discovery, would still be theirs. The fact that they are grounded in and change with their neighborhoods, draw in their neighbors and promote self-organization along natural lines may indeed be the secret of the persistence of settlements in the midst of change. In the impending contests for industrial control the settlements will be needed, as they were in the 1890's, as centers of contact, understanding and impulse.

Meanwhile the economic shifts being ushered in by mass production and mass distribution are only in their inception. Man's invention has gone but a short way toward devising ampler schemes for living for all. Experimentation is not well done in the mass. The neighborhood house is intimately bound up with the community, where conviction springs from personal contact and can offer a fresh interpretation of the problems of an industrial civilization in the process of finding itself.

SOCIAL SURVEYS. In its broadest sense a social survey is a first hand investigation, analysis and coordination of economic, sociological and other related aspects of a selected community or group. Such a survey may be undertaken primarily in order to provide material scientifically gathered upon which social theorists may base their conclusions; or its chief purpose may be to formulate a program of amelioration of the conditions of life and work of a particular group or community. Although either type of survey may yield results of value to the other, scope and method are governed chiefly by the initial purpose of the study. The first type was introduced into sociological thought by Frédéric Le Play in the middle of the nineteenth century and has resulted in a rich and varied literature as well as in a less definite but nevertheless powerful influence, particularly in French and German sociology. The latter, while gaining much from the impetus given by Le Play's studies of European working men's family budgets, had its actual inception in England in the last quarter of the century with the work of Charles Booth and his associates and has attained its fullest development in the United States. Thus the social survey as a method for the study and analysis of social phenomena as well as for the application of a program of social planning is of comparatively recent origin, although it had been envisaged by thinkers belonging to an earlier period.

Le Play realized that in order to study the chaotic forms and material of society, some basic unit which would contain within itself the essentials of the larger complex must first be selected. He chose the family as both the simplest and the most universal unit of society. The next problem was to devise some adequate method for the quantitative measurement of the different components or elements of that unit; and for this Le Play chose the family budget as yielding by careful analysis of all of its component items the best quantitative expression of the whole family, its organization and functions and its relation to all the other groupings and institutions in the society in which it existed. His monumental *Ouvriers européens* (6 vols.,

1855) was the result of two decades of studies of thousands of budgets of working men's families in a number of countries. From these he selected for intensive monographic study a few families and their functioning and on the basis of both types of approach formulated a number of conclusions with respect to the organization of various types of society. Nor did Le Play limit himself to methodology for social analysis as a basis for sociological generalization. In this work, in *La réforme sociale en France* (2 vols., 1864) and in the journal which he edited he sought to use such studies as a basis for practical proposals for social amelioration.

The disciples of Le Play, notably Demolin, however, concerned themselves more with the former type, broadening the basic unit, for which they felt the family was not a sufficiently comprehensive form, and seeking more satisfactory methods of measurement than those expressed in monetary terms. The *nomenclature de la science sociale* which they devised included examination of other social units and institutions and of geographical and related environmental factors. Indeed the survey in the human geography and the ecological schools of sociology owes much of its methodology to the followers of Le Play. Other sociological schools, however, have been influenced by Le Play's method and approach.

While Le Play's method of studying family budgets as the basis for social planning still remains the model for such studies, the social survey which includes a broader view and a more comprehensive measurement of working class communities may be said to have originated with the epoch making work of Charles Booth and his associates in their study *Life and Labour of the People in London* (17 vols., London 1903). Aroused not so much by interest in social generalization as by the startling revelations of London poverty, Booth, himself a statistician of note, and a selected staff of investigators composed of outstanding economists and social workers undertook an extensive field investigation. Limited to a definite group within a single city, Booth and his associates did not restrict themselves to any single grouping as the unit of measurement but used every available source of information in the community which would not only throw light on the income, working conditions, housing, health, living standards and free time activities of working class London but also show the effects of education, religion and administration upon them.

The influence of the Booth survey in the field of social planning was as significant as that of the survey method in sociological generalization. Social workers, philanthropists, economists and statesmen who on the basis of speculative deduction from economic or moral laws had looked for the causes of misery in the individual shortcomings of the poor were now made aware of the close interrelation of all the forces which make for and perpetuate poverty and its accompanying social problems. Booth's study of London was followed by a less ambitious survey of York sponsored by B. S. Rowntree (*Poverty; a Study of Town Life*, London 1901, 2nd ed. 1902), which was significant chiefly because it verified the major conclusions drawn in Booth's previous study.

In the United States the social survey made its appearance in 1909 with the Pittsburgh survey undertaken by Paul U. Kellogg and his associates (*Findings*, 6 vols., New York 1909-14). Indeed it was in connection with this study that the term survey was first applied. In the United States, as in England, realistic if not scientifically conducted investigations of social conditions had preceded the survey. Chief among these were the revelations of slum conditions by Jacob Riis and by the workers at Hull House, Lincoln Steffens' muckraking accounts of civic corruption and Upton Sinclair's novel of the conditions of the workers in the meat industry, *The Jungle* (1906). It was the Pittsburgh survey which introduced the use of trained social workers, sociologists and economists in a study of the living and working conditions of the unskilled immigrant laborers in the city's principal industry—the steel mills. The survey applied the methods developed by Booth and his associates; in addition it made abundant use of photographs and it publicized and interpreted the findings through an exhibit and through the periodical press. The fact that the Pittsburgh survey was from the outset sponsored not by an individual but by a group of social agencies, including the periodical *Charities and Commons* (which subsequently changed its name to the *Survey*) and the Russell Sage Foundation, aided the institutionalization of this method of social study. In 1912 the Russell Sage Foundation established a department of surveys and exhibits, and in 1914 its executive head undertook the next important community survey of Springfield, Illinois. This differed from the Pittsburgh survey in that its emphasis was more on general social than on economic aspects, and it marked

a progressive step in that it initiated a far wider degree of community participation.

Since 1914 the social survey has become an established method of studying group and community problems. Up to January 1, 1928, no fewer than 2700 surveys are listed by the Russell Sage Foundation for various communities and groupings. This development may be attributed to the changing and mobile character of American life, both urban and rural, and to the growing number of social reform and fact finding agencies, public as well as voluntary, which have sought to bring to light the problems involved in a dynamic industrial civilization. For this purpose, however, the generalized social survey of a community has given way to the specialized local or group survey covering a particular phase of community life, such as health, crime and delinquency, recreation, education and housing. Of the 2700 surveys listed only 153 were of the general community type, 81 being of urban and 72 of rural areas. The specialized survey was first undertaken in the Cleveland series on education (25 vols., 1915-17), hospitals and health (11 vols., 1920), recreation (7 vols., 1916-20) and crime (1922). *The Regional Survey of New York and Its Environs* (8 vols., New York 1927-31) and the *Regional Plan* (2 vols., 1929-31) based upon it are broader in scope and marked by a somewhat different approach.

In England the social survey still adheres closely to the pattern laid down by Booth, as is evidenced by the *New Survey of London Life and Labour* (7 vols., London 1930-34) published by the London School of Economics. But the type of survey which stresses geographical and topographical relationships, particularly in connection with city and regional planning, began to appear about 1920. Even earlier the work of Geddes and Branford in the field of regional surveys showed the influence of Le Play. At the present time a land utilization survey is proceeding under the direction of L. D. Stamp of the London School of Economics.

Indeed the development of varied types of social survey, both by semipublic and by governmental agencies, marks the disappearance of the social survey as a clearly defined form of social investigation and its far reaching influence upon social planning. The use of the survey as a basis for social planning must be clearly differentiated, however, from that of earlier governmental surveys. While it is true that attempts of well ordered governments to obtain data with regard to communities as a basis for administra-

tive action date back even before the *Domesday Book*, and that the cadastral surveys of later periods as well as the registers which were the by-products of administrative action in cameralist and mercantile states yield rich material for the social economist, these were in the main mechanical and non-analytical in character and were little concerned either with social theory or with social planning.

In the United States at the present time the influence of the social survey method is not restricted to the field of planning programs of amelioration or change. Early in the century a number of surveys of small towns were undertaken by N. L. Sims (*A Hoosier Village*, Columbia University, Studies in History, Economics and Public Law, no. 117, New York 1912), J. M. Williams (*An American Town*, New York 1906) and other students of F. H. Giddings. The type known as the social process community study, which includes only incidentally program making aspects, has also been conducted through a long succession of rural, village and small town studies by sociologists and economists attached to state agricultural colleges and to the Institute of Social and Religious Research and has served as the basis of much recent thought in the field of rural sociology. Another type has been the area study undertaken by the so-called ecological group of sociologists. Here the emphasis has been not so much on process as on existing relations between the group and its area.

With the publication of *Middletown*, the study by R. S. and H. M. Lynd (New York 1929), the social survey in the United States entered on a new stage. This study covered every group in the community and based its descriptive and analytical summaries on an ordered and extensive array of data. If its scope seems to be as broad as that of the *nomenclature* of Le Play's disciples, its basic interest is not in theoretical conclusions or in the formulation of a definite program but in an analysis of the changing character of society under varying economic, political and social forces. Despite its popular and non-academic style therefore it represents a renewed approach to the study of the community as a whole and more nearly resembles the method used in anthropological field studies of primitive communities.

Because of the diversity of uses of the social survey there has inevitably developed a lack of uniformity in the selection of units and of the qualitative and quantitative indices devised for their measurement; this defect undoubtedly

creates difficulties if the surveys are to be used comparatively on the broader field of social generalization rather than with reference to the particular problem or community studied. But it also explains why the social survey method is no longer restricted to a particular school of sociological thought but has been adopted by rival schools. Similarly, in place of the former criticism of the limitations of the social survey method on the part of adherents of the statistical as well as the case work school, there has come an acknowledgment that the social survey combines and supplements both.

SOCIAL WORK

| | |
|------------------------------|---------------------|
| GENERAL DISCUSSION | PHILIP KLEIN |
| SOCIAL CASE WORK | PHILIP KLEIN |
| TRAINING FOR | MARY CLARKE BURNETT |

GENERAL DISCUSSION. Although the term social work did not come into use until the twentieth century, the recognized special field of activity now denoted by it dates back to the 1860's. The content and values of social work since that time have been sufficiently different from the "charity," "philanthropy," "poor relief" and "social reform" which constituted its historical antecedents to make it a new and characteristically modern phenomenon.

No satisfactory definition of the term has yet been achieved. Devine in contrasting it with "social economics . . . as community house-keeping," calls it by analogy its "salvage and repair service." Tufts offered a series of definitions based on a variety of principles of classification but finally decided on a definition by enumeration, taking as his guide a detailed list of social work occupations drawn up about 1912 by the Employment Bureau of the National Social Workers' Exchange (afterwards consolidated with the American Association of Social Workers). A more ambitious attempt was made by Alice S. Cheyney, who analyzed agencies listed in charities directories, curricula of professional training schools for social workers and proceedings of the annual meetings of social workers known as the National Conference of Social Work. "Social work," in her definition, "seems to comprise a group of allied activities called by a common name and considered to be but various phases of a single undertaking because they are all engaged in spontaneous efforts to extend benefits in response to the evidence

of need; because they all show a major interest in improving the social relationships of their beneficiaries and because they all avail themselves of scientific knowledge and employ scientific methods." In a discussion of definitions at the First International Conference of Social Work, which met in Paris in 1928, Percy Alden of England, dissatisfied with this last definition and with a half score others quoted by Miss Cheyney, resorted to what is essentially a definition by enumeration in describing social work as consisting—for Great Britain at least—of four major activities: relief or prevention of poverty, cure and prevention of disease, treatment and reform of the criminal and the general abolition of conditions "which hinder progress in our industrial and economic life."

Despite the distinct character of modern social work as contrasted with the older "charities," it is difficult to understand either its present scope and nature or the concepts, theories and philosophies now current concerning it and molding its future, without a recognition of the important historical elements which have gone into its making. Prior to 1860 little of what in retrospect would be recognized as social work had to do with anything but the relief of the poor. In the middle of the nineteenth century the status of poor relief and its philosophical substructure were essentially as they had been for the three centuries preceding. It was still assumed, for example, that poverty was the effect of shiftlessness and irresponsibility, that is, of character weakness, rather than of external

circumstances. The existence of any appreciable degree of involuntary unemployment was thus implicitly denied. The extent to which this theory had penetrated the field of poor relief is well shown in a passage quoted by P. F. Aschrott from the manual of the London Charity Organisation Society: "With regard to the relief of widows we find that the main object of the Charity Organisation Society is to instill among the population a sense of the importance of saving and foresight. If the head of the family makes no provision in case of his death part of the responsibility falls on his wife and it is doubtful whether the widow ought to be relieved of the consequences by charitable aid." In this respect as in the matter of unemployment the realities of economic life were not permitted to penetrate through the moralistic defenses, strengthened as always by a certain amount of psychological soundness.

There was indeed even during this period considerable concern for the child as such, although mainly as a victim of poverty or of its consequences; there was also a growing interest in the reform of penal institutions and laws not strictly related to poverty. But child welfare, as an endeavor separate from the mere support of dependent children by the poor law authorities, began to develop, first in the form of institutions for orphans and neglected and dependent children, only at the beginning of the nineteenth century. It was later and to a limited degree only that educational developments arising from the seeds sown by Rousseau, Pestalozzi and Froebel began to spread into the kindred fields of all child care and into the institutional practise for adults, as the function of institutions became educational rather than custodial. Penal reform, although traceable to Beccaria and Howard before the opening of the nineteenth century, occupied but a minor place in social work until the second half of that century. The work of Obermaier, Montesinos and Crofton still consisted of isolated experiments, and the entire body of modern penology and criminology was barely foreshadowed. The hospital, in so far as it was not merely part of religious institutions, had become a purely medical agency rather than one belonging to the field of social work.

Poor relief even at that time was not a simple idea, any more than the institutions and instrumentalities through which it was practised represented a logical and clear cut social plan of action. It was in a somewhat confused way associated with the care and education of children,

with ministering to the sick and crippled, with ethics and religion: almshouses, workhouses, hospitals, prisons, orphanages, homes for neglected children, were recognized as institutions in some way akin to although not coordinate with the central concern of poor relief.

In general the organizational constituents of social work as they appeared about 1860 were, first, poor law authorities, national, municipal or those of other local types with or without institutions for paupers, children, sick or infirm; second, private relief agencies, sectarian, fraternal or, in rare instances, independent, often endowed and providing either indoor or outdoor relief or both; and, third, a few children's reformatories and prisoners' aid societies. Charity was the watchword and character the earnest, often pompous concern of sponsors; social cleavage between donor and recipient was wide, while social reform was brought into the picture only where the poor were regarded as a menace to wealth and peace or as an unbearable burden to the taxpayer.

Yet certain factors of great importance, the effects of which are realizable only in retrospect, were already at work. Thus the humanitarian idealism which so clearly dominates all social work—as important in its hypocritical masks as in its true functioning—is clearly traceable, at least to the time preceding the French Revolution. One of its most conspicuous manifestations was the upheaval in the field of penology. In the United States, for example, almost at one stroke the bulk of capital offenses was written down to imprisonment; and incarceration replaced mutilation, stocks and branding. Much, possibly most, of the credit for the antislavery movement and for the English factory legislation as well as for the new attitude and institutions for child welfare, for the treatment of the insane and for Red Cross service in wars also must be assigned to this comprehensive humanitarian wave. In fact the first serious check to the movement did not come until the upheaval of the World War. More fundamental even than humanitarian work was equalitarianism, also associated with the French and American revolutions. This was no mere theory but a new, persistent, permeating habit of thought, which led not only to demands by the suppressed but to voluntary grants by the possessors of power. Under the sway of this sentiment the colossal conceit of the ruling class—not yet wholly extinct—by which the poor, when not a menace, were at least by definition of inferior stock and without title to

advancement in the social scale, could no longer parade as the expression of a natural law. Although this aspect of the aristocratic tradition is dying a very slow and reluctant death, its senescence has had a deep effect upon the development of social work, particularly in helping the emergence of a new value attributed to the individual in his own inalienable right as such. But most important undoubtedly has been the rapid spread of the habit of scientific thought in the realm of social subject matter. Ultimate credit for this phenomenon is due unquestionably to the work of physical scientists, whose intellectual reign was ushered in by the nineteenth century.

Moreover the social theorists of this new period were faced by a social crisis. Conditions of the depressed classes had become compelling in much the same way as at the end of the sixteenth century, when they had led to the series of legislative measures enacted between 1550 and 1642 for the relief of the poor on the continent and in England. To the attitude created by the humanitarian and equalitarian movements and by the spread of scientific thought was added the motive power supplied by the industrial revolution, which was creating an exploited laboring class and an increasing pauper class as fast as social theorists and rebels were defining the rights of man and establishing the democratic dogma. Luddite uprisings and the Chartist movement were expressions of the new paradox of increasing exploitation and poverty with expanding proletarian consciousness and power. By 1844, within a decade of the reform laws and of the new poor law (1834), the middle class, in which is to be found the body of reformers and philanthropists, had organized in London a Society for Improving the Condition of the Labouring Classes. About the same time an Association for Improving the Condition of the Poor was founded in New York. The Society for the Prevention of Pauperism, which originated in New York in 1818, had already translated its aspirations into a House of Refuge for Children. By 1868, according to Helen Bosanquet (*Social Work in London, 1869 to 1912*, London 1914), England had eight associations for "improving the conditions of the labouring classes." In 1857 the Social Science Association was founded by Lord Brougham, who became its first president. The establishment of the Charity Organisation Society of London itself, the agency which was to prove the most influential factor in creating what is now regarded

as modern social work, is credited to the effects of a paper read by Dr. Henry Solly before the British Association and Society of Arts on the subject of "How to Deal with the Unemployed Poor of London and with Its Roughts and Criminals Classes." At its very inception this society combined such distinct interests as that of Octavia Hill in housing the poor, that of Edward Denison in what would now be called field studies in sociology (and which soon was transformed into the social settlement movement) and the technical interest in poor relief administration—sharpened by the rediscovery of Thomas Chalmers and the Elberfeld system—which was to give rise to social case work and "community organization." The charity organization movement and the social settlements may be regarded as the beginnings and chief representatives of modern social work and may be recognized as present in some form or other in the protean organization of the field.

In the growth of modern social work, as seen against this background of cultural-economic events, the most conspicuous and probably the most important single factor has been the evolution of social case work and of certain of the agencies in and through which it has grown to its present stature. Its significance is more far reaching, however, than either its practise alone or the work of those agencies. It represents the source and avenue of the ideas which have made social work, for good or evil, what it now is. Social case work represents both historically and analytically the introduction into social work of the scientific mode of thought and of the specific contributions of such social disciplines as sociology, economics, biology and political science. Into the details of actual performance this new spirit brought a displacement of theological, religious and ethical principles, even though in the motivation of sponsors and to some extent of practitioners much of religion and ethics still continued. The scientific motif led inevitably to its technological sequel, and social case work is responsible for most of the drive for and much of the substance of technique in social work. To a considerable extent the technique in this part of the field actually became the basis of technique throughout the larger field, including areas such as group work and community organization. Technological developments naturally led to specialized training and therefore to the professionalizing of social work personnel. The results of this professionalizing in turn led to the unexpected but far reaching effect of the gradual

replacement of lay philanthropic leadership in social work by technically trained professionals, who now became not only the executive instruments of social work but also its conceptual leaders, program makers and interpreters. Social work is at present largely a professionally defined area of public service, whether financed by church, relief organizations, municipality or state; and this is for the most part due to events associated, directly or indirectly, with the growth of social case work. This professionalization of social work is moreover perhaps the most distinctive characteristic of modern social work.

By virtue of its new scientific character the perspective of all social work shifted from an "external" view previously held by social reformers, theorists and philanthropists alike, in which the poor, the sick, the criminal or the neglected child appeared mainly in contrast to the normal and quantitatively solid mass of population, to an analytic view as if from the angle of the client himself. The social worker in this new conception was no longer an agent serving the social mechanism so much as an instrument of adjustment manipulated in the interest of the client and upon the physical and social environment of the client. This shift of perspective is most pronounced in social case work but is unmistakable in other parts of the field as well. In one sense it is paradoxical, for the outlook of the client is of necessity individualistic, while social work by definition is social in principle and purpose. But that paradox is only the perennial and unsolved one of the relations of individual and society. The new point of view does not pass judgment or reassign values in this relationship. It merely shifts emphasis, for purposes of immediate action, from the deductive and mechanistic viewpoint of classification and definition of categories to the psychological and inductive method concerned with connotation and specific adjustment. The concepts of social justice, social responsibility, democracy (in the sense of the right of participation), gain a somewhat modified definition from this "inner," or client determined, perspective of present day social work. It is in this light that social work seems to put the emphasis upon the neighborhood and local community as the matrices of the individual and of the potential social work client. It is this shift to the internal perspective that has made possible the tremendous spread of the mental hygiene movement in social work, for mental

hygiene particularly contemplates the universe through the life and experience of the individual.

✓ Certain other specific events, conceptual as well as institutional, can best be understood in the light of this new point of reference. The place of child care in the modern social work system, for example, has been practically made over; and not a little of the improvement of the life and outlook of the child in normal circumstances may be attributable to this general tendency. The serious and widespread attention given to the education of the child in Soviet Russia, Fascist Italy and Hitlerite Germany, even though based on socio-political grounds, shows the unmistakable effects of this new attitude. The increase in governmental as well as private pensions for the care of the preschool child and for the pregnant mother is in part at least a manifestation of the same trend, particularly as expressed in children's codes passed in a number of American states and in the statements of the White House Conference on Child Health and Protection.

In the course of this development certain specific results have been achieved, some reference to which is imperative for an adequate sense of the nature of social work interest. Among these have been: the reform of the almshouse and removal of the insane and the child from this catchall of social refuse; the removal of the child from the mechanical maws of "criminal justice"; the popularization of play and playgrounds for city children and the organization of recreation as a basic educational and preventive social instrument; the introduction of prenatal care for mothers and of visiting nursing and health education; the reduction and social condemnation of child labor; the introduction of decent standards of living in the relief of the poor; the infusion of social work into medical treatment and public health, including the great movements for combating tuberculosis and malnutrition of children; a more enlightened attitude and procedure with respect to venereal diseases and the positive pursuit of social hygiene and sex education. Along somewhat different lines the social survey, case studies in social science, community appraisals and much of the progress in pensions for mothers and the aged and in social insurance and safety legislation may be counted among the accomplishments of social work.

One further classification of social work, especially current in the United States, will serve to complete the sketch of its present status. It is

based on the technological point of view and cuts across most other classifications, such as those founded on aetiology, objective or sponsorship. Social case work, group work, preventive and educational work and community organization constitute the categories of this classification. Most of the social agencies may be distributed among them according as one or the other technical process underlying the categories is paramount in their program. Of these four technological divisions the first only, social case work, has received reasonably adequate discussion in professional literature. The other three, although clearly differentiated in practise, in the distribution of personnel, in the curricular provisions of professional schools and in meetings, conferences, special associations and committees, still lack comprehensive formulation. Such articulation of techniques as exists in these fields, with the possible exception of the job analysis study of group work by Margaretta Williamson, may be found chiefly in the publications of particular, often national, agencies, such as the Association of Community Chests and Councils, child labor committees, the Young Men's Christian Association and the like.

To many social workers both in America and in Europe the foregoing survey, and especially the implied content of present day social work, would seem to be overbalanced on the side of social pathology. They would point out that in recent years more of the activities and personnel of social work are to be found in group work—public health and health education, industrial relations, vocational guidance, adult education, recreation, progressive education, child study, social legislation and "character building"—than might be surmised from the foregoing remarks. These areas of social work are, it is true, often larger and in some ways more important than the more narrow definition of the field, such as that of E. T. Devine, would imply. The attempt here has been, however, to deal with social work in its more clearly recognizable and undisputed areas, where the historical continuity is least open to question and where no doubt can exist as to appropriate auspices or personnel. In the other fields, which from the standpoint of a narrow social work interpretation would be considered peripheral, there is no such clear case for classification or historical identity. Here the medical and educational professions, the clergy, organized labor or the academic world would stake out an equal claim with social work. Too much would depend, with respect to

inclusion or exclusion of any given area, upon the particular definition of social work favored.

One of the oldest divisions in the social work of western nations has been that between voluntary, or private, and official, or governmental. To a considerable extent this division, at least until recent years, has been parallel with another division of interests; namely, between emphasis upon case work and that upon mass measures, such as categorical relief by legislative acts and social insurance. The United States, and Canada to a considerable extent, have been associated with the social case work point of view and, because of its history and tradition, with private philanthropic auspices for social work. Social case work techniques are at home primarily in these countries and the influence of psychiatric thought upon them has been most pronounced. Although England is the birthplace of social case work and the home of the most militant of its representatives, as opposed to categorical relief, it is now and has been since the social insurance laws of 1911 decidedly within the sphere of major influence of mass measures for general social improvement. It includes in the center of its field of interest a great body of social insurance and of educational and recreational programs and cedes a commanding position to governmental agencies as against private organizations for the conduct of social work. Germany, while perhaps the best representative—outside the Soviet Union—of social insurance and the socialization of social work, as a whole has nevertheless made relatively great gains in the application of social case work technique with its principles of treatment of the individual client, even though the status of the clients is determined primarily by categorical regulations as to the receipt of benefits. Next to the United States and Canada, Germany also has gone furthest in the professionalization and advanced training of its personnel. It has developed its association of professional workers and set up a considerable number of professional training schools. The Soviet Union and Italy, each in its own way, have absorbed so much of the social work program in their general social and political organizations that it is hardly possible to discuss the social work activities of these countries independently of their governmental systems. The actual practises current in these and other continental nations have now become better known through the meetings and publications of the International Social Work Conference,

the first of which was held in Paris in 1928 and the second in Frankfort in 1932.

In so far as social work has constituted part of the public activities of any country, the question of financing has been part of the general problem of taxation. The raising of tax funds and their distribution for social work were fundamental features of the political and administrative problem of the ancient civilizations and have become a major factor in the history of England in the form of poor law legislation and administration. Taxation has often been combined with private financing in a variety of ways, as in the form of subsidies to private agencies, emergency appropriations to supplement private funds and endowments, and various forms of division of labor between private and governmental agencies. Organized private philanthropic financing has been for the greater part of western history dependent upon church income from tithes and fees and profits of the large scale agricultural and industrial operations of church lands, endowments and foundations, the raising of money by personal appeal, mail campaigns and membership organizations. No striking change in private financing of social work, with the exception of endowments and foundations, occurred until the introduction of the campaign method and the community chest, the former in the latter part of the nineteenth century and the latter in the early part of the twentieth (*See DRIVES, MONEY RAISING*). Of these the community chest movement is more relevant and important for social work, not only because of the substitution of this new method for the sundry venerable systems of raising money by mail, charity balls, bazaars and the like but also because it represented an attempt to diffuse into the total community membership the philanthropic consciousness, the sense of social responsibility and, theoretically at least, the appreciation of the nature and function of social work in a community.

While principally an American movement, the possible ultimate importance of this new method of financing, initiated as a concomitant of the World War, might have become more significant had not the depression interfered with this as with so many later tendencies in social and economic life. The extraordinary shrinkage of private resources of all kinds has thrown back upon the organized political bodies, with their taxing power, the major task of providing relief for those in economic distress. Always the largest part of a social work

budget, this has recently been derived from public, not private funds, in the United States in the proportion of 90-95 percent in 1933 in comparison with a maximum of probably not more than 60 percent in 1928, the latter figure itself being a tremendous increase over the percentage prior to mothers' pensions. This increase of financing from public resources has weakened one of the major services of the community chest movement, that of providing with relatively greater efficiency than do other methods the necessary funds for the social work of the community. In view of the fact that appropriations of nearly \$1,000,000,000 were made by the federal government of the United States for relief between July, 1932, and May, 1933, the place of the community chest method of financing social work may become as uncertain as that of private philanthropy as a whole.

Thus, again, social work has had to face its oldest and most persistent problem: whether social work is, should be and will be chiefly the expression of organized philanthropic and individual voluntary interest or whether it is primarily and therefore fundamentally the organized expression of planned social economy, both as a temporary remedy for particular individuals and as a constructive and orderly mechanism for changing social conditions. And it still remains to be determined whether the relative constituents of social work are changing as the form of social life is changing, having passed through tribal communism, monarchic despotism, the feudal system and *laissez faire* capitalism, and are about to enter a new socio-political structure, whatever its temporary description may be.

The philosophical objectives of social work as they have gradually been crystallized in its institutions and programs since the middle of the past century are difficult to formulate. The very existence of a philosophy of social work is frequently denied, and it certainly is not available in a form which might be recognized as an acceptable general program for the entire field. It is involved and almost buried in the great variety of specific theories and objectives which appear in the form of agency programs and purposes, of credos of sponsoring bodies, and of individual faiths, theories, hopes and prejudices of social workers, boards of directors and presidents of agencies. Not only are these theories and statements of policy diverse, but for the field of social work as a whole they are often conflicting and antagonistic. On such matters as

industrial democracy, birth control, ethical conformity and cultural desiderata, a wide gamut of theoretical positions will be found among the personnel and in the formulated policies of social work organizations. There are, it is true, certain trends common to social work, such as the professionalization of personnel, the specialization of functions and the refinement of technique, but these are not part of its wider basic philosophy.

What then is common and to the field bears a philosophical connotation? First, negatively, social work does not contemplate or perhaps even recognize the possibility of a comprehensive socio-political system capable of being devised in toto and introduced in toto, of such a nature as to guarantee the elimination of the social and individual difficulties which now render social work necessary. In other words, social work does not recognize any of the proposed social systems, such as socialism, communism or anarchism, as an adequate utopia. Were capitalism and the institution of private property a program instead of a fact, social work would class them along with the other proposed systems. In practise consequently its objectives are addressed to the socially detrimental by-products of capitalism as the here and now. Philosophically then the premise of social work is the empirical impossibility of a deliberate and planned utopia. Its specific theories and programs are the pluralistic expression of this skepticism of a monistic concept.

In the second place, social work, both temperamentally and philosophically, is opposed to the idea of the sacrifice of the life, happiness and security of living generations for the putative salvation of those to come. If it were possible to be absolutely certain that in exchange for the price to be paid by the living generations a happy utopia for the future of mankind might be purchased, perhaps the pre-occupation of social work with the woes of the living might be surrendered. But nothing in the history of mankind justifies the likelihood of a kingdom of God on earth—a lasting kingdom. The chances would still seem—to the social worker—a poor statistical risk. He is still asked by the proponent of one or another complete social system to neglect the visible and often curable ailments of the day for an uncertain world of theoretical perfection. His focus is the misery of the present and of the predictable future. His instruments of precision, such as they are, are the perennial facts of individual and

social psychology manifested in a definable social environment rather than controversial measures for social reconstruction. Perhaps all this is truer of American and English social work than of that of other nations, for the same reasons that render Anglo-Saxon nations as a whole less ready to embrace fascism or socialism or similar replacements of the more orthodox systems of the past.

A third aspect of social work philosophy is in a sense but another phase of its pluralistic viewpoint: it holds that within limits prescribed in each instance by the particular nature of the subject matter social work must apply the scientific method in its processes. This implies the possibility of rational processes, of the application of the inductive principle to social study, of quantitative research. Social work is not only empirical in its outlook but almost by definition thoroughly pragmatic, despite the fact that irreconcilable differences may exist between pragmatism as a philosophy and the religion and ethical tenets of many of the institutional sponsors of social work, notably the Catholic church. Whether in the relief of the destitute, in the practise of social case work, in recreation, community organization or group activities with the young, social work gives recognition to the determining values of pertinent cultural tradition, folk mores, varying legal systems, temperamental and emotional selectivity; it recognizes political tradition, customary standards of living and the varieties of family cohesion prevalent among diverse groups: as data of no less independent objectivity than statutes, dietetics or the biological function of the family. Just as it refuses to recognize a perfect scheme for the socio-political organization of human society, so it rejects rigid criteria of mores, laws, tradition, ethics, in the daily practise of its activities.

This philosophical complexion of social work often produces an uncomfortable insecurity for the social worker in the company of his fellow tinkerers with the social system; he is reactionary and shortsighted to the socialist and communist; he is the hated uplifter to the man in the street, the harebrained idealist to the hard headed business man, a meddler to the politicians and a dangerous agitator to the more reactionary of the conservatives, in whose eyes any champion of the downtrodden is by definition a rebel. Moreover he often agrees with one or another of his own critics, sometimes with several, and often, in his incapacity to recognize

his own unconscious eclectic philosophy, with all of them.

All that has been said thus far about the nature and theories of social work should, strictly speaking, be dated as representing approximately the situation for the period ending in 1927. The world economic depression which has set in since then has brought to a head forces which were started or strengthened by the World War and by the Russian Revolution and which have made exceedingly uncertain a number of generalizations regarding social work, especially in the Anglo-Saxon countries. It is difficult to discern a permanent trend or an approximate form which the background and individual activities of social work may take in the immediate future, especially in the United States. Some of the important elements of this uncertainty, as they appear to the social worker, may, however, be recognized.

First, the social surplus on which social work has been operating has diminished and has in fact been rendered precarious even in principle. In its crudest form this fact makes the termination of some agencies practically certain, the continuance of others dubious and the contraction of programs and functions of still others imperative. What shall stay and what shall go: relief proper, the group training of the young, health administration and education, social case work, industrial welfare, or the improvement of working conditions and industrial relations? Is the period of contraction temporary or permanent, and are the social criteria for a selective contraction recognized?

Second, is the social surplus diminished only where private property and individual philanthropic funds are involved, and does society therefore face the assumption by the taxpayer of activities hitherto financed in whole or in part from private resources? On the face of it, this is what is happening, as the changing ratio of private to public funds in American social work would seem to indicate. But European practise has long been largely in the public field. Has the change indicated therefore merely a local significance for the United States? How much of it moreover represents response to the economic emergency and how much a reorientation in program and philosophy?

Third, under the goad of the accelerated development of the industrial system and more recently of the acute economic depression tremendous impetus has been given, despite the cost involved, to categorical relief in the form

of insurance or pensions. How far is this movement likely to continue and spread? Will it leave so small a residuum for the non-categorical forms of relief as to make this function a relatively unimportant one, regardless of whether it is conducted by private charity or by the government? Will these events moreover remove the focus of social work from relief to its other areas of endeavor?

Fourth, changes in social case work have widened the gap between the conception of social case work as a method of relieving destitution and that of a technique in personality adjustment, relatively independent of economic problems except as these problems themselves provide the setting and ideology of personality difficulties in families. The depression, however, has pushed economic problems to the fore and by bringing governmental agencies into the areas of services in unprecedented measure has set in bold relief basic questions as to the relation of categorical relief to relief on a case work principle. Much of the adjustment between possible answers to these pressing questions of the moment will depend upon the duration of the depression and upon whether it represents an acute, if prolonged, temporary situation or the beginning of a new economic era on a lower standard, as has been the case in continental countries. The question of standards is organically involved in the preceding one. Social work, increasingly well financed, especially in the United States, working in progressively comfortable economic environment and under the influence of a fast mounting and enormously pervasive standard of living, has built up and established correspondingly high standards of client services, covering not only higher cost but also more intensive individualization with all its attendant philosophical corollaries. From minimum relief of "less eligibility," social work has progressed to "rehabilitation" on the client's own former standard of living and to the provision of elaborate medical, vocational and psychological treatment. What is true of individual standards of treatment is true also of the whole concept of social services. Adequacy of provision of such services now connotes a minimum of economic recreational, educational, health and aesthetic components undreamed of a half century ago. The total budget of social services if ideally developed would require a social income far in excess of anything known. But does the productivity of man in this age of machinery and

efficiency preclude a system of indefinitely expanded social services? Whereas before the depression the answer might have been given in the negative, at the moment, despite the fact that technically it is possible, prediction is indeed impossible from the larger social point of view.

Finally, social work is not certain of its attitude to the family as a social institution. Parts of the social case work and relief field have developed an increasing loyalty to the concept of the family as a basic institution of society, the protection and enhancement of which is a major objective. This point of view has been held more on ethico-social grounds than on sociological and anthropological evidence. Other streams of thought have centered on the psychological problems of the individual, whose membership in the family is of greater importance as a libidinal fact than as a social or economic factor. The changing relationships in family life, arising from urban and industrial conditions, the emancipation of women, a revival of classical philosophy in sex matters and the contribution of psychoanalytic thought, give no clear indication as to which theoretical choice will contribute most to the progress of social work.

There is a tendency in the United States for social work to seek a more deliberate and articulate philosophy than the somewhat unconscious one projected above. Events in the Soviet Union and effects of the present depression in increasing public management of social work have probably done more to stimulate this tendency than the natural development in the field itself. To some extent this means the adoption bodily of current economic radicalism and particularly of communism. While this movement is substantial, especially among the younger element in the profession, and while it has a more sympathetic reception, if such it may be called, than it used to have among the contributing public, it would be unwise to take newer aspirations as the actual underlying philosophy of present day social work as seen in action. It is as yet, and will be as long as the present social system in capitalist nations continues, the hope and inspiration of individuals in an upset world rather than the realistic statement of the actual principles of procedure.

PHILIP KLEIN

SOCIAL CASE WORK as it is known today had its inception in the revolt against the methods and assumptions of the English poor relief laws

and their administration. Thomas Chalmers (1780-1847), clergyman and writer on theological and economic subjects, may be regarded as its initiator. After observing critically the workings of the English poor law and conducting an experiment in poor relief in his parish in Glasgow (1822) independently of the poor law and without the aid of public funds Chalmers concluded: first, that the tests provided by the poor law failed to differentiate between persons actually in distress and those merely taking advantage of the public provision of funds; second, that the remedies provided by the law not only did not remove distress but tended to create a pauper class; third, that there was an "invisible fund" available for the relief of those actually in distress, namely, the good will of friends, relatives, neighbors and church, which would render unnecessary the enormous drain upon the public treasury for poor relief; and, fourth, that the destitution of the "poor" was due not to external causes alone but also to habits of improvidence, to ignorance and similar causes. He proposed therefore a number of changes in the system of poor relief. First of these was the general use of investigation as a more scientific test of need than the automatic work test of the poor law and as an effective deterrent from voluntary pauperism. In the second place, he urged the discontinuance of public funds for poor relief, the tapping instead of what he called the invisible funds and the substitution in the administration of non-governmental agents, in his own case deacons of the church. Finally, he advocated more education for the poor, and he initiated activities intended to develop among them habits of thrift and other constructive improvements in their mode of living. The lines of thought thus opened up by Chalmers, after a period of quiescence following his death, were revived by a number of disciples, including Edward Denison and Octavia Hill, pioneers in social settlements and housing reform, and later by Charles S. Loch. These followers were instrumental in creating the first Charity Organisation Society, founded in London in 1869. This society and its many emulators became the chief vehicle for the definition and spread of social case work during the next generation; but Octavia Hill continued to be its chief spokesman and literary propagator, until she was succeeded by Sir Charles Loch. Investigation became the keystone of individual service. The manifold causes of poverty and distress were recognized; assistance other than monetary was emphasized.

the study of all social and psychological factors in the life of the client was urged; and the full resources of the community, both private and public, were marshaled and coordinated.

The charity organization movement, which continued to be the principal channel for the development and definition of social case work until the end of the nineteenth century, found economic conditions more favorable to its florescence in the United States than either in England or on the continent. Moreover it was in the United States that contributions to case work by children's courts and by medical and psychiatric agencies were beginning to be made at the opening of the new century and that the first authoritative formulation of social case work was promulgated in 1917 by Mary E. Richmond in her *Social Diagnosis*. This work soon came to be used as text and guide, wherever social case work was practised or taught.

Since the establishment of the first Charity Organisation Society, social case work has been continually enriched by advances in the physical and social sciences. Biological discoveries, studies in the field of mental deficiency, progress in pedagogical technique stimulated and guided by psychological experiments and theories, developments in medicine and the accumulating data and theories of sociology, all were being translated by the case worker into treatment procedure. Most important perhaps, the better understanding of personality problems ushered in by the mental hygiene movement and by Freud and the new psychiatry gave to case work a formula for increasingly fruitful synthesis of the disparate facts constituting the social history and aetiology of the "case." While on the one hand propaganda, imitation and the natural spread of information increased the number of social case work agencies, the workers themselves kept building up and intensifying the content and technical refinement of the subject.

From a technical standpoint social case work may indeed be regarded as having entered a new stage of development about 1920. By this time the sociological formulation characteristic of Miss Richmond's *Social Diagnosis* was yielding to the more psychological conception contained in her *What is Social Case Work?* with the "development of personality" as its goal. But this new psychological emphasis soon outgrew Miss Richmond's formulations. In the course of the next ten years the psychiatric interpretations of personality rapidly gained in the study and analysis of social case work situations. Still more

recently social case treatment along lines defined by psychiatric theory has tended to displace not only treatment in the older conception but also emphasis on social or psychological study. These stages of technical progress are set forth by Virginia Robinson in *A Changing Psychology in Social Case Work*. It is too early as yet to determine whether the revival of a sociological interest in the case work field, induced in part by the political and economic upheavals in western nations in the past decade and in part by the natural reaction to any strong new school of thought, will usher in still another stage in social case work technique. For the present, however, its technical literature is found mostly on the psychological-psychiatric "front."

In the light of these developments a definition of social case work is not only difficult but may easily become inherently controversial. All schools of thought in the field do agree, however, that social case work is not synonymous with poor relief, while the popular assumption that it provides the most frequent source of confusion. This is because the clients of most social agencies are drawn preponderantly from the lower economic strata and manifest in a large proportion of cases either acute or chronic economic distress, and because case work itself had its inception in poor relief. Briefly stated, the essential quality of social case work is the application of scientific method rather than the rule of thumb to the treatment of the individuals or families who are or are considered unable, in the words of Porter R. Lee, to make "their way to acceptable organization of existence" or, in the more usual terms, to the aid of the head of the family "who cannot secure for himself or his family the combination of opportunities, services and expert advice" with whose assistance he can be self-maintaining (introduction to *Vocational Aspects of Family Social Work*). But inasmuch as self-maintenance, either on a socially recognized minimum level or on a level ordinarily held by an individual, depends both on his particular human equipment and on his environmental circumstances, his failure in self-maintenance may be due to a breakdown in either of these compartments. Correspondingly the attempts toward his rehabilitation may have to be addressed to either of these phases of life or to both, and in varying degrees of emphasis. Indeed the breakdown of the human equipment itself may be traced as readily to undue environmental strain as to its inherent weakness; or an environment relatively favorable to a person

with reasonably adequate equipment may fail to serve one of lesser endowment. It is possible then that the means of readjustment may be determined not directly by the obvious area of breakdown, but by detailed analysis of the particular configuration of circumstances and equipment of the given individual. Social case work consists in the application of the suitable combination of techniques appropriate to the individual problem of maladjustment. It must therefore contain techniques adapted to both personality difficulties and environmental conditions. It is evident, however, that in the values attributed to the several aetiological factors in any case there is great latitude for differences of opinion and a correspondingly wider choice in the distribution of emphasis as to the selection and combination of methods of adjustment—psychological, economic or sociological. Failure in self-maintenance, as understood in social case work, may manifest itself in a variety of ways, and the particular form of failure or the immediate crisis usually determines the kind of agency by which the client will be served. The more frequent types of crises are: economic distress or emergency; death, disappearance or incapacitation of the head of the family; criminal act, delinquency or other behavior crises; illness; mental or nervous disease or disturbance; domestic conflict or marital disruption; release or discharge from therapeutic, custodial or penal institution or court.

The nature of the immediate demands and of the specific resources required to meet them may vary and the kinds of agencies called upon to serve on these occasions are naturally diverse. Essentially, however, the problem of self-maintenance and the procedure called for are the same in all social case work, whatever the client, from the temporarily unemployed to the psychopathic delinquent. This basic body of social case work principles and technique has of late been termed "generic social case work."

The principal steps representing different aspects rather than mutually exclusive categories in the social case work process are usually given as follows: social study; preparation of the social history; diagnosis; planning; treatment; recording.

Social study (formerly called investigation) is in a sense the basis of all case work. Historically it represents the origin of social case work. At first there was a tendency to emphasize the separation of sheep from goats, to test veracity and prevent deliberate pauperization; in Chal-

mers' scheme the investigation was a substitute for and improvement upon the workhouse test. This point of view is still retained by many, but it is theoretically frowned upon by social case workers and consciously guarded against by competent practitioners. Today the "social study" is superseding "investigation" as a term more truly descriptive of its nature. This first step is the collection and analysis of data pertinent to the aetiology of the client's difficulties and to the discovery of clues for suitable treatment. As such it is analogous to the corresponding procedure required in any research process in the physical and social sciences.

The preparation of the social history of the client as well as the investigation, or social study, usually takes place at the outset, but continues throughout the duration of treatment as new facts are uncovered or new light is shed on their relations and significance. The minimum contents of an adequate history for social case work, as agreed upon by some of the leaders of the profession in the United States after a series of conferences during the years 1923-27 and embodied in the Milford Conference Report, *Social Case Work, Generic and Specific*, show a wide area of sociological and psychological information deemed desirable for the practical purposes of individualized treatment. They include, for the individual client and—when applicable—for other members of the family, important details as to the history, current personal data and current environmental data, genealogical, medical, psychological, economic and social.

Diagnosis and planning as parts of the social case work techniques are regarded as partaking of the character of process as well as of formulation. Diagnosis is of course based on the facts gathered in the social study, but these do not necessarily lead to only one possible diagnosis. Experience, judgment and increasing skill in the evaluation of factors help to organize the disparate facts into an integral diagnosis. This social diagnosis is not a final statement, however, but is subject to correction and amplification as new facts appear. It is in fact a process of organization of data as much as a statement of their relations, even though it is expected to take the form of an explicit formulation and is so entered upon the records. Planning, also conceived of as both process and formulation, must show a relation to the diagnosis and a change in content as subsequent developments modify the diagnosis or as the presence or absence of facilities, technical skill or other circumstances imposes a

change in the plan as a whole or in individual items of treatment. Treatment of course is the objective of the case worker and the justification of all other processes involved. It is conditioned, however, by those processes and by the resources of the community.

Every change in the concept of social case work has created a new definition of its objective and a corresponding change in the emphasis on various types of treatment and methods of procedure. The early objectives of social case work in the only types of agency which practised them were the relief of the poor, the avoidance of pauperizing those relieved and the exclusion of those not requiring economic assistance. Investigation, provision of adequate assistance, friendly visiting, aid in securing medical service, employment or recreational opportunities for children and encouragement in thrift and good habits made up the stock of treatment. In this last phase the moralistic tendency was gradually being displaced by psychological considerations. The extension of case work practise to hospitals and children's courts added new objectives, included a new group of administrative factors, found economic needs often absent and at least not a central consideration and brought into methods of treatment more of psychological content and into investigation a new field of inquiry and a new emphasis. Sympathetic understanding, pedagogical handling, persuasion, purposive provision of educational, recreational and health facilities, widening of opportunities by advice and assistance, all these gained new importance among the galaxy of treatment methods. The appearance of psychiatric social work, child guidance and child placement in the social case work area, the spread of mental hygiene and of the psychoanalytic theories, the recognition of the intimate interaction of human equipment and external circumstances together with the rapid rise of the standards of living due to general prosperity and the corresponding diminution of the economic factor in the potential clientele of an increasing variety of social case work agencies tended to give to readjustment a more psychological content and to treatment a psychological technique. First the investigation expanded into a wider area of social, psychological, hereditary and developmental study; and then the methods of treatment came to embrace a larger amount of technical procedures, from medicine and psychometry to psychiatric service and psychoanalytic guidance. Objectives were redefined in terms of changing attitudes, attain-

ment of psychological security, satisfaction of emotional life, with economic and environmental adjustments to subserve these objectives to the extent that they might be necessary therefor or responsible for the existing imbalance. On the whole this is the present status of social case work. The most recent innovations in its sphere relate less to objective than to technical method. The emotional level on which the client's motivations proceed is affected both by the tangible circumstances of his existence and by his emotional reactions to them. Readjustment on the plane of intellectual and material dealings with circumstances may be not only inadequate but even impossible without consideration of the emotional counterparts and complications in the client's consciousness. These circumstances moreover include personnel relations, to child, parent, spouse, friend or social worker. Treatment therefore must include a high degree of technical skill in the handling of the emotional complexion of the case configuration, and for this purpose the newer social case work emphasizes the analytic and therapeutic relationships among personalities close to the client and particularly as between client and worker. This phase of treatment, as interpreted by Grace F. Marcus, Virginia P. Robinson, Jessie Taft and others, has recently occupied the center of interest in the technical side of social case work, except in so far as the depression has tended to lift back into focus economic causation and the paramount importance of material relief in treatment.

One aspect of this new emphasis in social case work has, however, continued as an independent development despite the depression. In fact the depression or any other environmental considerations are irrelevant to it, for it actually steps out of the field of social case work into that of professional therapy for emotional complications. It might well be called psychological case work as distinct from social case work. As presented by Virginia P. Robinson and even more unequivocally by Jessie Taft, this sort of case work is a distinct professional service as different from social work as medicine or religious ministrations and, like these, pertinent only when particularly indicated. The technique is described as "relationship treatment" through a "therapeutic situation" set up between worker and patient and is based chiefly on certain psychoanalytic and philosophic theories promulgated by Otto Rank, a dissenter from the schools of Freud, Adler and Jung. This expansion into a

neighboring field of activity might seem not quite pertinent to a discussion of social case work except for certain important connecting links, among them psychiatric social work, the general mental hygiene influence already referred to and the fact that these contributions come from the personnel of social case work agencies and have arisen out of the work of these agencies.

Pervading the technical considerations of social case work treatment and complicating them still further is the question of the social and political philosophies current in the community. The very foundation of all social work lies in a priori judgments of what is socially desirable and what is not. Any attempt at readjustment implies maladjustment. This is as true of individuals as of groups or conditions. The modern community, in particular the large American city, comprises a population varying widely in economic range, in industrial distribution, in racial and national origins, in cultural traditions, in political and social ideals, in church affiliations and in the opposing philosophies of life of the older and younger generations. In this population there exists therefore a vast range of a priori judgments, both communal and individual. The client's cultural standards are as often as not different from those of the community as represented by the social agency. Each case thus involves the possibility of seeking adjustment to standards on which there may be no agreement between client, community and worker. Which of the many heritages and viewpoints shall determine the plan of treatment? How far, for example, may coercion be used in the interest of a child or other dependent at the expense of individual freedom and mental health of the parent? What are the obligations of the case worker when his client gains economic independence through bootlegging; when religious or church principles and the empirical situation are at variance with regard to birth control, marriage, custody or education of the child; when father, mother, social worker and social setting of the client cannot agree on a guiding principle of treatment? In industrial disputes, strikes and attempts to establish wage standards many cornered disagreements may, and with discouraging frequency do, arise between community, agency, management, worker and client. In an educational conception of case work such philosophical questions assume fundamental importance and create continuous difficulties.

The final step in the case work process is

recording. The case record is as important to the case worker as are laboratory notes to the experimenting scientist. In most instances services are rendered by a succession of workers and supervisors, all of whom must be equally informed concerning the case, regardless of the stage at which they enter. Solid facts and imperponderables, social history, diagnosis, plan, sequence of treatment, interviews, the response of clients to treatment services, must be recorded in such manner as to result in a minimum of lost motion, embarrassment to the client or chaos in procedure. Except for the fact that every case begins at some time and may be closed at some time, there is no clear cut division in the record between process and result. Both are cumulative, interwoven and related to a changing objective. The record in the best agencies usually has the following constituent parts: the face sheet of ready reference data; the social history; the chronological record of every occurrence of any nature—interviews, receipt of important documents, units, telephone calls, events in the family; correspondence, documents and reports of medical, school, court or other auxiliary agencies. Considerable ingenuity is expended in the arrangement, organization and handling of these records, and experience has shown that the quality of the record tends to be an index of the caliber of the case work.

Practically all case work is carried on by agencies employing professional personnel rather than by independent practitioners. There have grown up therefore both an individual technique and an agency technique commonly accepted for social case work. As in other fields, so here also technique is thought of as procedure in which skill may be acquired by practise and which is negotiable from practitioner to novice by demonstration as well as by theoretical exposition. Its value lies not only in making for efficiency, time saving and sureness of touch but also, in a more intangible way, for conformity between theory and practise. Among individual techniques interviewing, observation, recording and establishing rapport with the client are accorded chief emphasis. In view of the difficulty of transmitting these important techniques except under actual working conditions the training in professional schools includes field practise in operative agencies under competent supervision.

In addition to the technical methods applying to individual practitioners there is what might be called agency technique, which is necessarily

of an administrative nature but which because of its effect upon the task of the worker is regarded of prime importance. It includes such items as "case accounting," "inter-agency relationships" and adaptation of techniques from other fields, specialists and professions. Case accounting includes such matters as the opening or closing of cases, transfer to other agencies, assignment to worker or supervisor, accounting for case loads to the management and to the contributing public. Closing a case, to take one example, is in one phase merely a bookkeeping job; but it implies some of the most important case working processes in analysis, diagnostic review and prognosis and usually follows a conference of workers and a supervisory review. Similarly the proper adjustment of "inter-agency relationships" for a particular case requires a delicate and skilful coordination of functions and resources of two or more—sometimes excessively numerous—agencies, properly adjusted to the needs and psychological problems of the client. The same is true of the adaptation of techniques from other fields, a very frequent process, ranging from the utilization of legal advice to psychiatric examination and vocational guidance.

One of the significant developments in the field has been the professionalization of personnel and the organization of professional training schools for workers. It is pertinent to the consideration of social case work, however, to point out the particular demands that its practise imposes on any plan of training. The high degree of cultural preparation and the extensive acquaintance with the social sciences demanded by the work have led to the requirement in practically all professional social work schools in America of a college education or its equivalent either for admission or for graduation. The acquisition of at least the rudiments of technique make it necessary to include in the curriculum of these schools a substantial ratio of field work in supervised practise. In addition to preparation in professional schools case work agencies of good standing constitute the first year or two of employment of the new graduate, a training period in which work load and supervision are adjusted to the pedagogic as well as to the administrative requirements. In this respect the training of social case workers in the United States is more highly organized and standardized than that for other types of social work. Further specialization in training for the separate branches of case work has introduced other

refinements which add to the comprehensiveness of educational and technical preparation.

Not only the extension and refinement of social case work but also its division into special fields has been most intensively developed in North America. Despite the basic uniformity of the case work theory a certain specialization in practise has been brought about by the peculiar conditions and institutional traditions of the several types of agencies.

Family case work as the first of these is the parent of all social case work. It is a large feeder to the special fields enumerated below and has in many cases fostered the development of new specialized agencies, such as legal aid societies, antituberculosis societies and the like. In response to some of these developments many family case work agencies have been gravitating to the theory that their function is not merely that of helping dependent clients to recapture their self-maintenance but also and increasingly to serve in an educational capacity for the definition and improvement of the family as a social institution. The shift of emphasis has led many charity organization societies and relief agencies to change their names to "family welfare associations." This tendency has been counteracted in part by the effects of the mental hygiene influence already described, and both have been somewhat at variance with the historical origin and present popular interpretation of the function of the agency. Family case work in varying degrees of intensity and skill is performed by such agencies as the following: family welfare agencies, under private and often denominational auspices; municipal and county relief departments; state and county mothers' pension or aid departments; church auxiliaries under various names; privately financed travelers' aid societies; and American Red Cross chapters, privately financed but with semi-official status.

Child welfare work was not recognized as a special field of case work until toward the close of the nineteenth century. This was probably because of the existence of well established institutions for child care, particularly orphanages, which antedated the modern social case work agencies both in Europe and in America and represented vested interests in institutional identity and in procedure. The first application of the case work principle to this field was foreshadowed by the early placing out experiments in Europe and the United States and was actually introduced by Charles W. Birtwell in

Boston in the late 1890's. It was soon followed, from a different point of attack, by the Juvenile Court of Chicago in 1899. There developed an increasing number of the non-institutional agencies for the care of neglected, dependent and delinquent children. Eventually even some custodial institutions resorted to case work in place of institutional treatment, thus practically destroying themselves in the interest of better child care. Agencies now carrying on children's case work comprise a large variety of names and auspices, often overlapping psychiatric and family case work, schools and correctional agencies. The chief types are: children's aid societies, state wide or local, privately conducted; orphanages, especially in their after care departments, under a variety of auspices; municipal and county departments, sometimes in connection with family welfare work, mothers' aid or juvenile courts; guidance bureaus connected with schools or independently conducted; visiting teachers as part of school personnel; and special departments or divisions of other agencies, such as family welfare agencies, having wider scope. The distinctions between strictly children's case work agencies and other case work agencies are uncertain and unstable, since most social case work, dealing as it does with families, involves the interests and special problems of children and since children also tend necessarily to draw into their problems parents, kin and home neighborhood. This fact has led to many controversial issues among agencies.

✓ Medical social work, sometimes called hospital social work, is social case work carried on in connection with hospitals, clinics and sanatoria as an adjunct to medical treatment. Cases arise primarily from initial crises in the health of the breadwinner or other member of the family, complicated by other factors, among which economic difficulties are frequent. Often these cases develop into multiple instances of need for medical treatment as other members of the patient's family may be found to have undiscovered or untreated maladies. Medical social work originated in 1905 at the Massachusetts General Hospital in Boston. It speedily spread over the country; by 1925 there were some five hundred agencies and by 1932 perhaps double that number. The distinctly auxiliary position that this branch has held with respect to medical institutions, their strictly medical problems, personnel and institutional objectives, has created some difficulties and limitations. It is obvious that the acceptance of cases tends to be

determined by purely medical rather than by social considerations, and that it is often impossible or at least exceedingly difficult to continue the case work to its logical conclusions when the responsibility for medical treatment on the part of the hospital or clinic has ceased.

Psychiatric social work is an offshoot of medical social work, but has gradually become distinct as the development of mental hygiene has afforded an increasing field for specialization. This type of work, at first confined to institutions for the insane and to organizations serving war veterans, was rapidly extended to child guidance clinics, psychiatric clinics connected with hospitals, courts and correctional institutions, protective agencies for pre-delinquent boys and girls, mental hygiene clinics, schools aware of difficulties with problem children and private practise. Social case workers with psychiatric training have frequently been employed by other case work agencies, such as family welfare societies, to advise and help with difficult cases involving conspicuous problems of mental hygiene. This practise of employing the psychiatric social worker is diminishing only because the general training of all case work tends to place increasing emphasis upon personality study of the client.

Probation, parole and after care are grouped together as a special case work area, first, because of the knowledge of legal procedure involved and the acquaintance that they demand with penal legislation and technicalities and, second, because, although in a sense they represent the official and legal recognition of social case work, the standards in these fields are as yet relatively low. In the United States in recent years, however, there has been a marked improvement in the caliber of social case work under public auspices. In the United States probation developed as early as 1869 and parole in the 1870's. But substantial progress has come only in the last decade or two. Probation is an almost universal practise where there are children's courts. In adult courts it is far less general in the United States except in the larger cities and then usually for cases of felony or for women only. Parole in the United States is for the most part connected with correctional institutions for children and women. Adult institutions as a whole are as yet far behind in anything but legal-technical use of parole. One significant feature of this phase of case work is that, as institutions of all kinds from orphanages to prisons lose their time honored place as social

agencies, by virtue of the growth of probation and placing out, the amount of social case work in this division increases, so that probation and parole promise to develop into the largest field of social case work. Aware of this tendency, its leaders are making efforts to place training and qualifications of practitioners on a level comparable with other case work divisions.

Rural social case work is still comparatively new. In the United States the great body of social case work has been done in the urban centers, chiefly because its practise and extension have depended in considerable degree upon private endeavor and finances. Since wealth as well as exploitation has been a predominantly urban phenomenon, money can be raised or is voluntarily offered in the large communities but is relatively unavailable in rural districts. For a short period only, during and directly after the World War, the country districts contributed more generally to the "home service" of the Red Cross and to other agencies whose popular appeal arose from the war. Such work as is carried on in rural communities at present tends to be financed from cities. As a result a rural case work technique or the adaptation of technique recognized as necessary in dealing with rural psychology has not as yet been worked out adequately. Where it exists the tendency is away from specialization, since the rural worker must take on all types of cases. This is conspicuously shown in the duties of county welfare officers of a few states, for example, North Carolina, in which social case work is being introduced under public auspices by county units and under state supervision and direction.

There has been some progress in the utilization of the social case work method and personnel in industry, as, for example, in the introduction of case workers in the welfare and employment divisions of industrial plants and mercantile establishments and more recently in the addition of case workers to the staff of the compensation service in at least one state government. There had been a few instances of the former type before the war in the more progressive establishments and in some of the more patriarchal industrial communities (see COMPANY TOWNS; WELFARE WORK, INDUSTRIAL). The war multiplied the number of such workers, as it multiplied all welfare and personnel activities in industry, and tended to establish the principle of case work technique in industrial welfare service, even though the post-war deflation brought a corresponding shrinkage in

quality and extent of personnel. The brief sway of this movement and its grudging recognition by industrial executives did not bring the social case work in this field to a high standard of performance. The employment of case workers in connection with compensation service is of particular significance, however, in that it followed the recognition by public authorities of the fact that even satisfactory legal and administrative provisions for compensation in industrial accidents have in many cases failed to reestablish the reasonable adjustment of the family, and that the necessary instrument for the purpose was the routine availability of social case work as a supplement to social provision by law.

It has been the general experience that public or governmental agencies do not lend themselves as easily as do private agencies to the practise of social case work of a high degree of intensity. In addition to the unfavorable conditions imposed upon most public departments by the mass demands upon its operative machinery and staff, and by legal limitations, many of which are necessarily inflexible, there are the psychological hindrances which in the United States are covered by the term politics and in Europe by the tradition of bureaucracy. Roughly speaking, social work in the United States has been in private hands. It has been free to experiment and to refine its methods. The material resources of a nation fast increasing in wealth have been tapped easily, especially in view of the tendency for social leadership and wealth to coincide. On the continent and to a lesser degree in Great Britain social work has developed mainly through legislation and has been operated by public departments. The gain in social legislation has been somewhat offset by the tardy and imperfect application of the social case work method, which is only slowly being grafted upon the public operation of social work functions. The post-war conditions in Europe have helped probably more than any other factor to enrich these public services by the introduction of case work principles. In Germany, for example, these principles were embodied in the statutes of 1922, 1923 and 1924 which provide for public relief and child welfare. Flexibility in service, keeping together of the family, relief in forms suitable to the individual circumstances, are legally established. With the increasing trained personnel and development of professional esprit de corps among the workers, these provisions may be realized. In Belgium the only example of what may strictly be called case work reported at the

International Conference of Social Work in Paris in 1929 was in connection with work to be conducted among homeless men through cooperation between the public authorities, empowered by the law of 1891 to suppress vagabondage, and the Belgian National League for Mental Hygiene; the work is carried on in the Bureau of Social Rehabilitation administered under joint auspices. In these as in other continental countries the mass of social work is a public function and social case work is introduced as rapidly as professional pressure, the provision of trained workers and the influence of private agencies can force the pace. Great Britain has maintained a fair balance between the influence of private and that of public social work, and a number of agencies have been following theories defined by the London Charity Organisation Society. In recent years an intensive controversy has been conducted between adherents of the unemployment insurance scheme and its opponents, who draw their forces in part from the personnel of the Charity Organisation societies. The issue in the eyes of the latter is between "dole" and case work, between pauperization and social rehabilitation. Regardless of the merits of the controversy, it is of importance to note that Great Britain is the only European country in which social case work operates to an appreciable degree through agencies entirely independent of the public authorities and in which, although far less developed, it occupies a position comparable with that in the United States and Canada.

In both the Soviet Union and Italy political conditions and theories of government have to an appreciable extent precluded the practises of case work since the World War. It seems, however, that the social work of the Soviet government does tend in that direction, there being nothing repugnant to Communist principles in the individualization of this phase of state service.

The practise of social case work by public agencies has been limited consistently by legal restrictions as to settlement, residence, the amount or type of relief to be given and types of cases which are acceptable. In American communities the client of a public agency runs the danger of becoming designated a "public charge," which in many cases may lead to deportation, an action always serious and sometimes catastrophic to the client. The physical aspect of public departments, the requirement that the applicant must appear and often that

he must "sign up for the pauper list," the policy of making budgetary provisions reach a maximum clientele, the generally untrained public service personnel, especially before the introduction of civil service reforms, have constituted further obstacles to case work standards in public agencies. In the course of time and in view of these difficulties certain compromises have been worked out between public and private agencies. Among these are the public subsidizing of private case work agencies; the designation of private agencies as agents of the public authorities either in toto or for investigation and recommendation; the division of functions assigning simpler or pension types of cases to the public body and more intensive cases to private agencies; the supplementation of public relief in specific instances on recommendation of the private agency (which, however, retains responsibility for treatment); and, especially in courts and penal or reformatory institutions, the supplying by private agencies of the necessary case work personnel, which, while thus holding quasi-public positions, is financed and controlled by private agencies.

Few concepts in the social sciences are so little understood and so cavalierly dismissed from serious examination both by social scientists and by laymen as that of social case work. The colorful remark about "the cautious statistical Christ" well describes the attitude of those who regard social case work as a synonym for charitable relief and reject it therefore as an ungenerous and spiritually or aesthetically objectionable type of charity. On the other hand, as an integral part of social work it has been condemned as "a palliative" by the representatives of political and economic thought who proceed from an analysis of the present social order to a positive scheme for its displacement or radical modification. More pertinent perhaps is the criticism brought forward by those who accept the function of social work in the existing order.

A searching scrutiny of the theory of social case work and of its evolving technique has indeed appeared in recent years within the profession itself. The question has been asked, for example, whether it is possible to judge the results of social case work. How are such results, if any, to be measured? What are the criteria applicable to so complicated a process? What allowance, if any, in these results can be made for the accidental but quantitatively important factors of an inadequate caliber of workers and

agencies, of an uninformed public, of insufficient funds? What proportion of such improvement as is found is due to social case work rather than to other environmental changes, such as increasing prosperity, social legislation, education? And if benefit may come from both case work and mass measures, which is the more economical expenditure of material and energy? The recent introduction of a "dependency index" to measure statistically the incidence of the economic factor runs counter to the theory of social case work which has maintained that the economic factor may be only one of many and therefore an inadequate guide for diagnosis or treatment. Is this theory valid, and will it stand statistical scrutiny as it does demonstration by individual cases?

In social case work as in all social work the service of agencies has been expanding beyond the limits of the lower economic strata into the community as a whole. Courts, child guidance bureaus, visiting teachers, bear relatively little of the stamp of service for the economically disadvantaged. But prior to the depression which began in 1929, even in the so-called family agencies which carry the older burden of relieving economic distress the proportion of "needy" cases had been decreasing as compared with cases of family maladjustment independent of the economic factor. In fact it has been the avowed purpose of many of the agencies to divest themselves as fast as conditions would permit of any distinct responsibility for assistance in cases of purely economic distress and to specialize in dealing with unadjusted families and other strictly case work tasks independently of the presence or absence of the economic factor. Moreover some of their spokesmen would make the focus of interest for family agencies the functioning of the family as a sociological institution—a purely educational and propaganda task—while still others regard case work as an exclusively psychological service rendered entirely on the level of personality relationships. The question then arises as to whether the development of case work as a scientific method of dealing with those incapable of social self-maintenance leads logically away from relief of those in economic distress, leaving this function to the public authorities, to a kind of "service to the unadjusted." If it is thus dissociated from material relief, can it obtain private support? Or should it not also become a distinct public function? In any case social case work thus conceived falls into the category of mental hygiene and

psychiatric social work or of psychological therapy. Still another possible conclusion has been suggested that if case work is a skilled service for unadjusted personalities and families, unrelated to the question of economic self-support, it should be carried on by private practitioners who would charge fees as do other professional workers. Psychiatric case workers in conjunction with psychiatrists have already gone into such private practise for definite fees, others in a somewhat informal way have carried on independent private practise, and several social case workers have seriously considered inaugurating professional private social case work practise. Thus the case work agency now supported by philanthropic contributions may logically become either a public service function or private professional practise or both.

In countries outside the United States and Canada some of these questions are not immediately pertinent, since a much larger proportion of the case work is already under government auspices and is clearly recognized as a function incident to the other public services, such as hygiene, poor relief, education, social insurance and child welfare. Private philanthropic endeavor is employed more in exerting pressure for the introduction and development of advanced technical case work methods, in most instances derived from American techniques.

Whereas some of the questions enumerated have been explored by the usual method of discussion and conference, others have given rise in various American centers of social work to research projects of more or less far reaching scope, involving evaluation of case work results and procedures, qualitative and quantitative studies of the incidence of case work in population units, indices and fluctuation of case loads and studies in recording and terminology.

Social case work, while chiefly a borrower from the social sciences, has also made reciprocal contributions: first, the concept of social maladjustment of the individual as replacing in emphasis that of social or individual pathology; second, the case method of social research; and, third, the case work test of social conditions and of the effects of social mass measures. These contributions are claimed by case work not as independent concepts of its own creation, but as the synthesis and focus of nascent thought which the particular function of case work rendered possible of articulation. Thus, for example, whereas sociology has tended to deal with social work as a series of separate social

problems, such as dependency, alcoholism or crime, to be met by a variety of social institutions, each functioning in its special field, the experiences of the case worker have found this interpretation less and less tenable and the cumulative results of case analysis have forced the breaking down of these separate classes of social pathology. On close analysis the clients of the several types of social work institutions show greater similarity than diversity as groups and greater divergence than resemblance as individuals. Thus the social case worker has been led to conclude that the individual client presents not a specimen of a social class, but rather an instance of imperfect adjustments to the particular concatenation of environmental and psychological conditions. Each individual client according to this conception represents the cross section of a multiplicity of social forces, both "creative" and "pathological." The social worker conceives of social life as continuously creating for the individual problems of adjustment which cannot always be met successfully. Any instance of failure represents a combination of "causes," recognized as such in retrospect only and presenting a particular pattern of maladjustment which calls for its corresponding pattern of readjustment or treatment. The task of self-maintenance, in other words, is a function of variables in a variable setting.

As a contribution to methods of social research case work has brought a refinement in intensive analysis as a corrective to the threatening abuse of statistics. Case work is not opposed to or necessarily distinct from or inconsistent with the statistical method, any more than the case method of teaching in medicine or law is incompatible with generalizations. It serves rather as a counterpart, emphasizing the more intensive analysis of fewer items and the use therefore of simpler statistical methods, as against the correlation of large numbers of items and their manipulation by the more complex methods of statistics. It is concerned more with the variations and multiplicity of correlations than with their uniformity. But it raises the doubts shared by other fields of social science as to the possibility of reducing all or the most important variables in social relations to items sufficiently clean cut and comparable to permit of manipulation by advanced mathematical formulae, and as to the applicability of statistical treatment to qualitative factors which do not lend themselves to numerical expression beyond the count of "good, fair and poor." The case work method

has spread into the broader field of social research partly by way of the social survey, although in the field of family budgets the social survey antedated the development of the individual case work method. Studies in criminology, judicial procedure and abuses, psychiatry, community organization, cultural changes, industrial relations, the working out of special problems like those of casual and migratory labor, difficulties associated with immigration and the like, all have been pursued with increasing use of the case method, and in many instances personnel trained in social case work have been called upon for assistance.

The third contribution of case work to the social sciences is attributable less to its particular technique than to its routine practise by organizations interested in the larger social problems and in the promotion of mass measures. The data for much social and educational legislation have come from routine social case work. The practicability and effectiveness of such measures have often been tested in the same way. Public health education, including anti-tuberculosis work, social hygiene and mental hygiene, changes in the judiciary system, criminal and civil procedure, safety legislation, workmen's compensation, child labor, minimum wage legislation and legislative changes in public administration are some of the social measures and movements thus initiated, tested or improved by the practise of case work. The contribution involved in this function is not strictly of a theoretical nature, nor is it, on the other hand, merely of a practical administrative character. It may be compared with the function in political science of field studies of different political theories by local observation of their workings under the several governments practising them. Perhaps the difference and the chief limitation of case work in this field of usefulness lie mainly in the tendency of social case work to regard the theoretical generalizations as relatively incidental to its main task rather than as distinct objectives in themselves.

PHILIP KLEIN

TRAINING FOR. The question as to whether social work is or is not a profession has been the subject of continuous debate since 1915, when Abraham Flexner answered the question in the negative. Certain developments have been under way which point definitely toward the fulfilment of at least some of the necessary conditions upon which that status is predicated. These relate to

the establishment of professional standards and the creation of educational institutions in the field of social work. Even today, however, the answer cannot be given unequivocally. For the standards are not uniformly high and it is difficult to determine to what extent they are met by those employed in social work. The United States census of 1930 for the first time classified social work as a distinct profession, listing 31,241 persons as members. Ralph Hurlin, who in 1926 estimated the number of social workers in the United States as 25,000, concluded on the basis of this census that if persons classified in other categories who might properly be termed social workers were taken into account, the total number in 1930 was probably between 40,000 and 42,500.

Professionalization in social work as in other fields has passed through several stages. The pioneers necessarily secured their training on the job. Soon there developed organized apprenticeship plans, providing supervision and related study along with practical experience in a social agency. Then came the formalization and improvement of training, beginning as early as 1898 with the establishment of a summer school in New York and followed at the opening of the century by schools offering academic courses covering an entire year. In 1919, 15 such schools joined together to form the Association of Training Schools for Professional Social Work, now the American Association of Schools of Social Work.

Professional organization developed later. Although the National Conference of Social Work had been founded as early as 1873 as the Conference of Charities and Corrections, it was not until 1921 that a professional organization, the American Association of Social Workers, was created. Its program has comprised: protective aspects, including interest in salaries, vacations, security of tenure; standards of practise, represented in qualifications for admission to membership; organization of local chapters; stimulation of research and publication of job analyses and other technical literature; improvement of standards of social work in civil service; and constructive moves with respect to administrative and legislative questions, chiefly of nation wide concern. The membership of this organization on July 1, 1933, was approximately 7500.

The impetus toward the development of special schools of social work came first from the social agencies themselves rather than from educational institutions, although from the begin-

ning some of these schools were affiliated with universities. The Boston Training School for Social Workers, founded in 1904, was conducted under the auspices of Simmons College and Harvard University. Almost at the same time an unaffiliated institution, the New York School of Philanthropy (now the New York School of Social Work), expanded its curriculum to fill a full academic year instead of a summer course.

The original constitution of the association schools limited membership to educational institutions "maintaining a course of training for professional social work covering at least one academic year, and including a substantial amount of both class instruction and supervised field work." Standards as at present applied to schools seeking admission were formulated in 1928; they stipulate that the school must have existed for two academic years and require a satisfactory written guaranty that it will continue for not less than three years from the date of admission. In 1933 there were 25 member institutions, 10 of which were among the 15 charter members. With 4 exceptions—the New York School of Social Work; the Pennsylvania School of Social and Health Work, founded in 1908, the Graduate School of Jewish Social Work in New York City, founded in 1926; and the Atlanta School of Social Work, founded in 1920 and conducted primarily for Negroes—all these schools are at present an integral part of an academic institution, in 9 cases a state university. Geographically the schools are highly concentrated in the northeastern states. Fifteen are located north of the Mason and Dixon' line and no farther west than Chicago, 3 in the south and only 7 west of Chicago. The location of these schools corresponds roughly to the distribution of social workers. Since schools in the association vary widely in their plan of organization, it is difficult to make general statements about their curricula. Usually, however, the curriculum of a school includes three types of material, which have been designated by the association as follows: fundamental techniques, adaptations of scientific material to the needs of social work, courses in the practise of social work, general courses in social work theory and philosophy, and field work, which is stated to be "planned and supervised experience in the practice of social work" and which must be "under the educational control of the school."

To assist the schools in developing their curricula and to work toward greater uniformity of content in training for social work, the asso-

ciation in December, 1932, adopted a minimum curriculum and agreed by the year 1935 to authorize a school to offer to any student having completed that curriculum at the end of one graduate year of study a provisional certificate approved by the association. It is not anticipated that this will increase the number of persons who receive advanced degrees, as it is assumed that such degrees would not be awarded unless additional graduate work had been completed. Part of the minimum curriculum may be included in the undergraduate year, provided that the student completes in addition one year of postgraduate study in a professional curriculum. Committees composed of persons teaching these courses in member schools are studying the content of each of the courses prescribed in this curriculum with a view to suggesting some degree of uniformity in subject matter. No attempt has been made to set up prerequisites in the social sciences for admission to professional courses; and at the present time there is little uniformity on this point, although the undergraduate schools usually prescribe study of the social sciences.

There is no unanimity among the schools as to entrance conditions, length of course or recognition accorded to those who complete it. The association stipulates merely that a school should "provide a curriculum covering two full academic years," and that "at least 90 percent of the students accepted for subjects in the professional curriculum must have secured two years of academic credit beyond high school." Whether or not both these years must be postgraduate is still an open question. To attract graduate students to the schools financial inducements in the form of scholarships or fellowships may be offered, and in some instances there is a modified apprenticeship arrangement whereby an agency pays a stipend to the student, usually in return for a certain proportion of his time and a "gentleman's agreement" that he will remain on the staff, at least for a year, upon completion of the training period. It is doubtful, however, whether the latter plan can be followed if field work is to be in any real sense under the control of the school. After circularizing the member schools a committee of the association reported in 1929 that "fully three-fourths of the expressions of opinion are to the effect that fellowships or other forms of financial aid are essential in securing the more desirable students for other than undergraduate courses." In one school every student had either a scholarship,

fellowship or assistantship. An inquiry by the writer in 1930 showed that of the total of 1015 degrees awarded in the five-year period 1926-30 inclusive, slightly over 50 percent were bachelors' degrees, doctors' degrees accounting for 1 percent. Certificates and diplomas are given in some instances in addition to an academic degree; in others to persons who do not qualify for the latter; while in still others, primarily those schools not a part of a degree giving institution, they are the only recognition offered. In this period 284 one-year certificates and 400 two-year certificates or diplomas were given by 17 schools. Most of the schools admitted unclassified as well as regular students.

Figures compiled since 1930 by the association do not show an increase in the percentage of advanced degrees granted. The total enrolment of students majoring in social work in 24 schools on November 1, 1932, was 2863, of whom 1534 were full time students. Fifty-five percent of the total were reported as holding bachelors' degrees. In the academic year 1931-32 the schools awarded 283 bachelors' degrees, 166 masters' and 5 doctors'. Students who did not receive degrees but who received diplomas or certificates numbered 170, making a total of 624 who completed a program of training. The influence of the schools is, however, wider than the number of their graduates would imply, since there are many part time students in addition to those who leave before completing all degree requirements.

The extent to which professional standards are met by the total number of social workers cannot at present be measured effectively in terms of the membership of the American Association of Social Workers, since up to July 1, 1933, membership had been based simply on a record of experience in "social agencies of recognized standing." New requirements adopted in 1930 and put into force July 1, 1933, stipulate that applicants for full membership must have a minimum of 24 semester hours of technical courses in a school of social work and 300 hours of supervised field work practise in addition to 20 semester hours of biological and social sciences, which may be taken in any approved college. From this date on therefore it would appear that the professional association of social workers will be recruited from those who have had at least some professional preparation in schools of social work. Whether this step will lead to the certification of social workers cannot at present be determined, but the experimental

plan of voluntary registration in California effective after May 1, 1934, points in this direction. The rapidity with which public tax supported agencies are assuming the responsibility for many social work activities increases the need for some such method of identifying qualified practitioners in the field.

Monetary remuneration in social work is closely related to the problem of standards. A study by Hurlin made in 1926 indicated that the average wage of the social workers had not increased in terms of real wages from 1913 to 1925 and was at the time on a par with that of elementary school teachers and below that of high school and university teachers. At the same time social work is demanding postgraduate training and the vacation schedule in social agencies does not, as in the case of the teacher, make it easy to secure advanced academic work without relinquishing employment.

Social work, like teaching, is predominantly a woman's profession. According to the census the ratio of men to women social workers in 1930 was 1 to 4, a probable overestimate of men because of definition. The ratio in the membership of the American Association of Social Workers is estimated at about 1 to 6. Among the students reported as enrolled in the schools in September, 1930, the ratio was 1 to 0.2, but on November 1, 1932, it had risen to 1 to 6.5. It is noteworthy that the men were not evenly distributed in the 18 schools in which men and women are accepted on equal terms, 7 schools reporting 83 percent of the total male enrollment.

The predominance of women in the field, both in the professional associations and in the schools, is even more marked in Europe. Most of the European schools accept only women students. The German association of social workers has been solely a women's organization, although men have occupied administrative positions in social work. In Europe the developments in training have in general paralleled those in the United States; there are, however, some important differences. Schools of social work in Great Britain, from their inception at the opening of the twentieth century, have been closely tied up with the universities; and all 12 in 1930 were members of the Joint University Council for Social Studies. Connection with universities is not as general in the 9 continental countries which in 1928 recorded schools of social work, ranging in number from 36 in Germany to 1 in Poland. In Germany and Belgium the schools are under the control of government authorities,

and in the former country graduates who receive state diplomas as *Wohlfahrtspflegernnen* are qualified for positions in the public service. In general there is greater emphasis upon preparation for social work in European countries than in the United States. On the other hand, more schools are conducted under religious auspices in continental countries than in the United States; in Great Britain there are no schools with religious affiliations. In Germany the classification of schools into Roman Catholic, Protestant and non-sectarian is formal and definite. The Roman Catholic schools of all countries are organized in the International Catholic Social Service Union, with headquarters in Brussels. In a report to the International Conference of Social Work in Paris in 1928 there were listed 111 schools in 17 countries and 4 continents, not including 2 schools newly opened, 1 in Japan and 1 in Italy. In 1928 the International Conference founded an International Committee of Schools of Social Work to facilitate exchange of opinion and experience among schools and to deal with problems of international cooperation, such as exchange of teachers and students, organization of an information center, formation of international study committees and participation in international congresses for social work.

Social work is in a sense passing through a phase of development which has been common to all professional groups in its emergence from the apprenticeship plan of training to the establishment of professional education in institutions of higher learning, with emphasis upon work done on the graduate level. Moreover it is attempting to cover the distance between those extremes in a space of time which may seem alarmingly short as compared with the experience of older professional groups.

In achieving its goal of professionalization social work is faced with a difficulty inherent in its own nature which is not shared, for example, by law and medicine. Its practitioners are for the most part employed by one group to render service to another and thus their allegiance is claimed in two directions, sometimes diametrically opposed. To build up an ethical code of practise under these circumstances is a difficult task, and the failure of the community at large to value the services of social workers in the terms accorded to other professional groups may be the result at least in part of this characteristic of the service program. For this among other less important reasons it is impossible for social work

to follow too closely the forms provided by any of the other professions, although it looks to these professions constantly for suggestion and precedent.

SOCIAL WORK, TRAINING FOR. See SOCIAL WORK, section on SOCIAL WORK, TRAINING FOR.

SOCIALISM. The terms socialism, communism and collectivism, which have often been used interchangeably, are ambiguous and ill defined; for this reason they have an exceedingly wide range of specific connotations. Proudhon, who passionately combated communism as understood in his time, was later classed by Heinrich Dietzel as a communist. The Bakuninists in the First International were the original collectivists, but to Paul Leroy-Beaulieu collectivism stood for all varieties of scientific socialism. The term socialism was first used in its modern sense in 1827 in the Owenite *Co-operative Magazine* to denote tendencies opposed to liberal individualism and in the 1830's was applied in both England and France to describe the social ideals of Owen, Saint-Simon and Fourier. With the victory of the Marxian ideology, however, it came to be interpreted in a restricted sense. George Bernard Shaw, for example, understands by socialism "the complete discarding of the institution of private property . . . and the division of the resultant public income equally and indiscriminately among the entire population," a description which would not apply to the social order advocated by Saint-Simonians and Fourierists and would be rejected also by many socialist leaders of the present time. Every definition must fail—as Dietzel and Sombart have conclusively shown—which focuses attention upon external features only and overlooks the central motif of all socialist movements.

Although collectivism has been used as the general concept of which socialism, communism and anarchism are the special variants, it seems wiser to adopt socialism, an expression which has left so much deeper an imprint on the public mind, as the all inclusive term. For the purposes of this article therefore the definition of socialism must embrace the characteristic common to all these ideologies throughout history and to the organized socialist movements of the more recent period. These are: first, a condemnation of the existing political and social order as unjust; second, an advocacy of a new order consistent with moral values; third, a belief that this ideal is realizable; fourth, a conviction that the immorality of the established order is traceable not to a fixed world order or to the unchanging nature of man but to corrupt insti-

tutions; fifth, a program of action leading to the ideal through a fundamental remolding of human nature or of institutions or both; and, sixth, a revolutionary will to carry out this program. The fact can scarcely be overemphasized that no true socialist is satisfied with merely economic reforms but advocates also a distinct educational, ethical and aesthetic policy.

The content of socialism may further be circumscribed if it is indicated what doctrines and movements, to which the socialist label has for some reason become attached, are not to be regarded as forms of socialism. To begin with, the communism which some students discern in certain types of primitive social organization is not a socialist phenomenon, since it represents a natural, organic evolution rather than a conscious effort. Nor is the communism of the early Christians and of some of their later followers a manifestation of socialism. If they rebelled against the existing order, it was to save their own souls rather than to build a new society; and their organization represented a communism of consumption of goods freely given and received, a form of *religiöser Liebeskommunismus* (Troeltsch). Similarly the communistic orders of mediaeval friars were not fighting the world but fleeing from it. The famous Jesuit colony in Paraguay, which flourished between 1602 and 1767, did not attempt to create a better society but was merely an experiment in religious colonization and missionary work among the natives. Organized Christianity, both Catholic and Protestant, has never been socialist; it has tried to eradicate the worst features of the prevailing system by developing the moral forces of society. The *Rerum novarum* of Leo XIII promulgated in 1891 and the *Quadragesimo anno* of Pius XI in 1931 are of similar purport, except that the later encyclical indulges in a stronger criticism of the existing order. Analogous in spirit was the *Social Creed* announced by the Federal Council of the Churches of Christ in America in 1908; it emphasized humanitarian principles and has been revised in line with newer programs of social planning and control in *Social Ideals of the Churches*, which was approved by the same body in 1932.

In recent years a number of governmental policies have been improperly identified with socialism. One of them is war communism, which has often recurred in history, coupled occasionally with an exalted messianism. An outstanding instance of this is the empire of the Incas in Peru, which was primarily a military

organization serving the interests of its rulers. The glorification of the regulative measures of belligerents in the World War as war socialism was in part a halting apology for a war which members of the Second International supported; such misinterpretation was possible only because of an overemphasis on the externals of socialism. Municipal socialism may in the future become an integral part of a functioning socialist system, but in its present form it is a purely utilitarian program. The same is true of all schemes of planned economy and partial socialization which do not disturb the essential features of capitalism. Nor is the Italian corporative state, which has not been fully realized as yet, a socialist institution. Despite its pretensions at a synthesis of nationalism and socialism German National Socialism is fundamentally a reaction against socialism. Yet some elements in this extremely heterogeneous movement may be regarded as a late offspring of the feudal and romantic type of socialism. Thus Gottfried Feder, an early and still important theorist of Hitlerism, considers the domination of finance capital to be the chief cause of economic distress; he advocates the nationalization of banks and the financing of public works through the issue of non-interest bearing certificates.

Finally, the programs of certain reform groups have sometimes been unjustly interpreted as socialist. The teachings of a school of leading German professors in the last third of the nineteenth century were designated by their opponents as socialism of the chair merely because they criticized the shortcomings of *laissez faire* capitalism and advocated its regulation. There is not much more socialism in the economic, sociological and juristic doctrines of the French solidarists, who without rejecting the capitalist system propose to make it more cooperative in character, thereby improving the status of the propertyless groups. A similar judgment should be passed upon so-called Darwinian socialism of Ludwig Woltmann and others, who attempt to base socialism upon the principle of struggle for existence.

Varieties of socialism may be classified according to their ideals of justice, their motivations, their attitudes toward the state and their methods of attaining their ideals. The aristocratic socialism of Plato, of Campanella, of Fichte in his later period, of some of the romantics and of Rodbertus condemns existing society from the point of view of society, not of the individual, in terms of the *volonté générale*

rather than of the *volonté de tous* (Dietzel). The *sum cuique* of Plato is therefore its regulative principle. It is socialism imposed from above which disregards the selfish interests of individuals and tries to establish justice by organizing society in variegated groups. In recent years Othmar Spann, who regards popular socialism as an inconsistent medley of collectivism and liberalism, has sought to revamp such aristocratic socialism in a system which he calls universalism.

Communitistic socialism, the oldest of all forms, looks toward the ideal of absolute equality and seeks to express the *volonté de tous*; it appears in practically all periods when masses are living in wretchedness, surrounded by wealth. Its ideal, which represents an unlimited extension of the ideal of the family to the state, can be expressed in the maxim, probably of stoic origin: "From each according to his capacity, to each according to his needs." On the other hand, the socialism which has as its ideal not a mechanical equality of all members of society but rather a potential equality—in the sense of the maxim of Saint-Simon's followers, "From each according to his capacity, to each according to his merit"—has as its fundamental tenet not common ownership but the elimination of all unearned increment. The contrast between these two ideals, which was striking when scientific socialism first emerged, virtually disappeared when Marxism became the dominant socialism of Europe; but after the World War the distinction again acquired vital importance.

Socialism may be motivated by the religious or moral convictions of its advocates or by principles derived from empirical facts claimed to be the source of Marxian socialism and other recent trends or by resentment against the ugliness of capitalist civilization, as in the case of William Morris. Socialist attitudes toward the state differ: state socialism would establish state ownership and would have the state control future production, while cooperative socialism, which distrusts the state and fears the overdevelopment of bureaucracy, would base its system upon the organization of independent producers (guild socialism, syndicalism, industrial unionism). On the other hand, anarchism holds the historical state to be the ultimate source of exploitation and maintains that no reasonable social order can be established without its destruction. Conceptions as to the methods whereby socialist ideals are to be realized likewise vary: experimental socialism claims

that the new social order can result only from new social inventions; evolutionary socialism assumes that the essential elements of the new order are gradually evolving within capitalist civilization; revolutionary socialism maintains that the establishment of the new society can be achieved only by violent uprising; agrarian or liberal socialism regards as the only remedy the elimination of land monopoly, which it considers to be the sole cause of exploitation; jural socialism conceives the main task of the new society as the codification of economic rights, of which A. Menger holds three to be fundamental: the right to the whole produce of labor, to existence and to work.

All attempts to show strictly delimited periods in the development of socialism have failed. There is no positive correlation between the socio-economic surroundings and the type of socialistic theory, for the creative power of great individuals is always decisive. Neither is it true that modern socialism is exclusively scientific whereas the previous forms of socialism were utopian. There are, for example, elements in the thought of Plato, More and Proudhon which express fundamental relations more clearly than do any of the later socialists. It is nevertheless true that there is a dominant tendency in modern socialism to secularize the state completely, to base socialism exclusively on science and to make it a conscious movement of the proletarian class.

PRE-MARXIAN SOCIALISM. The precursors of socialism from antiquity until the eighteenth century worked in a highly religious or metaphysical atmosphere. Certain theories or movements developed during this period, however, show sentimental reactions or ideologic constructions which approach certain aspects of modern socialism. Robert von Pohlmann has contended that socialism entered Europe in the sixth century B.C. and became the central problem of the Greek world from the fourth century on. Max Weber, on the other hand, has affirmed that the foundations for a socialistic movement were lacking in Greece. It is obvious that the ancient world could not produce a socialism of the modern type, because there were no capitalistic structures but only capitalists eager for gain; small industry prevailed and there was no progressive concentration of industry; there was no labor problem, as the system was based on slavery; and the class struggle was confined to the oligarchic parties. But it is equally true that from the fifth century the disintegration in the

ancient state and the bankruptcy of traditional moral values had reached a point where there was widespread distrust of existing institutions. Dissatisfied intellectuals embraced the surviving traditions of the golden age; Sparta and Athens of the past were admired for their unified social structure. A comedy of Aristophanes, the *Ecclesiazusae*, was a satirical attack upon communist phantasmagorias and radical feminism. But far more important than these symptoms was Plato's *Republic*, in which he laid down a complete system of aristocratic communism. Although Plato's scheme is to be considered not as a utopia but as a genuine revolutionary effort, Platonic communism was essentially different from modern communism and according to Barker is more analogous to mediaeval monasticism. It maintained a rigid class rule based on slavery; its communism was confined to consumption; it repudiated equality; its outlook was not hedonistic but ascetic; it was militaristic and not international. The other products of ancient socialism, the series of utopias exemplified by the *Sun-State* of Iambulos, seem to be purely literary products rather than manifestations of revolutionary thought.

From the tenth century on, popular mass movements developed which were strange combinations of religious and social revolt. These movements, practically universal in the more developed countries of Europe, were the result partly of the dissatisfaction of peasants and partly of the discontent of industrial workers, especially weavers exploited by rising capitalism. As belief in the immediate approach of the Kingdom of God decreased, people became conscious of the antagonism between the equality of men preached by the gospel and cruel reality. A combination of religion and communism became the ideology of the Cathari, the Bogomiles, the Patarins, the Arnoldists, the Albigenses, the Lollards and many other sects. Some preached a moral asceticism, which makes them precursors of Tolstoy; others, like John Ball, expressed vehement class hatred. These movements increased greatly during the Reformation, when revolts broke out in some mining districts of Germany and agrarian discontent assumed a menacing form in other regions. The most stirring religious movements were associated with the Anabaptists, whose doctrine was a kind of anarchistic socialism looking toward equality in Christendom. Their condemnation of the whole fabric of society led to the mass uprising in Mühlhausen in 1525 led by Thomas

Münzer, who advocated what might be designated as a religious dictatorship of the proletariat. Another Anabaptist rising in the city of Munster in 1534-35 led to the establishment of the "New Zion." The Anabaptist communities established in Moravia in the sixteenth century were the largest communistic organizations on Christian foundations in Europe.

With the spirit of criticism aroused by the Renaissance and the Reformation and with the beginnings of capitalism a significant literature came into being, of which the *Utopia* of Thomas More (1516) has become the classic model. The new utopias are comparable to those of the Greeks, yet their tone is far more earnest; they are animated not by sensationalism but by a deep moral conviction. More, exasperated by the misery following the enclosure system, when "sheep ate men," described an ideal community on a strictly communistic basis. He was an ardent individualist, seeking a maximum of pleasure for everyone. The acumen of More's criticism has rarely been surpassed. The remarkable utopia of Campanella, *Civitas solis* (Frankfort 1623), is nearer the *Republic* of Plato than the work of More; it is distinctly of the aristocratic type, based on the absolutistic rule of a philosopher-priest-prince. Harrington's *Oceana* (1656) may be called a liberal-socialist utopia for it placed greatest stress on the equal distribution of landed property.

The movement of the Diggers, or True Levellers, which arose during the Cromwellian revolution, culminated in 1649 when Winstanley led a few men in Surrey to dig and manure land which did not belong to them. Leonard Woolf calls the Diggers the first fathers of modern democracy, but it was virtually their intention to establish communities as the Anabaptist colonists had tried to do a century earlier. Winstanley has been described as a communist by Max Beer; the main ardor of the Digger movement, however, was directed against monopoly in land.

In all these manifestations the reaction against the historical state was more sentimental and religious than political and rationalistic, and the movements had an individual or sectarian character. In the eighteenth century, when a world new in both its economic and its moral structure emerged, several traits of modern socialism appeared. Increasing importance was attributed to economic life. An entirely lay conception of the state was developed and the world view of the individual became more ra-

tionalistic. With the rise of large scale industry came a proletarian class and the social outlook became more and more international. All these tendencies reached their climax in the French Revolution. Significant changes in social views had occurred between the sixteenth century and the eighteenth. The spirit of the natural sciences, of Galileo, Kepler, Harvey and Newton, had undermined the preponderance of religious cosmogony. The movement of the Enlightenment had encouraged the individual to use his own reason. Economic life had been divorced from the interference of religion. The new morality of the puritan sects had overemphasized work, moderation and asceticism and had served to encourage the entrepreneur. The doctrines of the law of nature had been revived and in the hands of Hobbes, Locke, Rousseau and Kant had asserted the necessity of a rational political order. Modern economic science was born and the physiocrats and Adam Smith tried to emancipate economic life from the despotism of the mercantilistic state. Morality came to be separated ever more pronouncedly from religion and utilitarianism declared enlightened self-interest to be the foundation of the commonweal. The deistic metaphysics of Rousseau and the critical idealism of Kant showed the existence of a superindividual moral law. Finally, the fight against despotism by Locke, Montesquieu, Voltaire, Rousseau and the *encyclopedistes* had sought to transform the absolutistic state into a government controlled by the people.

More imminent were the economic changes, whose influence has been felt progressively since the second half of the eighteenth century. The beginnings of the industrial revolution had shaken the foundations of the guild system and the self-sufficiency of the local centers. Closely connected with these changes was the growing disintegration of the feudal agricultural world, which had prevailed almost unaltered for a thousand years. The ancient manorial society with its many collective regulations, its feudal participation in common land, forest and roads and its intimate connection with the manor system proved an obstacle to the forces of the new age (see Heine, *Die Bauern und die Bauernkriege*, pp. 1-10). Rationalistic and competitive forces were far more remunerative than the old guild system. The army of bankrupt artisans and petty tradesmen, even a century ago, was a social force of great importance. The foundation for the modern proletarian class was laid. The social process was accelerated by the political means of violence and the new enclosure movement in England. The eighteenth to the beginning of the nineteenth century was a period of social polarization.

of society. Napoleon III in his *Extinction du paupérisme* (Paris 1844) warned society of the approaching danger, as did de Tocqueville, speaking in the Chamber of Deputies in January, 1848. The revolt was spreading against the philosophy of economic liberalism. Sismondi tried to show that the liberal doctrine of spontaneous readjustment was no longer valid. In an essay honored by the French Académie des Sciences Morales et Politiques (*De la misère des classes laborieuses en Angleterre et en France*, 2 vols., Paris 1840) Buret demonstrated that industrial civilization uncontrolled by the state must lead inevitably to destitution.

This setting was undoubtedly propitious for the maturation of the socialist doctrine. After the transitory calm of the post-Napoleonic period there came a rebirth of the revolutionary propaganda focused around Paris among the exiles of various countries. Secret societies multiplied; a new wave of Jacobinism flourished. The Carbonari, the Young Europe, the Amis de la Vérité, the Amis du Peuple, the Société des Droits de l'Homme and other secret conspiratorial organizations were formed. Under all these influences an extremely rich socialist and communist literature arose.

The socialism of the nineteenth century shows certain characteristics which differentiate it from both eighteenth century socialism and the later Marxian synthesis. It was undoubtedly more scientific than the previous socialism. General formulae of reason and the law of nature had a lesser appeal; economic problems were now stressed. It differed in several respects from Marxian socialism. In the first place, it was based on a desire for sympathy and better understanding between the classes. Most of its representatives therefore, far from teaching a recognition of class struggle, placed their emphasis upon cooperation. The appeal of Owen is typical: "It will therefore be the essence of wisdom in the privileged classes to cooperate sincerely and cordially with those who desire not to touch one iota of the supposed advantages which they now possess. . . ." Second, it was an isolated intellectual movement and often assumed the form of sects. Third, it favored socialist colonies as practical economic experiments. Fourth, it was bound to the traditional moral and religious values.

In France Saint-Simon gave new impetus to socialism. He was convinced that a central organ regulating economic life and a new humanitarian religion instead of a falsified Christianity were

necessary if anarchy was to be avoided. He declared the new society to be preformed in the body of the old. The work of the French Revolution he regarded as incomplete because the world still remained feudal in essence, ruled by lawyers, soldiers and metaphysicians. As a form of organization for the new world of the industrialists Saint-Simon proposed a kind of socialization of economic forces, the subordination of private enterprise to regulation and directive councils of experts to maintain the harmony of the whole. His successors Bazard and Enfantin corrupted his teaching in many respects with materialistic mysticism or sexual libertinage. Nevertheless, certain popularizations of the Saint-Simon school had considerable influence upon contemporary and later thought. They emphasized the exploitation of man by man, the need for emancipation of the workers, the suppression of surplus value, and they expressed the fundamental principles of socialism more clearly than did the preceding schools. Present efforts toward a planned economy may be said to have a Saint-Simonian character.

Fourier, on the other hand, can best be described as a liberal cooperative socialist. The essential for him was not the establishment of a general plan and leadership from above, but rather the building of fundamental social units in which a healthy economic life might develop. Believing that an attraction exists between human desires and the various economic occupations, he proposed the remodeling of society on the basis of spontaneous cooperative associations. He ridiculed the idea of a sovereign people dying of hunger and maintained that the proper satisfaction of individual desires would lead to the most efficient type of production. Fourier may be regarded as one of the chief predecessors of the antistate movement. At the same time he expressed clearly the law of capitalist concentration and of the growing misery of the masses. Victor Considérant, the most important member of the Fourier school, in his *Principes de socialisme* (Paris 1847) formulated the ideas of capitalistic concentration, proletarianization, pauperism, the right to work, insurance for workers, the transformation of the wage system and the appearance of a new industrial feudalism with such vigor that the book may be regarded as an important step toward the *Communist Manifesto*, which appeared in 1848 (G. Sorel).

The liberal socialism of Proudhon urged not the suppression of capital, but only the elimination of its function of exploitation; it ad-

vocated the organization of a national cooperative bank which would be able to give gratuitous credit to all producers. Proudhon believed that the producers, liberated from the bondage of capital, would form spontaneous associations and would exchange their products on the basis of labor value; that government would thus be supplanted by the economic organism; and that this would lead to true industrial democracy (Proudhon was perhaps first to use this term), without which political democracy would always remain a farce. He proposed a system of political federalism which in his opinion would break down the centralized unity of France. Proudhon exerted a strong influence on the French masses, still *petit bourgeois* in character. It was doubtful for some years whether the First International would become Proudhonist or Marxist. At the end of the nineteenth century Proudhonism revived in the syndicalist movement.

The rebirth of religious feeling in large circles of French society gave impetus to several propagandists called Christian Socialists. Buchez tried to found a producers' cooperative movement; Lamennais in the second part of his career openly embraced the principles of communism; Cabet in his influential utopian work, *Voyage en Icarie* (Paris 1840), carried on the traditions of More, Campanella and to some extent of Fourier. Pecqueur, another religious socialist, had far greater theoretical importance; he described the process of growing capitalistic concentration and advocated the idea of nationalizing the means of production, with an admixture of cooperative socialist principles. He may be regarded as a precursor of the idea of occupational representation.

More important in its practical consequences was the work of Louis Blanc, a keen critic of capitalist society, who analyzed the process of concentration in detail and emphasized that a system of competition must lead to monopoly. He attacked the consequences of the liberal system and declared that the principle of *laissez aller* meant *laissez mourir*. He advocated productive associations of working men provided with necessary capital by the state, which should, however, not be the administrator or the proprietor of these workshops but only make the laws regulating them.

In England during this period socialism did not elaborate as many systems as it did in France and it showed more sobriety and greater realism, largely because of the higher development of the

British labor movement. English socialism continued the natural rights theory and especially the labor theory of value as initiated by Locke and scientifically developed by Ricardo. The influence of the latter on English socialism cannot be overrated; his reduction of value to labor in practically all important cases, his prediction that wages could not fail to be pressed down to the level of subsistence, his theory of land rent, his construction of the *homo oeconomicus*, were factors fostering belief in the necessity of class struggle. Charles Hall's agrarian socialism advocated the nationalization of the land and its division among the proletariat. Hall is one of the founders of the theory of surplus value—he held that the poor are robbed of seven eighths of their natural income—and of the theory of class struggle. Thomas Hodgskin was an individualistic socialist who made acute observations concerning the labor theory of value, class warfare and exploitation. He hoped that the coalition of workers would limit the unearned increment of lazy capitalists but insisted that working capitalists were entitled to an adequate wage. He was an anticommunist, declaring the right of property to be essential to the welfare of society. John Gray sought the solution of the social problem in the process of circulation; he asserted that barter and barter alone is the basis of society and urged that since the whole principle of exchange was falsified, national warehouses should be established to determine the price of all commodities on the basis of labor value. John Francis Bray gave a kind of synthesis of Owenite teachings and anticapitalistic criticism.

The two dominant figures among the founders of English socialism were William Thompson and Robert Owen. Thompson, whose original teachings Menger contends were appropriated by Rodbertus and Marx, was a follower of Bentham. He maintained that the first agent in the economic process was not the capitalist but the producer, and formulated what later became the *ehernes Lohngesetz*, iron law of wages, of Lassalle. In his hope for the transformation of capitalist society through cooperative-socialist communities composed of associations of producers he shared the plans of his contemporary Robert Owen, by far the greatest figure in British socialist history. Owen had little interest in political reforms but was convinced that the main task for the social reformer was the elimination of disorderly competition and faulty education. When he commenced his activity he was

scarcely more than an ardent social reformer; later, exacerbated by the resistance of the cotton lords, he became more and more a communist. He was convinced that the new economic system would create unlimited prosperity and therefore he never seriously contemplated the problem of distribution. His plans for education, for making work agreeable, dignified and pleasurable, are comparable to those of Fourier, while in his emphasis on the necessity of establishing free productive associations he can be regarded as a precursor of Blanc. In his views on the state he came closer to Proudhon than to the state socialists. He was the first to initiate labor defense legislation, trade unionism, cooperative organizations and all embracing educational reforms.

In Germany the socialism of this period was far more abstract and theoretical than was the French and English, because the German structure of society remained traditional, feudal and autocratic. German socialism was a moral protest and a religious hope rather than the battle cry of an organized class. What later became militant German socialism had its source in four ideologic currents. First, there was the tradition of the German idealist philosophy of Kant, especially as formulated by Fichte, who elaborated a system of socialism of an aristocratic and authoritative character in which elements of state socialism were combined with a kind of guild socialism in order to guarantee to the individual the right to a minimum subsistence. Fichte proposed that a meticulous system of planned economy be developed, that the frontiers of the state be closed to foreign commerce and that all the citizens be organized on an occupational basis. The second current was the type of socialism which Marx denounced as German, or "true," socialism, represented by such men as Hess, Weitling and Grun. This school, also called *Handwerkerburschen-Sozialismus*, represented a humanitarian, optimistic tendency comparable with that of early French and English socialism. Feuerbach's philosophy also exerted a growing influence. A third strain was the reaction against the beginnings of capitalism among the ideologists of the old regime, which gave rise to a romantic and authoritative type of semisocialistic thought described by Marx as reactionary, or feudal, socialism. In fact, however, it was not entirely reactionary; occasionally it was a genuine protest against unbridled Manchesterism, calling for the reorganization of professional life along medi-

aeval lines, thus representing an early precursor of guild socialism. In particular Franz von Baader and Adam Müller sharply criticized the capitalist system and prophesied its collapse, and Winkelblech proposed a detailed plan of guild organization. Finally, there was the current of socialist thought which is generally characterized as scientific, with the implication that economic researches play a paramount part in its formulations. The term scientific is not a fortunate one, because previous types of socialism cannot simply be discarded as unscientific; an economic foundation does not necessarily go deeper than a psychological or a moral one. A leading figure among early scientific socialists was Karl Rodbertus, who vigorously criticized the capitalist system as creating pauperism and commercial crises, because five sixths of the nation by virtue of the meagerness of their incomes are in effect excluded from the benefits of civilization. As a remedy he recommended that the working class be given a greater share in the national income. Rodbertus was an anti-individualist and anti-egalitarian socialist of the type of Plato, Saint-Simon and Fichte. Another protagonist of scientific socialism was Lassalle, who from a practical point of view was post-Marxian but in his theoretical foundation was rather pre-Marxian, deeply influenced by Blanc and Lorenz von Stein. He popularized the wage theory of Ricardo under the slogan of the *ehernes Lohngesetz*, which makes the rise of the working class impossible. Following Malthus he argued that if wages should be above the point of minimum subsistence, more frequent marriages and more rapid reproduction would occur and the increase in the supply of workers would depress wages. But if wages should be below this point, emigration, celibacy and sexual abstinence would diminish the supply and wages would rise accordingly. He contended that neither the cooperative nor the trade union movement could offer a way out of this dilemma but that the only true road toward freedom was the intervention of the state, which, in opposition to Marx and in accordance with Hegel, Lassalle regarded as the supreme reality. In his opinion the state could emancipate the working class by giving them credit with which they could organize producers' associations. He regarded universal and equal suffrage as a means of conquering the state and as the royal road to socialism. Likewise in opposition to Marx and later socialism, Lassalle was a convinced nationalist and urged the proletariat to cooperate

with the state; in this regard he gave great impetus to post-Marxian socialism.

Certain practical experiments also influenced the next period of socialism, mostly in a negative way. In France the unfortunate venture with the *ateliers nationaux* in 1848 compromised the idea of productive associations, although the experiment had not had a fair trial. The codification of the principle of the right to work proved to be ineffective. The tragic battle in June with its consequent deportations crushed the revolutionary ardor of the proletariat by depriving it of 10,000 of its most revolutionary elements. The collapse of many communistic colonies inspired by the schemes of Fourier, Cabet and Owen or by religious groups was also discouraging. Lorenz von Stein had attributed the greatest importance to these endeavors, quite unhampered in the United States, because he saw in them a crucial test for socialist doctrine. As practically all these experiments were failures, he was convinced that they had demonstrated amply the impossibility of communism, for all these communities had succumbed not in competition with the capitalist system but because discipline and harmonious cooperation could not be maintained. Socialists argued, however, that the situation would be quite different if only one social and economic pattern, supported by an inclusive system of social education, were to be tolerated. The growing impatience of the proletariat with the political and experimental method gave new fervor to the tradition of Babeuf. Dézamy rejected bourgeois aid and summoned the proletariat to free itself. Blanqui was involved in a series of violent plots. He was one of the leaders of the demonstrators who in 1848 entered parliament and dispersed the Assembly. The culmination of the movement of unsuccessful armed upheavals was the Paris Commune in 1871. Although recent researches have proved that socialism was not the most important element of the revolution and that its general ideology was more Proudhonist than Marxian, coupled with national indignation against an inefficient government, yet the commune became a landmark in the history of communism, and Marx hailed it as the "glorious harbinger of a new society."

The first important experiment in England toward independent political action by class conscious workers and the first great movement in modern times directed and controlled by working men was the Chartist movement (1830-48). In addition to the efforts of the Chartists for

constitutional change they were concerned with socialist issues. At the same time the first socialist international organization was established as the Society of Fraternal Democrats. A Christian Socialist movement was organized in 1848 under the leadership of the humanitarian clergymen Maurice and Kingsley and Ludlow, a lawyer; it resembled the French religious socialist movement, except that it did not preach a single principle or doctrine peculiar to socialism. About forty "associations for cooperative production" were founded, but all of these collapsed and in 1854 the movement disappeared. In Germany in 1863 Lassalle succeeded in founding the first independent labor party, the *Allgemeiner deutscher Arbeiterverein*. His sudden death, however, weakened the resistance of his ideology to the new synthesis of socialism, which had as its center the International Working Men's Association, of which Marx became the leading spirit.

✓**MARXIAN SOCIALISM.** Although the most important aspects of modern socialism were performed in a long course of historical development, nevertheless the synthesis associated with the names of Marx and Engels represents a new variety, some characteristics of which were determined by the further development of the structure of capitalism. The industrial proletariat became more independent of the other classes of society, and at the same time a new intellectual class developed which lost its connection with the upper classes and felt itself to be the exponent of the proletariat. The proletariat began to develop its own élite. The growing strength of the proletarian organizations rendered their press and ideology financially independent. The Marxian synthesis was not, however, a simple reflex of a new situation but was partly a result of previous currents of thought and partly the creation of the genius of Marx and Engels. It has often been emphasized, usually in a deprecatory way, that the founders of the new socialism did not add anything original to socialist thought; that the theory of surplus value was an inheritance from Turgot, Godwin, Hall and Thompson, the theory of capitalist concentration from Pecqueur, Fourier and Blanc; that the class struggle theory was already developed by Plato and Aristotle and modernized by Blanc, von Stein, Thierry and Guizot; that the theory of the growing misery of the proletariat originated with Rodbertus and the crisis theory with Owen, Sismondi, Fourier and Rodbertus; and that the technologic-eco-

conomic theory of history was completely developed at the end of the eighteenth century. Even granting these assertions, it cannot be denied that socialist theory received a synthesis and completeness through Marx and Engels and that because of such dynamic impetus socialism, which had formerly been confined to the speculation of isolated thinkers or of sectarians, became a mass movement embracing the entire world.

Marxian thought contained several elements which caused it to triumph over all former varieties. In the first place, Marxian socialism made a definite turn toward communism. As Engels declared: "In 1847 socialism was a bourgeois movement, whereas communism was working class. Socialism was, on the continent at least, quite respectable, whereas communism was the very opposite. Since, already at that date, we were wholly convinced that 'the emancipation of the workers must be the task of the working class itself,' we could have no hesitation as to which of the two words we should choose. Nor has there ever been any inclination on our part to repudiate our first choice." Second, it abandoned all the religious and moral claims of pre-Marxian socialism and became rigorously "scientific." The slogan "Religion is the opiate of the people" was a creation of Marx. Third, it did not concern itself with the economic institutions of the future society, which were the chief interest of pre-Marxian socialism; this attitude enhanced its fighting strength. Fourth, it ridiculed the experimental method of former socialism as utopianism and accepted an evolutionary interpretation of human history. Engels declared at Marx' funeral, "Just as Darwin discovered the law of evolution in organic nature, so Marx discovered the law of evolution of human history." The new doctrine, however, combined with this evolutionary interpretation a distinctly revolutionary philosophy. Fifth, the new ideology not only abandoned the principle of cooperation with other classes but glorified the class struggle as the source of all virtues for the proletariat. The working class was described as the class which alone had the historic role of bringing about a better social order. Sixth, Marxian socialism taught a kind of radical behaviorism, as expressed in Marx' phrase, "The whole of history is a continuous remolding [*Umwandlung*] of human nature."

It is easy to understand the extraordinary dynamic power of this synthesis. The checks and restraints of traditional religion and morality

were released; the expectation of a transcendental millennium was replaced by hope for an ideal future society on earth based on materialistic principles. It not only developed the feeling of dignity in a class until then neglected, but exalted its self-consciousness. Finally, the element of Bakuninism in this synthesis, favoring the ruthless qualities of human nature, becomes justified because the destruction of capitalist society is regarded as absolutely necessary to insure the future of civilization.

The origins of the new synthesis are to be observed in the atmosphere of the English philosophy of the seventeenth and eighteenth centuries, especially in the spirit of Hobbes and Locke; its transformation is to be seen in the materialistic philosophy of the precursors of the French Revolution, in the daring optimism of the French and English socialists, in the devastating religious criticism of Feuerbach, in the humanitarian visions of the "true" German socialists and in the evolutionary spirit of the new natural science. Engels declared that the German socialists were proud of their descent not only from Saint-Simon, Fourier and Owen but also from Kant, Fichte and Hegel. In spite of the insistence of Sombart and others to the contrary, the works of the young Marx prove that he was deeply influenced by German idealism; that he was motivated by an ethical humanitarianism; that his system not only has as its purpose the improvement of the economic status of the masses but that its fundamental thought is to abolish the "fetishism of commodities," the malevolent power of human products over the free will of men. Spengler has tended that the Prussian concept of *Obrigkeitsstaat* had an important influence on Marxian socialism. Finally, the influence of "the Jewish spirit" in Marxian socialism has often been stressed; for example, by Bakunin, Dühring, Sombart, Plenge and the National Socialists. The idea of justice has always been strong in the Jewish race, and its hereditary prophetic chiliasm found an outlet in a materialistic quest for a new society. Furthermore because of their lack of a national homeland they have made a virtue of internationalism. Yet this racial factor should not be exaggerated; the role of the Jews has been disproportionate in all other intellectual activities as well, and public careers have been closed to them in many bourgeois parties.

✓The reconstruction of the main elements of Marxian thought is difficult because Marx and Engels adopted different points of view in

different periods and at times the system is obscured. Furthermore Marxian socialism as a driving force is an ideology and not a theory: it lives not only in the works of the founders but in the diverse interpretations of disciples. Its philosophical foundation, historical materialism, sometimes qualified as economic interpretation of history, transformed the static materialism of the eighteenth century and of Feuerbach into a dynamic materialism. This synthesis was achieved through the dialectic conception of Hegel; but whereas Hegel held reason, or the idea, to be the ultimate promoter of the whole process, Marx regarded the idea as nothing but the material process becoming conscious in the brain of man. This materialistic dialectic helped Marx to describe the movements of ideas, not as rigid categories but as manifestations of an ever changing reality. The doctrine was never fully developed, it was merely formulated in some brilliant passages, especially those in Marx' preface to the *Critique of Political Economy* and by Engels in *Anti-Duhring*. The fundamental idea is that "the mode of production in material life determines the general character of the social, political and spiritual processes of life. It is not the consciousness of men that determines their existence but, on the contrary, their social existence determines their consciousness." New forces of production, which cannot find sufficient activity in the existing jural and ideologic framework of society, are continuously developing. The result is a struggle between the class representing the old status of the forces of production and the class representing the new. Engels thus concludes that "the final causes of all social changes and political revolutions are to be sought, not in men's brains, not in man's better insight into eternal truth and justice, but in changes in the modes of production and exchange. They are to be sought, not in the *philosophy* but in the *economics* of each particular epoch."

✓ This concept involves several propositions. The first is the *Uberbau* theory, according to which all the spiritual forces of society, law, religion, art, philosophy, are only a superstructure developed by the material, productive forces of society. Second, the chief cause of movement in society which in its totality is considered progress is the antagonism between the productive forces and the existing relations of production. Third, this development of the productive forces is inevitable; either the new forces through their representative class will be vic-

torious or society will perish in a blind and useless strife. Human reason cannot alter this inevitable evolution; it can merely alleviate the pain of creation of the new society which is already developed in the body of the old. Fourth, every phase of the historical process is inevitable and reasonable in its relative position. Fifth, the approaching revolution of the proletariat will be a final one, because it will mean the emancipation of the last class in society; no exploited class will remain. Therefore mankind's prehistoric period will end; man will make the final leap from the realm of necessity into the realm of freedom, because all the productive forces of society will be controlled by reason in a classless society of free and equal men. The strict materialistic determinism of the original formulation was later considerably mitigated not only by certain followers but by Engels himself. In a letter to Mehring in 1893 Engels acknowledged at least the relative independence of spiritual forces in history. The idea of the forces of production (*Produktivkräfte*) which determine the relations of production (*Produktionsverhältnisse*, the organization of the economic structure), upon which the spiritual and cultural superstructure is based, has remained vague and contradictory. Sometimes it is used, apparently quite correctly, to refer only to the "forces of production or what is the same . . . the stage of development (*Entwicklungsstufe*) of the technic," as by Bukharin; other writers, such as Bernstein, include climate, natural surroundings, law, religious traditions and the nature of man.

✓ The central thesis of the economic teachings of Marx and Engels is that capitalist society is hopelessly torn by antagonistic forces which will ultimately destroy the whole social fabric, but in such a way that the communist embryo preformed in capitalist society will be set free. Marxian economic theory is based on the Ricardian theory of value, with the limitation that for Marx pure economics did not exist; economic laws, like all other so-called social laws, are to him only transitory categories. Marx made the Ricardian theory of value more rigid and exclusive, leaving no room for consideration of scarcity and utility. Value for Marx is an objective substance; it is congealed labor, not visible but measurable. The value of commodities is determined by the "average socially necessary labor" expended in their production. This definition is an apotheosis of physical labor, because highly qualified intellectual labor cannot be

measured under this category. Human labor is the sole factor in production of goods, for capital is only previous human labor not consumed but used in the process of production. It follows that the interest on capital, the entrepreneur's profit and the land rent are all paid out of the work of the laborers as surplus value. The creation of this surplus value is explained by the fact that the value of the labor force depends upon the amount of labor needed for the production of those things which are necessary to maintain the worker and his family on the minimum level of subsistence. But in a day's work under the capitalist system the worker produces more than the necessities of his minimum existence; the rest of his work constitutes the surplus value. In this way the essence of capital is not a sum of money or an agglomeration of productive implements but an instrument for the production of surplus value. Workers perform this surplus work for the capitalists, without physical or legal compulsion, because the land and the other means of production are in the hands of a few capitalists who have at their disposal free workers, free in the double sense that they are free to make contracts and that they are free of all possessions other than their working energy. The workers constitute an industrial reserve army, composed of a growing number of unemployed, whose competition keeps wages always at the lowest possible level and makes it necessary for the workers to do the surplus work. Without such an industrial reserve army capitalism could not exist, for if wages should increase above the subsistence level the working class could save enough capital to acquire the necessary means of production. The question as to how this reserve army of the capitalist system is continuously reproduced was not difficult for Malthusians like Ricardo or Lassalle, but Marx repudiated their explanations categorically. He described the reserve army as created purely by economic means; the small artisans were ruined by large scale industry, capitalists expanded the working hours, and the employment of cheap woman and child labor was made possible through the development of machinery. The whole trend of the industrial revolution is the replacement of the worker by the machine, which continuously increases the number of the unemployed. Therefore the chief cause of the reserve army is technological unemployment. On the other hand, Marx showed elsewhere that the capitalist system was created not by its economic superiority but by the violent and

lawless expropriation of the rural masses, who became paupers and who thus afforded a cheap labor supply for the capitalist. Whether these two explanations can be reconciled and whether violence itself is an economic power, as Marx sometimes asserted, was never thoroughly treated.

✓ The theory of value and surplus value leads inevitably to the law of concentration, according to which capitalist enterprises tend to grow continuously by the extermination of the smaller establishments. In the course of evolution all production will be concentrated in a few colossal enterprises. By reason of the bankruptcy of smaller producers and the growing exploitation of the workers, not only the technical implements but wealth itself tends to concentrate in a few hands according to the law of capitalist accumulation. This inevitable process, which will culminate in increasing misery of the masses, is thus described by Marx: "While there is thus a progressive diminution in the number of the capitalist magnates (who usurp and monopolize all the advantages of this transformative process), there occurs a corresponding increase in the mass of poverty, oppression, enslavement, degeneration, and exploitation" of the swelling masses of labor. The growing efficiency of production and the accumulating misery of the masses, combined with the anarchy of the capitalist system, under which every capitalist produces at random, lead to more and more devastating crises. This crisis theory, with the theory of concentration, is the most important bulwark of the Marxian system, because Marx was convinced that soon the crises would destroy the entire capitalist structure. Marx and Engels in this connection laid the foundation for a theory of imperialism: "The conditions of bourgeois society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand, by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets, and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises. . . ." Marx and Engels were convinced that the world revolution was imminent, that one of these sharp crises would be the turning point at which "the knell of capitalist private property sounds. The expropriators are expropriated." This gloomy prophecy contains an element of hope for the theory of concentration and at the same time involves a theory of

socialization—for colossal private enterprises absorb great masses of workers who carry on socialized production. As Engels said: "The contradiction between socialized production and capitalistic appropriation manifested itself as the antagonism of proletariat and bourgeoisie," as "an antagonism between the organization of production in the individual workshop and the anarchy of production in society generally." This tension will continue to increase; the capitalist integument will burst asunder; the communist embryo will come to life with the birth pangs of the social revolution. Although the character of the new society is not described, certain statements indicate that Marx and Engels believed in an ultimate state of "free association of individuals" and in a classless society, wherein everyone would receive according to his needs.

The political conclusions of the system follow from its philosophic and economic theses. The doctrine as a whole is less developed than the other parts of the system. It consists of occasional remarks, historical fragments and propagandistic guides. According to Marx the state is a new institution not known in the feudal period; only after the dissolution of the political power of the church was the state established. Engels, influenced by the studies of Lewis H. Morgan, described with great admiration the tribal organization of the Iroquois as an example of a stateless society founded on equality and freedom. He contended that the agglomeration of wealth, the beginning of sharp class divisions, destroyed the stateless condition of mankind and established the historical state, which "having arisen amid these conflicts . . . is as a rule the state of the most powerful economic class. . . ." Only in exceptional cases do the "struggling classes balance each other so nearly that the public power gains a certain degree of independence by posing as the mediator between them. . . ." The modern state is "nothing more than a committee for the administration of the consolidated affairs of the bourgeois class as a whole." The state thus assumes simply the role of an instrument of class exploitation. This situation will not last for long; "We are now rapidly approaching a stage of evolution in production, in which the existence of classes has not only ceased to be a necessity, but becomes a positive fetter on production. Hence these classes must fall as inevitably as they once arose. The state must irrevocably fall with them. The society that is to reorganize production on the basis of a free and equal association of producers

will transfer the machinery of state where it will then belong: into the Museum of Antiquities, by the side of the spinning wheel and the bronze axe.' This is the theory of the withering away of the state, in which Marx and Engels and practically all the founders of modern socialism agree with the ultimate consequences of the anarchist doctrine. The picture of the new political society, like that of the economic, has never been fully portrayed, although in many isolated passages its chief features have been described. Not only will the state and classes disappear but also the difference between manual and intellectual labor and the gulf between town and country. The parliamentary system will be replaced by the occupational representation of the workers. The main feature of the new society will be colossal abundance of production on the basis of an all embracing planned economy.

Tactical considerations play a very significant part in the Marxian system. This feature is so strong that Croce rightly asserts that it would be far more difficult to continue the political perspicacity than the theoretical work of Marx, the "most remarkable continuator of Machiavelli." The most important and immediate objective is the organization of the proletariat into a class conscious proletarian party. This party must be international in scope, for working men know no country; they must unite the world over. The emancipation of the proletariat will be brought about by a world revolution, which will be accompanied by warlike complications. Marxism is not pacifism; the concept of the brotherhood of man was characterized as "the most trivial stump oratory." The wars of the capitalist countries must be utilized in the interest of proletarian emancipation, the fight for which should be different in various countries. Although Marx and Engels made utterances which seem to indicate that in highly advanced democratic countries, such as the United States, England and Holland, a peaceful transformation would be possible, their fundamental teaching was that of revolutionary action and a complete destruction of other classes. Reformistic measures are only auxiliary means of overthrowing the bourgeois state. The proletariat is not to take compromises with the bourgeois class seriously, but to keep the revolution permanent is to disregard all agreements. In this continuous revolutionary struggle the working class should not be hindered by considerations of conventional justice and morality.

The final transition to a communist society can be made only by the dictatorship of the proletariat. It was not only in his youth that Marx entertained such an opinion; as late as 1875 in criticising the Gotha Program he announced that "between the capitalist and communist society lies a period of revolutionary transformation from one to the other. There corresponds also to this a political transition period during which the state can be nothing else than the revolutionary dictatorship of the proletariat." Engels made an analogous declaration a few years before his death. Marx and Engels therefore did not oppose the methods of armed violence advocated by Babeuf and Blanqui but only conspiracies not sufficiently prepared and organized. Violence is held to be "the midwife of every old society pregnant with a new one."

DEVELOPMENTS AFTER MARX. After the founding of the Second International in 1889 socialism became a world movement. Its internationalism, however, was rather decorative, and in various countries national differences came to the fore. German socialism was the leading force within the International; its power in Germany after the Erfurt program (1891) was very great and throughout central and eastern Europe it became a strong revolutionary force. But while the scientific and moral prestige of Marxian socialism grew in the great western democracies, it remained a minority opinion. This difference is due to some extent to the feudal, aristocratic and authoritarian character of central and eastern European countries where the working class had to fight not only for its economic emancipation but also for the political rights which had already been achieved by bourgeois revolutions in the west. At the same time religion remained in these countries largely an ally of the state, glossing over social exploitation. Whereas in the west democracy led inevitably toward cooperation between the working class and the advanced elements of the bourgeoisie, in central and eastern Europe the gulf remained unbridgeable. Central and eastern European socialism was as a consequence animated by a consciousness of social inferiority on the part of the working class, a feeling which did not exist in the west.

Differences in national character also are important. The system making, metaphysical outlook of the Germans and the sentimental mysticism of the Slavs were propitious for the acceptance of the rigid architecture of the Marxian synthesis with its prophecies for a future society; whereas the common sense

philosophy of the English and the lucidity of the French, combined with the humanitarian religion of the French Revolution, revolted against a system in which the ideology of individual rights was discarded. These national differences resulted in a process of cross fertilization of orthodox Marxism with certain new tendencies.

In no country of the world, with the exception of Russia, has socialism encountered so much persecution, chicanery and contempt as in Germany. The *Sozialistengesetz* of Bismarck from 1878 to 1890 made it an outcast, able to maintain its political existence only through underground organization. Later, however, with the growing forces of democracy and relative prosperity, as in France and England, the Social Democratic party became one of the strongest organizations in the country. The exclusively proletarian color of Marxian ideology became less intense; large masses of the petty bourgeoisie and of the intellectuals became socialists. At the same time the antimilitaristic efforts of socialism endowed the movement with a broad humanitarian appeal. In the years immediately preceding the World War socialism came to be regarded as a bulwark against all kinds of reaction; in 1912 at the congress of the Second International at Basel Jean Jaurès, the idealist leader of French socialism, reflected European labor opinion when he asserted that "the International represents all the moral forces in the world."

The change in the mentality of the socialist movement became so marked that Engels in 1895, the last year of his life, wrote a preface to the new edition of Marx' *Class Struggles in France* in which he modified considerably the revolutionary rigidity of Marxian philosophy. Although Ryazanov has proved that certain passages of the preface were falsified and some completely suppressed by the editor, the tone of the whole document was less revolutionary than Engels' earlier work; the importance of peaceful action was emphasized and the difficulties of revolutionary street fighting were stressed. The influence of the preface was great; Rosa Luxemburg attacked it as pernicious in its effect upon the labor movement. The growing participation of socialism in national life brought about a widening gulf between the practical needs of the movement and the formulae of Marxian socialism, which remained unchanged in the official ideology of the party. In 1899 Masaryk, who stood outside the socialist camp, saw the dangers of this antagonism and concluded that "hushing up and diplomatizing hurts the party more than

an open revision of the contested questions and the confession that the philosophical and to a large extent the sociological bases of Marxism are untenable."

The revisionist movement grew out of this awkward situation. In 1899 Eduard Bernstein published his *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (Stuttgart; tr. by E. C. Harvey, London 1909), in which he challenged the fundamental theses of the Marxian system and restated many points of the anti-Marxian bourgeois criticism. He tried to show that a gulf existed between orthodox Marxian theory and the realities of life which made the development of an efficient proletarian movement impossible. He attacked the theoretical foundation of the system and emphasized the independence and importance of ideologic factors in history. He invoked the spirit of Kant and especially of F. A. Lange and asserted that a critical revision of the whole Marxian system had become inevitable. He held the interests of society as a whole to be above class considerations. In the economic field he made many concessions to professorial criticism and to the theory of marginal utility. He contended that the concentration of industrial enterprises did not mean a concentration of property, that the number of owners of capital grows both absolutely and relatively. He saw no sign of that collapse of capitalist economy which Marxism prognosticated and found no polarization of society among the immensely rich and the starving majority; on the contrary, the structure of capitalist society had become far more complicated and differentiated. He argued that agricultural evolution especially had categorically refuted Marxian prognostications in that the peasants not only remained as peasants but the rule of the large estates was shaken all over the world. The recent trend of capitalist evolution he interpreted as showing that crises instead of becoming more and more catastrophic have been attenuated by growing cartels, which serve as a more efficient check against overproduction. In the light of these conclusions Bernstein rejected the theory of the growing misery of the masses. When dealing with the political foundations of the Marxian system he sought to refute the violence theory and overestimation of the state, and he defined socialism as a movement toward a cooperative scheme of production. He believed that no state would be able to take over even the largest and the middle sized enterprises without a collapse. He emphasized the great

importance of the peasants and their cooperative movement and the necessity of democratic agrarian reforms. His criticism culminated in the assertion that socialism must be purified of utopian elements which still remained in the Marxian system. Instead of the mechanical inevitability of communism he urged the radical democratization of the movement and cooperation with all progressive forces of society. He stressed the lasting values of liberalism and cautioned the proletariat not to overestimate its own importance and not to regard the bourgeoisie as a decadent and corrupt class.

Simultaneously a movement with the slogan *Zurück auf Kant* tried to reconcile Marxian fundamentals with the principles of critical idealism. But although both tendencies were expounded by able men and although the criticisms of Bernstein were adopted by a group of socialist leaders, the majority of the party congresses remained loyal to the rigid Marxian interpretation of the then revolutionary leader, Karl Kautsky. Although revisionism was crushed by the anathema of the official party, nevertheless the practical activity of the party was more and more determined by Bernstein's views. After the World War the Social Democratic party became the bulwark of the German Republic and assumed a revisionist role along the lines of Lassalle and Bernstein. The theoretical foundation of the party remained, however, purely Marxian.

Another movement which has also proved unable to cope with Marxian orthodoxy is liberal socialism, which originated in the Anglo-Saxon countries with the works of Spence, Ogilvie, Paine and to a lesser extent with those of James and John Stuart Mill. The doctrine was later developed with great force by Henry George, who in *Progress and Poverty* (San Francisco 1879) restated the argument against monopoly in land and urged the confiscation of land rent in the form of a single tax. The same ideas, but with different methods of solution, were advocated by Alfred Russel Wallace. The doctrine assumed its most systematic development, however, in Germany, where independently of his predecessors Eugen Dühring formulated a new system of socialism, called by him the *sozialitäres System*, in which in opposition to Marxian socialism he stressed the decisive influence of politics on economics. He declared that value is not only an economic category but is influenced fundamentally by political factors, the chief of which is *Gewalteigentum*, property created by

conquest, which leads to inequality and oppression. Dühring called for a system which would base all human relations on just reciprocity. The chief method of emancipation he believed would be the growing coalition of workers, through which the capitalist power would be met by an equal power, with justice the alternative of chaos.

Using many ideas of his predecessors and combining them with elements of the Marxian system, Franz Oppenheimer tried to reconcile liberal economic thought with an advocacy of the elimination of all unearned increment, interest, profit and rent. He set out to show that not capital in general but only the large landed estates are the disturbing factors of social equilibrium, that they are an "alien body" which breeds disease. Accepting the Marxian theory of value and vindicating all its accusations against the capitalist system, he asserts that Marx was unable to give a satisfactory explanation of the industrial reserve army. According to Oppenheimer this reserve army was created not by economic but by political means, by the violent or fraudulent expropriation of land, through which large numbers of people have been rendered landless, whose desperate competition keeps wages at a subsistence level. This situation described by Marx he regards as a consequence not of the capitalist system but of the fact that free competition, in itself a highly beneficent force, is hindered by the existence of feudal or semifeudal monopolies. The capitalist system presents itself as "a bastard of freedom and servitude," in which freedom is defined as the element of liberalism in its true sense, servitude as the existence of a class monopoly created by the theft of land and of the political institutions based on it. In this situation Oppenheimer maintains that the remedy is not communism but the division of a sufficiently large number of landed estates among workers; through this measure free competition would be restored in favor of the workers and against the capitalists and mounting salaries would liberate the former from the latter's domination. These systems of liberal socialism have exercised a comparatively small influence in the history of social movements. In Germany a modified form of the single tax doctrine, represented by Damaschke in his *Bodenreform* movement, which seeks an increase in taxation of urban land rent, has attracted a number of petty bourgeois followers.

In England Marxism never became a guiding

principle—although its intellectual influence was continually growing—but it served largely as an inspiration. After the fall of Chartistism the labor movement assumed a more opportunistic attitude. Under the hegemony of British trade and finance trade unionism was able to obtain many advantages for its members, and therefore its policy became one of cautious progress. In the atmosphere of an expanding democracy and of religious movements penetrated by social principles labor found important allies among liberals, conservatives and churchmen. The English working class felt itself not an outcast of society but a group advancing in social power with little need for independent political action. From the 1880's on, some acute critics realized the necessity of independent action, and Hyndman tried to introduce the ideas of Marxian socialism. Its abstract philosophic generalizations, however, did not appeal to the English workers. In 1884 a group of writers, scientists and propagandists founded the Fabian Society and elaborated an opportunist type of socialism which rejected the class struggle and set out to smuggle into all parties socialist ideas for carrying on socialization in various fields. They may be called the pragmatists of socialism; they built a bridge between socialists and trade unionists and were instrumental in the creation of a unified labor party in 1900.

This cautious work did not satisfy those who believed that purely reformist activity would never lead to the overthrow of the capitalist system. The same necessity that was felt in France at approximately the same time, and which resulted there in the creation of the syndicalist movement, led in England to a new variety of socialism called guild socialism. Its underlying idea was that it was not enough to engage in parliamentary struggles and to absorb the interest of the workers in the quest for higher wages and better working conditions, but that the main problem was how labor organizations can take over production and distribution. The guild socialists held that trade unions should cease to be exclusively organs of utilitarian reform and should reassume the importance of the mediaeval guilds, which were real organizations for production and distribution. In the constitutional field this type of socialism attacked the traditional conception of sovereignty; its state philosophy was pluralistic and emphasized the independent existence of other organizations besides the state.

In France the spread of Marxian socialism

was checked by the fact that the country remained largely agrarian, in the hands of an independent peasantry; big industry was counterbalanced by a strong handicraft system; there was an influential intellectual middle class; and the tradition of the French Revolution prevailed. The efforts of Guesde and Lafargue to introduce Marxian principles into France were therefore only partly successful; the teachings of Proudhon, Blanqui and Bakunin and the memory of the Commune were kept alive. Many socialist parties and sects developed, and French socialism came to be characterized by lack of organization. A group of *possibilistes* used parliamentary tactics to achieve advantages for the proletarian class and to put socialists into leading positions. When, however, the importance of the role of the parliamentary socialist increased and when in 1899 Millerand entered the cabinet of Waldeck-Rousseau with Galliffet, who had crushed the Commune, many trade union members and socialist intellectuals began to regard the reputed gains of socialism as setbacks from the point of view of ultimate aims. There was elaborated a new theory of revolutionary socialism, called syndicalism, which combines elements of Marx, Proudhon and Bakunin. From Marx it derived the emphasis on the economic basis of society and the necessity of a revolutionary consciousness, from Proudhon, the distrust of the state and the emphasis on freedom; from Bakunin, the belief in violence. Syndicalism fights against the expanding importance of the politicians and regards the trade unions as the real basis of the future society. It is a radical antimilitaristic and antipatriotic movement; the will to revolt is to be kept alive continuously by sabotage and antimilitaristic propaganda, which will ultimately prepare the working class for a general strike, by means of which capitalist society will be overthrown. Syndicalism was thus a protest against parliamentary tactics, against the petty bourgeois spirit and against the "putrefaction of democracy" which became manifest during the Dreyfus affair. It has had powerful repercussions in the Latin countries.

Marxism made its entrance into Russia in 1883 when Plekhanov founded the first social democratic group, but its progress was slow. The revolutionary movement had as its basis a Russian socialism (*Narodnichestvo*), whose chief ideologic leaders were Herzen and later Lavrov and Mikhaylovsky and which emphasized individual freedom, rejected state omnipotence, urged a cooperative rebuilding of society by the

utilization of the mir and other forms of Russian collectivism and insisted that the peasants were the only group upon which a new social order could be built. The original nucleus of the movement soon became divided. One group ended with nihilism, repudiating all traditional values and favoring individual terroristic acts; the second, the Social Revolutionary party, which remained closest to its source, disagreed with the industrial formulae of Marxian communism; the third group, centering around Plekhanov, formed the Social Democratic party on a strict Marxian basis in 1898. The situation was propitious for revolutionary movements. Official Russia through its policy of repression had Europeanized legions of Russians and educated them to revolution. Terroristic pressure made Russia for decades a hotbed of anarchist revolts; artificial industrialization and the forcible Russification of the native population made the atmosphere even more tense. As the peasantry was easily crushed, the urban proletariat became the center of gravity of the revolution. The emotional religiosity of the people was a fertile ground for gospels of social reconstruction. In 1903 the Bolsheviks, who favored a radical, centralizing and dictatorial program, gained control within the Marxian party over the Mensheviks, who favored more caution and advocated cooperation with all the revolutionary elements of society. This schism became accentuated during the revolution of 1905, the rehearsal of the revolution of 1917, which was bourgeois and constitutional until the Bolsheviks came into power.

In the United States socialism made little headway; the possibility of social ascendancy, better living standards, free political institutions; the absence of feudalism, of an inferiority complex on the part of the workers and of hereditary haughtiness on the part of the bourgeoisie; and the existence of free land, all these factors made the idea of class struggle unpalatable. The influence of Fourier, Owen, Cabet and Proudhon was apparent in the establishment of a number of utopian colonies. The first mass movement following a socialist pattern was the Knights of Labor (1877-87), which in many respects was markedly analogous to the Chartist movement. After its collapse the American Federation of Labor became the promoter of a trade unionist policy of the orthodox type. A reaction against this spirit of compromise was the ideology of industrial unionism, whose most influential leader was Daniel DeLeon, a man whom, ac-

cording to Rasky, Lenin considered "the greatest of modern socialists, the only one who added anything to socialist thought since Marx." Industrial unionism fought against craft unionism and against reformism of the western parliamentary type represented by Morris Hillquit. DeLeon campaigned against Kautsky when the latter was still the acknowledged revolutionary leader of European socialism, and he was treated as an anarchist. The ideology of the movement had much in common with French syndicalism, with the important difference that it stressed the necessity of a centralized and disciplined leadership. It was not unlike Bolshevism, except that it did not accept the idea of the dictatorship of the proletariat, maintaining that in highly industrialized countries like the United States such a political structure would be unnecessary.

The World War changed the status of Marxian socialism considerably and led to a crucial schism within the movement. The patriotic participation of the leading socialist parties put an end to the inspiring legend that the unity of the working class would maintain the peace of the world through the International. The proletariat instead faced governments which stressed national concentration, and the imperialistic war was supported by the socialist parties of the allied countries as a war of liberation against czarist oppression and by those of the Entente as a war for democracy and national self-determination. The resulting suffering of the masses provoked vehement criticism against the Second International and formidable moral conflicts among its leaders. In April, 1915, Rosa Luxemburg accused German Social Democracy of having betrayed "the fatherland in the hour of greatest danger. For the first duty in that hour . . . was to show the background of this imperialistic war, and to tear asunder the fabric of patriotic and diplomatic lies. . . ." Instead the leaders of the Social Democratic party collaborated with the imperialistic system and secured for it popular support. Friedrich Adler, as a symbolic protest against the manoeuvres of the Austrian Social Democratic party, killed the Austrian premier and at his trial vehemently attacked the party for abandoning the thought of social revolution. The feeling of rebellion became more embittered when in Germany the socialists in power, under the leadership of Ebert and Noske, participated in crushing the Spartacus movement and at least tolerated the counter-revolutionary organization of former

officers which killed Karl Liebknecht and Rosa Luxemburg. The Second International was likewise discredited by the bureaucratization of the socialist parties, especially in Germany; the leaders tended increasingly to become comparatively well paid party officials entitled to pensions. Membership in the party became almost traditional—it was said that the proletarian worker was born into the Social Democratic party as was the Catholic German peasant into the Center party. There was also growing dissatisfaction with the fact that the victorious socialist parties of Germany and Austria did not try to realize their Marxian program; they fought for democracy and social reforms but did not take a single step toward real socialistic measures.

In 1917 this revolt of the masses found powerful leadership in the Russian Revolution, after which began a vast experiment toward the establishment of a communist state. Lenin, Trotsky and other professional revolutionists elaborated a new doctrine of Marxian socialism, conveniently called Leninism, which denounced the tactics of the Second International, its outlook and its theoretical background. The Communist Third International was founded in Moscow and a bitter campaign was organized against the "social patriots," the "social traitors" of the Second International who "falsified the principles of true Marxian socialism." Social Democracy of western and central Europe refused to participate in the preparation for the world revolution and in England, Germany, Austria and Czechoslovakia accepted cooperation in the government of bourgeois states. This meant defense of bourgeois democracy against the attacks of the communists and led to a further modification of the practises and ideologic formulae of the Second International. The abyss between the Second and the Third Internationals became unbridgeable, in spite of the endeavors of the Austrian Marxists, who tried to restore the original intransigency of the doctrine.

The rebirth of revolutionary Marxism was caused also by economic developments. Before the World War there was a marked tendency toward prosperity and a diminution of the crises; the gloomy economic laws of Marx were considered definitively repudiated by the facts. After the World War, however, unheard of misery afflicted many European countries; and following a short period of relief a world crisis of unprecedented magnitude commenced to strange mankind. This crisis was interpreted by the

Bolsheviks as the full realization of the Marxian formulae, as a colossal *Verelendung* due to technical progress and imperialist expansion. The many other explanations of the crisis—the consequences of the World War, the growing trend of economic nationalism, the rebirth of mercantilism, the new system of pseudo-capitalism, new frontier barriers, reckless lending and borrowing, ruthless inflationist policies, the spendthrift expenses of military dictatorships, the race for armaments—did not temper the expectation of the final collapse of the capitalist system.

According to Stalin, "Leninism is Marxism in the epoch of imperialism and of the proletarian revolution," which means that the Bolshevik doctrine has reconstituted the original revolutionary purity of the Marxian doctrine and has developed according to the necessities of a new situation. The Bolshevik doctrine is an accentuation of all the revolutionary elements of Marxism with the omission of its later moderating elements. The Bolsheviks seek the complete destruction of the capitalist state; they advocate mass insurrection and class terrorism; they develop the Marxian idea of the dictatorship of the proletariat; they stress the necessity of a transitional period between capitalism and communism through state socialism. If this final aim should be realized, there will be no need for the state, its withering away will be achieved mainly by the radical simplification of state functions. However, until the ideal of a stateless society has been reached, the state will not diminish its power but will on the contrary intensify it. Only through vigorous dictatorial power can the enemies of the proletariat be crushed, the structures of communist production be established and the people become accustomed "to observing the elementary conditions of social existence without force and without subjection." There must be a system of compulsory and universal state education, and religion must be destroyed through mass propaganda and the removal of the social conditions which promote its influence upon the masses.

There are several aspects of the Bolshevik system which seem to be distinct additions to the former ideology. The "scientific" and mechanical materialism of the Marxian successors has been transformed into a dialectic materialism; that is, from a static, metaphysical theory into knowledge of historical reality, from an evolutionary into a revolutionary theory. The Bolsheviks follow the thesis of Marx that "the im-

portant matter is not to know but to change the world." There is no abstract theory; the movement, the carrier of which is the proletariat, must itself be understood. Economic propaganda alone is inadequate; a general world view must be implanted in the proletariat. Therefore whereas in earlier literature the intellectuals played an almost despised role, Lenin attributed capital importance to the work of revolutionary intellectuals. Lenin realized the central importance of the agricultural problem, that without the assistance of the peasant masses there cannot be a successful revolution and without the socialization of peasant property true communism cannot be achieved. This is a problem which western socialism has not dared to face. The fundamental importance of the national problem was already acknowledged from a theoretical point of view by the Austrian school of socialism, especially by Otto Bauer and Karl Renner; but through Bolshevism the nationalistic point of view became a world force, with its emphasis on the principle that only "internationalism can satisfy nationalism." In the communists' campaign for world revolution the propaganda for national and racial emancipation has played perhaps a more decisive role than the fight for communism. The extreme importance of imperialism had been recognized in Hilferding's *Das Finanzkapital* (Vienna 1910) and in Luxemburg's *Die Akkumulation des Kapitals* (Berlin 1913), which contain the main elements of a doctrine of imperialism. Socialists like Cunow, Lensch and Parvus, impressed by these ideas, tried to show during the World War that a German victory would mean German imperialism and that a higher economic organization, propitious to the further development of socialism, would result. There was no place for such reactionary opportunism in Lenin's theory of imperialism. Economic imperialism is for him the climax of capitalist development; it means the replacement of competition by monopoly through trusts, syndicates and gigantic banks. Free competition goes hand in hand with democracy, monopoly with political reaction. The entire earth has been divided among the wealthiest countries and the system of capitalist monopolies will inevitably produce a rise in the cost of living and intensify the class struggle. This tension will be aggravated by national and racial oppression. There is no possible transition from monopolistic capitalism to socialism. Although atheism was always the preponderant mental attitude of Marxian socialists, the parliamen-

tarian competition for mass support led to the acceptance of the slogan, *Religion ist eine Privatsache*. To Bolshevism, on the other hand, militant atheism is absolutely fundamental.

The capital difference between the old and the new ideology of socialism is that whereas before the World War the revolutionary doctrines of Marx were only theoretical, they have now been put into practise in a vast country possessing one of the strongest military and police organizations of the world. Instead of waiting for slow evolution in the Soviet Union under the leadership of the small Communist party a revolutionary effort is being made to establish the prerequisites of the communist state: to create the industrial equipment for socialization, to eliminate the remnants of the bourgeois class, to collectivize the peasants, to establish a strong proletarian army, to develop the communist pattern of human nature. The Bolsheviks have introduced military discipline wherever necessary; they use the system of deportation against the kulaks; they accept methods of piecework wages and the Taylor system; they impose tremendous sacrifices on the working class in the belief that the end, the transformation of the lives of the masses in terms of the communist ideal, justifies the means.

Kautsky, Diehl, Schmidt and others declare that such doctrines and practises have nothing to do with true Marxian thought, while the Bolsheviks and academicians, such as Sombart, Liefmann and Brutzkus, maintain that Bolshevism is the only logical outcome of Marxian doctrine and that the Bolsheviks are "the legitimate executors of the Marxian heritage." The anti-Bolshevik thesis has been most clearly stated by Kautsky, who argues that "nowhere will the workers abdicate those liberties which they have hitherto acquired and which are dear to them." He contends moreover that according to Marx the new society must be preformed in the capitalist society before any serious revolution can be accomplished, whereas in Russia capitalism had only a rudimentary beginning. The communists, supported by many bourgeois thinkers, reply that the present stage of Russian communism is not real communism but is only a transitory stage. Furthermore Russia although very incompletely capitalized was the weakest link in the capitalist chain. The answer given to the preformation argument is that Marx already in 1848 and several times during the nineteenth century regarded the European situation as ripe for a communist revolution, and therefore Lenin

could regard Russia in 1917 as ready for this transformation.

RETROSPECT AND PROSPECT. The controversies created by the Marxist school fill a library; only a very few can be mentioned here. In the philosophic field the Marxist system has an inner contradiction; it represents a fatalistic and mechanistic interpretation combined with an activist and revolutionary practise. It asserts the economic origin of all change, but it does not explain how the change occurs in the economic structure itself. The "forces of production" assume almost a fatalistic role while the creative spirit is neglected; yet no new type of civilization is simply the result of economic forces but is more or less a conscious work of a new vital and moral type. Capitalist civilization was created by the new bourgeois, as opposed to the older seignior type. Now the bourgeois type is decaying both intellectually and morally; hostility and disgust are growing against sheer wealth (Scheler).

In connection with the *Uberbau* theory it must be recognized that the cause and effect relationship between social phenomena is not one-sided but involves mutual interdependence. The investigations of Troeltsch and Max Weber have tended to prove that religious conceptions have an independent development and have reacted on the economic series. Similarly, economic relations are at the same time legal relations and economics is meaningless without a correlative system of law (Stammmer). The history of science also shows the relative independence of great scientific discoveries.

In regard to human nature there is a marked trend toward a purely economic or environmental interpretation, whereas Sorel, De Man and others clearly recognize the enormous importance of an independent moral idealism and of a heroic attitude in the emancipation of the working class.

In the field of economic theory the main criticism of the Marxist system has been directed against the exclusive labor theory of value. Bohm-Bawerk, Loria and others have shown that Marx in the third volume of *Das Kapital* practically abandoned the labor theory of value set forth in the first volume. The importance of this controversy was, however, exaggerated. Even several adherents of Marxian thought have discarded the theory and it has been demonstrated that the Marxian edifice would remain intact without it, provided that the dynamic

tendencies of capitalist evolution described by Marx and attacked by the revisionists were correct. More important is the consideration that a perfect equality of remuneration and, even more, a remuneration according to need would mean a system of exploitation to the detriment of the abler, more diligent worker. Besides it might easily be possible for the present "surplus-value" to flow, in an even greater amount, into the pockets of soldiers and bureaucrats. Furthermore many capitalists cannot be qualified as simple parasites, since they accomplish the highly trained work of organization which is absolutely necessary for a progressive economy. Because of the elimination of competition the new system would find it difficult to determine which branches of the economic system are productive and which are not. But the gravest danger is overcentralization, the unlimited power of bureaucracy, which inevitably means also the danger of a growing militarism and police force. Communist economy must lead toward the totalitarian state, a leviathan state more enormous than mankind has ever known. The theory of the unlimited plenty of a communist society has been seriously attacked by Pohle, Cassel and Liefmann. Since Proudhon it has been correctly argued that the complete suppression of private property would mean slavery, and John Stuart Mill asserted that "the principle of private property never had a fair trial in history."

In the field of political theory the Marxist assertion that the state is simply an organ of economic exploitation is an exaggeration. The present dominance of the capitalist class is not due to a dictatorship but to the fact that the forces of democracy are not sufficiently organized, while popular culture is very low. The belief that the communist state will necessarily put an end to class struggle and establish a classless society may be questioned. The growth of social democracy has been followed by the emergence of a fifth estate; everywhere there has been a growing antagonism between intellectuals and non-intellectuals, between those who administer and those who are administered. The slogan that in a communist state the rule of men over men will be replaced by the administration of things by men may be answered in Kelsen's words: "There is no administration of things which would not be administration of men and there is no directing of production processes which would not be a government over persons." It may be argued further that no higher society can

be developed on the ruthless revolutionary tactics of civil war and terrorism. As Bertrand Russell has remarked, "There is no alchemy by which a universal harmony can be produced out of hatred." No economic order can be maintained by purely economic and coercive means, because, as Durkheim has shown, "the individual abandoned only to the pressure of his needs will never admit that he has arrived at the extreme limit of his rights. . . . In order that it should be otherwise, the existence of a moral power is necessary, a power whose superiority he recognizes and which tells him, 'You cannot go farther.'" As to the realization of a totalitarian communist state, it would inevitably lead to a *bellum omnium contra omnes*, because not only the capitalists but also the entire middle class and the peasants would bitterly oppose a system which menaced them with the total extinction of private property and personal freedom. The collapse of socialism in Germany is evidently connected with this fear complex of vast masses.

Whatever the scientific residue of socialist ideology may be, it has made a significant contribution to civilization. It has exercised a beneficent influence on the social sciences; it has destroyed the complacency of bourgeois science and laid bare the sore spots of contemporary society. It has organized the working class, filled it with a sense of human dignity and made it a conscious cooperator in the historical process. It has fostered a growing feeling of internationalism which mankind has never witnessed before. It has denounced war and all kinds of exploitation. And although its attack against religion has sometimes been narrow, it has contributed vitally to the elaboration of a new moral synthesis to replace the decaying old religion of the masses. "If communism achieves a certain success," Keynes has said, "it will achieve it not as an imposed economic technique, but as a religion." Socialism is not therefore a concomitant of modern industrialism nor is it, as Nietzsche and some of his reactionary followers contend, simply the resentment of the hungry and oppressed, a kind of slave uprising against the natural privileges of the superman. There has been a remarkable continuity in the socialist movement, which is derived from a deep common stock of ideas and emotions. It is not bound to any form of social or economic organization, but arises everywhere and at all times when this common inheritance of human nature is offended. These fundamental moral values were the real source of the revolutionary law of nature,

later adopted and divinized by early Christianity. The fight for religious and political freedom in later centuries was a logical continuation of the same development. And when religious and political equality, and to some extent national equality, were achieved, socialism necessarily appeared as a drive to economic equality.

The present setback of socialism in western Europe and its collapse in Germany and Italy do not indicate the downfall of socialist thought; they simply mean that western socialism needs a new ideologic synthesis more in accordance with social and moral realities. The growing fear of Bolshevism, the ideologic rigidity and practical impotence of the Second International, which seems unable to give new life to western socialism, serve as pretexts for counter-revolutionary forces in the organization of fascist, essentially capitalist, dictatorships. Lacking a new socialism, communism will remain the only ideologic system with a sufficient fighting force against nationalistic and militaristic fascism, because, however great the difficulties and logical contradictions in Bolshevism may be, the colossal attraction of its ultimate vision, combined with a heroic activism, will continue for mankind with the growth of intelligence and moral freedom. As John Stuart Mill said more than eighty years ago: "If . . . the choice were to be made between Communism with all its chances and the present state of society with all its sufferings and injustices; if the institution of private property necessarily carried with it as a consequence, that the produce of labour should be apportioned as we now see it, almost in an inverse ratio to the labour—the largest portions to those who have never worked at all, the next largest to those whose work is almost nominal, and so in a descending scale, the remuneration dwindling as the work grows harder and more disagreeable, until the most fatiguing and exhausting bodily labour cannot count with certainty on being able to earn even the necessities of life; if this or Communism were the alternative, all the difficulties, great or small, of Communism would be but as dust in the balance."

SOCIALIST PARTIES. The origin of socialist parties may be traced to the rise of the industrial proletariat, just as the more remote lineage of the European liberal and conservative parties goes back to the mediaeval estates. The peculiar ideology acquired by each of the older parties is paralleled by the position which Marxism has held since the nineteenth century in the class policy of the industrial workers. If Marxism be interpreted, in this context, as aiming to replace

the capitalistic system by the socialization of the means of production, socialist parties may be defined as those political parties of industrial workers which are striving to realize the transformation of the prevailing political and economic system in accordance with the teachings of Karl Marx. The parties formed after 1914 as a result of secessions from the older socialist parties and now united in the Communist International have been treated elsewhere (see COMMUNIST PARTIES), as have the labor parties (*q.v.*) of Anglo-Saxon countries. While the latter have never formally subscribed to Marxist tenets, from the beginning they have had significant relations with the professedly Marxist socialist parties and since the World War British Labour has evolved into the leading socialist party of the world.

As a result of the slower pace of their industrial development the continental countries, where socialist parties originated and have attained their greatest success, failed until 1848 to produce a labor movement remotely comparable with that of England. In the form of Chartism the first genuine labor party had appeared in England before the publication of the fundamental doctrines of scientific socialism. Upon their arrival in England Marx and Engels, realizing the significance of the Chartist movement, sought to establish connections with its leaders and were disposed to convert it into a Marxist party, until its decline in the 1850's disappointed their hopes.

During the period when Chartism was at its height the only continental parties which stood to the left of the liberals were composite groups representing the poorer and more radical elements of the population in general—petty bourgeoisie, peasants and intellectuals as well as workers; it was such democratic movements which constituted the force behind the revolutions of 1848-49 in Germany, France and elsewhere. In 1847, however, the Communist League had been founded under the leadership of Marx and Engels. Marx and Engels intended that the league should join in the revolutionary struggles as the left wing of the democratic movements and after the victorious consummation of this first stage carry the revolution beyond its bourgeois limits. But even in Germany, where most of its following was recruited, the Communist League never became a real political party. Weak both in numbers and in the techniques and agencies necessary for effective agitation, it was unable to exercise an inde-

pendent influence on the masses and finally collapsed in 1852.

The first Marxist to win a few thousand workers from bourgeois liberalism and to weld them into a well knit and permanent organization carrying on an overt campaign of nation wide scope was Ferdinand Lassalle. In 1863 Lassalle founded in Germany the earliest real socialist labor party, the *Allgemeiner deutscher Arbeiterverein*. His organization, surviving his death in 1864, was to become the basis of the German Social Democratic party and the model for all other socialist parties. Parallel to the *Allgemeiner deutscher Arbeiterverein* there arose a second small German socialist party, created by August Bebel and Wilhelm Liebknecht and formally launched in 1869 at Eisenach as the *Sozialdemokratische Arbeiterpartei*. The designation social democratic was also used by Lassalle's party; henceforth this term, which in the earlier period had been applied to all democrats with an interest in social problems, or socialist, which had formerly been a generic name for social reformers, was generally assumed by Marxist groups, while communist, the term used in 1848, fell into discard. Between the two German socialist labor parties an important difference existed. The group founded by Liebknecht and Bebel was strongly anti-Prussian and *gross deutsch*, whereas Lassalle's followers accepted as inevitable the unification of Germany under Prussian leadership. Marx and Engels, accusing the Lassalleans of excessive submissiveness in their attitude toward the Prussian government, became increasingly estranged from them, until finally an open break resulted. It is curiously ironical that the first real socialist labor party was disdained by Marx.

☞ The First International, which was established in 1864 under the leadership of Marx and which dominated the international labor movement for the next decade, can scarcely be considered to have been a cartel of socialist parties. Its basic nucleus consisted of the English trade unions, which after the decline of Chartism began to take a growing interest in political questions. In addition it included certain labor groups from the Latin nations, America, Switzerland and other countries; these were more or less loosely organized and varied greatly in ideology and tendency. The only genuine labor parties in the International were the two German parties and of these the Lassallean group soon withdrew. In France no socialist or labor party was in existence even at the time of the great uprising

of the Parisian workers which culminated in the Commune of 1871, while the disastrous defeat of the commune prevented the emergence of a socialist or revolutionary organization of French workers for many years to come. After the English trade unions abandoned active politics the International broke up as a result of the fundamental unsoundness of its structure.

In 1875 at Gotha the two German parties merged as the *Sozialistische Arbeiterpartei Deutschlands*, a name soon changed to *Sozialdemokratische Partei Deutschlands*. With the new united front German Social Democracy entered upon a period of steady numerical expansion. Even the laws promulgated by Bismarck in 1878 against the labor movement involved only a temporary setback. During the 1880's Marxist parties and groups arose also in France, Italy, Austria, Scandinavia, Holland and Belgium. In 1889 all these socialist parties combined in the Second International, which lasted until 1914.

During this era the socialist parties succeeded in enlisting the majority of the industrial workers in Germany, France, Italy, Austria-Hungary, Switzerland, Holland, Belgium, the Scandinavian countries, the Balkans and, despite enormous difficulties, in Russia. In England, on the other hand, notwithstanding numerous attempts to found socialist parties on the model of the continental parties, a socialist mass party failed to develop before 1914. The English trade unions increased in significance but confined themselves almost exclusively to their economic functions. The majority of the English workers continued to vote for the Liberals or even for the Conservatives and did not recognize the necessity of a separate socialist labor party. Even the Labour party, which appeared in the House of Commons in 1906, was nothing more than an appendage of the great Liberal party and in the years preceding the outbreak of the World War had only from about 30 to 40 representatives in the English Parliament out of a total membership of 670. In the United States also, although the present Socialist party was founded in 1901, the overwhelming majority of the workers continued to cast their ballots for the two great bourgeois parties. Nor did the Second International acquire any significant influence in Asia, Africa or South America. The strong Labour party of Australia, which achieved political power even before the World War, pursued its separate course. Thus to all intents and purposes the socialist parties of the Second International were confined to continental Europe.

By far the largest and best organized party of the Second International was that of Germany, especially after the laws restricting socialist activity in that country were revoked in 1890. At the outbreak of the World War the German Reichstag included 110 Social Democratic deputies out of a total membership of 397. By virtue of their revolutionary and theoretical activities the Russians also occupied a position of great significance in the International, while the Anglo-Saxons and the Latins played a subordinate role. The outstanding theorists of the socialist parties were the German Karl Kautsky and the Russian Plekhanov. The undisputed political leader of the International, after the death of Friedrich Engels, was August Bebel, the leader of the German socialists.

All the parties of the Second International were confronted by a basic dilemma. Owing their existence to the growth of industrial capitalism and to the rapidly expanding army of industrial proletarians, the parties were, on the one hand, the political representatives of working class interests. But since they had accepted as their ideological basis the revolutionary Marxism of 1848, it was also their avowed purpose to capture political power by revolutionary means and to abolish the private ownership of the instruments of production.

During the period between 1889 and 1914, both in the United States and in all the European nations except Russia, the position of the established governments and of the existing social order seemed too impregnable to offer any opportunity for serious revolution. The socialist parties were everywhere in a minority, and outside of Russia no revolutionary bourgeois groups existed with whom they could combine to overthrow the government. Hence none of them except the Russian carried on any real preparatory work for revolution, nor did any of them even visualize a socialist revolution with any degree of clarity. Had they been merely occupational parties of the working classes, their task of formulating a practical routine policy and program would have been comparatively simple. They would naturally have taken the same attitude toward state, nation, army and foreign policy as would, for instance, a peasants' party; they would merely have represented the interests of the workers within the framework of the existing political order and with legal means. Such a policy they might perhaps have pursued with resoluteness and clarity, had it not been for the complications resulting from their ad-

herence to Marxism. Yet they clung tenaciously to Marxist theory, despite the impossibility of realizing it in practise, because this theory provided the ideological force which distinguished them from the bourgeois parties and gave *élan* to the socialist organization.

It was natural that Marxism itself should undergo certain modifications in the course of these developments. What the socialist parties of the Second International took over was not the realistic and empirical revolutionary doctrines of 1848 but rather a system of dogmas which sought to supply a definitive answer to every question. The sum of these answers represented the party ideology. Friedrich Engels clearly recognized the ideological shortcomings of the Second International, although he was powerless to alter its course. While the Russian socialists took a revolutionary stand even during the period of the Second International, almost all the theoreticians among them were convinced that the imminent revolution in their country would be bourgeois rather than socialist. In Russia therefore Marxist doctrine was used to demonstrate the necessity of developing bourgeois capitalism and to work out the organization and technique fitted to the bourgeois revolution. The contradiction between the practical activity of the socialist parties and the ultimate Marxist goal is the basic explanation of all the vacillations, dissensions and difficulties with which the history of the parties down to 1914 is replete.

◀ All socialists of the Second International were agreed on matters of practical social legislation, such as the eight-hour day, increased wages and improvement of working conditions. Likewise they all favored democracy, universal suffrage and the vesting of supreme authority in the decisions and assemblies which were based on universal suffrage. The Russian socialists were no exceptions in this respect, for they planned to convoke after the victorious revolution a Russian national assembly, which should establish a democratic and republican constitution. In principle the republican form of government was favored by all the socialist parties, but in practise they carried on an active struggle against monarchy only in lands, such as Germany and Russia, where monarchy was of a feudal and semi-absolutistic type.

The socialist parties experienced particular difficulty in defining their relations toward state and nation. In view of the impossibility of carrying out a revolution the only policy which they

could adopt toward the existing system without repudiating Marxism was one of passive intransigence. The symbolic expression of this attitude was the opposition carried on by socialist parliamentary deputies toward the government budget. They criticized all measures proposed by the governments and voted against them. In particular the nationalistic, imperialistic and militaristic policies characteristic of the great powers in the generation before the World War came under the constant fire of the radical socialists, who made the support of international pacifism part of their daily routine. This involved a highly significant modification of Marxism, for Marx and Engels had always recognized war and force as decisive weapons and had moreover approved the existence at least of the great nations. Their only demand had been that the proletariat "must constitute itself the nation." The pacifism of the parties of the Second International was a specific result of their inability either to approve the existing order or to alter it by revolution.

This policy of unflinching obstructionism without real preparation for the revolution was characteristic of official socialism and until 1914 was the general direction followed by the German party executives, the majority of the Italian party and the international socialist congresses. But disagreement over the major political problems led to the development of internal cleavages both to the right and to the left.

To the right of the official radicals stood the revisionists. Refusing to allow their day to day policies to be determined by reference to what they regarded as a chimerical final goal, they strove to achieve practical gains for the working classes within the framework of the existing order. They saw no reason to shrink from compromise and would have welcomed any bourgeois allies who could be induced to support their routine policy. Minorities in the German and Italian parties belonged to the revisionist faction. In France an unusual opportunity was offered to the revisionists by the bitter clash, dramatized in the Dreyfus affair and the anticlerical movement, between opposing factions of the bourgeoisie, the monarchistic and authoritarian right and the liberal and democratic left. Taking advantage of the situation the revisionist wing under the leadership of Jaurès joined the bourgeois liberals in a left bloc for the defense of the republic. In this way the French socialists became for a long time a government party. Despite vehement protest on the part of the

radical members of the Socialist International, they even contributed to coalition cabinets of the left individual ministers, such as Müllerand and Briand, both of whom eventually went over to the bourgeois camp.

The left wing of the socialist parties consisted of those members who discountenanced the unsubstantial Marxism of the center because they were convinced of the imminence of a period of great wars and revolutions. They believed therefore that the workers should make ready for real revolutionary activity, study the doctrines of the Russian revolution of 1905-06 and equip themselves for a general strike. Numerically weak, the left wing of the Socialist International was confined chiefly to the Rosa Luxemburg group in Germany and a small Marxist coterie in Holland.

Within Russian Social Democracy official radicalism in general was represented by the Mensheviks and the left by the followers of Trotsky. There were also certain adherents of revisionism. The Bolshevik group under Lenin, taking a unique stand, denied the advisability of building a mass party of workers organized on democratic principles and made it their chief objective to develop a highly disciplined nucleus of professional revolutionaries, who would be able to assume the leadership of the workers and peasants in the uprising against czarism.

The factional antagonisms within the socialist parties led to several open schisms. The Russian Bolsheviks broke away in 1903. In French socialism various conflicting parties and groups existed from the very beginning and it was not until 1905 that they achieved even a formal unity. Schisms also occurred in Holland and Bulgaria in the period prior to 1914.

The international affiliations between the individual socialist parties were very loose. International congresses, such as those held at Amsterdam in 1904, at Stuttgart in 1907, at Copenhagen in 1910 and at Basel in 1912, were convened at intervals of several years but their decisions exerted no profound influence on the policies of the individual national parties. The function of coordinating the parties rested with the International Socialist Bureau, established in 1900 at Brussels, but this organization was devoid of executive power. Since a strong and active international organization would have been a prerequisite for any serious struggle against nationalism by the socialist parties, its absence is further indication that their profession of internationalism was merely formal.

Parallel with their own organizations the socialist parties in all countries endeavored to create trade unions. The latter were intended to direct the purely economic and industrial disputes between workers and employers and were to recruit as many workers as possible, even those still indifferent to political radicalism. Although nominally independent, in practise those unions which were under socialist leadership worked in cooperation with the party. In Belgium the Socialist Labor party was nothing more than a cartel of the political, the trade union and the cooperative organizations.

In order to attract the laboring classes the socialist parties were forced to wage war on two fronts. In the first place they were confronted by the problem of winning over workers who thus far had been satisfied with the bourgeois parties. This group included most of the workers in England and in the United States as well as those in Germany who belonged to the Catholic Center party. On the opposite front were arrayed the numerous workers who took the syndicalist view. These rejected the bourgeois parties but believed that no political party whatsoever could help them. Maintaining that the socialist party only became corrupted in the capitalistic parliament, they wished the working classes to abandon the parliamentary conflicts and to confine their attention to their occupational organizations, the trade unions, which should carry on the struggle for power through direct action and particularly through the general strike. Irreconcilable opponents of the socialist party, the syndicalists repudiated the trade unions dominated by socialist leaders and ideas and set up rival unions of their own. While they were comparatively weak in the Anglo-Saxon countries, the syndicalists controlled the majority of the workers in Spain and had considerable influence in France and Italy. In France, for instance, the socialist party could make little headway with the trade unions because of syndicalist resistance.

The great historical achievement of the Socialist International during the period between 1889 and 1914 consists in its having effectively raised the self-consciousness, the standard of living and the cultural level of the proletariat in all the countries where it held the leadership of the workers. At the same time, however, the Second International spread an abstract and unrealistic dogmatism that was neither clearly revolutionary nor outspokenly reformist. In times of peace such a formal radicalism was in-

nocuous enough, for the strong bourgeois political power protected it from its own consequences. But socialist parties so oriented could not withstand a serious crisis. This became apparent with the outbreak of the World War.

The collapse of the Second International in 1914 cannot be attributed to the inability of the socialists to prevent the war, since they were in a minority in all the belligerent nations and none of the war cabinets was under socialist influence. Nor can the socialist workers be condemned for participating in the defense of their country: Marx and Engels had never challenged the right of national defense. Nevertheless, when the socialist parties in Germany and France as well as in Austria and Belgium approved the war credits and established a truce with their governments and the bourgeois parties, the daydream of radical intransigence vanished into thin air. The party members were cut adrift from their historical moorings, and the party organizations themselves in this unaccustomed situation became inert and followed meekly the dictates of their governments. In Russia, on the other hand, where the socialists had always pursued a genuinely revolutionary goal, the majority of the party opposed the government's war policy. The Socialist party of Italy also remained in the opposition; here, however, the division of the bourgeois parties on the question of entry into the war eased the problem for the Socialists. But in any case, with the German and Austrian socialists ranged behind the Central Powers and the French, English and Belgian socialists supporting the Entente, the International was shattered.

As the war continued, however, certain groups among the socialists began to oppose the truce, and the desire to resume the class struggle re-emerged. This was particularly true in Germany, where in 1915 the opponents of the truce withdrew from the majority socialists and in 1917 formed the Independent Social Democratic party. At conferences held at Zimmerwald and Kienthal in Switzerland the socialists of the neutral countries together with the Russians, the Italians and the independent elements in Germany, France and elsewhere sought to revive the International. But the Zimmerwald movement was itself lacking in unity. Whereas the majority wished to reestablish the old International on the basis of repudiation of the truce policy, Lenin, who as early as 1914 had pronounced the Second International dead, insisted upon the creation of a Third International of active revo-

lutionaries fitted to carry on the world uprising which he confidently expected would follow upon the World War. The left Zimmerwaldians under Lenin's leadership attracted only a scattered following outside of the Bolsheviks, and the Zimmerwald movement left no permanent organization.

For the German and Austro-Hungarian bourgeois revolutions, which came in 1918 as a result of the complete exhaustion of the masses, the widespread yearning for peace and the discrediting of the reigning governments, the socialists had done nothing to pave the way. Hence they were hardly able to convert them into socialist revolutions. It was purely a result of historical circumstances that after the collapse of the monarchy the leadership of the German Republic as well as of the new states of Austria, Czechoslovakia and Hungary passed into their hands. In Russia after the bourgeois revolution of February, 1917, the Mensheviks, or democratic socialists of the western European type, joined the government of the short lived bourgeois republic. With the Bolshevik revolution of October, however, the Menshevik party was annihilated.

The Bolshevik victory, with the resulting party dictatorship and inauguration of state socialism, made a profound impression upon workers all over the world. Lenin's call to the workers of all nations to abandon the disintegrated Second International and join the revolutionary Third International was received with enthusiasm. During 1919 and 1920 all the socialist parties except British Labour experienced serious internal convulsions and disturbances. The majority of the workers in Germany, France, Italy and many smaller countries were ready to adhere to the Third International, which had discarded the compromised name of socialist and called itself communist in the spirit of 1848. That the apparently impossible task of reviving the socialist parties and reconstructing the Second International was successfully performed in these circumstances must be laid to the policy adopted by the Bolsheviks themselves. The Russian leaders had no desire to create a free community embracing all workers. They wished rather to enjoy complete control of parties in other lands and to make them serve the interests of the Russian state. For this reason the Bolsheviks repelled the majority of the socialist workers originally attracted to them and were able to organize into the Communist International only a minority of the international

proletariat. Many socialist parties and groups which had at first sympathized with the Third International united to form the Vienna International, and at the Hamburg Congress of 1923 they joined the other socialist parties in the Labor and Socialist International, with headquarters now located at Zurich. The International Federation of Trade Unions, which had been established before the war under socialist leadership, was reorganized in 1919 at Amsterdam, where its central office was located until 1931. Afterward it was transferred to Berlin, and now its seat is in Paris.

In the history of the socialist parties the decade 1923-33 was marked by struggle against the communists on the one hand and against the bourgeois counter-revolutionary movements, such as fascism and national socialism, on the other. The pre-war tradition of abstract radicalism had to be abandoned by the socialists, and its perpetuation fell rather to the lot of the communist parties. In taking up the task of building a new theoretical and tactical foundation the socialists turned to pre-war revisionism for their guiding principles. It was the English socialists, carrying on the tradition of the Fabians and the guild socialists, and the Austrians, the so-called Austro-Marxists, who made the most important contributions to these theoretical developments.

The socialist parties now emphatically proclaimed their intention to attain power only through democratic means rather than through the forcible dictatorship of a minority. The use of force was said to be permissible only when a reactionary minority wrested power by violence from the democratic-socialist majority of the nation. The socialists of all lands also openly announced that they were working for reforms within the framework of the capitalist society. Recognition of a constitutional monarchy, coalition with bourgeois parties, participation on the part of socialist ministers in bourgeois governments and approval of the budgets of capitalist states, all came to be regarded as consistent with socialist theory: the decision in each case was to be made from a practical point of view. Yet despite all these compromises the parties did not renounce the objective of carrying on a definitive struggle against the capitalist economic system and setting up a socialist society.

The difficulty which the socialist parties experienced in attempting to develop a realistic and activist policy from one based on abstract slogans is particularly well exemplified by the German Social Democrats. Their abstract re-

judication of the old empire became transformed into an equally abstract support of the new republic, of which they assumed the leadership on November 9, 1918. They came to identify themselves with that republic and thus were swallowed up in its catastrophic overthrow in 1933. This was the more ironical because the Social Democrats had early lost their leadership of the republic. The division between majority socialists and the independents until their union in 1922 and subsequently the rivalry between communists and socialists dissipated the force of the socialist working classes. The bourgeoisie soon recouped its powers under the republic, and since 1923 except for brief intervals the German national government has been wholly bourgeois, although until 1933 the socialists continued to share in the local administrations of the states and municipalities. The Social Democrats, however, still looked upon the erection of the democratic republic as an enormous achievement, a view which in itself is entirely justified. At all times they remained ready to enter into coalitions with the bourgeois parties for the protection of the republic. As the bourgeois democratic republic, unable either to ease the economic distress or to achieve equality for Germany in foreign relations, progressively lost prestige among large masses of the population, especially within the middle classes, the mass hostility came to be directed also against the Social Democrats as the typical republican party. When the National Socialist cabinet succeeded the military government of General Schleicher in January, 1933, they were not seizing power from the socialists and republicans: one bourgeois government merely succeeded another. Hitler's government proceeded to suppress completely first the German Communist party and shortly thereafter the Social Democratic party. It is difficult at present to offer any definite judgment as to the future of German socialism.

During the post-war period the British Labour party developed from a virtually insignificant parliamentary group into a powerful organization backed by millions of supporters. British Labour had the great advantage of not having gone through the school of the Second International from 1889 to 1914. It therefore has remained free from all the peculiar contradictions springing from the official Marxist dogmas of the Second International. It suffered no embarrassment in formulating its attitude toward nation and state, the struggle for power and monarchy. At the same time it was in a better

position than most of the continental parties to offer the masses a clear and precise program of socialization with a view to the formation of a socialist society. As a result the Communist party in England is practically insignificant, while with the collapse of the Liberal party after the war Labour became and has remained the second strongest party in the land. Its amazing display of vigor in weathering its two great crises—the unfortunate general strike of 1926 and in 1931 the electoral defeat and the withdrawal of MacDonald—is added proof of its vitality.

In France the position of the socialists is virtually the same as before the war. In the struggle between the national bloc of the bourgeois right and the radicals or the bourgeois left they often hold the balance. On numerous occasions since the war the French socialists have made strategic alliances with the bourgeois left and have thus exerted an influence on the direction of national policy. Although during 1919 and 1920 most of the French workers were in the Communist camp, the socialists have since succeeded in winning back the great majority. In the course of the conflict between socialists and communists the French trade unions were split into two groups, the socialist and the communist-syndicalist.

In Italy the entire socialist party entered the Third International after the war, but as the result of a dispute with Moscow the majority of the party later withdrew. The Italian socialists had a tragic fate. While they appeared revolutionary enough to arouse the apprehensions of the bourgeoisie, they were not sufficiently so to carry through the actual seizure of power. This was but a recurrence of the old dilemma of the pre-war Second International. Hence both socialism and communism in Italy have been annihilated since 1920 by the Fascists. Only small groups of Italian socialist and communist émigrés remain.

In the United States the numerical influence of the socialists is no greater than before the World War. Socialistic ideas have undoubtedly become diffused to a certain extent among the intellectuals of the country; but at the presidential election of 1932, which came at the height of the economic crisis, only a small percentage of the voters supported the Socialist candidate. The Communist party is even weaker, while the Farmer-Labor party has also collapsed except within the state of Minnesota. Nevertheless, the ideas and achievements of the Roosevelt ad-

ministration may open the way for a stronger socialist influence.

In Spain following the establishment of the republic in 1931 the socialists participated in the coalition government until the end of 1933. Their position, however, is difficult, since the majority of the Spanish proletariat still sympathize with the syndicalists. The socialist parties have a greater influence in the Scandinavian countries, in Belgium and Holland, in Switzerland and in Czechoslovakia. In Austria the socialists successfully controlled the administration of the city of Vienna from 1918 until 1934. They struggled hard to protect the democratic national constitution against the powerful bourgeois groups of Christian Socialists, National Socialists and the Heimwehr. But in February, 1934, after an armed uprising of workers, the Austrian Socialist party was suppressed.

In the industrialized countries where socialism has won over the majority of the industrial workers, the combined vote of socialists and communists during the last decade has ordinarily averaged about 30 or 40 percent of the total number of ballots cast. This was true in England, Austria, Czechoslovakia, Belgium, Denmark, Sweden and in Germany so long as there were free elections. The striking uniformity of this percentage reveals the fact that the socialists have failed to attract any sections of the population outside of the working classes. In the modern industrialized nations the majority of the population consists of employees but not of factory workers alone. Among other types of employee groups—clerks, civil servants, craftsmen and agricultural workers—socialism has had slight success. Judging by past experience it is virtually impossible for the socialists to grasp control of the state if they must rely solely on the industrial proletariat. The Bolshevik revolution in Russia was able to succeed only through an alliance of workers with peasants.

In Asia the leadership of the working class movement after the war fell into the hands of the communists, but in the last few years the Communist International has declined in Asia as well as elsewhere. Although it is still impossible to predict the future of the labor movement in the leading Asiatic countries, significant socialist tendencies are to be found in Japan, particularly among the intellectuals. In Australia the opposition to the bourgeoisie is the powerful Labour party, which belongs to no international. Similar smaller but also influential Labour parties are

found in New Zealand and South Africa as well in Ireland.

Argentina has long had a socialist party, and military and revolutionary leaders in the other South American countries have not infrequently professed adherence to socialism. It is, however, difficult to ascertain to what extent such declarations really emanate from a labor movement. Mexico is controlled by a powerful workers' and peasants' movement which is carrying out a revolutionary reconstruction of society but which does not belong to any international.

The communism of the Moscow variety is today politically powerful only in Russia. The only other country where the Communist party still has some influence is Czechoslovakia. Socialism is at present suppressed in Russia, Italy, Germany and Austria, but the parties in France, England and the smaller European countries and the prospects in Asia and America make it still a significant international power. Present day socialism represents a continuation of the pre-war Second International only in a formal sense. Actually the International under English and French direction is quite different from the old International controlled by Russians and Germans. A socialist international of the English and French type may be expected to depart further and further from the stereotyped Marxist dogmas, which never gained a foothold in England and exerted very slight influence in France. This does not imply that it will renounce true Marxism, which is thoroughly undogmatic and realistic. The socialist parties will in fact become more truly Marxist as they abandon the traditional dogmas of the official Marxists. In Russia the dynamic Marxism of the revolutionary period has long since been reduced to an inflexible grammar of authoritarian politics. The future of socialism thus rests with the democratic and intellectually independent parties of the West.

SOCIALIZATION. The term socialization has been employed in its first and widest sense in Marxist sociology. In his account of the historical evolution of society Marx defined the characteristic of the modern development of the productive powers as the progressive socialization of the processes of industry and manufacture. As industrialism advances, it involves a rapidly growing degree of cooperation among the individuals engaged in production. The division of labor is the first form of this cooperation, which proceeds to a second stage with the subdivision of labor in "manufacture," that is, capitalist organization of handwork before the days of machinery, and to a still further stage in the "machinofacture," which begins with the industrial revolution. The workman under both manufacture and machinofacture is increasingly converted from a complete producer with a product of his own into a "detail laborer," whose work has significance only in relation to a cooperative group; while even the separate factories and industries built up on a basis of this productive cooperation come to possess significance only in relation to the wider interchange of products in the economic system as a whole. In the last resort Marx holds that the capitalist system in its final and absolute phase can best be regarded as producing only one congealed mass of commodities possessing a single unified value derived from the combined labor of a single mass of workers whose activity has been completely socialized. This growth of socializa-

tion in the productive processes is forced upon capitalism by the inherent necessities of its own internal processes of development and is at the same time the means of carrying capitalism to its ultimate point and of bringing about its supersession by a socialist system; in the latter the class divisions characteristic of capitalist society will disappear in a classless society corresponding to the completely socialized character of the productive system.

The word socialization, however, is more commonly employed not in this wider sociological connotation, but with certain narrower meanings relating to the actual forms of industrial ownership and control. In this connection it is used in at least three distinct senses, which are nevertheless often confused. In the first place it is employed loosely as equivalent to nationalization; that is, the assumption by the state of the ownership of industry, whether this assumption comes about by direct expropriation of the capitalists or is accompanied by some form of compensation. In another sense the word socialization is sometimes contrasted with nationalization, as it often was among British Marxists before the World War, who used it to mean nationalization without compensation, whereas they regarded the word nationalization as identified with the piecemeal methods of nationalization with compensation associated with the British Labour party. In yet another sense the word socialization has been used to mean something wider than nationalization, as including forms of public or quasi-public ownership other than direct ownership by the state. Thus before the war it was often used to include municipalization as well as nationalization, and sometimes it was broadened to include cooperative ownership regarded as a form of social ownership complying with the requirements of a socialized economic system. Since the war it has been applied also to forms of ownership of industry not directly by the state, but by public boards or corporations established under the authority of the state and amenable to public control and regulation.

With the growing controversies concerning the forms of socialist ownership and control of industry, this last application of the word has become particularly important. Its German equivalent, *Sozialisierung*, was widely used in connection with the discussions of the post-war socialization commissions in Germany and Austria. Both the German Social Democratic group headed by Karl Kautsky and the Austrians led

by Otto Bauer were opposed to direct state management of industries and advocated the placing of socialized industries and services under some form of representative council or commission, including side by side with state nominees representatives of the consumers and producers and sometimes also of the technical and managerial personnel. This question was debated extensively by the first German Socialization Commission in 1919, which worked out a form of organization for the mining industry based on tripartite control by representatives of the workers, the management and the community. The second German Socialization Commission under Rathenau's influence proposed a commission of four parties, including representatives of the managers of local mines, the workers and officials, the consumers and the state. Meanwhile other German writers, notably Rudolf Wissell and Otto Neurath, worked out a plan known as the "economic scheme" for the social control of all industries in accordance with a planned arrangement of production and distribution but without actual public ownership. Kautsky, advocating public ownership although not direct state control, criticized this plan vigorously in his book *Die proletarische Revolution*.

Meanwhile in France the Confédération Générale du Travail had worked out its scheme of *nationalisation industrialisée*, whereby it proposed to exclude the state from an actual share in the control of industry and to hand over its conduct to representative organizations of the producers, technicians and managers, under a form of public control. The guild socialists in Great Britain had developed even more far reaching schemes for the completely functional control of socialized industries and services, and some echo of these proposals was heard in the United States in such projects as the Plumb Plan for the management of the railroads. In Great Britain the miners also elaborated and placed before the Coal Commission of 1919 a detailed project for the socialization of their industry on a basis of public ownership and administration by a council of which the Miners' Federation of Great Britain was to appoint half the members, the other half to be appointed by the state to represent the technical and administrative grades. Under this scheme there was also to be a coal consumers' council, but this body was to be advisory and was to have no actual managerial or administrative functions. The National Union of Railwaymen likewise

presented a plan in less detail for the nationalization of the railways on a basis which would have given the railway trade unions at least half the seats on the proposed managing body; and in the scheme for the coordination of the railways put forward on behalf of the government by Sir Eric Geddes in 1920 it was proposed to give the workers representation on the directorates of the grouped main line railways, which were, however, to remain under private ownership. This offer was rejected by the railway trade unions, which were not prepared to participate in management under private ownership and preferred the scheme for negotiating Whitley councils and for a statutory wages board that was subsequently embodied in the Railways Act of 1921.

It was in connection with the railways that the first sharp difference of opinion on the subject of socialization appeared within the trade union movement in Great Britain. While the National Union of Railwaymen, by far the largest union in the service, advocated a representative council on which the trade unions would have at least half the seats, the Railway Clerks' Association, which enrols the clerical and supervisory grades, advocated the socialization of the railways in respect of ownership but also supervision by a full time expert board of a non-representative character. This controversy again came to the fore during the tenure of office of the second British Labour government between 1929 and 1931, in connection with Herbert Morrison's bill (which has since become an act as modified by the subsequent National government) for the socialization of London passenger transport. Morrison proposed to place the coordinated passenger transport service, which was to pass into public ownership with compensation to the previous owners, under a salaried expert board and rejected the demands of the trade unions concerned for representation on this body, on the ground inter alia that if the trade union claim were admitted, it would be impossible to exclude claims for representation from other groups, such as the municipalities, and even perhaps from the former shareholders. Over this issue an active conflict arose within the British trade union movement, and at the Labour party conference of 1932 further proposals for the socialization of the electricity and transport services were referred back for reconsideration in the light of the trade union demand for representation upon the administrative boards.

It is clear, however, that this controversy applies only to the question of direct workers' representation on the managing bodies and not to the proposed form of socialized undertakings in itself. It is now generally accepted among socialists alike in Great Britain, Germany and France that the actual conduct of socialized industries and services should in most cases be entrusted not to government departments, but to special ad hoc boards or commissions set up under the authority of the state. It is a moot point how far these boards or commissions should be representative of the actual workers engaged in the various services or of the consumers or of any other special groups, and further how far they should be amenable to political control. On the first point British opinion has commonly rejected the plan favored by the German socialists immediately after the war, of giving representation to consumers' groups on the managing boards, on the ground that boards consisting partly of producers' and partly of consumers' representatives would be likely to take an unduly sectional point of view and to prove inefficient in the business of day to day management. The trade unions continue to press hard for direct producers' representation on the boards, but in some quarters a distinction is drawn between two bodies—a small, full time managing board of experts formed on a non-representative basis and a wider council or commission of part time members, with power to override the smaller board in matters of policy, on which the workers would be strongly represented. These two bodies would correspond to some extent to the board of directors and the "council of oversight" of a German joint stock company.

On the question of political control there have been strong differences of opinion. The socialists are for the most part in favor of the appointment of managing bodies by the state, even if the state acts to some extent only as a ratifying body for nominations made by outside groups. The state, it is held, should have the right of ultimate appointment and dismissal. Most socialists also hold that the boards or commissions of socialized industries ought to be responsible to a minister and to the cabinet, and that this is especially necessary if socialized services are to be brought together as parts of any comprehensive national economic plan. Non-socialists, on the other hand, even where they admit the necessity of some measure of socialization of any particular industry or service, generally wish to

go as far as possible toward excluding all forms of political interference and to retain as many of the features of private enterprise and business management as they can. Thus in Great Britain the British Broadcasting Corporation and the Central Electricity Board, both statutory bodies set up for the control of services under public authority, are kept as far as possible outside parliamentary or governmental interference. Both these bodies, it should be noted, although they are definitely forms of socialization, were established by Conservative governments. In the case of the London Passenger Transport Act the Labour government's proposal that the managing board should be appointed by the minister of transport was altered when the bill was taken over by the national government into a scheme whereby the members of the board are appointed by a non-political body of trustees so as to exclude all forms of political interference. Thus the dividing line between socialist and capitalist schemes of socialization seems to depend mainly on the degree to which political intervention in the affairs of the socialized industries is admitted.

The illustrations given above are of course instances in which certain particular industries have been more or less completely socialized within a system under which the great mass of industries continues to be conducted under conditions of private ownership and control. In many countries there has been since 1928 a considerable advance of state control over industry and even of positive socialization of particular industries or services. Apart from Soviet Russia this process has gone furthest in Germany, where even before the depression the state had already become a partner in a large number of industrial and similar enterprises and where during the depression state participation in private industry advanced much further. This was especially true as the financial difficulties of the banks, the steel industry and various other industries and services compelled the state to step in and provide them with fresh capital, while assuming a large share in their actual control. The German railways were indeed in form denationalized under the Dawes plan of 1924, as the Italian railways were denationalized by Mussolini. But even denationalized railways remain necessarily under a large measure of state control, so that the change is in the form of a transfer from direct state management to management through a public utility corporation rather than from socialization back to private

enterprise. It is even said that the British railways under the Railways Act of 1921 are already more than half nationalized, as the Bank of England and most other central banks are more than half nationalized, although their ownership remains in private hands. In Great Britain even the coal industry, while remaining privately owned, has been brought under a form of state control in the shape of a compulsory cartel, largely on the German model.

There is, however, a wide difference between the extensions of state control in these forms or even the complete socialization of certain particular enterprises and the complete change of economic system which the socialist idea of socialization envisages. Thus in Soviet Russia, where alone socialization has assumed a definitely socialist form, although all industries were not taken over at once, all basic industries passed speedily into the hands of the state; small scale enterprise has been progressively reduced in scope under the two Five-Year plans and is in process of gradual elimination. Moreover a real progress has been made with the socialization of Russian agriculture, partly through actual state farming but mainly through collective farming under state control. Communists regard this policy of socializing small scale industry and peasant agriculture as vital to the completion of socialism in Russia, because they hold that the socialist attitude of mind can be developed only under conditions of socialized economic living. The socialization of a country in their view is far more than the socialization of its industries; it involves the radical socialization of the entire way of life of its people.

In other countries where peasant systems are strong socialists, in their endeavor to secure an adequate following among the masses, have been far readier to promise the peasant immunity from interference with his holding. The French socialists, for example, have repudiated all idea of bringing the land under any actual form of collective cultivation. The German socialists have been divided on this issue but have regarded the collectivization of agriculture as coming, if at all, only late in the process of socialist evolution. To whatever school of thought they belong, however, socialists think at least in terms of the progressive socialization of all major industries and services as productive agencies and contemplate the state control of such industries as are not directly socialized through the socialization of the processes of marketing and purchase of materials. This form

of socialization, whether achieved directly under state auspices or through the recognition of the cooperative movement as an agency of socialization, is regarded as indispensable in order that the socialist state may be able to undertake and carry through a comprehensive economic plan upon a national scale as a foundation for collective arrangements with other countries for the interchange of goods and services. Until recently socialist thought, except in Russia, was concentrated mainly upon the problem of socializing particular industries, with the idea of making a beginning with certain of the basic industries and services, such as coal, electricity and the main forms of transport. But of late two factors have combined to widen the socialist conception of the immediate requirements of the policy of socialization. In the first place, a growing number of capitalist industries have fallen into difficulties which seem to demand some form of collective reorganization; and in face of the reluctance of these industries to reorganize themselves or because of their lack of the necessary powers there has been an increasing tendency among socialists to insist that the state ought to assume control rather than leave them in private hands after reorganization. This applies to such industries as iron and steel, ship-building, engineering and textiles. Secondly, the adoption and partially successful execution in Soviet Russia of the first Five-Year Plan have had a notable influence on all phases of economic opinion in other countries. They have induced non-socialists to set to work on schemes whereby national planning can be introduced on a basis of continued private ownership of industry; and they have led socialists to think less in terms of the socialization of certain particular industries and services and far more in terms of the assumption by an incoming socialist government of powers wide enough to enable it to embark simultaneously on measures of socialization over a very wide field, and to apply drastic forms of state control to those industries left for the time being in private ownership. Above all, a growing body of socialist opinion has held that the first step toward a constructive introduction of socialism by other than revolutionary means must be the complete socialization of the banking and financial system, including not only the central bank but also the deposit banks and the other leading financial agencies concerned with the provision both of short term credit and of long term capital for investment. This socialized control of the financial machine has been increasingly re-

garded as the key to the entire process of socialization in industry as a whole.

The core of meaning common to all these senses in which the term socialization has been used goes back to the wider Marxian use; for basic to all the plans and ideas is the conception of a social system developing steadily toward a higher degree of integration, which brings with it a growing socialization of the processes of production and therewith of the services of the actual workers, manual, technical and administrative. The socialization of any particular industry or indeed of industry as a whole is thus regarded not as a deliberate and artificial creation, but as the realization in the field of economic policy of the inherent necessities of the general course of historical evolution in the modern world.

SOCIETY may be regarded as the most general term referring to the whole complex of the relations of man to his fellows. In an attempt to arrive at a more precise definition the present article will discuss the main trends of social thought in the West as they bear on the concept.

In the Greek language there is no actual

equivalent of the English word society. In so far as man was thought of as anything more than a biological organism he was, in Aristotle's phrase, a "political" animal, that is, he was thought of as participating in the life of a *polis*; essentially his membership in the *polis* constituted his humanity. There is no modern institution corresponding exactly to the *polis*. Like the modern state it was a territorial unit and as such it held jurisdiction over all residents within its borders; but its scope was far broader, for it combined state, church and society. Only the family and the individualistic aspect of economic acquisition were to a certain extent outside its domain. They were regarded by the Greeks as of secondary importance largely because the individual did not in the modern sense constitute a being with his own independent aims and values, apart from and even potentially in opposition to the consensus in which he participated in the *polis*. Plato carried these principles to their fullest logical development.

Later Greek thought, concurrent with the actual breakdown of the *polis*, developed a far more individualistic conception of social life. The individual, especially in the stoic doctrine, had an independent position of his own. On the other hand, the objective law to which he was obliged to conform was no longer that peculiar to his native *polis* but expressed the natural order of the whole universe. With this cosmopolitan conception there became fused the developing doctrines of the Roman law, which, while possessing essentially the same objective and superindividual conception of the *polis* as the Greek theories, from a very early date left room for a jealously guarded sphere of private interest, untouched by public authority, on the part of the individual *paterfamilias*. The fusion of the two made possible the later Roman stoic conception of the civilized world as constituting a single world empire, the expanded Roman *polis*, comprising a rigid legal framework of order within the limitations of which individuals were free to pursue their private interests without let or hindrance. The final extension of Roman citizenship to all freemen of the empire completed the institutional development corresponding to the theory. The whole conception rested on a rigid dualism of the sphere of public concern, which was conceived as a unit as in the original *polis*, and the private sphere of individuals, in which they were thought of as essentially independent, entering only into contractual relations with one another. Local and functional groups had only a

secondary place in the Roman conception and were considered strictly subordinate to the state.

Christianity brought into this absolutist-individualistic world of late antiquity a new element. In its social aspect it was at once transcendental, universalistic and individualistic. Its universalism fitted in admirably with the cosmopolitanism of stoicism and Roman private law. Its transcendentalism, on the other hand, gave men a set of values entirely outside of and, from the Christian point of view, superior to everything in this life. While the predominant early Christian development accepted the existing social order as necessary and enjoined men to "render unto Caesar the things which are Caesar's," it insisted even more strongly that the inner religious life of the individual was to be kept apart from and above all worldly things. It thus gave the individualistic aspect of the social thought of late antiquity a deeper transcendental foundation than had any of the pagan theories. Especially in its more ascetic leanings it could under certain circumstances radically undermine secular authority.

At the same time the fact that the predominant development of Christianity was toward the organization of a sacramental church added a further complication. Not only were individuals religiously independent of the politico-legal order of the Roman state, but that religious independence was organized in and supervised by a highly integrated group structure which could in no case accede to the doctrine of Roman law that corporations derived their right of existence solely from the sanction of the state. Henceforward it was scarcely any longer possible, at least on a Catholic Christian basis, to think in terms of the simple dichotomy of pagan antiquity, between individual and state. The raising of the problem of church and state, which was to dominate social thought for nearly a thousand years, was the first major break in the old identification of man's total social relations with the political unit to which he owed allegiance.

In two fundamental respects mediaeval social thought differed from that of antiquity, even in its latest Christian phase. The latter remained in its peculiar sense strictly dualistic. Society belonged in the realm of the flesh, with the sole exceptions of the Christian church and the extent to which on a private level the individual utilized his social relations as an opportunity for the practise of Christian charity. But the emphasis was on the non-Christian, sinful aspects,

especially coercion in the institutions of slavery, property and the state. Mediaeval thought first worked out the conception of human society as essentially an expression of Christian principles. At the same time this was possible, given the original Christian dualism of the worlds of the spirit and of the flesh, only on the basis of a hierarchy of groups, orders and estates which formed a gradual transition from the purely carnal to the purely spiritual.

With regard to the first aspect it was common ground for all mediaeval thinkers that the eternal law, both revealed and natural, was the measure of all things, that all authority and all principles of justice came from God. Human society was a single organized unit under these principles, the *respublica christiana*. The controversies were over the question whether there were one or two channels by which that authority was transmitted to human hands. According to the extreme papalists the pope was the sole immediate representative of God on earth, while the secular authorities were in effect merely branches of the church. The most extreme expression of this view was put forward by some of the canon lawyers who, having transferred to the church the unitary conception of authority derived from the Roman law, could think of other authorities only as delegated by this one supreme authority. The imperialist view, on the other hand, was that the emperor and through him all secular authorities were sanctioned directly by God without the church as an intermediary. In neither case was pope or emperor thought of as sovereign in the modern sense, but both were subject to the eternal law, however independent of earthly superiors they might be. The idea of any human authority as empowered to legislate, that is, to lay down the fundamentals of social organization, was not mediaeval.

In the other main aspect of mediaeval society and thought, that of its hierarchical group structure, the principal influence appears to have come from Germanic conceptions of group relations. The rigid dualism of individual and unitary single group was foreign to feudal law, which dealt rather in terms of a hierarchy of independent units, each with real personality, extending from the individual at one end, through a whole series of corporate groups—village community, guild, commune, estate, monastic order, ecclesiastical chapter and kingdom—to the supreme groups of church and empire at the summit. Just as in mediaeval property law the *dominium* of one person did not exclude that of

others in the same thing, so the real personality of the individual human being, an indispensable axiom of Christianity, did not exclude the simultaneous attribution of personality to a plurality of group relations in which he participated.

Moreover the rigid dualism of antiquity was further repudiated in that not only were the individual and the Christian church given positive religious sanction, but this was extended in greater or less degree to all the main groupings of mediaeval society. To be sure, the principle of its extension was not that of equal merit but of a hierarchical order extending from the mere village community of peasants at the bottom to the rigorous monastic communities at the top, on a religious scale. Furthermore it was extended in such a way as to confirm the general traditionalism of mediaeval life. But even this relative sanction was possible only because of a great change in actual social relations. The "great society" of Roman imperial times, which had largely broken down, was replaced by a society based in the main on relationships of personal loyalty, even though socially sanctioned, which opened a far wider opportunity for the exercise of the Christian virtues than had hitherto been available. And anything which, like much of feudal warfare, did not exactly fit this religious schema was often attributed to the ever present element of carnal sin.

The mediaeval synthesis, which reached its highest degree of rationalization in the thought of Thomas Aquinas, contained, however, significant elements of instability. The most important lay in the extent to which from a very early time mediaeval thinkers had been dependent on the conceptual tools inherited from antiquity, above all in the Roman law and in Aristotle. This was evident first in the conception of the church built up by the canon lawyers. Not only was the church conceived as a power at least independent of if not sovereign over the state, but it came to be regarded as having a structure radically different from that of the secular mediaeval hierarchy of groups. There was only one source of authority which flowed from the papacy down through the various ranks of the organization, ultimately reaching the parish priest. No other element had independence in its own right. And even when the papal absolutism was challenged, it was generally in Roman fashion in the name of the united body of the church as a whole, as in the conciliar movement, and not of the several organs. Thus there was a

genuine structural disharmony between the bureaucratic hierarchy of the church and the feudal hierarchy of the secular sphere, both in fact and in theory. This was the more evident the more strenuously the papal claims were pushed.

At the same time the growth of nationalism at the expense of feudalism gradually eliminated the relativity of the true mediaeval hierarchy and brought early modern theories more and more into line with those of antiquity. This movement was accelerated by the extent to which monarchs made use of the revived learning in the Roman law to justify their continual attacks on the powers of the great feudal estates and corporations. The result was an increasing tendency toward the conception of an absolute state on the one hand and a society of independent individuals on the other. Christianity, however, had become far too deeply embedded in European thought for the development ever to revert completely to the Greek idea of absorption of the individual in the state. On the contrary, an increasingly important place was given to a theory of the natural rights of individuals. The main trend was thus against the kind of absolutism which left no room for the independent rights of individuals and on the whole more and more against any absolutism at all. ~

The irreducible independence of the Catholic church remained the principal obstacle in the way of the completion of this process of the elimination of the quasi-independent groups between the individual and the state. The Reformation brought a change in the situation in this respect both in fact and in thought by its repudiation of the sacramental church. Protestantism did not cast aside the conception of an organized church as such, but it radically altered its sociological status. Nor did it reject the essentially mediaeval ideal of a Christian society; in some respects it carried it even farther. The various branches of the Protestant movement came to essentially different results in these respects. Once the independent sacramental church was eliminated, the organized aspect of religion began to fall into line with one or the other of the two elements into which contemporary thought was dividing secular society, the state or the plurality of independent individuals. The Lutheran branch, which laid emphasis on the purely subjective and emotional state of penitence, had little place for a direct Christian influence on daily life even in matters close to religion and tended to place all organization in

the hands of the secular prince ruling by divine right. This trend was accentuated by the Lutheran tendency to renew the radical dualism of early Christianity without the complication of the sacramental church. All organization even though divinely sanctioned belongs to the world of sin. The individual's attitude toward it is one of passive acceptance of authority and tradition, since these are ordained of God, but he reserves his inner religious life in a world apart. Only in a modified sense could Lutheranism be said to hold that society could or should be radically Christianized.

At the other extreme stand the radical Protestant sects, Baptists, Quakers and others, which stem from a long history of sect movements prior to the Reformation. These hold that there is no objective institutional church structure at all, and that such religious organization as exists is entirely in the form of voluntary associations of true believers without coercive authority of any kind. In the literal interpretation of the evangelical ethics this hostility to ecclesiastical authority tended in some cases to be extended to all authority whatever. Thus the radical sects carried the implications of the individualistic side of Christianity to the extreme and were among the most important forerunners of modern anarchism.

Calvinism was in most respects midway between these two wings. Sharing with the sects the attempt to remodel the sinful world into the kingdom of God on earth, it could not subscribe to the Lutherans' passive acceptance of things as they were. Nor could it accept their turning of authority, religious or moral, over to a secular government. In so far as Calvinism was dominant it therefore tended toward a theocratic system of discipline, as in Geneva in Calvin's time, where the secular government was thought of as merely an instrument in the hands of the church in its attempt to realize the kingdom. But when the Calvinistic churches could not control the secular authorities, they tried above all to avoid being controlled by them and were pushed more and more in the direction of the radical sects and of the separation of church and state. The ascetic branches of Protestantism, especially Calvinism, have thus thrown the main weight of their ethical sanction into the activities of the individual in the sphere of his private relations. In particular the concept of the "calling" as a field for proving one's state of grace has served to promote individualism and to emphasize the ethical value of economic activities.

Thus Calvinism and the Protestant sects may be said substantially to have completed a process which had been going on since classical antiquity, the transfer of the locus of religious values in this world, and with them the bulk of culture, from the state to the individual. This process may be divided into three main stages. The later Greco-Roman cosmopolitanism created a sphere for the individual outside the state without giving it a religious content. Early Christianity then removed religious values from the state but largely to embody them in the sacramental church, in which, to be sure, the individual retained a highly important position. Finally, the Protestant repudiation of the church passed these values on to the individual. This accentuated the tendency to look upon the state and every other social grouping as essentially instrumental in the realization of individual values, culminating in the radical individualism of the eighteenth and nineteenth centuries.

After the close of the religious struggles following the Reformation there came a pronounced secularization of social thought. Man in relation to his fellows was no longer thought of in terms of his relations to an eternal law, transcendently ordained by a personal God. The first phase of secularized thought did not, however, depart radically from this fundamental thought form. In place of the law of God was put a law of nature, a conception which had been taken over from later antiquity and incorporated into Christian thought, where it performed the highly important function of supplementing the revealed law. Now it became again an independent standard of human institutions. It still retained the character of changelessness and eternity which it had held from the beginning; there was one law of nature for all times and places.

As it emerged into independence in the seventeenth and eighteenth centuries, however, the conception of an order of nature had a strongly individualistic cast because of the peculiar character of the later phases of Christian thought from which it had emerged. It focused on a doctrine of natural rights, of the liberties of man which should not be interfered with by human institutions or authorities. The standard by which institutions were measured was largely negative; they were criticized in so far as they were held to violate these natural rights.

With the shift of emphasis in the interpretation of the idea of natural order from the normative to the explanatory, which was already strong

in the physical science of the seventeenth century and was making itself felt in the social realm in the work of such thinkers as Hobbes, it was easy for this individualism of natural rights to pass over into utilitarianism and thus to introduce a relativism in the realm of individual wants essentially unknown to previous social thought.

From this point of view society became the mechanism whereby individual wants, conceived to vary at random with no common standard, could be satisfied in the greatest possible degree under the existing conditions of human life. Social relations were thus reduced to the level of means to individual satisfactions. All idea of essentially normative control was abandoned; but on the other hand an element of determinism of a different sort was introduced by the analysis of the nature and extent of the limitations imposed on action by the conditions, the external environment and man's inherited nature under which it took place. Pushed to its final logical conclusion this determinism in terms of conditions ended up in the positivism of the later nineteenth century, completely eliminating the relativism of the earlier utilitarianism. This view of society as simply a phase of deterministic nature has, down to quite recent times at least, grown progressively in importance among theorists.

On this secularized, individualistic basis there have been two great phases of social thought. The one, on the whole earlier in time, was concerned primarily with the individual's relation to the organized state, the problem of political obligation. This has tended to end up at two poles. The one tendency, first in terms of natural rights, then of individual utility, has looked upon the state merely as a contracted instrument for the protection or promotion of individual rights or interests. The other, in terms of the modern doctrine of sovereignty in particular, has reaffirmed the Greco-Roman qualitative supremacy of the state over the individual and, especially in its later utilitarian form, has conceived of a state absolved from obedience to any eternal law whatever. While in Hobbes this doctrine was in its relativity narrowly limited by the difficulty of maintaining the conditions of mere order and security, in Rousseau the positive aspect became much more prominent. Each state has its own general will, and whatever it wills is right.

On the other hand, thought was turned more and more to the relations of individual to individual within civil society. The same theorists,

like Hobbes and Locke, who were concerned primarily with the relation of the individual to the state, at the same time laid the foundations of the individualistic theory of social relationships. Since previous developments had tended to rob all organized groups and finally even the state of any but an instrumental value, the predominant conception of society came to be that of a plurality of individuals entering into relations of contract for the promotion of their own personal interests.

The most prominent relationship is that of exchange, which results from the division of labor and is entered into for mutual advantage. The earlier laissez faire individualists pictured a society consisting solely of these independent individual units. Since conditions of peace and substantial equality in exchange were assumed, the center of this society came to lie in economic relations. The peak of influence of this view lay in the classical economics of the first half of the nineteenth century. A further element was the voluntary association entered into by contract. The more radical contract theorists conceived of the state in these terms, and voluntary co-operation on the level of means was besides exchange the other principal mode of carrying out individual aims through the medium of relations to others. On the whole, however, the exchange relationship has predominated in this type of thought.

The most modern development of social thought and with it of the concept of society has been largely in reaction to this individualistic utilitarian tradition. One main alternative has lain in the emphasis on the determining influence of the limiting conditions of individual action. In this direction under the influence of the Darwinian movement and of psychological anti-intellectualism society has come to be thought of as simply the human phase of the organic evolutionary process. In particular, human conflict, especially economic competition, has been interpreted as a special case of the biological struggle for existence. This movement accounts for a large part of the social thought of the later nineteenth and the earlier twentieth century.

This positivistic and in some ways also individualistic trend of thought has, however, been only one of the two important modern movements in reaction against utilitarianism. Men have never ceased to think that in some sense social groupings constitute more than a mere sum of individuals and must be thought of as possessing in some sense independent reality

There have, however, been many different interpretations of the nature of this reality and of its relation to individuals.

Attention was originally concentrated on the state, and the first important version of modern social realism is to be found in the modern doctrine of sovereignty. The aspect on which emphasis is placed here is the phenomenon of coercive authority, which no individual can legitimately exercise over another in ordinary contractual relations. Even the most extreme modern adherents of this line of thought do not necessarily exclude the essentially Christian idea of an inviolable sphere of individual personality. Bodin, generally regarded as the founder of the doctrine, still considered the sovereign as bound by an eternal law of nature in the normative sense. When that limitation was dropped, there was introduced a fundamental element of relativism, which played a very important part in subsequent social thought. Each sovereign unit represented a specific synthesis which did not have to coincide with that of any other. This is the essential type of relativism which, although not necessarily bound to the state, has been maintained down to the present by the anti-individualists.

The next great step may be considered to have been Rousseau's doctrine of the general will. This went behind the question of the fact of sovereign authority over the individual to find its origin in a common will, in values shared by the members of the community. But in harmony with the traditional dualism of state and plurality of individuals Rousseau saw his general will as expressed entirely in the state. There was no place for internal social differentiation on the superindividual level. This view, with some modification, was passed on to Hegel as well as to the more recent philosophical theory of the state.

Later social theory, while retaining the element of common will or values as the essential basis of social reality, has tended to divorce it more and more from the state alone and to find a plurality of manifestations for it. Thus in a sense there has been a movement back toward the more instrumental conception of the role of the state, but this time not on an individualistic basis. The state then becomes not so much a contractual instrument for promoting individual interests as an organ of the entire community for the promotion of certain of its common ends.

At the same time the tendency has been to find that the basis of social reality lies deeper

than in the state itself in something like a consensus, explicit or implicit, of the members of the community. With Rousseau's conception of will as a point of departure, the coercion of a sovereign authority has come to be seen as only one means of enforcing on the individual the supremacy of common ideals and attitudes. In fact it is moral authority which is held to be fundamental, since without its general backing among the majority the coercion of the state cannot in the long run be effective and interests cannot be made to conform. The secondary importance of state coercion has been illuminated further by the recognition of the relatively effective functioning of social norms in primitive communities which are entirely without any organized state machinery.

The immediate historical background of the development of the most modern conception of society and the main elements in the thought of the late nineteenth and early twentieth century lies in positivism and idealism. The former is of much greater importance for the English speaking world, and the main process of development of thought there may be said to have been one of emancipation from positivistic conceptions. The first step in this process is the distinction between a scientific theory and a practical art, which is implicitly at issue between utilitarianism and the radical positivistic position that attempts a purely scientific interpretation of human life and action. A scientific theory involves only the coordination of elements in the experience of the scientist, all of them of things "external" to himself. A practical art, on the other hand, involves the adaptation of means, on the basis of scientific knowledge of course, to an end which is not, to the actor, an element of the external world in the same sense. It involves in some sense the admission of the role of ideas in action. The second step is the realization that the ideas involved at least in the ultimate ends of action cannot be scientific theories in the positivistic sense, simply because in so far as they are true ends they cannot be mere reflections of external empirical reality. They are hence in some sense non-scientific or even metaphysical.

It has been observed that these ultimate ends of action cannot be thought of as merely existing at random but must, both in the individual and in any significantly coherent group, be regarded as integrated into a harmonious system of ends, governing in various ways all the actions of the members of the group. Without a system common to the members of a community social

order itself cannot be accounted for, as Hobbes' analysis of the state of nature so clearly showed. The recognition of such a common system is a return to Rousseau's general will, but in the more strictly sociological thought growing out of positivism it has been most prominent implicitly in the thought of Pareto and much more explicitly in that of Durkheim.

These considerations apply to the ultimate ends of action, which cannot be considered as means to further specific and tangible ends. But subsidiary to them is an important element of action in the pursuit of ends which are not ultimate. This intermediate element may be said to fall into the three sections—the technological, the economic and the political. All action of course takes place also under certain ultimate conditions of external environment and human nature which must always be considered as present; they are not, however, properly speaking elements of human action or of society itself. At the same time the intermediate elements of action can never be thought of as taking place in the absence of a system of ultimate ends, an error implicit in a great deal of individualistic thought.

The system of ultimate ends of the community determines what is specifically sought after as wealth and power but also affects action in other fundamental ways. In the first place, ultimate ends may form the immediate ends of specific actions, as in the case of a religious war. Secondly, they may form the basis of a framework of regulatory norms which guide and control action in the pursuit of immediate ends, maintaining orderly processes and relationships and keeping the vast complex of such utilitarian actions in some kind of harmony with the ultimate value system of the community. This system of regulatory norms, which exists in every community, may be called its institutions. In mode of embodiment, whether in custom or the law of the state, in the type of enforcement and in their structure they may vary enormously from one community to another. They form the backbone of the social structure. Durkheim may perhaps be regarded as the most eminent theorist of institutions in terms of their relation to the individual, and Max Weber in terms of the comparative analysis of their structure. Thirdly, where action becomes a direct expression of ultimate value attitudes outside the sphere of practical techniques, the means is no longer intrinsically related to a tangible end but becomes a symbol. This is illustrated particularly in the

case of religious ritual, which is another fundamental constituent of the life of every community.

In this scheme of analysis the state has a triple role. First, it is the principal organ of common action of the community. Secondly, it is the main guardian of its institutions, especially in so far as their automatic and informal functioning through custom breaks down and the need of deliberate and sometimes coercive enforcement arises. This is brought out particularly in the case of a change in the type of institutional relationship from the communal to the rational-legal or, as Tonnies put it, from *Gemeinschaft* to *Gesellschaft*. Thirdly, the state constitutes one but only one of the principal focuses of the common sentiment and thus plays an important symbolic role.

While it is true that to a greater or less degree the common value attitudes of a community must be regarded as integrated into a single system, there is room for wide variation both in the degree of integration and in the kind of system. In the latter relation there is no reason for excluding a type of social organization involving many different kinds of complex structure of real groups and social classes. Hence modern social theory rejects as far too simple the rigid alternatives of the view that there is on the one hand the state and on the other the unintegrated plurality of separate individuals. It is true, however, that some social structures, as notably the Roman Republic in its earlier stages, may approximate this simple type.

In the light of the analysis presented here society may be defined as the total complex of human relationships in so far as they grow out of action in terms of the means-end relationship, intrinsic or symbolic. According to such a definition society is but an element in the concrete whole of human social life, which is also affected by the factors of heredity and environment as well as by the element of culture—scientific knowledge and techniques, religious, metaphysical and ethical systems of ideas and forms of artistic expression. Society cannot exist apart from these things; they play a part in all its concrete manifestations, but they are not society, which comprises only the complex of social relationships as such.

SOCIETY OF JESUS. See JESUITS.

SOCIOLOGY. The history of sociology can be circumscribed within a century or two or it can be extended to cover the whole range of human reflection on society from the remote past, according to the degree to which the scientific desideratum implicit in the term is emphasized. Sociology, as a more or less definite body of

systematic knowledge with a distinctive place and name among the family of sciences, must be dated by decades rather than by centuries. The reasons for this late emergence are significant of far reaching changes in the conception of society itself, without which a science of society could not have been born.

The nearest approach to a genuine sociology before the present age was made by the Greek philosophers. The distinction which the sophists drew between nature (*physis*) and convention (*nomos*) was of signal importance, for, distinguishing laws of nature from those of society, it made the social order itself a social product and thereby stripped it of the last attributes of sanctity which precluded its scientific study. Their main objective was not scientific study but a revolutionary ethic; the challenge which they offered could, however, be met only in the spirit of free investigation. It was in this spirit that the challenge was taken up by Plato and Aristotle, who sought in epoch making formulations to show that society was the inherent condition of human fulfilment; that in this sense it was prior to the individual; that its essential structure, apart from the particular historical variations and degenerations to which it is subject, arose out of the inborn impulses of man; and that its essential bond, the justice which achieves the ordered functioning of a social system, is not merely an imposition of the strong subjugating the weak or of the weak seeking to fetter the strong but a principle of union expressive of the organic community of social animals. It is significant that in Plato, especially in the earlier dialogues, these tenets are generally developed in express antithesis to the doctrines of the sophists and that Plato's most realistic contribution to sociology—the most definite piece of sociological writing to be found in classical antiquity, the account of the emergent *polis* in the second book of the *Republic*—is presented with something of the condescension of the philosopher who returns to the cave. Plato never returned to the study of the attitudes of the ordinary man and the way they operate in the creation or maintenance of a social system. When he concerns himself again with the details of social life, as he does finally in the *Laws*, it is purely in the interests of prescription.

Aristotle, in spite of his greater realism and his indefatigable interest in systematizing available knowledge, cannot be said to have gone much further than his master in advancing sociology. He is reputed to have examined the

constitutions of 158 *poles*, but this very activity revealed the impediment to the development of sociology which existed not only in Greece but in the whole Greco-Roman world. The Greeks lacked the concept of community as distinct from state. The state community synthesis of the *polis* prevented any focal study of the community itself or generally of social relationships apart from their political aspects. The political factor under the dominance of a purely ethical interest, the interest in the good life, which the liberation of Greek thinkers from theological prepossessions fostered, was given priority over the social factor. The regulative aspect, the means and ends of political control, obscured the study of the inherent processes of society or of those social relationships which are not centrally controlled. These processes and non-political elements were not thought of as having any coherence, any pattern. This point is illustrated, for example, in the *Crito* of Plato, where the whole social heritage—the whole set of cultural and economic conditions as well as the definite social regulations under which Socrates grew to manhood—is personified under the forms of “the Laws” of the mother city, demanding obedience to their decrees as if they formed a unity of prescription.

Hence Greek thought on society never takes specific sociological form but is limited to scattered reflections on such subjects as custom and convention, sex relations, family life, friendship, social harmony and strife, the division of labor, slavery, the lot of women, class distinctions and the primitive condition of mankind. These reflections and observations, strewn freely through the works of the dramatists and the historians, are never gathered up into a coherent system. In the last resort the obstacle was the inability of the Greeks to distinguish the concept of community from that of state, the same inability which in another manifestation was responsible for the fact that the Greek political ideal never transcended the bounds set by the walls of a small city.

The city-state community synthesis failed to yield to the expansion of the Roman *imperium*. Although formally the concept of community came to be distinct from that of state and the *socius* could no longer be identified with the *civis*, nevertheless the *orbis* was conceived under the form of a magnified *urbis*. Moreover the Roman preoccupation with law obscured the view of the non-legalistic aspects of society. In so far as the latter required interpretation, there

came to hand, in Cicero for example, the convenient principle of natural law, which, however, remained normative, not descriptive or constitutive. The transition from natural law to natural social process, which would have prepared the way for a science of society, was nowhere made explicit. While it was generally admitted that man was not only, in the older language of the city-state, a *zoon politikon* but also a being whose nature demanded the universal conditions of society (*natura hominum . . . communio ac societatis ac appetens*; Lactantius, *Divinarum institutionum*, bk. vi, ch. x), the actual processes of social relationship were taken for granted, save in respect to their conformity to or deviation from an ethical or a legal norm.

A survey of the social philosophies of antiquity reveals that the birth of sociology required a naturalistic as opposed to a theological conception of human society; a clear distinction between the state and society; and a scientific, or positive, interest in the forms and processes of social relationships, as contrasted with a legalistic or normative interest in the right ordering of these relationships, or the general well being of society. It is not here assumed that the interest of the ethical thinker and that of the social scientist are irreconcilable; a mind devoid of any sense of social values would not be fitted to study social institutions and activities, which themselves are thoroughly impregnated with the valuations of social beings. The normative, or ethical, interest is, however, no substitute for the scientific; and unless controlled by the latter, it either prevents or biases the attempt to understand society.

This point is illustrated particularly by the oriental theories of society. A vast amount of the classic literature both of China and of India is concerned with political and ethical philosophies. The social teaching of the sages is devoted to the right conduct of the individual in his various relationships and to the proper function and good order of social categories. But there is practically no social philosophy and still less a sociology which offers a non-moralistic interpretation of the trends of social life, of the dependence of institutions on environmental and cultural factors, of the processes by which individuals become socialized or even of the social problems which beset the patriarchal family system. Both in Hindu and in Chinese thought the controversy between the Machiavellian and the anti-Machiavellian doctrine of the state is present; but the former is realistic in

the political and not in the scientific sense, advocating the abrogation of the code of ordinary morals in the conduct of state affairs, which means only the substitution of another type of code more in harmony with nationalistic, imperialistic or dynastic ambitions.

Except for the conventional theory of the four *Varnas*, interpreting and justifying the castes by function and degree of purity, there is a conspicuous lack of theory in the Hindu classics. In the stress laid on the individual's suprasocial sanctions to conformity as the condition of a higher status in a future life some writers have seen the explanation of the non-sociological character of Hindu thought. In Chinese social philosophy there is a preliminary analysis and classification of the various types of social relationship, expressed in the *wu-lun*, or five relations, of Confucianism: those of governor and governed, parents and children, husband and wife, older and younger brothers, friend and friend. But once the classification is posited, the treatment reverts to the ethical. To say, as some Chinese scholars do, that *wu-lun* constitutes a general term denoting social phenomena as contrasted with natural phenomena and that the distinction between state and society is made in the enumeration of the five relations is to read later abstract thought into the descriptions of simple social categories in which these distinctions have from the first been implicit.

The treatment of society in the writings of Confucius and the other sages of ancient China clearly illustrates the way in which the dominance of an ethical attitude may inhibit the development of sociology. The thought of Confucius is almost entirely devoted to social relationships. He posits the Aristotelian principle that man is both a rational and a social animal and suggests that personal and social equilibrium are intimately interdependent. But his preoccupation with right personal relations overpowers his consideration of the social structure itself. While, for example, he emphasizes the basic role of the family in the social structure and makes the state simply the family writ large, he deals nowhere with the principle of social organization thus implied and attempts no description of the manner in which a society built of family units is actually constituted. So little is he concerned with sociological structures that when he turns to his ideal society, even "the bonds of marriage and parenthood no longer exist; everybody will be motivated by altruism and look after others' affairs as though they were

his own. Hence the only relation that will exist is that of friendship" (Wu, Y. C. L., "The Social Thought of Confucius" in *Chinese Social and Political Science Review*, vol. xii, 1928, p. 309). For this ethical attitude social structure is of minor significance and social change is envisaged only in terms of moral advance or decline.

In the mediaeval period in Europe the soil was still less favorable for the growth of sociology, for not one of the conditions on which its growth depended was present. The distinction between society and state was obscured and rendered ineffective by the overruling distinction between the secular and the ecclesiastical order, typically viewed as two systems of institutions hierarchically related to each other. If all theories are called sociological which are concerned with the relation of man to man, the conditions of social solidarity, the basis of class distinctions or the general nature of human association, then sociological theories were rife in the Middle Ages, culminating in the architectonic system of the *Summa*. Yet if science is distinguished by method rather than by content, there was no sociology. The reasons for the general barrenness of science in the Middle Ages have a peculiar validity for the social sciences. They lie not so much in the appeal to authority as in the grounds of competence which assured authority in scientific matters. The impediment was not the abstract speculative trend of the age, whose real defect was the limit set to the premises of speculation. Nor can it be stated as simply the intense preoccupation of the age with a priori judgments of value, which might still have admitted scientific investigation of the social conditions under which the posited values could be realized. The major impediment lay in the conception of law as something revealed, imposed and uniform, with the corresponding view of nature as the material which passively or reluctantly takes the imprint of law. In the human sphere that reluctance was identified with natural depravity and sin, a viewpoint which effectively precluded any objective observation of the patterns and interactions of the social order and any sustained research into the conditions under which in their manifold and changeful varieties they emerge.

Throughout the Middle Ages the social theories and social prescriptions, produced first in the Catholic and later in the Protestant scheme of things, passed through various stages and exhibit definite historic trends. These

changing theories no doubt reflect changing social conditions and social attitudes, but they do not consciously interpret them, for the conditions as well as the attitudes remain merely implicit in the variations of avowedly theological constructions. Throughout the whole range of mediaeval speculation an independent or positive sociology is not approached. The social philosophy remains a priori, derived from a higher source, never the free speculative exercise in system making which follows the discoveries of science and provides an impetus to newer discoveries. Divergent schools disputed the Thomist theory of the *perfecta societas* but they argued from the same premises. If some made much of the analogy between society and the natural organism, it was only in a superficial taxonomic representation of the order of relationship and subordination which should exist between the elements of the social body. If they spoke of natural relationships, it was in the sense of relationships accordant with a natural law of an ethical or idealist construction.

In this period society is not yet thought of as an independent focus of theoretic interest and of scientific study. This standpoint, the precondition of sociology, is not possible so long as any one form of association, state or church or economic organization, is conceived of as including or controlling or even, as later in Marxist theory, as determining all other types of human relationship. For in so far as these other relationships are thus made derivative, they fall within the ambit either of ethical and religious philosophies or else of the hypothetically master sciences of politics and economics. It is questionable whether a genuine sociology can be established even on the premises of Troeltsch, who, while according an independent existence to religious associations, yet defines society in Marxist fashion as "primarily the social relationships which result from the economic phenomena" (*Die Soziallehren der christlichen Kirchen und Gruppen*; tr. by O. Wyon, 2 vols., London 1931, vol. i, p. 30). The rise of sociology comes with the perception that no one order of social phenomena is adequate to comprehend, directly or indirectly, the manifold activities, processes and trends of society, a perception which itself was advanced by the increasing range and complexity of social relationships which began with the era of modern civilization.

With the break up of mediaeval thought forms the same conditions which liberated the physical sciences gave impetus to the quest for

sciences which should interpret the life of mankind. As the time honored subjects of law and politics took new directions, men came to examine afresh the social and psychological conditions which gave both sanction and specific form to codes and constitutions. From this point of view the work of Montesquieu was of signal importance. With broad insight he showed that laws were an expression of national character and that the spirit which they exhibited was to be explained in the light of the conditions, social and geographical, under which men live. Social theory was thus developed as prolegomena to politics.

The penetration of sociological into political thought is well illustrated in the history of the social contract school. The grounds of political obligation, no longer assured by authority, were sought in a theory of the harmony of ends attained through the simple reciprocity of interests. But the legally conceived contract of Hobbes proved wholly inadequate and the movement advanced to its consummation in the doctrine of Rousseau, which under the cover of contract sought to penetrate to the bonds that hold men together, not simply in the state but—although he failed to realize the significance of the distinction—in society itself. The legal individualistic idea of contract was thus in effect transformed into a sociological idea. Burke with his traditionalist bias sought to retain and ennoble the old idea of society as contract, but at the very period when his concept of the indissoluble union between a society and its political institutions was shaken to pieces by the French Revolution. From that time the old contract theory of society became a dead letter, although echoes of it are heard in the writings of Spencer, Durkheim, Fouillée and others.

The supersession of social contract individualism meant a return to the concept of man as *zoon politikon*, but now with the essential clarification that *politikon* was translated social as distinct from political. The theory of society was not to be identified with the theory of the state. This distinction played an important part in the thought of the German philosophers from the close of the eighteenth century. In the contributions of men like Fichte and Novalis the old philosophy of history was reoriented as *Gesellschaftsphilosophie* and *Gesellschaftslehre*. For Fichte society meant the relation of reasoning beings to one another and the state was only a specific, empirically limited form of society. The positive character of society he found in

reciprocity through freedom (*Einige Vorlesungen über die Bestimmung des Gelehrten*, Jena 1794). From then on an essential problem was that of the relation of society to the state and consequently of *Gesellschaftslehre* to *Staatslehre*. While some of the German romantic school, like Schlegel and Adam Muller, continued to use the two terms almost interchangeably, the trend was in the opposite direction; and even Hegel, for all his idealization of the state, made his own somewhat curious distinction between bourgeois society and the state. It remained only to bring this distinction from the realm of philosophy to that of science. In this process sociology as a definite subject was born.

There were also in the late eighteenth century and early nineteenth certain broad movements which turned the attention of men to the study of the non-political aspects of society and thus almost insensibly gave rise to a distinctive if rudimentary science of sociology. The rapid changes of constitutions which the post-revolutionary period exhibited apparently made relatively little imprint on the currents of social life. On the other hand, the new industrialization seemed to penetrate into the social order, deeper than did any scheme of government. The slower economic revolution was more enduring, more resistless, than the political. If these manifestations aided in the distinction of economics from politics, they were no less influential in generating the demand for a science of the social life, on which economic and political changes alike impinged. Some of the economists of this period might accordingly with equal title be classed as sociologists. Thus Saint-Simon, who proclaimed the oft reiterated principle that the social sciences should follow the methods of the physical, was fundamentally concerned with the class structure of society. Malthus, although duly celebrated in the history of economic doctrine, has scarcely been given the credit he deserves as a sociologist, for he pointed to a law governing the progress of society which depended, as he saw its operation, on drives antagonistic to those of the economic man; and he sought, appealing to the best inductive evidences he could muster, to discover a biological rather than an ethical or political basis for the essential conditions under which human groups live and struggle.

There was also manifest in this period a new direction of interest in the study of society. Revolutionary changes affected in different degrees and with different tempos the various

aspects of the social order. There came thus into prominence the question of the relationship of one set of social factors and forces to the others, the question of causal relationships in the social field. One answer to this question was given in effect by the economic laissez faire school. From their different viewpoints the utilitarian school of Bentham and the anarchist school of Godwin gave not dissimilar answers. The same premises of the causal superiority of economic and technological factors led the socialists of the school of Saint-Simon to very different conclusions regarding the role of the state in society. The opposite point of view from that of all these groups, giving the crown to the cultural and ideal forces active in society and therefore to the state as the conscious embodiment of these forces—not as the mere registrar or executor of materialistically determined laws of economic production—found its fullest expression in Hegel. When his left wing disciple Marx drastically reversed the Hegelian causality, a challenge was issued which has since been a spur to sociology, especially to European sociology.

The earlier nineteenth century thinkers who took up the study of these relationships cannot be classified distinctively as economists, political scientists or sociologists. They were all these at the same time. Le Play for example made the family the main focus of his social studies and analyzed family budgets as a quantitative inductive basis for his conclusions. But he was also intensely interested in economic organization and social and political reform, and at the same time sought the determinants of social phenomena mainly in geographical conditions and the economic activities to which they give rise. He may therefore be called a sociologist in the same broad and unspecific sense in which the term is applicable to Montesquieu. The specialization of interest, of the focus rather than of the field of investigation, which led to the express development of sociology, not as social science in general but as a specific social science, was not yet attained.

This development received a peculiar impetus from the work of Comte, as contained in his *Cours de philosophie positive* (6 vols., Paris 1830-42; tr. by H. Martineau, 2 vols., 3rd ed., London 1893). Comte sought to establish a science which should embrace the totality of human life and activity, a goal not in itself new but at least as old as Plato. What distinguished Comte, apart from his advocacy rather than application of modern scientific methods in this

quest, was the manner in which he envisaged this synthetic science. It was not merely that for him society was an inclusive concept containing the categories of the cultural as well as of the economic and political life, an architectonic form which both implied and transcended the laws of all the sciences from mathematics to biology. More than that he conceived this social unity as dynamic, fulfilling itself through a series of evolutionary stages which revealed in myriad concrete phenomena an order of spiritual, essentially human advance. These stages—the theological, metaphysical and positive—were integrated, each in itself, under a prevailing thought form. It was this thought form, not merely the type of economic or political organization, which expressed the fundamental principle of social solidarity in each epoch.

Comte's system heralded rather than achieved the advance of sociology to a place among the sciences. His positive philosophy never became the positive science which he desiderated; his religion of positivism set limits to his science of sociology. His classification of the sciences was an admirable starting point, but he left sociology itself too vaguely comprehensive. His three stages are not explicitly social stages at all, but stages in the evolution of human reason—or at least of human attitudes toward the world; and while he finds them revealed in history, his basis of induction is too narrow and too eclectic. Nor are they properly correlated with types of social organization. His positive stage, which should correspond with the existing types of civilized society, is as much prophetic as actual. He further makes the assumption, which was to cause considerable trouble in later nineteenth century sociology, that social evolution is ipso facto social progress. But Comte none the less not only gave sociology its name but also inspired the first definite schools of sociology.

The concept of society received no adequate analysis from Comte. It was a totality of human experience, a solidarity of all living, in which individuals found their meaning, within which all they did and thought somehow belonged. Thus culture became simply an aspect of social life. Sociology could not maintain its claim as a specific science until this position was reversed, until the social factor was itself seen as an aspect of all human experience. But the more inclusive formulation, although it lent itself too easily in Comte and some of his successors to a mystical interpretation, was yet consistent with the simple evolutionary doctrine that Comte ad-

vanced. It allowed him to think of society as organism, an evolving whole, manifesting in all its activities a principle of life, the biological rising in it to the higher level of the rational spiritual, the sociological. This evolutionary organic concept received new vitality when Darwin stirred the age with *The Origin of Species* (1859). To conceive of society as organism was one of the oldest refuges of human reflection; to explain it as an evolving organism became now the goal of the biological school of sociologists.

Spencer took the foremost place in this group. Like Comte but in a vastly more concrete exposition, he accepted a principle of evolution which was the key to the universe and was most fully realized in civilized society, the simple law of differentiation. He showed its working in his elaborate studies of early social institutions, which enabled him to draw evolutionary contrasts between primitive and civilized society. In doing so he was led to various conclusions regarding the social role of religion, custom, fashion, war, the industrial arts and so forth, which, while often superficial, were at least sociological in interest and method of treatment to a degree which Comte never attained. At the same time his system contained an essential contradiction that pointed to the shallowness of his thought. There was a curious incongruity about a social organism which possessed an alimentary system but no common sensorium. He could never reconcile his biological conception of social unity with the psychological factors which social unity implies. Nor could he deal effectively with the cultural conditions of social change, for adaptation as a biological category is not itself a principle of change. Consequently his treatment of social stages is external and unsatisfying. But the root of Spencer's difficulty went deeper, for his social philosophy rested on a belated *laissez faire* individualism, which in effect denied the implications of his own doctrine of the organic nature of society.

Most of the other members of the biological school avoided this contradiction by insisting on the principle of social solidarity. Some, like Fouillée, thought the problem solved when they defined society as a moral organism or a contractual organism, a fusion of concepts which destroyed the significance of the organic analogy. Others, like Worms, were content to minimize the apparent differences between organism and society, while admitting their existence. But all alike, by construing the social bond

in biological terms, were led into analogical reasoning which became the more illusory or even fantastic the further it was pursued. Thus Lillienfeld-Toailles in "Die menschliche Gesellschaft als realer Organismus" (in his *Gedanken über die Socialwissenschaft der Zukunft*, 5 vols., Mitau 1873-81, vol. i) expounded the process of social metabolism and compared the mobility of social individuals to the movement of free cells in the body and the migration of individuals to the transmission of spermatozoa. A. E. F. Schaffle in *Bau und Leben des socialen Körpers* (4 vols., Tübingen 1875-78), although more guarded and ready to admit important distinctions between society and organism, is reduced to treating the cultural life of a community as its nervous system. Bluntschli in his book on the state distinguishes it as a male organism from the church, which is a female organism. These attributions impeded the direct study of society by diverting the energy of the student to the discovery of dubious analogies. They involved moreover the initial false hypothesis that a composite unity must be integrated by the same principle which its units exhibit; that, as Novikov claimed, society must be a living organic being because it is composed of such.

The full blooded organic school had great vogue in the last quarter of the nineteenth century, but its influence was on the whole short lived; for, like all schools with doctrines based on analogy, the further it advanced, the more barren were its results. The influence of Spencer was particularly meteoric. The spirit of his elaborate construction, at once so optimistic and so helpless, was soon outmoded. A system which seemed to many of his contemporaries once for all to establish sociology fell suddenly into neglect and even into a derision which was as undeserved as its preceding fame.

Attention meantime was turning from the presumptive biological nature of society to the biological basis of society. Here too the first applications of biologically derived ideas were narrow and one-sided. The attempt was made to apply the Darwinian theory to the interpretation of social evolution, involving the rejection, as anti-evolutionary, of the socializing principles of cooperation and mutual aid. Although T. H. Huxley protested against such conclusions in his Romanes lecture, *Evolution and Ethics* (London 1893), they found many supporters; and they seemed to receive new confirmation when the teaching of Weismann on the non-inheritance of acquired characters won scientific favor

over the views of Lamarck. The issue resolved itself into a conflict between such natural selectionists as Schallmayer and Karl Pearson and the sociologists, such as Novikov, Tonnie and Kropotkin, who denied the validity, as applied to the life of socialized man, of the principles which these biologists deduced primarily from the study of lower organic life and then sought to erect into social imperatives.

Another form of sociological Darwinism was put forward by a school of theorists who, reacting from the Comtian notion of solidarity, found in the struggle of groups the key to social evolution. Gumpłowicz and Ratzenhofer were the chief representatives of the school which laid stress on racial and other supposedly biological groups. For them the focus of interest was not society but the group viewed as a coherent aggressive unit within a civilization. Gumpłowicz, for example, did not deal with social relationships as such but only, and in a somewhat naive fashion, with group relationships, and, like the majority of writers who have limited their range in this way, he showed a lack of psychological grasp. Ratzenhofer was less one-sided, and his doctrine of interests although superficial proved not unfruitful. But on the whole the criticism passed on this school by von Wiese is well founded, that not one of these writers has succeeded in surmounting the difficulties presented by his own sympathies and prejudices. This criticism is even more applicable to the proponents of doctrines of race superiority and race purity. In this respect J. A. de Gobineau's *Essai sur l'inégalité des races humaines* (4 vols., Paris 1853-55; bk. i, tr. by A. Collins, London 1915) set an example of pretentious exegesis, which was followed by Chamberlain and the popular votaries of race. Lapouge and Ammon, with their classification of mankind by head types, achieved a greater semblance of scholarly exposition; but their conclusions, such as the association of dolichocephalic and brachycephalic types with cultural differences, were rash generalizations in which complacent belief made up for faulty evidence.

Whereas Comte had fused in one great cloudy synthesis a biological and a cultural conception of social evolution, these writers laid stress on biological consideration, seeking in effect to reach sociology by a biological approach. Another school, concerned with the social mind rather than the social organism, strove to discover the relationship between the mentality of

the individual exponents of society and the system of beliefs, traditions, ideas and ideals which were embodied in social institutions. Comte had found no specific place for psychology in his hierarchy of the sciences. While he insisted that the dominating factor in the history of society was the human mind, he thought of it as itself socially determined and thus made the psychological element a derivative from the sociological. This position was emphasized by his disciples de Roberty and de Greef and found its complete expression in the work of Lévy-Bruhl and Durkheim. De Roberty insisted on the evolutionary role of ideas; de Greef brought out the importance of environment as giving cohesion to the group mind. To the latter the stages of social advance are those by which, as domination gives place to free contractual reciprocity, the mind of the group finds freer expression. Fouillée followed similar principles and in particular evolved a doctrine of what he named *idea forces*. These ideas, themselves social, are incarnated in the members of a society so as to lead them in a different direction, even an opposite direction, from that which their native heredity would determine.

The most distinguished member of this school was Émile Durkheim, whose earlier studies, however, were along a rather different line. In his work on *Le suicide* (Paris 1897; new ed by M. Mauss, 1930) he developed an interpretation associating the frequency of suicide with conditions which led to the social isolation of individuals and the loss of the sense of solidarity, a work recently competently redone by Halbwachs. In his *De la division du travail social* (Paris 1893, 6th ed. 1932) Durkheim contrasted the mechanical unity of the simpler societies, in which division of labor is undeveloped and the social bond is one of coercive uniformity based on the sense of likeness, with the complex organic unity of an advanced society in which myriad differences of personal aptitude, disposition and habituation are incorporated in the social organization. Although the argument is developed with Durkheim's usual felicity, the individualist Spencerian attitude which allowed him to regard primitive societies as segmentary is curiously out of accord with his later doctrine of collective representations as formulated in *Les formes élémentaires de la vie religieuse* (Paris 1912; tr. by J. W. Swain, London 1915). In the latter work the evidences of primitive society on which he drew before—language, codes, usages—are seen in the light of the doctrine of the

social mind. They do not arise from the reflections of individuals but awake into being among them out of their togetherness in a situation. They are impressed upon all individuals, as it were, from without themselves; society itself is a consciousness above individual consciousness.

In so far as the purport of this doctrine is to show the profound social conditioning of the attitudes and beliefs current among men, it can be and has been employed most effectively, as in Halbwachs' sociological interpretation of memory, in studies of religion and tradition made by Hubert and Mauss and by Lévy-Bruhl and in various other contributions to the review founded by Durkheim, the *Année sociologique*. But the overpowering thesis of the collective consciousness retains too much of the mystic solidarity expounded by Comte. Its supporters appealed to the phenomena of primitive society or to the emotional mass manifestations which tend to deindividualize those subjected to them. This resort to the less differentiated types of social group suggests a caution; it is contrary to the principle that the nature of anything is revealed more fully in its more developed forms. Above all, the school has never come to grips with the objection that the phenomena it thus interprets can be explained without the aid of this additional entity, in terms of the interactions of individuals subjected not to the dominion of a social mind but simply to the influence of common environment and common social heritage. The studies, for example, which Wundt made of folk psychology would have been no less complete as scientific studies if he had discarded the hypothesis of the collective consciousness.

Closely allied to the sociologists concerned with the collective mind is another group, of which Hauriou, Bourgeois and Bouglé are representatives, which seeks to investigate the nature of the feeling of solidarity as the subjective basis of all social manifestations. Hauriou distinguishes various types and expressions of solidarity, somewhat on Comtian lines and with the aid of physical analogies which are perhaps more imaginative than helpful.

Over against both these groups may be set the writers who interpret social phenomena from the standpoint of individual psychology. An example is Tarde, who defines society itself in terms of imitation, using the word in a very broad sense; thus custom is the imitation of ancestors and fashion the imitation of contemporaries. In keeping with this principle he

finds the origins of social change not in broad movements generated by groups but in the individual inventive mind. Tarde, like the other members of his school, minimizes the significance of the common conditions of environment and the common elements of experience, which evoke in men not only similarities of behavior but also the deeper sense of their community. His influence is evident in the treatment of group phenomena by the Italian writers Sighele and Pasquale Rossi.

The impact on sociology of the young and vigorous science of psychology tended to increase as the biological schools declined in influence. Thus in England, when the influence of Spencer waned, the new impulse came largely from psychology. This is manifest in the work of Graham Wallas, who sought to give in *The Great Society* (London 1914) a picture of the psychological adjustments and maladjustments of modern social life and who followed lines similar to those developed in the social psychology of McDougall. It appears also in the wider canvas of Hobhouse, who sought to reveal the evolution of society as the correlate of the evolution of mind.

The psychological influence became still more powerful in the United States, where sociology achieved its most rapid extension. The earlier leaders, in particular Ward and Giddings, had Spencerian affiliations but, like Hobhouse, although without his philosophical grasp, they came to interpret social evolution in psychological terms. Ward put forward a doctrine of social forces, characteristically naming them sociogenetic. Giddings abjured biological analogies and, proclaiming the consciousness of kind as the basis of society, proceeded in rather broad fashion to categorize social stages as expressions of dominant mental processes. Patten developed a theory of social forces in which the evolution of society is represented as a transition from a pain economy to a pleasure economy. The nature of the fundamental processes of society was attacked by the more philosophical exponents, such as Baldwin, Cooley, Mead, Balz and Dewey. The analysis of society into its psychological elements was undertaken from new standpoints and with richer materials by Thomas and Znaniecki. Classifications and descriptions of particular social processes, such as assimilation, accommodation, adjustment, were elaborated by Ross, Ellwood, Park, Burgess and others. In fact society seemed in the pages of the last mentioned writers to resolve itself into a

welter of processes which were hard to distinguish from one another or to limit for purposes of more precise study. The German sociologist von Wiese has lately attempted in his *Allgemeine Soziologie als Lehre von den Beziehungen und Beziehungsbildern der Menschen* (2 vols., Munich 1924-29) to give precision and thoroughness to this mode of analysis.

A further influence came into sociology from psychological sources with the appearance of behaviorism, as developed by Pavlov. In the United States particularly, while relatively few sociologists accepted the extremist claims of Watson, a not inconsiderable number found the behaviorist method congenial. It seemed to satisfy the demand for objectivity and mechanical certainty in the business of research. It was in keeping with the pragmatic and empirical tendencies hitherto fed by the psychology of James and the philosophy of Dewey. It promised the translation of sociology into an exact and natural science. Unfortunately for these pretensions, scarcely any sociological contributions really based on this principle have followed, possibly because in the nature of the case it is not possible to interpret social facts solely in terms of overt behavior that dismisses from the record the subjective factor in virtue of which they are defined as social. The positive significance of the movement is to be found not in its interpretations but in the stimulation it has given to a more rigorous scrutiny of the objective indices of subjective phenomena. A newer development in the same direction is the social behaviorism of the Viennese sociologist Neurath, who along with Carnap has devoted himself to a philosophical justification of the principle. While the behaviorists generally refuse to recognize any scientifically important distinction between the realm of society and the realm of nature, Neurath admits the importance of the subjective level but maintains that from the standpoint of the unity of science social phenomena must be recast into the forms of space-time. This physicalistic monism is not exclusive with the behaviorists, having been attempted by a number of earlier writers, such as the social philosopher Carey.

Among the psychological sociologists mention must be made of Pareto, who founded his sociology on a type of psychological analysis peculiarly his own. Pareto put forward a vigorous and clear cut argument for an objective social science, denuded of all evaluative elements and resting solely on the logico-experimental meth-

ods of the natural sciences. It is significant, however, that the relation between his concept of method and his own lengthy treatment of illustrative social situations in *Trattato di sociologia generale* (2 vols., Florence 1916; 2nd ed., 3 vols., 1923) is by no means obvious. His deep scorn of ideologies is turned particularly against those which have a humanistic bent and suggests the disguised presence—less disguised in his doctrine of the circulation of élites—of a counter ideology, such as in fact has grown up among his followers. His elaborate distinction between the residues, the variant forms assumed by deep seated human drives or instincts, and the derivations, the inconsequent ideological, socially created masks of the former, rests on a hypothesis concerning the genuine or basic motivations of human nature, as contrasted with their fictitious appearances or moralizations or rationalizations, which Pareto accepts with too little scrutiny. Pareto here reveals his affinity to the Freudian school, to the behaviorists, to the Marxists and to the writers of the new history and the new biography, who search for the real motives underlying the overt actions, especially the speech reactions, of historical figures. The quest is a significant one, but the danger of an oversimplification, the obverse of the sentimental or romantic oversimplification which these schools effectively attack, is ever present.

The dependence of social phenomena on specific geographical factors, on the presence and degree of exploitation of specific natural resources, on climate, on the distribution of rural and urban areas, on natural conditions favorable or unfavorable to free communications, and so forth, has from ancient times been a subject of reflection. It impressed mediaeval commentators such as ibn-Khaldūn and Bodin. It was enlarged upon by Montesquieu and toward the end of the eighteenth century it played an important part in Herder's philosophy of history. Ritter followed in the same strain, but added the important caution that geographical conditions grow less determinative as civilization advances. Le Play began a more scientific study of the social effects of locality. Buckle in his *History of Civilization in England* (2 vols., London 1857-61) emphasized the dependence of race on environment and introduced considerations regarding the influence of the food supply. From Le Play there developed the observational descriptive methods of Demolins and the contributors to *Science sociale*, who sought to bring out the cultural and social

differences characteristic of various areas. In Germany there arose the somewhat similar geographical school, stimulated by Ratzel's comprehensive *Anthropogeographie* (2 vols., Stuttgart 1882-91; 3rd-4th ed. 1921-22). Most of the writers of these schools take the general position that geographical factors set conditions and limits within which the hereditary characters of the group, the nation or the race take form and particular expression. Some, however, like Mougeolle and Huntington, have leaned toward an extreme determinist position without adequate analysis of the difficult problem of causality involved. These last mentioned writers stand in contrast to such recent moderate exponents of the geographical basis of society as Brunhes.

One form of the geographical approach to sociology is the regional survey made familiar in England by Geddes. Semple has applied the method of Ratzel to the New World, and Turner has shown the role of the frontier in the formation of American mores. The ecological school, centered primarily at the University of Chicago, has developed somewhat elaborate observational and statistical techniques for the study of urban districts, on the principle that objectively marked boundaries within the city delimit the natural areas of group solidarity and group attributes. These locality patterns have been described with much wealth of detail by Park, Burgess, Shaw, McKenzie, Wirth, Zorbaugh and others. Their tendency to define these patterns in physical terms (for example, gradients, zones, interstitial areas), their use of such concepts as accommodation, invasion and dominance and their acceptance of the distinguishing title ecological suggest a hypothesis of the determination of social differences by environmental factors. But this hypothesis is qualified or even rejected by some members of the school, and on the whole the group has been much more interested in descriptive studies than in the theory of environmental determinism. Their work has thus fallen broadly into the field of urban sociology, corresponding in this respect to the studies of rural sociology advanced in the United States by Sims, Kolb, Zimmerman, Sorokin, Brunner and others. Both urban and rural sociology, with their predominantly descriptive character and their large employment of statistical methods, belong to what the Germans call sociography, the mapping out of the concrete social facts relative to determinate areas or groups.

Closely related are demographical studies, which owe their modern development to the range of statistical data collected by the state and by other agencies. Malthus, writing at the time when census taking was in its infancy, could deal only in rough estimates of the relation between land and population. Nevertheless, even if he had possessed accurate figures for populations and class groups, his conclusions would have been rendered obsolete by the vast changes in the trends of birth rate and death rate throughout modern civilization. These changes have inspired numerous studies of the relation between population and living standards, cultural attitudes, class differences, social mobility and urban and rural conditions.

The schools thus far discussed are distinguished by the fact that they applied to social phenomena the specific concepts or the specific methods characteristic of some other science or group of sciences. The gradual rise of sociology to an autonomous or at least a distinctive science has been fostered by the experience gained through these various approaches, as they proved inadequate—however useful they might be—to compass the subject matter of society. Sociology came to claim its own approach, one not merely biological or psychological but sociological. In seeking to create a sociology from a point of departure in other sciences these thinkers imparted influences derived from sociological reflection into these sciences in turn. The reciprocal influence is evident not so much in respect to biological or natural science, although Darwin did find his clue in Malthus, as in respect to jurisprudence, politics, economics, history, the study of religion and other cultural factors and general anthropology.

In political science, for example, the conception of the state was enriched as well as more adequately defined when it came to be seen as a social creation or as a social organ responsive to social demands. This was in contrast to the legalistic attitude which saw the state in terms of a traditional doctrine of sovereignty, as itself the disposer and creator of rights. The relation of the state, no longer merely of the government, to society became a leading problem of political thought. Thus von Stein made the distinction of state and society the basis of his theory of the state. The rise of sociological schools in politics and jurisprudence not only in France and in England but also in Germany led to fresh legal and political ideas. Of particular moment among these developments was the corporation theory

of Gierke, based on the principle of the corporate personality of associations—a lead followed by various other writers, among them Preuss and Maitland. Another important contribution was that of Stammer, who helped to give a new orientation to jurisprudence by insisting that law is only one type of social regulation, must be seen in relation to other social rules and must be understood as an aspect of a still larger system, the solidarity of social life. In fact the results of sociological reflection and investigation appeared in the development of legal as well as political theory, exemplified by such works as those of Maine and Bagehot; in the reformulation of the concrete problems of legal jurisdiction, as advanced, for example, by Holmes and Pound; in new directions given to the studies of criminology and of penology; and in the actual reorganization of the administration of justice through the courts.

These developments constituted one aspect of the interfertilization of the social sciences which accompanied their attainment of a new degree of maturity in the late nineteenth and the early twentieth century. Another aspect is seen in the relation of sociology and economics. While some economic schools, from the classical to the marginal utility, assumed for theoretical simplicity the hypothesis of the economic man and the purity of the economic motive, others, including various non-socialist as well as socialist schools, found it necessary to modify this hypothesis. In particular economic historians were led to interpret economic change as an aspect of social change, for the isolation of economics led only to errors when applied to the historical treatment. Economic historians, from Roscher and Schmoller to Sombart, came increasingly to be sociologists. Several sociologists who have made effective use of historical methods, like Max Weber and Oppenheimer, have entered sociology by way of economics.

The two authors just mentioned illustrate, however, two different avenues of approach from economics to sociology. Weber, seeking to discern the character and the basis of the mores that sustain an economic system, the *Wirtschaftsethik* behind the *Wirtschaft*, was led by theoretical considerations into the field of sociology. Franz Oppenheimer was impelled by his urgent sense of the need for social reconstruction to seek in sociological studies for the grounds of economic maladjustment (*Allgemeine Soziologie*, his *System der Soziologie*, vol. 11-2, 2 pts., Jena 1922-23). The interest in social

reconstruction helped to inspire the studies of social stratification which have been an important contribution of German sociology. The interest in social reform played a particularly prominent part in the history of sociology in the United States. It appeared in a more limited sense in the contrast between Ward's concept of telic evolution and the automatic progress of the Spencerian formula. It was reenforced by the professional connection between sociology and schools of social work. It helped to give the practical bent to sociological studies in the United States, which, as new schools came to attack the normative attitude in the name of science, turned to the meticulous organization of research in very many delimited areas of social behavior.

In Germany particularly the question of the sphere of sociology and more especially of the relation of sociology to economics took new significance from the repercussions of the challenge of Marx. If what Engels had named the materialistic interpretation of history was valid, then social phenomena are primarily reflective of economic phenomena. For Marx and Engels the causal order was essentially one that led from changing techniques of production to changing economic relationships and thence to changing social relationships. The question at issue was not whether economic factors had an important impact on the whole social fabric but whether the latter, together with the totality of the cultural life, should be construed as derivative from the former. This position can be tested only by the difficult analysis of the causal nexus involved in the whole complicated pattern of interrelationships between technological, cultural and social factors. It implies in the last resort a psychological analysis of the system of human motivations, as manifested in responses to changing environmental conditions.

The historical rather than the scientific importance of Marx gave impetus to such studies. The various single factor theories of social causation, whether geographical, technological, economic or cultural, can all be supported by certain evidences but they tend to refute one another. Thus Marx regarded the technological factor as working indirectly on society through its economic consequences, while Thorstein Veblen based a deterministic theory on its direct operation through a process of "work-a-day habituations" (*The Theory of the Leisure Class*, New York 1899; new ed. 1918). One group of historians and historical sociologists, like Lam-

precht and Spengler, constructed schemes of social evolution on some idealistic hypothesis; while another group, like Goldscheid, Loria and Max Adler, constructed others on a naturalistic basis. Fundamental questions of methodology were here raised, one of the central issues being the causal nexus between religious and economic factors. Of those who have addressed themselves to this problem of methodology perhaps no one has posed the question with more breadth of comprehension than Max Weber. It is a task which has also engaged the attention of the sociological epistemologists, such as Scheler. The problem, although it is becoming sufficiently clarified to negate the more extreme deterministic claims, by its nature demands the continuous and combined assault of the theoretical analyst and the practical investigator into the causation of specific social situations.

An apparent way out of the perplexing problem of social causation is that of the cultural approach. In the manner of cultural anthropology it envisaged as an inclusive system of the superorganic all the manifestations of conduct, achievement and institution which characterize a social group. This method serves no doubt for the broad distinction of cultural or social stages, like that advanced by L. H. Morgan in his *Ancient Society* (New York 1877) or by Muller-Lyer in his *Phasen der Kultur und Richtungs-linien des Fortschritts* (Munich 1908, tr. by E. C. and H. A. Lake, London 1920). But it leaves sociology without a focus, and it evades altogether the real question of social causation as distinct from the quite different question of independent origin and the diffusion of culture traits. Sociology on this principle can be little more than a general science of classification and description, in no way properly differentiated from anthropology. The interpretation of social phenomena involves the relation of the specific social factor not only to the cultural order conceived in this broad sense but also to the different elements within it. As Alfred Weber has shown, the three primary systems within which all human constructions fall—the system of civilization in the sense of the utilitarian technological order, the system of culture understood as the complex of the arts, creeds, philosophies, manners, morals and enjoyments in which human nature finds its freer expression and the system of social relationships—have to be regarded as exhibiting distinctive characters and different tempos of change in the historical

process which weaves them all together ("Prinzipielles zur Kultursoziologie" in *Archiv für Sozialwissenschaft und Sozialpolitik*, vol. xlvii, 1920-21, p. 1-49).

Society thus came to be seen as a system distinct from the state; a system revealing internal principles of coherence and change of a different order from the prescriptive rules of morality; a system not to be identified with the economic, the cultural or any scheme of human behavior other than that which expresses itself in the interaction of man with man, or, in Max Weber's language, in the orientation of a person or persons toward the behavior of others. Once sociology emerged as the study of this subject matter, it continued to borrow the particularist principles or methods of other sciences, as distinct from the universal logic or methodology which is inherent in the nature of science. Sociology then attempted to attain the maturity which involves not only a particular subject matter but also its own particular approach, derived from experience gained within and not without its own field. Some of the sociologists previously considered, notably Durkheim, have striven to this end, but they have revealed some uncertainty or limitation in its pursuit. Durkheim, for example, showed a tendency to interpret cultural phenomena rather exclusively in terms of the social factor, although his aim was to treat the social factor as a reality *sui generis* and to develop methods of investigation which were appropriate to this distinctive subject matter.

One of the first clear attempts to base a sociological system on principles derived from the study of the social element itself was made by F. Tönnies, in his *Gemeinschaft und Gesellschaft* (Leipzig 1887, 7th ed. Berlin 1926). By *Gemeinschaft* Tönnies meant a social unity of a deep rooted organic character, arising out of the essential social nature of man and expressive of a collective will; such formations, for example, as the tribe or the clan. *Gesellschaft*, by contrast, is a deliberate social construction, in which individual aims are conjoined contractually for their better fulfillment. *Gemeinschaft* is the matrix, the source of social development; whereas *Gesellschaft* is prominent in the more complex civilization—in the life of the city but not of the village. The distinction has proved a fruitful one, although perhaps the stress laid by Tönnies on the relatively artificial character of *Gesellschaft* introduces a dubious element of valuation, especially if one considers the use

made of these conceptions by romantic writers like Spengler.

Tönnies was followed by a group of German sociologists who sought to lay the foundations of an autonomous sociology, all of whom centered their interest on social relationships as the primary subject matter of sociology. Georg Simmel gave his chief work, his elaborate, discursive and suggestive *Soziologie* (Leipzig 1908), the subtitle *Untersuchungen über die Formen der Vergesellschaftung*. His emphasis on forms, the characteristic general modes of relationship, arising from his desire to delimit the field of sociology, has led to misapprehensions as to the nature of his contribution. In his studies of social differentiation, of the persistence of social groups, of the various relationships, such as superordination and subordination, with which he dealt in the *Soziologie*, Simmel revealed himself as a discerning analyst of social phenomena, in no way as a formalist in any narrow sense. Von Wiese has on the whole followed the lead of Simmel, although he prefers to use the term social process instead of social form and shows his kinship to recent trends in sociology in the United States by his use of extensive classifications and his insistence on empirical methods. Vierkandt was a more eclectic thinker, who besides his studies in cultural history and his contributions to the analysis of types of social relationship proclaimed the value of the phenomenological method, the discernment of the essential psychological factors of a situation or process by direct apprehension of its nature, which may be regarded as the precise opposite of the behavioristic method. In the same vein, while the behaviorists draw a sharp line between sociology and social philosophy, Vierkandt maintained that sociology is productive only when it has a philosophical basis.

Vierkandt's position approached in some respects that of the outstanding exponent of method, Max Weber. Weber held that sociology, directed as it is to social behavior, which is by definition intentional or meaningful, must not seek mechanically to measure phenomena but is directed to understanding them. In this he followed the maxim of Dilthey: *Die Natur erklären wir, das Seelenleben verstehen wir*. Pursuing this distinction, Weber developed his principle of ideal types or constructs. In the complex vicissitudes of historical change social factors, attitudes, movements, are aspects of a concrete reality which does not conform purely to the type forms by which it must be under-

stood. Hence the ideal type (the idea, in the Platonic sense, or specific essence of the phenomena) is a construct framed by experience and employed thereafter as an instrument of discovery and as a hypothesis to be refined by further experience. It differs, if at all, from the abstractions of other sciences only by its reference to the peculiarly sociological method of understanding. It was in keeping with his methodology that Max Weber rejected the deterministic interpretation of history and in his studies in the sociology of religion showed the role of religious factors in the maintenance and change of social systems.

These sociologists formed part of a larger group of German writers who contributed from various angles to the development of sociology; among them may be included Troeltsch, Alfred Weber, Barth, Scheler, Mises, Gotheim, Spann and Oppenheimer as well as those whose sociological contributions were formulated mainly in their economic or political studies, such as Sombart, Kelsen, Kantorowicz and Lederer. In Germany particular interest was taken in the theoretical foundations of sociology, and hence controversies over fundamentals have been rife. Thus the discussion between Max Weber and Sombart concerning *Wertfreiheit* gave prominence to one of the most significant and most unsettled issues of the social sciences; nor was the position taken by Rickert and Sombart wholly turned by the strong assaults directed against it by Weber, von Wiese and others. Closely related was the endless controversy over the distinction, in respect of subject matter, concepts and methods, between the natural sciences and the social or cultural sciences. A third much debated question was whether sociology should be considered an inclusive (general) or a delimited (special) social science; and while the trend has been to the latter view, away from the position of Comte, it is still opposed by the cultural sociologists and by the universalists, like Spann, Baxa and Landheer, who are willing to define society as a spiritual totality made manifest in action (Spann, Othmar, *Kategorienlehre*, Jena 1924).

While the Germans were seeking to establish an autonomous sociology, activity toward the same end, although of a highly contrasted nature, was also being displayed by American sociologists. In European countries generally the temperamental antithesis showed itself in the conflict of the synthetic-speculative and the analytic-historical school, whereas in the United

States the main issue lay rather between the normative-speculative and the inductive-research school. A few writers, most notably Cooley, sought to build up systems of sociology on the analysis of types of social relationship, although even Cooley treated as much on ethical as on scientific lines his pregnant distinction between the face to face group and the impersonal organization. A few others followed the anthropological style developed preeminently by Sumner in *Folkways* (Boston 1906) and with A. G. Keller in *The Science of Society* (4 vols., New Haven 1927-28). Others, such as L. L. Bernard, made psychological analysis the basis of sociological contributions. The dominance of the research schools with their ideal of meticulous research pursued by the case study and statistical methods has brought out a rich array of sociological data, although, as more attention was devoted to techniques of discovery than to principles of interpretation, the data have often remained as the raw materials of science. One of the leading exponents of the statistical method has been W. F. Ogburn, who nevertheless essayed a considerable task of interpretation in his *Social Change* (New York 1922). Sociology in the United States has been chiefly concerned with an extensive and intensive mapping of the contemporary social scene. It is noteworthy that although, and possibly because, American society is itself characterized by rapid transitions, its students have been little concerned with the historical perspective. In the field of historical sociology little more has been done than to record, as in the massive cooperative volumes of *Recent Social Trends in the United States* (2 vols., New York 1933) and the accompanying monographs, quite recent developments. The earlier evolutionary sociologists, such as Ward and Giddings, scarcely dealt with historical factors in their sweeping classifications; while the newer schools of ecologists, behaviorists, statistical and applied sociologists have followed methods more adapted to the survey of contemporary conditions than to the investigation of historical processes.

The practical problems of a society subject to rapid and drastic change, the conflicts of mores and social practises within the complex life of a modern civilization and the growth of a positivist as contrasted with a normative attitude toward society itself have led to a widespread development of sociological modes of thought. This is attested not only by the rise of sociological schools and systems, by the impact of sociology

on the study of politics, law, economics and history, by the extensive application of sociological principles to educational practise, to the treatment of crime and the like but also by the permeation of sociological interest into general literature. While such literature at all times affords rich materials for the sociologist, modern popular literature has consciously and in abundant measure dealt in sociological terms with social situations and problems. There is in this respect a marked difference between the novels, plays and periodicals of the present time and those of a century ago.

In another respect sociology has been advancing its frontiers. It has been necessary in this survey to focus attention on the countries which have exhibited the main trends of modern sociological thought. But in many other countries sociological studies have begun. It is in the nature of the social sciences that the phenomena they deal with are in part not universal but uniquely determined within the boundaries of political social areas and social unities. Hence every country or distinctive community has its own effective contribution to make to the broad science of society. This point is today finding illustration in various parts of the world. Thus in China there are at present two groups of sociologists, those, like Y. C. L. Wu and Lin Yu-T'ang, who assess the teachings of the ancient sages in modern sociological terms and those who are applying to studies of contemporary Chinese society the techniques of investigation they have learned from the West. In Japan western sociology has been adapted and applied by Toyama, Yoneta, Endo, Takebe and Takata. In India an attack has been begun, notably by Ketkar, Ghurye and N. K. Dutt on the rich social materials to be found in the historical and changing order of caste. In South America, while a number of sociologists have been dependent on European or North American inspiration, others have developed a vein of their own. Preeminent among these are D. F. Sarmiento, in his brilliant study entitled *Facundo* (Santiago, Chile 1845; new ed. Madrid 1916; tr. as *Life in the Argentine . . .*, New York 1868), and A. E. Álvarez Suárez, in his comprehensive treatise entitled *Sud América* (Buenos Aires 1894; new ed. by E. Nelson, 1918), which depicts and seeks to explain the Latin American attitudes toward institutions and particularly toward forms of government. In the works of more recent writers, such as Ernesto Quesada, in his *La sociología* (Buenos

Aires 1905), José Oliva, in *Sociología general* (vol. i- , Santa Fé 1924-), and Raúl A. Orgaz in *La sinergia social argentina* (vol. i- , Buenos Aires 1924-), concepts of sociological theory have won a larger place. While the sociologists of North America have tended to neglect historical materials, these have been perhaps the main interest of the sociologists of South America.

SOCRATES (c. 470-399 B.C.). Greek philosopher. Socrates was the real founder of Greek philosophical ethics, bringing into moral inquiry a spirit of intellectual criticism and personal sincerity which it had lacked and without which it would have been futile and even mischievous. The sophists before him had indeed made questions of conduct the philosophical order of the day, but they were far more interested in teaching accepted moral usage than in inquiring into principles or evoking a spiritual enthusiasm for right conduct. Socrates, who had no system to propose and whose professions of ignorance were received with incredulity, was dogmatic merely in his insistence that there was a science to be learned and that a start could be made only by inquiring into the assumptions behind man's actions and framing definitions of specific and universal goods until they formed a system. Although he maintained that virtue was knowl-

edge and that no man did wrong knowingly, he guarded against giving the impression that intellectual knowledge or analysis by itself was equivalent to virtuous action. He himself, after preliminary analysis, always acted on the basis of a practical sign from within—his famous "divine sign"—and the implication of his doctrine is that while analysis should discover the universal principle or major premise of the moral syllogism, the conclusion or the incorporation of the principle into the concrete situation should be the work of a practical act. In politics or social theory Socrates' doctrine was even more undeveloped than his ethics; the only definite pronouncement which can justifiably be attributed to him is that wherein he objects to the methods of democracy as unscientific. In shipcraft a pilot is selected for his expert knowledge, but in government everyone is regarded as fit to be a statesman even though he possesses no mastery of the science of statesmanship.

The influence of Socrates, which was enormous during his lifetime, was greatly increased through his dramatic trial and condemnation to death by the Athenians on the charge of impiety. The circumstances of the accusation, which contained the double charge, first, that he denied the gods recognized by the state and introduced strange divinities and, second, that he corrupted the young, are still obscure. Socrates surprised everyone by not running away, as his opponents had hoped, and by making the trial a platform for the proclamation of his principles. When he was found guilty by a small majority and it was his turn to propose a sentence, he declined to entertain the idea of banishment and insisted that his career merited not punishment but maintenance at public expense for the rest of his life. Strangest of all, however, was his refusal, after his condemnation to death, to accept his friends' arrangement for escape from jail. "I am and always have been one of those natures who must be guided by reason," he told Crito, "and now that this fortune has come upon me, I cannot put away the reasons which I have before given." These words, or rather the action which they express, strike the highest note in Greek philosophy. It is not difficult to appreciate the impression they made on Plato and the others who were then turning to problems of ethics. They symbolize the new seriousness of tone in Greek moral thought of rival and divergent schools in the period after Socrates.

SODEN, GRAF FRIEDRICH JULIUS HEINRICH VON (1754-1831), German economist and miscellaneous writer. Soden, in earlier life a bureaucrat in the service of Brandenburg-Ansbach and of Prussia and a prolific writer in many branches of the social sciences and literature, is permanently significant only for his nine-volume treatise on economics and the science of administration (*Die Nationalökonomie*, 9 vols., Leipzig, Aarau and Nuremberg 1805-24). The work owed its inception to Soden's study of Adam Smith at a time when the latter's fundamental ideas were being propagated in Germany chiefly by such academicians as Christian J. Kraus, Georg F. Sartorius and L. H. von Jakob. Unlike the manuals of these professors, which amounted to little more than selections from or paraphrases of Smith's writings, Soden's work constituted an ambitious attempt to reconcile Smithian economics with German cameralism. His political conceptions were, however, too deeply rooted in the cameralist soil for him to appreciate fully the implications of Smith's system. Consequently in discussing the legal foundations and distribution of landed property, the grain trade, the export trade, the guild system, state property, taxation and the like he immediately discarded the fundamental principles of economic freedom whenever they came into direct collision with ethical and natural law tenets or threatened the stability of the existing corporative structure of society. The apparent inconsistency was made more plausible by the fact that, like Sartorius before him, he drew a sharp distinction between the science of universal economic laws and their application to the various branches of state administration, to which the last five volumes of his work are devoted. It was perhaps precisely

because of its compromise position that Soden's economics, despite its rambling character and lack of any clear theoretical basis, had a stimulating effect upon the discussion of Smith's ideas in Germany. The orthodox followers of Smith have, however, always judged Soden's work with a certain reserve, although they have recognized the comprehensiveness and the high intellectual level of his discussion.

SOETBEER, ADOLF GEORG (1814-92), German economist and statistician. Although his university training was in the field of philosophy, Soetbeer's active life was devoted to dealing with empirical economic problems. From 1843 to 1872 he was secretary of the Hamburg Commerzdeputation, a semi-official body representing mercantile and shipping interests, and thereafter honorary professor of the University of Gottingen, his alma mater. At first Soetbeer's interest centered on the history and current development of commerce in Hamburg; he produced a number of independent studies and organized a bureau whose *Tabellarische Uebersichten des hamburgischen Handels* constitutes one of the earliest German publications of the statistics of trade and prices.

The complexity of the currency situation in Hamburg—where silver money was used for circulation while accounts were kept in an uncoined mark banko, the city being surrounded by small territorial units with independent currencies—as contrasted with the efficiency of the English monetary system based on gold drew Soetbeer's attention to problems of currency policy and history. He became an early and effective exponent of a unified gold standard currency for Germany and thereby of the gold standard in general; indeed he incorporated in the memorial of 1856 a complete draft of currency legislation, which is of great historical interest. In historical monographs published in the 1860's he endeavored to prove that the transition from gold to silver money had already occurred in the late Merovingian epoch and that it was the outcome not so much of a decrease in

gold production as of the withdrawal of gold from circulation combined with a general decline of prices. His international reputation, however, rests upon the statistical investigations of the production and utilization of precious metals after the discovery of America. For the early period these are based in part upon the researches of Alexander von Humboldt. It is a tribute to Soetbeer's genius that to this day the world gold production figures for 1493 to 1885 published by the United States Mint are derived from his compilations.

In the last years of his life Soetbeer was occupied chiefly with the statistics of the value of money. He compiled an index number of wholesale prices in Hamburg in 1851-85, later extended to 1890. This is an unweighted index including as many as 114 quotations, an unusual number for the time, divided into eight groups; the value of the index was calculated by years as well as by five-year periods.

SOHM, RUDOLF (1841-1917), German jurist. Sohm studied under Wetzell, Bohlau and Paul Roth and taught successively at Freiburg i. Br., Strasbourg and Leipsic. He was perhaps the most brilliant dogmatic jurist of his time; but although he was an adherent of conceptual jurisprudence, there was nothing narrow in his approach. He was a constructive thinker with a penchant for provocative ideas, highly endowed with historical insight and imagination. Working in a period in which the conflict between Romanists and Germanists had abated somewhat, Sohm was attracted toward Roman as well as Germanic law and later in life toward the canon law. He achieved almost equal fame in

the fields of Roman, Germanic and canon law.

Sohm's *Institutionen des römischen Rechts* (Leipzig 1883, 17th ed. by L. Mitteis and L. Wenger, Munich 1923; tr. by J. C. Ledlie, 3rd ed. Oxford 1907), although almost casually written, became the most important legal textbook in Germany in his time. He achieved renown as a Germanist with the publication of his *Der Prozess der Lex salica* (Weimar 1867). While this was a work of small compass, it established the view in opposition to Siegel that it was not the acceptance of Christianity but changes in public relations which exerted the greatest influence upon the old Germanic law of procedure. In his ambitious *Frankisches Reichs- und Gerichtsverfassung* (Weimar 1871) Sohm sought to prove that the Frankish empire was a true state, and in opposition to Gierke he worked out a series of famous antitheses—between *Staat* and *Genossenschaft*, *Amtsrecht* and *Volksrecht* and the like. Sohm was preoccupied particularly with Frankish law. In a challenging essay, "Frankisches Recht und römisches Recht" (in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte Germanistische Abteilung*, vol. i, 1880, p. 1-84), he sought to show that the Frankish law had had almost as wide a reception as the Roman law, largely displacing other bodies of Germanic law. He regarded even the common law as hardly more than another Frankish conquest.

Sohm's *Das Recht der Eheschliessung* (Weimar 1875), occasioned by contemporary disputes as to the effect of civil marriage, marks the transfer of his interest to the canon law. This work, which was also Germanistic and comparative, was epochal in that it advanced the doctrine that "formal" contract and "real" contract were the two ultimate forms of liability. Sohm's fundamental position with regard to the canon law was that such a body of law was in contradiction to the nature of the church. This view, which he developed in his *Kirchenrecht* (vol. i., Leipzig 1892; vol. ii, ed. by E. Jacobi and O. Mayer, Munich 1923), arose not from a straining for paradox but from his own profoundly religious nature. At the same time, however, he recognized that despite the inherent contradiction the canon law represented a historical necessity.

Sohm was a master of the art of drawing upon all the resources of style and language in the service of his ideas, and for this reason his works must be read critically. Not all his doctrines have remained uncontested; this is particularly true of his canon law theory, which has aroused a tremendous amount of controversy. Gierke

questioned Sohm's conclusions as to the ultimate forms of liability; and he has been reproached also for introducing modern ideas into his exposition of Frankish judicial organization.

SOILS. The soil cover of the earth is a continuous body of unconsolidated mineral and organic material without natural variations, but man on the basis of differences of characteristics has divided it into units. The unvarying association throughout the world of any given soil unit with a particular geographic environment has convinced investigators that soils constitute that feature of man's geographic environment which expresses more clearly than any other the combined result of the action of all the other environmental factors. Man is one of the dynamic factors of this environment. When occupied by him the soil is subjected to certain transformations, partly through the removal of some of its constituents, partly through the mechanical effects of the instruments of tillage, but mainly through the change effected by him in the other natural soil developing factors. He is unable to effect any important change in climate, in relief or in the geological character of the parent rocks; but he may carry out profound changes in the character of the natural vegetation and therefore in its influence upon soil development. Since the latter is the strongest of the forces which have produced soils, important changes in its character must bring about changes in the soil.

While the action of climate on soils is in general destructive, the direct action of vegetation is constructive. Of the two great groups of vegetation, however, grass is more effective than forest vegetation. Since the most important of man's crops, the grains and grasses, belong botanically to the grass group, it follows that the changes of vegetation made by man are less de-

structive than would have been the case had most of his crop plants been selected from arboreal plants. In changing a forest vegetation to crop vegetation man may actually improve the character of the soil, if nothing more is involved than change in the character of vegetation. This relation of soil character to that of the vegetation under which soils have developed or are developing may be generalized into the statement that natural grassland soils are productive and natural forest land soils are relatively unproductive.

Since soil degradation, or the progressive decrease in soil productivity by both chemical and physical changes, is brought about mainly through leaching, soils may be differentiated into unleached soils, partially leached soils and leached soils. The term leached refers to that characteristic brought about by the removal from the soil of an important part of its original supply of alkalies, alkaline earths and silica. This differentiation is based on changes brought about by the destructive effect of climate, mainly rainfall. The same groups of soils may also be designated as desert soils, semi-arid to subhumid soils and humid soils. In terms of productivity the groups comprise soils which under irrigation are highly productive, soils moderately productive without irrigation and soils of low natural productivity.

In discussing the influence of the different types of soils on the economic, social and political conditions of countries dominated by one or the other type Ramann has shown that countries located mainly on desert soils have tended predominantly, if not universally, to an extreme differentiation of the population into classes; this has involved political control by a very small class and the degradation of the masses of the population to the lowest economic and social level, without social or political influence. These conditions arise because of the impossibility of utilizing desert soils except through community action. The individual without assistance and without capital is unable to bring water on to such land and to control its distribution. Whoever controls the distribution of water has absolute command over the conditions of life of the population concerned. Ancient civilizations, like those of Egypt, Babylon and the countries of the Turkestan basin, were characterized by a small ruling or wealthy class and a subject population whose economic condition was barely above that of slavery.

The most important of the desert soil areas

occupies a broad strip across Asia and Africa from Mongolia to the Atlantic coast of the Sahara; another large area comprises the western intermountain regions of North America. By far the larger areas have always been sparsely inhabited by a nomadic population, for only in the valleys of great rivers, where water is abundant and available for irrigation, has man been able to develop a complex civilization on desert soils.

The second group of soils, those developed under grass cover, have high potential capacity for production and do not require irrigation. On the basis of soil character alone there seems to be no reason why these soils should not have been highly important throughout history. Until recent times, however, regions consisting largely of such soils have been of relatively little importance in the development of civilization. They have constituted the historic home of the spectacular nomadic kingdoms of central and western Asia. The social, economic and political effects of such soils on the population are almost the reverse of those of the desert soils. Because of the large areas required for the support of the animals essential to the subsistence of the population fixed habitation has not been possible, since there must be an almost incessant search for pasture. This contingency has made stability of land occupation impossible. On the one hand, it has encouraged the assertion of freedom by the individual and the development of a warlike attitude, a necessity in the defense of pastures; on the other, it has led to disorganization and to almost complete absence of most of the institutions which are associated with civilization.

The great grasslands of the world lie mainly in the interiors of the continents; the largest is the Eurasian, extending from Lake Baikal southwest to the Carpathians and in isolated areas and narrow strips to the southwest and northeast of each end of this belt. The second in size is to be found in the interior of the North American continent from the Canadian northwest to Texas. There are smaller belts in South America, including a considerable part of Argentina, in Australia and in Africa. Up to the thirteenth century the Eurasian grasslands constituted the homeland of hordes of warring nomads, who repeatedly invaded the outlying lands of western Europe; invasions during the Middle Ages reached westward as far as France. The successive great migrations have been attributed to a change of climate within the interior of the Asiatic continent. When, however, full con-

sideration is given to the characteristics of the soils and their distribution and to the other factors of the natural environment affecting their development, it becomes apparent that it is not necessary to explain the waves of invasion by a change in climate.

Within restricted areas, however, grassland soils have been historically important as the basis of stable agriculture and civilizations. This was the case in the borderlands of the Mediterranean, a region which was the seat of the second of the great civilizations of antiquity. The importance of these soils in the development and maintenance of the civilization of ancient Rome has not received deserved attention. The ancient civilizations of the irrigated valleys did not present conditions favorable to an extensive development of commerce, partly because of the difficulty of communication (they were separated by long stretches of desert sand) and partly because of similarity of conditions and products of each. In both these respects the Mediterranean basin presented entirely different conditions, especially because it was a region also surrounded by or within reach of important areas of grassland soils.

The economic and social foundations of the Roman Empire rested on slave labor, which natural conditions, especially the soil, tended to favor. Slave labor made commercial farming not only a possibility but almost a necessity. One of its social consequences was the development of a body of unemployed Roman citizens supported by doles. This in turn required the production of grain in large quantities and within easy access. The grassland soils are the most productive grain producing soils of the world, in which production can be carried on without irrigation; the conquest of Carthage placed Rome in possession of rich grain lands of this character in Sicily and north Africa. The extension of Rome's conquests over Egypt, where grain was produced by irrigation, and around the east end of the Mediterranean and along the north coast of the Black Sea added other areas of natural wheat producing soils. Free distribution of grain or bread to a large population in Rome could never have been maintained for almost half a millennium had it not been possible to produce wheat cheaply on productive grasslands by slave labor.

There has been prolonged discussion among historians of the possible effects of declining soil productivity on man's institutions. In particular there has been extensive consideration of the causes of the decline and fall of Rome, which

many scholars have attributed to outworn soil in the Mediterranean region. The chief basis for such a conclusion is the historical fact that the Italian peninsula in early Roman history was a region of wheat production and that during the later stages of the republic grain production declined and livestock, oil and wine production took its place. This shift in crops, it is maintained, occurred because of the declining productivity of the soil, which had been exhausted through grain production in the early years of the republic and under the preceding kingdom. But historical evidence of depleted soil has not been brought forward. The simplest explanation of the change from grain growing to wine, oil and livestock production applies also to the case of shift in production in the New England states, New York and Pennsylvania after 1870. Although the shift is still charged to a worn out soil, this was not the real cause, as studies made in the region within the last quarter century clearly show. In the United States it was brought about by destructive competition of grain growing in the western states. It seems probable that in Italy the same kind of competition from Sicily and north Africa after the Punic Wars and the influx of grain from other parts of the Mediterranean region, which because of their soils were natural wheat producing regions, effected a similar result. These regions contained large areas of highly productive soils, many portions of which were natural grassland soils. The more humid and poorer soils of the mountainous peninsula of Italy could not compete in grain production with the fertile plains of Sicily and north Africa. Spain and Egypt both contributed their wheat at the same time and with the same effect. The soils of these regions were not only adapted to the production of wheat of good quality but they were inherently fertile enough to stand abuse and to favor large scale methods. Cheap production on such lands and by such labor flooded the market with cheap grain and brought failure to the grain farmers of Italy. Their drift to the cities and gradual submergence into the lowest class of city population, recruited from the artisans ruined by slave labor, made necessary the development of the grain and bread dole system. Italian landowners, left without labor, were forced to use slaves, and the capital investment required necessitated the growth of commercial crops.

There is thus no real evidence that the exhaustion of soil fertility caused the breakdown of the Roman Empire and the northward shift of

western European civilization. Whatever may have been the cause, however, the shifting of the center of civilization changed the relationship of man to the soil. Western Europe, north of the Alps and west of central Poland and the Hungarian plain, is occupied by soils of the third, or humid, group. These are relatively unproductive even in their virgin condition. Although they offer possibilities of great improvement, for a long time man did not possess the means of exploiting them advantageously. Humid soils developed under forest cover and were subjected to the influences of high rainfall and warm summer temperature. Because of the ineffectiveness of the forest cover in the struggle of the plant against the degrading effect of the climate upon the soil, soil leaching by the climate proceeded without strong interference. Throughout the world soils developed to maturity under a forest vegetation contain, because of this vegetation and the high rainfall, a low percentage of organic matter and therefore a low percentage of nitrogen.

Not only were the soils of western Europe poor, but the type of agriculture practised on them for many centuries after the beginning of the Christian era was ineffective in modifying their low productivity. Until little more than a century ago the prevailing type of agriculture throughout western Europe was that of the three-field system. Essentially this was a system of grain growing. The tract of land cultivated by each peasant was divided into three fields. Spring grain was grown on one and winter grain on another, while the third was left fallow, so that there was a three-year rotation. The fallow originated in an attempt to maintain the productivity of the soil by leaving it uncultivated every third year, giving nature an opportunity to restore some of its productivity. Since, however, its natural, or virgin, productivity was low, it is evident that merely leaving it out of cultivation one year in three would not assist greatly in making it productive. The grains, as plants, belong to the grasses and are therefore relatively effective in the struggle of the plant against the degradation of the soil by the climate. But this struggle is vain unless the plant is able to return to the soil its total product. When man grows grain, he cultivates it not for the purpose of returning the whole plant to the soil but in order to remove an important part of the plant from the land. Nitrogen and the mineral constituents of the soil were extracted through the removal of the grain. Very little of the plant materials was

returned in the form of organic matter to the soil, and as a result there was a progressive exhaustion of these constituents. The three-field system failed to improve the soil also because it did not include as an important part of the farming system the growing of livestock. This was a necessary result of the extensive growth of grain, which left no opportunity for a forage crop. Part of the grain was fed to what little livestock there was, but the amount of grain available for this purpose was extremely small.

As a result of poor soil, narrow range of crops and scarcity of farm animals the period between the decline of agriculture in ancient Rome and the beginning of modern agriculture in the early part of the nineteenth century may be described as one of man's continual struggle to provide food for the population of western Europe. Conditions made impossible a constantly greater food production for the maintenance of a permanently increasing population. The theory therefore of the growth of population at a more rapid rate than that of the food supply became widely accepted. This was finally expressed in the profound pessimism of Malthusianism.

During the closing decades of the eighteenth and the opening decades of the nineteenth century three events took place which had pronounced influence on the future of food production. The first was the introduction of a crop rotation which included a feed crop. This began first in England with the growth of turnips. The same effect had been brought about somewhat earlier through the introduction of grass in various places in Europe. This was a momentous advance, since it permitted the maintenance of a much larger number of livestock per acre of land than had previously been possible. The maintenance of the productivity of these lands demanded just those constituents which were furnished by animal manures. Thus the rotation of crops, including a feed crop, and the result of this innovation in the improvement of the quality and the increase in the quantity of livestock produced constituted two far reaching gains in the direction of soil improvement. A third influence of equal if not greater importance was the discovery of guano and the development of the use of commercial fertilizers. These three developments marked the beginnings of a revolution in agriculture.

The new methods of soil improvement were of particular significance in the cultivation of poor soils; for while these soils are naturally unproductive, they are capable of great improve-

ment if the proper methods are used. As has been pointed out by Ramann, the utilization of poor soils requires a considerable area for the maintenance of a family unit. The natural forest cover must first be cleared, at the cost of time and labor. The growth of crops on such lands requires not merely the application of fertilizers but careful cultivation as well. The farmer must occupy his land, since it will not stand abuse. The fertility expressed in the growth of good crops on such soils must be fertility placed in the soil by the work of man. The occupation therefore of these soils requires residence on the land and continual effort for the maintenance of their productivity, thus promoting family cooperation, independence and self-reliance. Another important characteristic of these soils is that they are not particularly adapted to the production of any one crop. But for this very reason they may be utilized with moderate success for the development of a complex agriculture, comprising grains, grasses, fibers, fruits and vegetables.

Another forward step was the bringing into cultivation of the grasslands of the world, which previously had been cultivated only in relatively small areas within the Mediterranean basin. The great grassland soils which lie in the interiors of the continents contain a better supply of the constituents of fertility than the soils of any of the other three great groups, partly because of their development under grass cover. In none of the large regions of their occurrence—Russia, North America, Argentina and Australia—had these soils been cultivated prior to the middle of the nineteenth century. Since that time cultivation has been extended over them with great rapidity. The rapid growth of industry and population in Europe, particularly England, was sustained in large measure by the importation of American and Australian wheat. For a time this relationship was on the whole mutually beneficial. But the range of crops to which the grassland areas are adapted is narrow, consisting essentially of wheat and barley; and their expanding use for the production of these crops has flooded the world with an excess of the bread grains. This along with the development of crop rotation, the extension of grass growing and the use of fertilizers on the naturally unproductive humid lands helps to account for the increase in crop cultivation which has enriched and indeed almost overwhelmed the modern western world, creating an agricultural crisis and ruining millions of farmers.

Soils are subject to erosion by the action of

both environmental and human forces. Erosion is, however, essentially a local problem; its main importance is in relation to floods and flood control. For the world as a whole erosion is unimportant. The key to the agricultural crisis is the surplus created by the productivity of modern farming and the social relations which condition it.

SOLON, Athenian lawgiver. In the year 594-593 B.C., when Athens was at the height of the internecine conflict growing out of the concentration of landownership in the hands of the aristocrats and the reduction of the debt ridden small peasantry to serfdom, Solon was chosen by the contending parties as arbiter and commissioned to undertake a comprehensive reform. His essential objective was to create a basis for permanent order and tranquillity, and his policy aimed therefore at a fair compromise be-

tween the oppressed and the more greedily but less disorderly oppressors. The agrarian problem was solved by the *seisachtheia* ("shaking off of burdens"). In all probability this end was achieved by two expedients: the substitution of the Aeginetic monetary standard for the Euboic, which brought about deflation and decreased debts by about 30 percent; and the lifting of mortgages, which freed both the land and the persons of citizens. Under the conviction that certain guaranties of liberty were necessary to save Athens from a recurrence of the recent misery, Solon drew up a number of laws based upon this principle. In prohibiting the practise of pledging the persons of debtors as security for loans Solon in effect enunciated a rule of *habeas corpus*, which had incalculable influence upon Attic law. He further promoted individual liberty by abolishing imprisonment for debt, limiting paternal authority and dissolving the solidarity of the family; that is, of the *genos*, or group descended from a common ancestor. He secured freedom of property by contriving to divide the land and to render it mobile through a law of succession which granted the right of bequest in the absence of a legitimate son. In addition to his monetary reform many other measures taken by Solon served to develop commerce and industry as well as agriculture and to further the economic interests of all classes.

Solon also brought the customary constitution of Athens into accord with the principles of moderate democracy. He reduced the property qualifications which served as the basis for the timocratic division into four classes, and to a certain extent he democratized the already established custom of selecting magistrates by lot. The nine archons he grouped into a college. Alongside the Boule of the Areopagus, or the council composed of ex-archons, he set up a popular council which he called the Boule of the Four Hundred. The popular assembly, known as the Ecclesia, was to be consulted, at least formally, on the crucial problems affecting public life, while the tribunal of the Heliaea acquired appellate jurisdiction over judgments rendered by the magistrates—a jurisdiction which, chiefly by virtue of the recognized right of the first comer in certain cases to bring a public suit, soon became extensive. Solon's fusion of new ideas with old rules entitles him to be considered the founder of Athenian democracy.

SOLOVYEV, SERGEY MIKHAYLOVICH (1820-79), Russian historian. Solovyev was professor of history at Moscow University. His monumental history of Russia (*Istoriya Rossii s drevneyshikh vremen*, 29 vols., St. Petersburg 1851-79; 3rd ed. 1911), based not only on published sources but also on special studies in the Moscow and St. Petersburg archives, went far beyond the antiquated and incomplete work of Karamzin and still remains the only detailed account of Russian historical events up to 1774. Long quotations, chiefly on diplomatic relations, give Solovyev's work the character of a collection of first hand rough materials; but there are also general characterizations (especially volumes i, vii, xiv, xv, xviii). Solovyev wrote during the period of the bitter struggle between the nationalistic Slavophiles and the scientific westernists concerning the explanation of the Russian historical process. He belonged to the latter camp and therefore admitted the backwardness of eastern European civilization and the usefulness of the Europeanization of Russia by Peter the Great. He drew attention to the activity of the government in creating the Russian state both in the ancient and in the modern period, while the Slavophiles reproached him for having neglected the internal history of the Russian people. An especially sharp polemic was conducted between Solovyev and Konstantin Aksakov, the Slavophile theoretician, concerning the origin of the state. Solovyev explained it as the result of the dissolution of the primitive kinship relations, while the Slavophiles found the basis of the ancient Russian life and character in a primitive commune, which they idealized.

SOLOVYEV, VLADIMIR SERGEYEVICH (1853-1900), Russian philosopher. Vladimir Solovyev, the son of the historian Sergey Solovyev, was born in Moscow. He studied natural science and philosophy at the University of Moscow and devoted particular attention to the works of the Slavophiles, of Schelling, of the mystic philosophers and of the church fathers. In 1874 he became docent in philosophy at Moscow but was forced to resign in 1877; he passed the remainder of his life as a writer and publicist.

Solovyev's literary activity may be divided into three periods. In the first period, 1873-77, he wrote philosophical treatises in the spirit of the older Slavophiles, in which he criticized the metaphysics, materialism and empiricism of western philosophy as opposed to the eastern way of thinking. He developed the idea that it was the mission of Russia to realize the synthesis between rigid uniformity, characteristic of the Islamic world, and multitudinous divisions, as found in the western world. This synthesis, which was to pervade all spheres of life as "free theocracy," "free theosophy" and "free theurgy," would be an organic unity dominated by a divine principle. Solovyev's most important works in this period were *Krizis zapadnoy filosofii* (The crisis of western philosophy, Moscow 1874), *Kritika otvlechennikh nachal* (A critique of abstract principles, Moscow 1880) and "Filosofskiya nachala tselnago znaniya" (Philosophical foundations of a unified science, in *Zhurnal Ministerstva Narodnago Prosveshcheniya*, vol. cxc, 1877, pt. ii, p. 60-99, 235-53).

Solovyev's second period was characterized by an increased interest in theology and a turn toward the Catholic church of the West. The chief works of this period were his *Velikiy spor i khristianskaya politika* (The great dispute and Christian politics, Moscow 1883) and *La Russie et l'église universelle* (Paris 1889, 3rd ed. 1922). Solovyev's principal theme was the idea of a gradual elevation of man to God. He soon came to the conclusion that the "divinization" of humanity could be attained only through a unified universal church which should combine the

principles of discipline and freedom. Such a church, he found, existed in Roman Catholicism, and he envisaged a future world theocracy in which the spiritual leadership would rest with the pope in Rome and the political leadership with the Russian czar. At the same time he criticized severely the inactivity of the Russian Holy Synod and broke definitely with the Slavophiles. As a result of this intellectual evolution Solovyev developed a negative attitude toward every manifestation of nationalism and thus found many points of contact with Russian liberal westernism. His series of articles against the reactionary nationalists were collected under the title *Natsionalny vopros v Rossii* (The national question in Russia, 2 vols., St. Petersburg 1891).

The third period, as represented chiefly by his *Tri razgovora o voyne, progresse i kontse vsemirnoy istorii* (St. Petersburg 1899, 4th ed. 1904; tr. by A. Bakshy as *War, Progress and the End of History*, London 1915), reflected Solovyev's great disappointment with regard to the possibility of a realization of his theosophic aspirations. He no longer held that history was progressing toward the reign of God on earth but predicted the advent of Antichrist and the destruction of European civilization by a Mongol invasion led by Japan. The year 1896 marked his formal conversion to Roman Catholicism.

SOLVAY, ERNEST (1838-1922), Belgian social reformer and sociologist. As an inventor and industrialist Solvay amassed a large fortune, part of which he devoted to philanthropy and to the organization of various research institutes, particularly the Institut de Sociologie Solvay. The labor troubles of the 1880's aroused his interest in the social problem. An aristocratic and bourgeois reformer of the type of Saint-Simon, Owen

and Defuisseaux, Solvay was opposed to the socialist view that the working class unassisted can bring about a new society. In philosophy he adhered to a system based on an integral and monistic materialism. Man is subject to the dominion of law, a "universal determinism," and all man's acts obey the laws of a physicochemical energy which is transformed into social energy. His system of "social energetics" reduced the totality of biological and social phenomena to fundamental physicochemical actions and reactions. The rigid, mechanical nature of Solvay's materialism prevented him from recognizing that superstructural social phenomena acquire a certain autonomy and are subject to their own laws. This in part explains the utopian character of his general social views. Although he rejected revealed religion as a force retarding social evolution, his faith in science, in the absolute certainty of its deductions, led him to a kind of positivistic and materialistic mysticism. In politics Solvay acknowledged the decline of the liberal ideology, its insufficiency and its anachronisms: "The man of our day wants more than liberty." A pioneer of many reforms, including social insurance, he developed a theory of "social productivism" which was to organize production for the general welfare. This involved a problem of "rational social leveling," not a problem of classes, and implied recognition of a natural social hierarchy based on capacity (*capacitariat*), opposed to the hierarchy of wealth and serving the interests of the average man. Solvay's system included a form of "social accounting" which was to replace money with a unit of account based on a fixed value, abstract and absolute, representing a mortgage or "security" on property. This social accounting was an extension of Proudhon's mutualist conceptions, although Solvay was strongly influenced by the system of checks and postal transfers, then a novelty. He advocated that the security of "earned" fortunes be insured and unearned wealth suppressed by a tax on inheritances to continue from generation to generation, so that gradually "hereditary capital" would be abolished. At the same time he favored the nationalization of enterprises whose economic value had been proved and which could be directed by the *capacitariat*. This "free socialization" would assure the security of "earned" fortunes and gradually give the state a preponderance in industry: the funds of individuals would be deposited at fixed interest with the state, which would invest them in the appropriate enter-

prises. Solvay's ideas had considerable influence but much less than those of the socialists, with whom he had much in common although he disagreed, among other things, with their view of profit. He contributed to the development of a school of sociology which has a considerable achievement to its credit, but which gradually divested itself of Solvay's ideas, particularly his conception of money.

SONNEMANN, LEOPOLD (1831-1909), German newspaper publisher and political leader. Sonnemann was born of Jewish parents in Hochberg near Würzburg. He attended school at Offenbach and settled at Frankfort in 1849. At the age of fourteen he entered his father's business and wide traveling in this connection served to broaden his outlook. After his father's death in 1853 he assumed direction of the business and later transformed it into a banking establishment. The general prosperity of the years 1855-56 furthered the success of the young banker. Sonnemann, however, was too much interested in politics and general affairs to feel content with these activities; practical needs as well as journalistic inclinations stimulated his desire to establish a newspaper. Out of the *Geschäftsberichte* issued on every exchange day for his customers by the Frankfort banker Rosenthal, Sonnemann in conjunction with the latter developed a *Frankfurter Handelszeitung*. For many years he gave but part of his time to the newspaper. In 1859, however, when the business journal was transformed into a political newspaper, the *Frankfurter Zeitung*, the situation changed and Sonnemann's life became indissolubly bound up with the history of that publication. He directed the enterprise in the same fearless, democratic liberal spirit which he evinced as a Reichstag deputy from 1871 to 1876 and from 1878 to 1884. Thus he advocated the

approchement between Germany and France after the Franco-Prussian War, opposed the bill for the annexation of Alsace-Lorraine to the empire without a plebiscite, attacked the Socialist Law and supported a plan for workers' insurance. These political activities incurred for him the enmity of Bismarck, who once even went so far as to accuse him of secret relations with the French government. Sonnenmann's great aim was to transform the old absolutist military state into a bourgeois constitutional state. He made skilful use of his paper in emphasizing these points. Under his direction the *Frankfurter Zeitung* became the most important German newspaper and the most influential organ of German liberal opinion.

S. KRACAUER

Consult. *Geschichte der Frankfurter Zeitung* (Frankfurt 1911).

SONNENFELS, FREIHERR JOSEPH VON (1732-1817), German neocameralist. Sonnenfels was born of Jewish parents who migrated from Moravia, became converted to Roman Catholicism and settled in Vienna. He studied law at the University of Vienna and was appointed professor of cameral science in 1763; he taught also at the Theresianum and the Savoyische Ritterakademie. The wide acceptance of his political and economic views—his chief work, *Grundsätze der Polizey, Handlung und Finanzwissenschaft*, was the standard textbook for several decades—and his role as adviser to Maria Theresa, Joseph II and Leopold II made him one of the most influential persons in shaping the political and economic policies of Austria. In the field of social reform he was especially prominent as an advocate of state support of the sick and in penal reform as an opponent of torture and capital punishment.

In political theory Sonnenfels stood squarely on mercantilist ground, adhering to the theory of enlightened absolutism. He conceived the state as a conscious entity vested with the positive duty of improving the lot of the people to the point of guaranteeing a minimum of existence to all willing to work. Like the older cameralists, he considered a large population to be of central significance to national economy and appraised all measures of economic policy in the light of their effect upon the growth of population. Thus he advocated the promotion of those industries which provide a greater volume of employment, favored small holdings in land as encouraging a larger rural population and

condemned the restrictive effects of monopolies and guilds. In the interest of his population policy he urged the limitation of imports to raw materials and the stimulation of exports. His ideal, however, was a self-contained territorial state. Unlike the older mercantilists, he grasped the concept of balance of payments but, in conformity to his population principle, he regarded as favorable only that balance of payments which results not merely in pecuniary excess of payment accruing to the country but in an increase in the volume of employment in the respective national economy.

In monetary policy Sonnenfels modified the early statements of the quantity theory by emphasizing the significance of credit. He looked upon money not solely as a medium of exchange but also as a productive factor. He rejected the canonical prohibition of interest and treated the latter as price for the use of capital; he believed, however, in the economic desirability of low rates of interest. In his banking theories he was influenced by John Law and held that the banks have a currency as well as a credit function. Like most of his views Sonnenfels' fiscal doctrines followed essentially those of Justi; he continued to emphasize taxation against the public domain as the main source of revenue; he was a consistent advocate of indirect taxation; and he condemned all forms of revenue farming. On social grounds Sonnenfels favored the maintenance of an economic balance between the various branches of industry and therefore rejected excessive urbanization.

SOPHISTS. The philosophical and social doctrines of the sophists reflected the spirit of skepticism and almost of defeatism in all things which in the middle of the fifth century B.C. engulfed Greek philosophical, ethical and political thought. Ultimately perhaps this mood was incidental to the swing between too much assurance and too much doubt in which the human mind seems always to move. But it had also more specific causes in the condition of the times. Philosophically, and to the more thoughtful, the great constructive epoch of speculation initiated by Thales and capped by Democritus presented the spectacle of diametrically opposed systems pretending to equal truth and founding their conclusions on equally solid and convincing grounds. Religious fundamentalism too was rapidly waning. Orthodox belief was dissolving, on the one hand, before the onrush of mystical sects like Orphism and, on the other, before the spread of out and out agnosticism and disbelief, which found, especially in the enlightened and broad minded cities of Ionia and Graecia Magna, a congenial and fertile soil. Furthermore trade, travel, war and the growing interest in history and in the customs and institutions even of non-Hellenic, "barbarian" nations (as evidenced by Herodotus) were inculcating the spirit of cosmopolitanism and drawing attention to the relative, unstable and conflicting character of political institutions, social usages, religious beliefs and even moral standards and ideals, not only in the contemporary world at large but in the successive generations of any given community.

Athens, where this growing sense of relativity was destined to receive philosophic formulation, could not, for all its religious conservatism, its xenophobia and its suspicion of foreign liberalism, remain altogether unspotted by the world. The Athenian mind was too inquiring and in everything except religion too open to remain insensitive to the winds of the new doctrines. Moreover whatever immunity its traditions might have conferred was fast being worn down by the march of political and economic events. The rise of the Athenian empire had brought wealth, and with its accumulation and adulation of wealth ideals of expediency and worldly success at all costs were fast supplanting the ancient pieties and challenging the standards of the past. It was, however, the exigencies of the demo-

cratic form of government that invited the fertilization of the fallow field. Representative government was unknown, and not only the city but the whole empire was run by a "town meeting," in which every Athenian citizen was obliged to be his own congressman. And the absence of professional lawyers forced him also to plead directly in the law courts. Hence, as policies and situations became more complicated and litigation more frequent and more involved, it was increasingly imperative for him to acquire the ability to press or to defend his cause before the Assembly and his case before the courts. As a result of this need and also of the developing interest in science the old "classical" system of Athenian education gave way to the demand for the practical and the useful, and professional training in the art of persuasion, or rhetoric, assumed a dominant position in the new curriculum.

To meet this demand there arose a class of teachers known as "wise ones," or sophists. Recruited largely from foreigners from Ionia and Graecia Magna, their services were more frequently at the command of the rich than of the poor. They were doomed, then, from the beginning to arouse popular antagonism. Moreover, although the more eminent members were honest, their number included many unscrupulous men, who by their willingness to help their clients win any case, however shady, at any cost brought their calling into the disrepute that has made of the word "sophist" a term of reproval. Plato summed up the case against them for all time when he accused them of making the worse cause appear the better, and the better the worse. It was not therefore altogether an accident that the new skeptical spirit should have found its greatest philosophical exponents in the two most eminent sophists of the day, Protagoras of Abdera and Gorgias of Leontini, both of whom spent much of their life in Athens, where they had a great reputation as teachers of rhetoric and attained position and fortune.

Of the voluminous writings of Protagoras two fragments alone have survived: one an expression of agnosticism regarding the existence of the gods, the other the famous dictum that "Man is the measure of all things, of things that are, that they are, and of things that are not, that they are not." This fragment is commonly interpreted as a denial of universal truth valid for all men. Each man is the sole and final judge of what seems, and therefore is, true to him, and there is no higher authority to weigh and

decide between conflicting individual opinions. Nay more, since a man is constantly changing his mind, what seems and is true to him varies from moment to moment, so that truth is a matter not only of the individual but of the instant. The intellectual skepticism enunciated by Protagoras was ably seconded by Gorgias, who in his *On Nature or the Non-existent* argued that certain knowledge of any sort was impossible and, even if it could exist, was incommunicable by one individual to another.

The religious implication of their teaching was boldly recognized and enunciated by the sophists. Indeed Protagoras' agnosticism led to his expulsion from Athens. In the next generation Hippias preached that religion was a man made device for enforcing morality through fear, and Prodicus taught that the gods are personifications of natural forces and objects. The moral inferences, however—that universal standards of right and wrong are as fictitious as absolute truth and falsehood, and that the individual is the only judge of the morality of his own conduct as well as of the truth of his own thoughts and no judge at all of the right or wrong of his neighbor's behavior—were slower in being drawn. Indeed Protagoras and Gorgias were pinks of propriety in their teaching and deportment. So too were Prodicus and Hippias, who inclined to the austere, cynic ethics of self-sufficiency. Nevertheless, the inference was plain and was indirectly suggested at least by Protagoras' doctrine that the mind has no native morality but is taught virtue much as it is taught mathematics or history, and by Gorgias' contention that virtue is many, not one, and differs with age, temperament, occupation, sex and the like. Prodicus and Hippias moreover came near to preaching directly, if not to practising, the doctrine of relativity in morals when they gave prominence to the distinction between things founded on nature and those based merely upon man made conventions and classified law and traditional morality among the latter. Hippias indeed is represented by Xenophon as arguing that men are under moral obligation to obey only natural laws, and by Plato as condemning the laws and restraints devised by mankind because they so often enforce behavior contrary to nature.

All this, however, was only wild talk and the times were now prepared for more radical ideas. The rise of proletarian government at Athens after the death of Pericles and the slow agony of the Peloponnesian War had intensified

class hatreds within and national enmities without and had infected the Athenian public with a cynicism in ethical theory and practise which seems completely to have undermined what remained of traditional morality. Thus sophists like Callicles, Thrasymachus and Polus openly attacked the old fashioned notions of right and wrong and advanced views some of which have a curiously modern flavor. There is, for example, a premonition of Hobbes' vision of the *bellum omnium contra omnes* in the assertion, reported and attacked by Plato, that all men naturally desire to do injustice and are restrained from so doing solely by the fear of suffering injustice in return. And Callicles, in a manner heralding Nietzsche, maintained that conventional standards of right and wrong were merely a *Sklavenmoral*, devised by the many weak as a protection against the natural right of the few strong to rule and exploit them—a view which went hand in hand with Critias' explanation of religion as a device to check by fear secret evasions of conventional standards. Incidentally this preaching was perfectly summed up and practised by the Athenians in their reply to the protests of the island of Melos, which in the last years of the Peloponnesian War they had tried forcibly to annex to the empire. When the islanders appealed to justice human and divine, the Athenians retorted: "You know as well as we do that right as the world goes is only in question between equals in power, while the strong do what they can, and the weak suffer what they must." And when Melos, trusting in the gods and the righteousness of its cause, attempted to resist, the Athenians promptly landed an expeditionary force, massacred all the male population and sold the women and children into slavery.

By far the most radical of the younger generation of sophists was Thrasymachus, who denied the existence even of such a thing as natural rights. For him the strong had no inherent right to lord it over the weak. They simply happened to rule by the accident of their strength, and right and wrong were determined solely by their caprice and had no other authority than their ability to impose their behests by *force majeure*. In these circumstances the "natural" attitude of the mass of mankind toward the legal and moral restrictions imposed upon them was one of convention at all times and of open defiance when possible. That Thrasymachus is reported also as questioning the guidance of the world by a divine providence is not surprising.

The widespread and influential character of these teachings, which both sprang from and contributed to the demoralization of the age, is attested by the sustained and vigorous attack to which they were subjected by Socrates and Plato. Indeed it was Socrates' task to rediscover universal and authoritative human sanctions for a morality binding upon all mankind. And it was left for Plato to transform these standards into ideas, and to find a metaphysical sanction for them in the nature of reality itself.

The sophist outburst of skepticism quickly petered out, as the validity of moral standards was restored by Socrates, and philosophy under Plato and Aristotle returned to constructive thinking. But for all that it fostered moral unrest and confusion, its influence was highly salutary. Its critical and doubting spirit, its pricking of philosophic pretensions to absolute knowledge and its suspicion that the human point of view is relative remained to lighten for all time every philosopher who came into the world. Henceforth no system could ignore the part played by mind in its making or take itself too seriously. Furthermore the philosophical meditation upon moral, political and social problems instigated by the sophists made of ethics one of the major branches and problems of philosophy. And the doubts they cast upon accepted standards, the disrepute into which they brought orthodox beliefs and the broad minded, relativistic outlook which they adopted and encouraged helped clear the ground of much that was outworn and to lay the foundations for all subsequent theories of morals based directly upon reason and upon empirical fact.

SOREL, ALBERT (1842-1906), French historian. Sorel's career provided admirable preparation for his work as a historian of French foreign affairs. He came of an industrial family at Honfleur. While studying law at Paris he sought to broaden his intellectual development as a volunteer member of Jules Quicherat's classes at the Ecole des Chartes. In 1866 upon the advice of Guizot he entered the Foreign

Office, and during the siege of Paris four years later he was sent to Tours to assist the comte de Chaudordy, who was delegate of foreign affairs. As a member of the Foreign Office staff Sorel had access to documents denied outsiders, a privilege he retained even after his retirement. Sorel remained in the Foreign Office until 1876, when he resigned to become secretary of the presidency of the Senate; this position, which likewise offered him opportunities to study men and events, he held for twenty-five years. Émile Boutmy had already created the Ecole Libre des Sciences Politiques and had invited Sorel to lecture on the diplomatic history of Europe, opening for him a long and distinguished career as a teacher. Sorel was elected to the Académie des Sciences Morales et Politiques in 1889 and to the Académie Française in 1894.

Out of his work grew his first volume, *Le traité de Paris du 20 Novembre 1815* (Paris 1872). Three years later appeared his *Histoire diplomatique de la guerre franco-allemande* (2 vols., Paris 1875), still recognized as of value; it was objective in attitude, although Sorel himself had been an actor in the great drama. His greatest work was *L'Europe et la Révolution française* (8 vols., Paris 1885-1904; 3rd-7th ed. 1904). Never has diplomatic history been written with a more penetrating intelligence or a greater artistic power in setting the stage and delineating the actors. The documentation of the volumes on the revolution up to 1795 was more solid than that for the Directory and the Napoleonic period. For material outside of Paris Sorel relied almost wholly upon printed collections. Like de Tocqueville and unlike Taine, he considered the revolutionary movement and policies as primarily a fulfilment of tendencies in process under the old regime. His main thesis as a historian of French foreign affairs was that once the revolutionists began to annex territory and to claim the "natural frontiers," the struggle with Europe and especially with England was inevitable and permanent; for the English at least would never rest so long as Belgium remained in French hands. Napoleon thus becomes a defender of national interests rather than a conqueror impelled by towering ambition. Sorel's ideas on history and historical writing are developed in volumes of collected essays, notably *Essais d'histoire et de critique* (Paris 1882, 12th ed. 1894) and *Nouveaux essais d'histoire et de critique* (Paris 1898).

SOREL, GEORGES (1847-1922), French social philosopher. The political personality of Sorel has been the subject of much controversy, since in the course of his development he was at various times affiliated with many contradictory movements. Generally accepted as the theoretician of revolutionary syndicalism he has also been designated by Mussolini as the most important inspirer of Fascism. The various attempts, founded on almost exclusive consideration of *Réflexions sur la violence*, Sorel's most popular but not his most representative book, to present him as a consistent political thinker arise from a one-sided and dogmatic interpretation of his thought. Only on the basis of his fundamental moral ideas is it possible to arrive at any unified interpretation of his work and his spiritual and intellectual position, and even these are not sufficient to explain clearly the contrasts and the contradictions in his writings.

Sorel was concerned more with the development of a human type than with the elaboration of a definite political and systematic doctrine. In this respect he was not unlike Proudhon, whose strong influence is revealed in all Sorel's books. Like Proudhon, Sorel was a typical French thinker. Even after abandoning his career as engineer, to which he had devoted twenty-five years, he remained essentially a French burgher whose political beliefs were dominated by notions of productive economic activity and technique.

Sorel's first important book, *Procès de Socrate*, was a sharp attack on the intellectuals. His later work *Illusions du progrès* was just as passionate an indictment of the "temerity" of the third estate, which, he held, had destroyed the reign of order. This work revealed the connections between the democratic ideas of the eighteenth century and the economic conditions of the time. Sorel, a militant pessimist rooted in the classicism of the seventeenth century, attacked

the optimistic cultural humanism and pacifistic faith in progress characteristic of democracy. He sought to release the labor movement from its close connection with the "belief in progress." Thus although he at first fought side by side with Jean Jaurès in the struggle for Dreyfus, he subsequently turned from him in disillusionment and became the theoretician of revolutionary syndicalism.

Sorel's socialism sprang not from a preoccupation with the needs of the proletariat but from a recognition of the moral disintegration of the ruling bourgeoisie. The labor movement he regarded always as a phenomenon of world history with a unique historical value to be distinguished from the destructive "slave uprising of the masses." He criticized the theory of surplus value and accumulation and was opposed to a revolutionary transformation of the economic system. Socialism, according to Sorel, requires organization of the proletariat and not of the economic system. He attacked finance capital but favored industrial capitalism on the ground that the discipline and heroic exertions characteristic of the latter create the moral foundations for the revolution of the proletariat, which, according to Sorel, represents the virtues of producers and warriors.

The same view of humanity is to be found also in his *Réflexions sur la violence*, the literary gospel of revolutionary syndicalism. Here Sorel attempted a synthesis of the ideas of Proudhon and the Marxian doctrine of class struggle. In this case the philosophy of Henri Bergson played a role in Sorel's thought similar to that of Hegel in the Marxian system. Here Sorel took a firm stand against any mechanistic idea of progress which viewed social change as historically and economically determined and the realization of socialism as an automatic process. Sorel maintained, on the contrary, that the victory of the proletariat was bound up with its fighting ethics and that the extent and the capacity for participation in the "myth" of the general strike were decisive factors in the struggle. Sorel was not interested in the workers fighting for higher wages but rather in the heroes of a "social war" who as a social élite were to lead on to the opening of a new epoch in history and civilization. The creative power (violence) of the proletariat must remain free and show itself superior to the purely technical economic power (force) of the bourgeoisie. The doctrine of direct action implies a sharp rejection of every attempt at mediation and humanitarian neutralization which ac-

companies faith in progress. The inevitability of the final struggle must also be borne in mind by the bourgeoisie if it is to present a formidable front against the proletariat. Actually Sorel exerted a greater influence on the French bourgeoisie than on French revolutionary syndicalism, which soon disintegrated; and it led Sorel himself to establish a closer relationship with the right nationalist circles in France before the World War.

The war and the peace signified for Sorel a "crusade of democracy" and the incarnation of what Pareto called "demagogic plutocracy." Sorel now became a confirmed pessimist. It is true that Bolshevism aroused his hopes somewhat, as is revealed in his essay "Pour Lénine" (appendix III to 5th ed of his *Réflexions*, p. 437-54); but it is nevertheless doubtful that Sorel may correctly be called a Bolshevik in this last phase of his activity. Still less may he be regarded as an advocate of Fascism. In both movements he saw the awakening of the modern industrial man. In Lenin he saw a "Peter the Great," and in Bolshevism a typical Russian phenomenon through which the Russian worker was to be educated to discipline and work and a "republic of producers" erected. The soviets he believed were organs of proletarian self-administration which as genuine social authorities had replaced the essentially non-Russian ruling class. Above all Sorel praised Lenin's realism and the large scale Soviet economic planning. Such planning constituted also the basis of his hopes for Fascism, in this movement likewise he valued the personality of the leader, Mussolini, and the Italian imperialism of producers which he represented. Sorel considered the creation of such powerful nations as necessary prerequisites for the development of socialism.

Although Sorel's position was certainly symptomatic of contemporary antiparliamentary movements and particularly of their revolutionary tactics, his importance should not be overrated. Even his oft quoted theory of the élite is quite different from the ideological basis of modern organizations which rest upon force and myth. Such contemporary phenomena may be interpreted according to Sorel as manifestations of the despised mass democratic movements, which in the hands of demagogues become forms of Bonapartist Caesarism. Sorel, like Pareto, was rooted in a liberal-republican aristocracy which was the source of his political faith.

SORENSEN, THEODOR (1839-1914), Danish statistician. While practising medicine in his native town of Hobro, Sørensen made several important statistical investigations on the condition of the working people and on the mortality of various classes of society. These studies gained him membership on various governmental commissions appointed to prepare legislation on social insurance. The work of one of these commissions resulted after several years of debate in the enactment of voluntary sickness insurance (1892) to be administered through publicly supported friendly societies. Sørensen became the first inspector of these friendly societies. He was a prominent member of the invalidity commission of 1903-14, one of the accomplishments of which was an unemployment insurance act in 1907, similar in character to the act on friendly societies. Although already approaching his seventieth year, he took on the office of inspector of these societies, retaining this position until his death. The success of the Danish legislation as voluntary insurance against sickness and unemployment owed much to his ability and personality.

The sound scientific basis of his statistical investigations would probably have won him international renown, if they had not been published solely in Danish.

SÖRGE, FRIEDRICH ADOLF (1827-1906), German-American socialist. Through the influence of his father, who made his home a station on the underground railway for Polish revolutionists, Sorge early entered the revolutionary movement. He escaped a sentence of death for his participation in the Baden revolution of 1849 and was expelled successively from Switzerland and from Belgium; finally, despite his objection to living in a slave owning country, he settled in the United States in 1852. Here he kept aloof from the movement headed by Weitling and first became active in 1857 as a leading member of the New York Communist Club. After the Civil War Sorge organized among German radicals a League for German Freedom and Unity but for a few years was more absorbed in the free thought movement. Following the failure of the Social Party of New York and Vicinity he devoted himself after 1869 to the North American Federation of the International Working Men's Association. At the Hague congress of the International he represented American elements in accord with Marx and was made secretary of the International when the Marxians transferred its general office away from the reach of Bakunin to the United States. It was his melancholy task to "expel" virtually every national federation. After the collapse of the International in 1876 he withdrew from active leadership, earning his livelihood as a music teacher. He continued, however, as adviser and conciliator in the struggle of various factions, insisting always that before socialist labor could attempt to enter the political arena it must be strongly organized in trade unions. He was thus not only the first authentic interpreter in the United States of

Marxian socialism, but through Gompers and Adolf Strasser, who respected him, he exerted a profound influence upon the American labor movement. He made a valuable contribution to American labor history through two series of articles which he contributed during the 1890's to the periodical *Neue Zeit*, in which he revealed an extraordinary insight into American conditions.

SELIG PERLMAN

Consult. Commons, J. R., and associates, *History of Labour in the United States*, 2 vols (New York 1918); Mehring, Franz, "Der Sorgesche Briefwechsel" in *Neue Zeit*, Jahrgang xxv, vol. 1 (1906-07) 10-19, 50-57; Sorge, F. A., "Erinnerungen eines Achtundvierziger's" in *Neue Zeit*, Jahrgang xvii, vol. 11 (1899) 156-60, 189-92, 252-56, 284-88, 317-20, 381-84, 414-16, 445-48, *Briefe und Auszüge aus Briefen von Joh. SOTO, DOMINGO DE (1494-1560), Spanish theologian and jurist. Soto studied at Alcalá and Paris and taught philosophy at the former university. Subsequently he joined the Dominican order and lectured at Salamanca, where in 1552 he was appointed *prima* professor of theology. Soto was an outstanding member of the Spanish delegation at the Council of Trent, where the Dominicans played an important role, and as adviser to Charles v and his councilors was influential in the formulation of Spain's colonial policy in America. He summarized for the government the arguments in the famous debate between Fray Bartolomé de Las Casas and Juan Ginés de Sepúlveda concerning the causes which might justify war against the Indians and their consequent subjection.

Influenced by his great contemporary Vitoria, especially in methodology, Soto was a follower of Thomas Aquinas, whose doctrines he extended and developed, reformulating the traditional problems within the scholastic scheme in relation to his own epoch. In this connection his work in international law, especially the law of war, is noteworthy. Although some of his writings have been lost, Soto's philosophy of law is revealed clearly in *De justicia et jure* (2 vols., Salamanca 1553-54; tr. into Spanish by J. Torrubiano Ripoll, *Clásicos jurídicos*, vols. xvi-xvii, Madrid 1922-26), which consists of commentaries and classroom lectures upon the *Secunda* of the *Summa* of St. Thomas and of discussions of contracts, usury and other legal questions. In this work Soto gave juridical form

to the moral ideas of Aquinas and attempted to bring into practise many of the principles which the Spanish moral theologians defended *Rationis ordinatio* (ordinance of reason) as the criterion of law became the foundation of his legal philosophy; and his writings, like those of the other Spanish philosophers of the period, bear witness to the triumph of the intellectual current represented by Aquinas as opposed to Scotus. Soto offered a remarkable analysis of the differences between natural law and *jus gentium*, including the latter in positive law.

His political doctrines likewise represented an application or development of those of Aquinas; he was one of a great number of casuists who helped to reconstruct the ethical norms applicable to politics at a time when they had experienced a profound transformation in practical usage.

ROMÁN RIAZA

SOUTHEY, ROBERT (1774-1843), English poet, historian and journalist. As an undergraduate, under the influence of the ideas of Rousseau and Godwin, Southey adopted a theory of idealistic communism and return to nature which he and Coleridge called pantsocracy. The progress of the French Revolution, however, brought disillusionment, and he became a strong Tory. He was one of the chief founders of the *Quarterly Review* (1809), for which he wrote prolifically in defense of the Anglican Establishment and the unreformed Parliament. He also wrote poems, mostly long epics, and voluminous histories of Spain and Spanish America. These are little read now, but his lives of Nelson and Wesley have survived. His outlook on social problems entitles him to be classed among the Tory reformers. He followed Coleridge in rejecting the dominant *laissez faire* and individualist philosophy. An able propagandist, he championed on religious and humanitarian grounds numerous social reforms and wrote sympathetically of the ideals of Owen, Spence and the early socialists. Above all, he may be regarded

as the immediate inspirer of Lord Shaftesbury in the movement for factory reform.

SOVEREIGNTY. It has been said that "what the term 'value' is to the science of political economy, the term 'sovereignty' is to political science." Sovereignty has somewhat varied connotations in the different branches of political science, but it always signifies a highest governmental or legal authority of some sort. It is an important term in international law, constitutional law and political philosophy.

In international law sovereignty is generally held to be an essential qualification for full membership in the family of nations. In other words, the subjects in whom inhere the rights and obligations defined by international law are states; and a community is not a state unless it is independent of legal control by any other community and is legally free to determine the nature of its relations with all other communities, except in so far as it limits its freedom contractually or voluntarily. The writers on international law do not as a rule regard this legal autonomy as incompatible with the existence of a body of definite regulations to which civilized states generally render obedience and which are supported by formal and well recognized sanctions of a legal sort. According to the prevailing conception a state, although subject to international law, is still a sovereign community because the rules of the law are not decreed and the sanctions are not applied by any common, unified authority. The rules are formulated chiefly through the cooperative action of the separate and equal communities obligated by them; and the sanctions are only the measures of protest or retaliation directed against an offending state by other states, acting severally or jointly. That is to say, the commands and sanc-

tions of international law do not issue from a political superior to a political inferior, and there is therefore no impairment of the "external" sovereignty of the units subject to such commands and sanctions. International law deals also to some extent with "internal" sovereignty. Thus, speaking very generally, it recognizes that every state has, as a sovereign community, the legal right to select its own form of government and to regulate as it chooses its own territory and the personal and property relations of its citizens and subjects—in so far as it does not exercise this right in such ways as to endanger the peace and safety of other states. International law describes as "semisovereign" a state which, although acting in many essential respects as a self-governing community, externally and internally, has surrendered to another state a considerable measure of control over its foreign relations or a right, under certain contingencies, of intervention in its domestic affairs or which has not yet acquired a status of complete (i.e. normal) freedom in controlling its domestic and foreign policy (see PROTECTORATE).

Constitutional law and political theory are concerned with sovereignty chiefly as an attribute of the state considered internally. It is sometimes said that the idea of sovereignty is peculiar to modern political and legal theory. In respect to a particular conception of legal sovereignty the statement has validity. Thus in the classical Greek political theory the state was not sovereign in the sense of being above law. The authority of customary, or unwritten, laws, embodying the dictates of gods or of a universal reason, ranked higher than that of the decrees of even the highest governors of a state. In regard to the more general meaning of sovereignty, however, there appears to be no essential distinction between ancient and modern ideas. For certainly the ancient writers attributed a superior authoritativeness to the state and accorded it a unique function in upholding the legal order. Aristotle described the state as "the highest of all associations . . . which embraces all the rest." The leading Greek and Roman political writers devoted much attention to questions concerning the right location and proper tasks of "the supreme power" within the state. Throughout most of the Middle Ages, it is true, the state was not generally the predominant organization within the community, and relatively few writers claimed any such position for it. Indeed the state of ancient and modern political theory hardly existed. Organized control over

the individuals within any region was shared generally by several authorities—Roman church, Holy Roman emperor, king, feudal lord, chartered town, guild—the several authorities often competing with one another in their efforts to extend their spheres of control. What laws there were of a "civic"—secular and territorial—character were for the most part customary, varying often according to the boundaries of fiefs and towns rather than larger political lines.

In the later Middle Ages various economic and social changes tended, in their combined effect, to restore the practical power and theoretical prestige of the state. On the one hand the changes created a need for relief from the confusion of overlapping and conflicting demands upon the individual's allegiance, and on the other they weakened the authority of the church as an agency of unity. The state appeared again to be, as it had been in ancient Greece and Rome, the most competent association for the maintenance of order and tranquillity and the furtherance of progress. In several regions of Europe strong national monarchies were evolving concurrently with the decline of mediaeval institutions and ideas, and the doctrine of the state as a unique authority in determining the form and content of civil law served as a useful theory to explain the claims made in behalf of monarchs. To make the claims good it was necessary to deny limits either by an imperial or papal authority outside the state or by rights of feudal lords, self-governing towns and autonomous guilds within the state. The idea of a supreme national monarchy was implicit in the actual situation in France in the fifteenth century under Louis XI; it had already been made explicit in several brief theoretical discussions, notably by Pierre Dubois and Bartolus of Sassoferrato.

In the late sixteenth century Jean Bodin, in his famous *De republica*, defined the commonwealth, or state, as an "association of families and their common affairs, governed by a highest power (*suprema potestas*) and by reason," and defined sovereignty (*majestas*) as "highest power over citizens and subjects, unrestrained by laws (*legibus soluta*)." "The chief mark of sovereignty," he said further, "is the power to give law to all citizens, generally and singly." By virtue of these definitions as well as by a discussion of the specific attributes of the sovereign Bodin has frequently been referred to as the founder of the doctrine of sovereignty. It is not certain, however, how far Bodin meant to

extend the powers of sovereignty by characterizing it as *legibus soluta*. He said explicitly that the sovereign is limited by "natural and divine laws" and by "laws of the realm" (*leges naturae et divinae* and *leges imperii*). Thus under the limitations of natural and divine law the sovereign could not violate private property or break contracts to which he was a party (unless in the latter case his sovereignty would be imperiled if he held to the contract); and "as to *imperii leges*," he said, "the prince [the repository of sovereign power] cannot abrogate or modify them, since they are attached to the very sovereignty with which he is clothed; such is the Salic law, which is the foundation of our monarchy." Bodin was not thoroughly clear and consistent in his position. Apparently he insisted upon an older idea that every political ruler is subject to customary laws which he cannot lawfully change, while at the same time he attempted to establish the doctrine that there are rules of an "ordinary," or "civil," character which become laws only by command of the political sovereign and which do not bind the sovereign himself. Although there are limits to the sovereign's power, there are no persons or institutional agencies ultimately independent of his control to impose these limits upon him.

Later theorists went further, building up more clearly and specifically the content of what has come to be known as the orthodox doctrine of sovereignty. Thus Thomas Hobbes in the seventeenth century maintained that laws, properly speaking, are nothing but the commands of a political sovereign, who is subject to no legal limits; so-called divine or natural laws have no legal significance for a sovereign, except to the extent and in the manner interpreted and accepted by him. Rousseau in the eighteenth century held that sovereignty, which in his theory could rationally be held to reside only in the "body politic," or "general will," had no legal limitations: "the sovereign, being formed wholly of the individuals who compose it, has, and can have, no interest contrary to theirs" and remains the "sole judge of what is important" for subjection to the general will.

A rigidly formal doctrine of legal sovereignty was set forth by jurists of the nineteenth century, notably by John Austin in the 1860's and by jurists of the German Empire during the last quarter of the century. As in the sixteenth century, so again in the nineteenth century practical political considerations influenced the precise formulation of a theory that attributed to a defi-

nite sovereign an authority unrestrained by law. Austin wrote under the influence of the early nineteenth century utilitarian attitude toward political action. The utilitarians were practical reformers and they sought among other things to secure the enactment of statutes removing anomalies and injustices from the common law. Their proposals were opposed by conservatives, who took the ground that law consists necessarily either of universal and permanent dictates of right or of principles embodied in the slowly evolving customs and unwritten laws of a given country. The utilitarians countered this position with their conception of law as a means for securing justice and the common welfare, and therefore as constantly subject to modification by the agencies to whom the community entrusts the task of preventing customs and traditions from becoming cloaks for injustice or impediments to progress. The German jurists—notably von Gerber, Laband and Jellinek—sought to give full legal validity to the extensive powers asserted by the imperial government in consolidating the German nation; thus they made the German state in its sovereign organization a free agent in fashioning law to meet the public needs of the day, unhampered by restraints embodied in the vague demands of universal justice or of a mythically conceived national mind.

This positivist conception of law is an essential maxim of the contemporary doctrine of state sovereignty. The doctrine holds that within any independent political community there is a determinate sovereign whose commands and permissions—given directly or indirectly, explicitly or implicitly—establish the law and whose position is above law. In every state there is a person or organ or a group of persons or organs—the British Parliament acting with the king, the czar of Russia (before 1917), the German imperial Bundesrat and Reichstag (before 1918), the United States Congress and commonwealth legislatures acting to amend the constitution—with legally unlimited authority. In the application of this theory to the contemporary constitutional state a discrimination is made between sovereignty, involving a power to make and change the fundamental law of the state, and ordinary governmental authority, supreme only within the limits prescribed by the fundamental law, which the sovereign alone and not the government can change. Another familiar distinction is that between legal and political sovereignty, the latter signifying the power that is

actually obeyed ultimately. Thus it is said that the people are sovereign in the sense that if they apply the pressure of their actual power they can in the long run force the formally sovereign authority to follow their desires. The analytical jurist describes this as "a political, not a legal, fact"; for he considers his task to be only that of finding out, by exact identification and precise analysis of the decisions of the legal sovereign or of inferior organs acting within the limits of competence allowed by the sovereign, what the law is. Questions as to the moral rightness or practical effectiveness of the law are referred to scholars of other disciplines.

A number of recent writers on law have been repelled by the claim that an act of political agencies can in any sense establish the essential distinction between lawful and unlawful conduct. As critics of the orthodox doctrine they maintain generally that some other mark than the fact of the state's command or permission is essential to give a rule of conduct the real character of law. They hold law to be anterior to, above and more comprehensive than the state. The latter's function is simply that of adapting an already existing rule of law to some given set of facts; and the task of the jurist consists not so much in identifying the state's commands as in testing their "validity," by standards that are independent of political action. Some of the critics (Duguit, for example) set up "objective" standards, accepting as law only those customs or imperatives, whether or not enforced by the state, which tend toward maintaining an orderly, peaceful and progressive social life. Others, like Carabbe and Laski, set up subjective standards but find the source of the standards not in any sort of political command or decision but only in the consciences of individual men or in the "sense of right" of a whole community.

Most of the recent jurists and political theorists go beyond the formal analytical doctrine or law and admit ethical and sociological standards of right law into their general theory; yet they leave essentially undisturbed the unique and important position assigned to the state by the traditional theory of sovereignty. They consider not only what the laws are as they appear in constitutions, statutes, decrees and decisions but also the social and psychological origins and effects of the laws and their ethical quality. They take account of the beliefs, desires and prejudices of various people, in and out of office, which enter into the determinations of rules of law laid down by organs of the state. They con-

sider how the laws operate and how they may be improved. In these ways they give due attention to the moral and social significance as well as to the practical effectiveness of various social imperatives other than those backed by state action; but generally they reserve the term laws for the latter and follow the orthodox theory in explicitly assigning to the state a peculiarly comprehensive and compulsive position in society.

Indeed the recent dispute between advocates and critics of the orthodox theory appears to arise essentially from a confusion of terminology, particularly from different senses in which the disputants employ the word law. No word in political science is used with a greater variety of meanings. Each side in the controversy over sovereignty generally recognizes the existence and acknowledges the importance of the social rules which the other side calls laws. The orthodox theorists admit that a state's law enacting assemblies or deciding judges act under the impulses and restraints of various types of opinions and sentiments current in the community or in its most influential sections. The critics, explicitly or implicitly, grant that there are distinctions of great practical significance between state supported rules and those enforced only by other forms of social pressure. Both sides appear to agree that in order that the state may fulfil adequately its essential functions of unification and coordination it must be comprehensive and compulsive in membership and must be equipped with a power to issue commands which may be executed through the organized force of the community; and that it must normally have a monopoly of this sort of power within any given community. The orthodox theorists persist in describing the state's unique function and position in society by the term sovereign.

SOVIET. The Russian word *soviet* means simply council, but revolutionary experience has enriched its connotations. Soviets, or councils composed of delegates chosen by workers in factories and workshops, were active in the Russian revolutions of 1905 and March (February by the Julian calendar), 1917. They became the basis of the governmental structure as the result of the successful Bolshevik seizure of power in November (October), 1917. Although it originated and developed on the terrain of specific Russian conditions, the soviet has become the accepted pattern for Communist revolution everywhere.

In periods of fundamental revolution new organs of government are regularly improvised to express the needs of groups revolting against authority. In England the Puritan revolution produced a type of council analogous to a soldiers' soviet in the General Council of the Army set up in June, 1647, and dissolved in the

following January. It was composed of the general officers and representatives of commissioned officers and soldiers of the regiments who assembled to press their demands for unpaid wages, moderate extension of the franchise and redistribution of seats in the House of Commons. In France the decrees of December 14 and 22, 1789, eliminated the intendants and other local officers of the *ancien régime*, thus legalizing the accomplishments of the "municipal revolution," and created a new system of local administration based on direct election of municipal, district and departmental councils, which, like the soviets today, were to attend to all matters of local competence and to act as the sole agents of the central government. But while the soviet system provides for occupational representation in the city and disfranchises the propertied classes, the French decrees limited the electorate by a fairly high property qualification and called for representation on a geographical basis. The far reaching local autonomy thus established was greatly reduced in 1791 and virtually abolished in Bonaparte's constitution of 1800.

Communist leaders attach considerable significance to the Paris Commune of 1871 as an essay in proletarian state organization. According to Marx the Commune showed that "the working class cannot simply lay hold of the ready made State machinery and wield it for its own purposes" (*Civil War in France*, ed. by R. W. Postgate, London 1921, p. 28); on the contrary, workers must "destroy the machine." The Commune united in its hands both legislative and executive power; all of its members were elective, were subject to recall at any time and received a salary not exceeding the average wage of a skilled worker, it replaced the standing army by an armed people and abolished the old police force. These aspects of the Commune which influenced the organization of the soviets were singled out by Lenin as indicating its superiority to the most advanced type of state produced by bourgeois revolutions. On the other hand, he held that the Commune did not go far enough, based as it was on universal suffrage and geographical representation.

The soviet as an organ of proletarian combat made its first appearance in the Russian revolution of 1905. The strike movement which swept over the industrial centers of Russia in that year assumed vast proportions. Virtually strike committees, the soviets were the direct outgrowth of this situation. As the movement assumed an in-

creasingly revolutionary character, the soviets, although overwhelmingly non-party in membership, took on the aspects of a political organization; they set up an armed militia, endeavored to obtain strike relief funds from municipalities and even attempted the introduction of the eight-hour day by direct action. The most important of these soviets was that in St. Petersburg created in October to direct the general political strike then raging; it consisted of delegates sent by workers in factories and workshops throughout the city (one for every five hundred workers) and was directed by an executive committee chosen by the membership and including representatives of revolutionary party organizations. Although it was not the first institution of its kind, the St. Petersburg Soviet set the pattern for similar organizations in other industrial centers.

The soviets of 1905 were short lived: the members of the St. Petersburg Soviet were arrested by the government two months after its organization; the Moscow Soviet perished on the barricades in the armed insurrection which took place in December; and the few provincial organizations were suppressed where they did not disband of their own accord. The *raison d'être* for the soviets disappeared with the recession of the revolutionary mass movement, for their essential function was to direct strikes and manifestations against the government. The soviet was not yet looked upon as an alternative form of government. It was only in 1906 that the Mensheviks saw in the soviets a labor parliament which might compete with the Duma boycotted by the socialist groups, and that the Bolsheviks discerned in them a possible agency for a united front of the proletariat with peasants and soldiers and the embryo of a revolutionary government which would accede to power after a successful armed insurrection. In fact, however, the soviets in 1905 were exclusively an organ of the urban proletariat. It remained for the revolution of 1917 to create soviets of soldiers and to transform the soviet from a fighting agency into an instrument of government.

The czarist government in Russia was overthrown in March, 1917, in a spontaneous uprising of the masses in important urban centers; the army garrisons, which at first preserved a sympathetic neutrality, soon joined the movement. The soviets, created in the early days of the revolution, functioned as the coordinating and directing agency; they supplied the leadership totally lacking at first, saved the demonstra-

tions from degenerating into riots, assumed control of the stores of arms to prevent their use by counter-revolutionary groups and assured the maintenance of the regular food supply. The soviets consisted of delegates sent by workers in factories and workshops and by soldiers in the various garrison units; they also included a few individuals deputized by socialist groups. Peasant soviets were organized later and, unlike the urban soviets, played no important role in 1917. The latter represented the great majority of those who made the revolution, but they did not take over the government, instead a Provisional Government was set up, which derived its authority primarily from the Duma, the lower chamber of the old regime, and proposed to carry on until the convocation of a constituent assembly.

From the outset there were thus two centers of power: the Provisional Government and the soviets. In the early months of the revolution the soviets, dominated by the Mensheviks and the Socialist Revolutionaries, preferred to function as an organ of democratic control over the Provisional Government preparatory to the convocation of the constituent assembly, which was expected to establish a democratic republic. In the capital this control was exercised by the Petrograd Soviet and later by the Central Executive Committee elected at the first All Russian Congress of Workers' and Soldiers' Soviets in June. But this situation did not endure. In April Lenin condemned the Provisional Government as a servant of capitalism and international imperialism; he also formulated the demand for the assumption of all power by the soviets, which shortly thereafter was adopted by the Bolshevik party. The ineffectiveness of the Provisional Government and the attempt by General Kornilov to establish a military dictatorship directed mainly against the soviets rapidly drove the masses leftward. By the middle of September the Bolsheviks had won control of the Petrograd and Moscow soviets and were making striking gains throughout the country. Thus the way was prepared for the overthrow of the Provisional Government. After a successful coup directed by the Military Revolutionary Committee of the Petrograd Soviet, the second All Russian Congress of Soviets, which met on November 7 and was dominated by a coalition of Bolsheviks and left Socialist Revolutionaries, declared itself the sole repository of state power. It vested governmental authority in a Council of Peoples' Commissars, with Lenin as chairman.

Local soviets were quickly transformed from agencies of control into governmental instrumentalities.

The wave of revolution which swept through central Europe after the defeat of Germany and its allies spread the soviet idea. In Germany workers' and soldiers' councils were utilized to carry through the revolution which led to the abdication of the kaiser. On November 11, 1918, the executive committee of the Workers' and Soldiers' Soviet of Greater Berlin, constituted two days earlier, assumed sovereign power in the German Socialist Republic; it allocated executive authority to a coalition government of Majority and Independent Socialists, retaining for itself and the subsequently elected Central Soviet a power later defined as "parliamentary supervision." In Germany, unlike Russia in 1905 and 1917, mass party and trade union organizations were already firmly established. The right Majority Socialists and the trade union leaders regarded the soviets as a potential challenge to their authority and sought to subordinate them to the existing party and trade union machine. The center offered the impossible compromise of combining soviets with ordinary representative assemblies, while the left pressed for a permanent soviet government, which it hoped to transform into its own agency. The extremists who called for a permanent soviet government were defeated; the congress of soviets which met on December 16 and was controlled by Majority Socialists set the elections to the constituent National Assembly for January 19, 1919. Although the Central Soviet turned over its powers to the Assembly early in February, the establishment of a democratic regime did not proceed unchallenged. Economic disorganization and the political mistakes of the government, which retained the old apparatus of military and civil administration, led to a radicalization of the masses and of the local soviets; in some instances, notably in Munich (April 7—May 1, 1919), there actually were established local soviet republics, which, however, were quickly suppressed by government troops. The revolutionary temper found expression also in the second congress of soviets held in April, which adopted a plan sponsored by Majority Socialists Kaliski and Cohen calling for the establishment of chambers of labor; the national chamber, enjoying an authority virtually coordinate with that of the Reichstag, was to be concerned particularly with economic legislation and the promotion of gradual socialization.

The Majority Socialist party as a whole and its representatives in the National Assembly refused, however, to support this program. Article 165 of the Weimar constitution stated merely that "for the purpose of safeguarding their social and economic interests the wage earning and salaried employees are entitled to be represented in workers' councils," while the works' councils law of 1920 purporting to carry out this article of the constitution provided for the abolition of workers' soviets. Even the status of the national economic council, a combination of workers' councils with representatives of employers and other groups, likewise promised by article 165, was that of an advisory body, not of a second chamber.

In Austria too soviets were created in the early days of the revolution of 1918. They were helpful in preserving discipline in the army and in combating profiteering in foodstuffs and housing but had no voice in national affairs. In the second quarter of 1919, under the influence of developments in Munich and especially in Hungary, a strong sentiment developed in Vienna and the surrounding industrial territory for the establishment of a soviet government; but the desperate international situation of the country and the danger of being cut off from the agricultural regions, where peasant soviets sabotaged the food policy of the central government, prevented any but minor outbreaks. Workers' and soldiers' soviets survived for several years thereafter, at first cooperating with the government dominated by Socialists and later acting as the shock troops of the Socialist party in opposing counter-revolutionary moves; eventually the soviets became indistinguishable from the local branches of the party.

Hungary was presumably a soviet republic from March 21 to July 31, 1919, but governmental authority was exercised by a coalition of left Socialists and Communists "in the name" of workers', soldiers' and peasants' soviets. The establishment of the new regime was not at tributary primarily to militant action by workers' soviets, from which Communists were barred although they controlled a number of works' councils and influenced the policies of the Soldiers' Soviet in Budapest. It was rather the result of a decision by Karolyi, hard pressed by the allied command, to place reliance upon the "Russian orientation" and to discard accordingly the liberal-socialist condition in favor of a left wing government. Although new elections to the soviets were held in April and a

soviet congress, which met in June, adopted a constitution modeled after that of Russia, the soviets functioned mainly as a tribune for governmental declarations and not as organs with legislative and executive functions. Moreover considerable friction developed between rural soviets and the central organizations. Internal dissension, allied intervention and the inability of Russia to offer military assistance spelled the doom of Soviet Hungary.

The only other country in which soviets have become a serious political factor is China. After its break with the Kuomintang in 1927 the Communist party declared that because of the treachery of the bourgeoisie the national revolution in China was developing into a proletarian-socialist revolution, and that armed insurrection and the establishment of a soviet republic should therefore constitute the next step. In the peasant uprisings which followed, especially after 1929, "red armies" occupied a number of districts and set up soviets. Where these exist in more than name they are in most cases identical with peasant unions, but sometimes they include also representatives of the associations of wage-workers, craftsmen and petty merchants.

In any discussion of the soviet as an organ of revolutionary combat a distinction must be drawn between workers', soldiers' and peasants' soviets, which are often considered identical; for the particular political orientation that they assume depends upon the interests which they represent and the strength of the Communist influence among them. Thus soldiers' soviets tend to become active revolutionary bodies only when they function in close contact with workers' soviets. This was largely true in Russia in 1917. In Germany soldiers' soviets practically disappeared as soon as city soviets were forbidden to interfere in army matters. In Austria the soldiers' soviets were an important revolutionary factor, because the Volkswehr was hand-picked from those who were recommended by labor organizations. As a plenary governing organization a soldiers' soviet is an anomaly; military discipline and elective representation are incompatible unless both are fused by a supreme party command. The belief that peasants' soviets were active in 1917 and the following years in any country except Austria is unfounded. Between March and November, 1917, the organ of the peasant revolution in Russia was the village land committee and *not* the soviet. In 1917 Lenin called for the seizure of power by soviets of farm hands and the poorest peasants and not

by general peasants' soviets. In the following years committees of the poor peasants were organized to combat the kulaks; at the same time the latter group, with the help of moderately prosperous peasants, attempted to use the newly organized village soviets as centers of resistance against the Communist dominated towns. Likewise in Austria in 1918-19 the peasants' soviets became definitely counter-revolutionary and pursued a separatist, antisocialist policy, revealing again that it is not the form of the institution but the character of the principle which infuses it that is of supreme importance.

Thus far the soviets have functioned as established governmental bodies only in Russia. The Russian system may be likened to a pyramidal structure resting on a base of village and town soviets and converging through district soviets and congresses for regions and republics in the All Union (before 1923, All-Russian) Congress of Soviets. At each of these stages the plenary meeting of the soviet or congress is vested formally with both legislative and executive power; the executive committee which it elects exercises this power in the interval between sessions. The executive committee and a smaller subcommittee, the praesidium, coordinate the work of the various local administrative departments, which follow the directions already outlined by the proper commissariat for the republic or the Union of Soviet Socialist Republics. In the center the commissariat is responsible to the Council of Commissars, which is an agency of the soviet congress and its executive committee.

The Soviet electorate is confined to those engaged in productive labor, while elements classified as hostile to the Soviet state—former members of the czarist police force, officers of the old army, the clergy, the former nobility and the like—are disfranchised. Occupational representation is the general rule; organized voters cast their ballots at their place of employment, and unorganized voters, such as housewives, home-workers and individual peasants, vote by geographic districts. No provisions are made for secret voting and no party tickets except those of the Communists are allowed. The electorate possesses the right to recall its delegate at any time, but the right is not often invoked in practice. Two electoral devices insure the dominance of the industrial workers over the peasantry: first, in the representation in district and regional soviets an urban voter is given as much weight as five rural inhabitants; second, the town

soviets enjoy direct representation in both district and regional soviets, while peasants have direct representation only in the district soviets. This arrangement is defended on the ground that industrial workers are politically more advanced and class conscious than the backward peasant masses.

Responsibility for selection of the members of the soviets and for direction of their activity rests in the last analysis with the Communist party. In the village the majority of soviet members tend to be non-party elements, but with each step upward in the hierarchy the proportion of Communists in positions of authority becomes correspondingly greater. In each soviet the inner board of control is invariably the Communist fraction, even when it is a minority. Since the Communist party commands a monopoly of legality, the party encounters no difficulty in preserving its dominant position. The soviets are thus deprived of a considerable degree of authority. As long as the party remains the real seat of power, the soviets are fated to serve merely as an imposing façade rather than as sovereign organs. Their task is to clothe the party thesis in the garb of constitutional legality. To be sure, they serve a useful educational function by drawing in sympathetic non-party elements to participate in the work of administration; and to the extent that they carry out policies popular in the country they constitute an effective link between the masses and the party. But their work is necessarily lacking in creative significance on larger issues because important decisions come ready made from the party leadership.

In the literature of international Communism the soviets are assigned a twofold function. In the conquest of power they are the instrumentality which the Communist party utilizes to combat the influence of non-revolutionary parties and their affiliated mass organizations. After the conquest of power the soviets persist as the form of government through which the Communist party seeks to ally with the proletariat semiproletarian elements, such as the peasantry, technicians, professional workers and the like, and thereby to consolidate the dictatorship of the proletariat. The soviet state is supposed to realize "proletarian democracy" by affording the mass of the people free access to economic and cultural opportunities, within such limits of course as are dictated by the supreme purpose of liquidating capitalism. In this sense it is thought to be superior to bourgeois democracy, which,

Communists contend, results in the dictatorship of the bourgeoisie, since the latter dominates economic life and controls most of the agencies of public opinion. As an instrument of rule the soviets are primarily a training school by which the laboring masses and their non-political organizations are enrolled in the governmental apparatus and taught to administer the country under the direction of the Communist party.

The soviet state is frankly an organ of class domination which is expected to persist during the transitional period between capitalism and communism. It is assumed that as the ultimate objective—the establishment of a classless society—is gradually realized, the soviet state will wither away and yield to a system of organization, still somewhat vaguely conceived, which will combine elements of voluntary cooperation and planned economy in accordance with the motto "from each according to his abilities, to each according to his needs."

SPARKS, JARED (1789-1866), American editor, historian and college president. Sparks was educated at Phillips Exeter Academy and Harvard College, working his way through the latter. He dreamed of exploring Africa but got no nearer than writing *The Life of John Ledyard* (Cambridge, Mass 1828). After a successful Unitarian ministry of four years (1819-23) in Baltimore he returned to Boston, purchased the *North American Review* and in his six years' editorship made it a magazine to be ranked with the English quarterlies and French *revues*.

His main work, the systematic exploration of American history, had already begun. For *The Writings of George Washington* (12 vols., Boston 1834-37) he visited all the older states and the public archives of England and France. The wealth of documentary material that these researches opened up led him to start six more books before the last of the Washington volumes came out. These brought him fame, the hand of an heiress and at Harvard the McLean professorship of ancient and modern history in 1838. Professor Sparks showed prophetic insight into the form that history teaching was to assume in American universities. He instructed by lectures, prescribed reading and essays; and he insisted on having time for private research. Yet Sparks considered history a gentlemanly avocation and trained no professional historians. Elected president of Harvard College in 1849, he was popular but reactionary, practically abolishing free electives. After his resignation in 1853 he lived quietly and unproductively at Cambridge until his death.

Jared Sparks has an assured place as an explorer and popularizer of American history. His thirst for original documents and his skill at selection and getting them published and distributed gave the American public a new conception of its history and provided historians and biographers with fresh material. His editorial methods, while not so bad as certain critics claimed, were literary rather than scien-

tific, with the result that his texts cannot be trusted by scholars today. If Sparks dressed his subject with too much formal dignity, it was because frontier manners would not in that age have recommended it to the family of Clio. His significance lies in the fact that he did obtain recognition for American history.

S. E. MORISON

Principal works: Sparks was editor of *The Library of American Biography*, 1st ser., 10 vols. (Boston 1834-38), 2nd ser., 15 vols. (Boston 1844-47), to this Sparks contributed "Ethan Allen" (1st ser, vol 1), "Benedict Arnold" (1st ser, vol III), "Father Marquette" (1st ser, vol. x), "Robert Cavalier de La Salle" (2nd ser, vol 1), "Count Pulaski" (2nd ser, vol. iv), "John Ribault" (2nd ser, vol VII), "Charles Lee" (2nd ser, vol VIII), "John Ledyard" (2nd ser, vol XIV) He also edited *The Diplomatic Correspondence of the American Revolution*, 12 vols (Boston 1829-30), *The Works of Benjamin Franklin, . . . with Notes and a Life of the Author*, 10 vols. (Boston 1836-40); *Correspondence of the American Revolution; Being Letters of Eminent Men to George Washington*, 4 vols. (Boston 1853). *The Writings of George Washington* included a *Life* written by Sparks and published as vol 1. Sparks also wrote *The Life of Gouverneur Morris*, 3 vols. (Boston 1832).

Consult. Adams, Herbert Baxter, *The Life and Writings of Jared Sparks*, 2 vols (Boston 1893), Bassett, John Spencer, *The Middle Group of American Historians* (New York 1917) ch. II.

SPASOWICZ, WŁODZIMIERZ (1820-1906), Polish jurist, publicist and historian. Spasowicz was born at Minsk and in his youth was subject to two influences, the Polish spirit of his home and the Russian environment of the local schools. He studied law at the University of St. Petersburg, where he also taught from 1857 to 1861. He published a manual of penal law in opposition to the positive and anthropological school. Obligated to abandon his chair as the result of political disturbances, he entered into practise as a criminal lawyer in St. Petersburg. His brilliant and penetrating speeches soon won him a great reputation. A keen student of Polish law, he prepared a critical edition of the Lithuanian Statute which was never published, participated in the editing of *Volumina legum* (9 vols., St. Petersburg 1859-86) and published studies on ancient Polish historians and translated Polish annals from the Latin.

Spasowicz' main significance, however, consisted in his attempts to establish a political and cultural alliance between the Russian and the Polish peoples. In furtherance of his ideas he published numerous literary and political works, including a history of Polish literature written

for Pypin's *Obzor istorii slavyanskikh literatur* (St. Petersburg 1865, tr. into German as *Geschichte der slavischen Litteraturen*, 2 vols., 1880-89; and separately published as *Dzieje literatury polskiej*, Warsaw 1885), and founded two Polish reviews—*Kraj* (Country) and *Ateneum*. For all his realism he was unable to foresee the World War, from which Poland emerged as an independent state. Firmly convinced that the Russian Empire and Germany were indestructible, he labored for Russian-Polish reconciliation and, imbued with the reformist ideals of the period of Alexander II, he centered his hopes on a radical change in the political structure of Russia. He thus opposed Polish revolt, holding that Poland surrounded by enemies had no alternative but to come to an amicable understanding with a liberal Russia. He was not in favor of autonomy for the Polish kingdom, which would leave the Polish eastern frontier—his native region to which he was deeply attached—outside of the autonomous area and thus expose it to cultural assimilation by Russia. Notwithstanding the purity of his motives, Spasowicz became the object of slander and vilification not only by Poles but by Russians.

W. LEDNICKI

Works *Sochineniya*, 9 vols (St Petersburg 1889-1903; 2nd ed., 10 vols., 1913), Polish edition, *Pisma*, 9 vols. (Warsaw 1892-1903).

(Warsaw 1913-20; vol II, 2nd ed 1933) vol II, p. 159-68; *Przyjacielom Włodzimierza Spasowicza* (To the friends of Włodzimierz Spasowicz) (Lwów 1907).

SPAVENTA, BERTRANDO (1817-83), Italian philosopher. As a youth Spaventa dedicated himself to an ecclesiastical career, but he soon abandoned theology for secular studies. In politics he shared the ideas and hopes of the Italian Risorgimento. Exiled after the reaction of 1849, Spaventa became a teacher at Turin. Following Italian unification he taught at the University of Naples, where he created a Hegelian school of philosophy in an atmosphere of conflicts and controversies closely bound up with doctrinal, religious and political issues.

Spaventa attracted his students to the study of Hegel through the history of philosophy. He set out with scholastic assiduity to retrace the Hegelian stages of the development of thought and to show the folly of the efforts to interrupt

its ascent. He saw this upward course interrupted in the great European philosophical tradition but compelled to confine itself in Italian thought to the very restricted and apparently isolated tradition from Bruno through Vico and Rosmini to Gioberti. He demonstrated that the ideas of each of these thinkers anticipated and confirmed to some extent the truth which step by step was appearing in the vaster current of European thought. In this effort to establish an interrelation between the two traditions he was guided by the criterion of the "circulation of thought," according to which there are in modern civilization no zones and sectors isolated from the common movement. This criterion was found to be as valid for civil and political as for cultural or philosophical history.

Spaventa was incapable of effecting any transformation of his own Hegelian model. He concentrated upon thinking out anew and penetrating the logical-dialectical concatenation of concepts in which Hegel had distributed the ideal history of the spirit and the world. His work reveals, however, a personal imprint and a notable robustness of mind. Particularly important in the history of philosophy is his liberal reinterpretation of the Hegelian ethics. For him the state which embodies the ethical quality of the world is not the state of the Prussian tradition but the constitutional and liberal state which emerged from the Italian Risorgimento. Thus refashioning of Hegelianism represented an important contribution to the political thought of the Italian historic right, of which Bertrando Spaventa, like his brother Silvio, was a convinced advocate.

Consult: Gentile, Giovanni, *Bertrando Spaventa* (Florence 1924), and *Le origini della filosofia contemporanea in Italia*, 3 vols (Messina 1917-21) vol. III, pt. I, p. 339-46, pt II, chs. 1-11, Ruggiero, Guido de, *La filosofia contemporanea*, 2 vols (3rd ed. Bari 1929), tr by A. H. Hannay and R. G. Collingwood (London 1921), especially p. 331-40.

SPAVENTA, SILVIO (1822-93), Italian statesman and jurist. Spaventa directed his activity from the outset toward the achievement of a liberal order in the Kingdom of Naples. In 1848 he founded a journal, *Nazione*, to support

the liberal revolution. Named deputy, he energetically advocated revolt against the absolutism of the Bourbon reaction. He was imprisoned in 1849 and condemned to death in 1851; but his sentence was commuted to life imprisonment upon the intercession of Napoleon III, and in 1859 the protest of European public opinion, initiated some years before in the celebrated letters from Gladstone to Lord Aberdeen, effected his release. When the Italian kingdom was proclaimed, Spaventa became home secretary and minister of public works in the government of the liberal right, which continued until 1876.

Spaventa's political faith was a moderate liberalism, basically somewhat authoritarian under the influence of German political and juridical philosophy of Hegelian origin. He linked up the problem of civil and constitutional liberty with the power of the state as the supreme moderator of political life. He was a strong advocate of the Italian "historic right" which sought to canalize in the institutions of the state and thereby to temper that sentiment of liberty that had emerged from the revolution with all the exuberance and intemperance which a popular movement usually brings with it. Spaventa was convinced that the expansion of political liberty threatened internal solidarity and that democracy might well lead to a new absolutism. His opinion that the consciousness of liberty cannot be dissociated from the consciousness of its limits inspired the most enduring work of the last period of his life—the application of justice in administration, embodied in the creation of the fourth, or jurisdictional, section of the Council of State. Since parliamentary government works through political parties which alternate in power and since a governing party may abuse its position, Spaventa felt that it was necessary to guarantee justice in administration through a supreme organ, independent of political alternations, which would protect the legitimate interests of all against partisan violation. The jurisdictional section still exists, and with its vitality is associated the most lasting fame of the man who initiated it and served as its first president.

SPEAKER. See PROCEDURE, PARLIAMENTARY.

SPECIAL ASSESSMENTS are compulsory levies imposed upon owners of property for the purpose of defraying the cost of specific public improvements likely to enhance the value of the assessed property. Traces of this form of revenue may be found in Roman history. The earliest English statutes, which may be treated as the origins of the present assessment system in the United States, date from 1427, when a series of drainage acts were passed, placing the costs of the reconstruction of sea walls, ditches and sewers upon all whose landed interests received benefits therefrom (6 Henry VI, c. 5). Rosewater has traced the subsequent historical developments in France, Belgium and Germany and has found widely varying dates of the first use of special assessments. The system of special assessment has found an increasing application in modern times; the growth of cities and their need for local improvements, the fiscal pressure on the tax system with its tax limits laws, the development of the highway system, the growing appreciation of public health and the importance of adequate drainage systems, the development of city planning as well as remunerative urban real estate speculation have been among the chief causes for the increased productivity of special assessments. In the United States the fiscal significance of this revenue has increased so rapidly that it now stands second in importance to the general property tax, and occasionally in some cities the annual receipts from this source exceed those of the general property tax.

The three essentials of a special assessment are legal compulsion, a specific improvement and special benefits accruing to owners of land. From the point of view of legal compulsion, the special assessment is upheld by the courts usually as an attribute of the taxing power, although in many early American cases the levy was considered an exercise of the power of eminent domain; later in some jurisdictions it is

was viewed as a quasi-contractual obligation of the owner upon which the municipality might sue to recover payment for benefits in an action in assumpsit on *quantum meruit*; while in other jurisdictions legal compulsion may exist in the form of an implied agency whereby the municipality levying the special assessment becomes the implied agent of the petitioning property owners seeking the specific improvement.

Because the taxing power of the state is involved, courts have interpreted strictly the provisions of the law in order to protect the owners of improved property; and only when there is an express legislative grant of power may the municipality impose a special assessment. The specific improvement must be vested with public interest if the taxing power is used, and courts have insisted further that the special benefit be distinct and measurable. In some states the local improvement must be of a permanent character; and where this requirement is in force, assessments for street repair, sprinkling, cleaning, lighting and other municipal operating expenses cannot be levied.

The special benefit is the justification, limit and measure of the special assessment and consists in the enhancement of land value of a given parcel of property over and above that which the same specific improvement causes for the general community. The efficiency of the special assessment system depends primarily upon the degree of accuracy with which actual increase of land value is approximated by the anticipated special benefit, according to which the special assessment usually is apportioned. Because of the widespread lack of district revolving funds, which permit an advance of public money for the construction of specific improvements and which also make possible, following the acceptance of the improvement, a lapse of time during which the special benefit may be more accurately computed, apportioners of special assessments attempt to forecast the influence of a local improvement upon future land value. The statistical tools and engineering formulae used as aids in such estimates have proved to be expedients approximating roughly actual land value trends. While it is generally admitted that the multiplicity and complexity of factors involved render a precise measurement of the special benefit practically impossible, the approximate determination of such benefit has been sufficiently accurate to justify the continued use of special assessments.

Although it was founded on an exercise of the

taxing power, the special assessment, sometimes called a betterment tax, should not be confused with general taxes. In order to exclude the special assessment from tax exemption and to permit the construction of necessary improvements which otherwise would be checked by the existence of tax limit laws, courts have found it necessary to differentiate between special assessments and taxes. The judicial reasons assigned for the distinction are that taxes are levied to provide general revenue, while special assessments are used to defray the costs of specific improvements; taxes are a burden upon the owner, while special assessments are a levy for an equivalent; taxes recur regularly, while special assessments are levied only upon the occasion of a specific improvement; taxes are imposed at the will of the legislative power, but assessments are subject to the review of the courts; taxes are levied without regard to measurable special benefit, although assessments depend primarily upon calculable special benefits. From the viewpoint of economic analysis, whenever a special assessment actually exceeds the special benefit, such excess constitutes a tax. In times of falling price levels a rapid decline in property values may take place following construction of an improvement, so that in fact many special assessments are more closely related to a tax than to an assessment.

The three primary purposes for which special assessments have been used in the United States are non-revenue yielding local improvements, revenue yielding utilities and nuisance abatement. The most common non-revenue yielding local improvements include street and highway improvements, drainage assessments for the construction of sewers and waterway improvements. Assessments for revenue yielding utilities comprise levies for subways, tunnels, gas and electric plants and similar utilities. Nuisance abatement assessments include levies for garbage and refuse collection, for removal from the streets of ice and snow and like nuisances; although levied primarily for common benefit, they have been upheld on the basis of legal duty and measurable special benefit.

As a safeguard for the assessed owners of property against the full force of the taxing power legislatures have provided statutory limitations in addition to the judicial principle that no special assessment may exceed the cost of the improvement or of the special benefit, whichever is lower. Indirectly such restrictions impose added burdens upon the public treasury. The

most common statutory limitations determine the maximum rate of assessment (per linear foot of paving or type of sewer or other kind of improvement), fix the percentage of the total cost of the improvement to be borne by the public treasury, limit the total amount which may be assessed during a given period of time to some fixed percentage of assessed value or prescribe that no assessment may exceed special benefit as ascertained by the court.

Special assessment bonds have become a necessary element in the system because of the widespread use of instalment payments and collection. Such bonds are retired by subsequent assessment collections, and either they are paid directly to the contractor who constructs the improvement or the marketing is undertaken by the city. In some states these bonds are guaranteed by the full faith and credit of the city, but in most jurisdictions the security behind the bond is the forced sale value of the assessed property. Because of their limited marketability they are frequently sold by the contractor at substantial discounts, which become an important item of cost when he computes his bid on the improvement. In large cities highly specialized bond houses make a business of buying and selling only special assessment securities or of using these bonds as collateral for the issuance of their own collateral trust bonds. As a rule these bonds are not included in the municipal debt, since they are regarded as "self-supporting"; but this distinction has proved treacherous in time of depression, since the burden of municipal indebtedness cannot be stated accurately unless such debt is included, and failure to include special assessment debt has accentuated the increase in municipal insolvencies. Investors secure no claim superior to that of the contractor to whom the bonds were sold originally, and therefore they require that the district or city furnish unbiased legal opinion as to the validity of the assessment which secures the bond. This additional expense also is shifted ultimately to the assessed owners in the form of higher bids by contractors.

In order to differentiate the incidence of a tax from that of a special assessment, it is preferable to consider the shifting of the assessment as a recoupment—a reimbursement for a payment originating in a quid pro quo transaction. The possibility of recoupment by the owner depends upon the effect of the local improvement on the demand for the site, which in turn depends upon the intensity of competition with substitute un-

assessed sites or upon the elasticity of demand for improved sites. As long as the owner is the occupier or when the assessment is levied on vacant property, there is no opportunity for recoupment except by sale or lease. If the local improvement increases the demand for the land to an extent equal to or greater than the special assessment, the owner may get back his payment of the special assessment. In decadent neighborhoods local improvements may be constructed to check further decline in demand, but the owner nevertheless is unable to regain his payment of the special assessment. Subdivisions laid out and developed by local improvements often permit the original owner to recoup, while subsequent owners may not be able to recover their instalment payments if the demand for the property subsequently declines. Assessment districts frequently are so greatly enlarged that areas are assessed in which properties actually suffer depreciation instead of betterment, and owners pay for improvements which lead to a decline in the market value of their properties. These acute burdens are traceable to maladministration rather than to the special assessment system.

An appraisal of the special assessment system in the United States leads to the conclusion that it has proved an expedient for providing necessary local improvements in rapidly growing cities. In some instances it has made improvements possible in advance of local necessity. It has been an effective means of raising revenue from those owning tax exempt property. It has been basic to the development of city planning. Through the instalment system it has become an effective form of compulsory saving. It has furthered the protective functions of the state by financing sewer and drainage projects. By providing funds for necessary local improvements it has tended to reduce tax rates. Finally, it has postponed the invasion of the unearned increment taxes in the United States. On the other hand, because special assessment indebtedness has not been considered a part of the general burden of municipal indebtedness, it has led to the overexpansion of ambitious cities; and whenever municipal insolvency occurs, the burden of the special assessment appears extremely heavy. Special assessment administration has been lax in determining accurately the special benefit. Overlapping assessment districts have tended frequently to confiscate the value of land. There has been inadequate study of the nature of special benefits, so that local improvements fre-

quently cause a lowering of value in competitive neighborhoods. A careful scientific study of probable land use and shifts in total land values should be made by a city before it orders additional levies for its major projects. Cities generally fail to differentiate between the complex procedure necessary for major improvement projects and the many minor local improvements willingly paid for by the assessed owners, with the result that the judicial system has been unduly handicapped by the special assessment cases; while in certain states where the local improvements in cities are left to the state legislature, the undue number of special assessments levied has glutted the state legislative machinery. With all its shortcomings, however, the system of special assessment has undoubtedly proved its value as a permanent element in local finance.

SPECIALIZATION is a technical term for all those phenomena—technological, social and biological as well as economic—which are usually subsumed under the phrase division of labor. This ambiguous expression, popularized by Adam Smith, actually applies to but one particularly striking manifestation of specialization in modern society; and even this apparently

simple phenomenon is in reality complicated and multiform. For on the one hand the division of labor in modern society is not limited simply to labor but applies to all the factors of production, and on the other it extends beyond the purely technical and economic field. Herbert Spencer envisaged a simple progressive division of labor, or an ever increasing differentiation in the classification of social types. The incorrectness of this hypothesis is evidenced by the fact that certain forms of division of labor undergo retrogression and atrophy while others flourish. Indeed there is a certain antagonism between the various forms: the specialization of an organism limits the specialization of its parts; the external differentiation of a society hinders to a certain extent its internal differentiation. Expressed in general terms, the functional differentiation or specialization of a whole and the functional differentiation of its parts are roughly in inverse ratio to each other.

There may be distinguished three main social manifestations of specialization: professional specialization, also called the social division of labor; technical specialization, or the division of labor within a particular enterprise; and territorial, or geographical, specialization, either among various countries and economies or within one economy in the form of localization of industrial activity. Specialization may apply either to individuals, to groups of men or to things. It presupposes as a basic complementary principle cooperation or interdependence, and consequently it is simultaneously a dissociating and an integrating social principle, in effect really creative.

The separation of occupations, the vocational or social division of labor, was to Plato a characteristic mark of economic progress. Its significance for economic life was not again recognized prior to Turgot. While Adam Smith merely interspersed occasional remarks on the subject in other discussions, Turgot in his *Réflexions* (written in 1766) showed in some detail how the necessity of refining materials led to the exchange of products for labor, with a resultant gain to society as a whole since each individual advanced further by devoting himself to a single form of work.

The unusually rapid progress of vocational specialization in the nineteenth century has led to a general neglect of the fact that this type of specialization began very early and culminated not in modern times but in the Middle Ages. Recent ethnological studies have shown that

vocational specialization was far more widespread in even the most primitive social groupings than was previously assumed. Such early specialization, however, followed other cultural laws than does the modern type. While essentially the latter is economically conditioned and oriented, the earlier type was fashioned chiefly by spiritual and political power, so that if the economic criterion is regarded as the norm, the older type was heteronymous rather than autonomous. Rationalistic theories assume that division of labor and specialization are contrived or discovered by the human intellect, which discerns the utility, desirability and advantages of the differentiated organization of work. Such hypotheses have been exploded by the evidence of anthropology, which bears out the contention that specialization of functions and methods is no invention of human ratiocination but a primary fact of life. Division of labor in itself is an ancient and natural phenomenon; what is novel is the discovery that it can be an instrument of economic rationalism. Specialization on higher cultural levels is distinguished from primitive forms by the rational purposive elaboration, the secular as opposed to the essentially sacred and ceremonial nature of primitive division of labor, the subordination of specialization to a dominant concept of economic utility and its industrial adaptation. But it was only after thousands of years of experience that elementary specialization could be recognized as advantageous, as possessing systematic utility for human welfare.

The earliest or most primitive type of specialization seems everywhere to have been the sexual division of labor. Husband and wife each represent a certain sum of specialized knowledge and in this way exercise a determining influence on the formation of primitive society. The husband generally carries on an active, externalized life; all such dynamic activities as trapping, hunting, fighting, clearing and collecting are masculine specialities. To the woman as the bearer and feeder of children rigid traditional rules assign the task of managing the household, the garden and other regular and settled duties. It is not the knowledge of a special technique but the imputation of special powers and endowments which determines this type of specialization. Plow culture introduced an important mutation in this order in that it altered the woman's position, giving man a larger part than hitherto in the production of the vegetable means of subsistence and relieving the woman

of traditional tasks. It is probable that this relief first created the conditions for the development of manual dexterity among women, a characteristic which distinguishes the late from the early stone age.

Another important break in cultural development came with the founding of ethnic groups and castes. Where these appeared and specialized in particular activities, special tools, utensils and techniques came to be intimately bound up with particular families, clans and castes, and thus special dexterities were fostered. At a still later stage the distribution of political power had a disintegrating and revolutionary effect on the traditional division of labor. In bureaucratic states dependent upon taxes in kind, such as Egypt, levies were passed along from the chief of the vocational group (generally ethnically unified) to the respective chiefs of village or commune, the elders of the caste and through them to the heads of individual families. As a result not only was the patriarchy pushed to the fore, but because of the increased compulsion to produce there also came about a greater participation of men in the family productive activities. Moreover with increasing density of settlement direct provision of sustenance for that part of the population engaged in handicrafts became ever more difficult, and handicrafts were thus developed into industry; that is, into a steady source of income. The traditional roles of the sexes were reversed, and the more intensive activities shifted to the men.

The appearance of the city was of the utmost importance for the development of specialization. For the city assembles a population whose existence is based not upon the direct extraction of the means of subsistence but upon the indirect satisfaction of needs through exchange. Wherever the division of labor is found, there is also the precondition for the development of urban communal life; conversely, urban communal life fortifies and intensifies the division of labor. Early concentration of population, in compelling a more complete division of labor than was possible among scattered peasants, led to the discovery of new sources of income, the growth of rigid state organizations and the development of the ancient river and oasis cultures. Not until the advent of the mediaeval city economy, however, was specialization—at least of industrial work—based on an economic criterion. Even then it was limited by socio-ethical concepts derived from a narrow and static economic codex. However, it was with the rise of a city

economy that a professional basis was first given to the separation of agrarian from industrial activity. The guild system was also influential in the increase of vocational specialization. Its system of quotas and its systematic restrictions upon the expansion of individual enterprises necessarily led to an ever greater multiplication of separate-vocations.

Between the end of the sixteenth century and the beginning of the nineteenth the vocational division of labor failed to bring about any real progress in industrial methods. But with the industrial revolution a new and powerful development set in under the influence of capitalism. The impact of new techniques upon traditional forms resulted in a compromise from the point of view of specialization. Vocational specialization increased, partly through the founding of new kinds of industry and partly through the multiplication of specialties, a development along the lines characteristic of the Middle Ages. There was also, it is true, a more than compensating breakdown of special skills, which led to a decrease of vocational specialization; and in the production of raw materials vocational specialization remained backward. But the idea that the nineteenth century fostered only the technical division of labor is false.

Technical specialization, or technical division of labor, comprising chiefly the specialization of skills and of auxiliary capital, consists in the breaking up of technical productive tasks within a given shop into their elementary components or partial processes and the entrusting of the continuous execution of each elementary technical operation to a selected and specific human or material productive force. Such specialization, the most obvious manifestation of the intellectualizing and rationalizing of production, culminated in modern industrial machine technique. It first appeared in significant measure in the production of commodities under the household economy system, developing in opposition to specialization on the basis of sex or profession. A similar pattern prevailed in the mediaeval manors. Both the manorial and the household economy types constituted technical division of labor, inasmuch as they took place inside a more or less closed sphere and had as their object an increase in the productivity of labor, in contrast to vocational or social specialization, which is based on the exchange of products. Technical specialization in the domestic system reached its apex at the moment when vocational or social division of labor set in. Where agriculture be-

came the sole or primary occupation, such specialization disappeared naturally; but in the realm of handicrafts its spread was artificially delayed by the guild system. The guilds' restrictions upon the enlargement of handicraft enterprises and the increase of labor productivity checked technical specialization as practised on the great estates and effected instead a dismemberment of production into independent enterprises.

One great difference between precapitalistic and capitalistic forms of technical specialization is to be found in the fact that the former is based on specialized human labor, while the latter involves in addition the specialization of auxiliary capital. In both cases the organization of production is directed by an entrepreneur, himself a product of the vocational division of labor. The factory creates a system of work and a type of specialization entirely different from those of the handicraft. The basis of the latter is the worker's mastery of an entire field of production and the resulting graduated classification of personnel into apprentices, journeymen and master workmen. The factory, however, has place only for categories of work classified according to type of skill, involving no necessary ascension from one to the other; it organizes the use of labor with respect to the performance required, which today is determined by machines. Bucher called this new type of division of labor *Arbeitszerlegung*: the entrepreneur, motivated solely by technical considerations, divides the process into separate steps and entrusts them to individual workers; he thus distinguishes skilled from unskilled and heavy from light labor, resolving all labor processes into their simplest elements. Equally important in technical division of labor is the specialization of the auxiliary means of production. Indeed in modern industry this has become decisive, and the speed of development as well as the rhythm of differentiation of labor now conforms to it. Special machines, each of which carries a particular operation to completion, make possible an enormous expansion of a factory's productive capacity. One result of such specialization of instrumental capital and mechanical technique is a growing differentiation and specialization of labor not only in the planning and managerial staffs but in the entire factory, with the development of corresponding wage differentials.

The typical figure in all fields of modern economy is the specialist, the expert, with limited but skilled knowledge and final respon-

sibility within his own sphere. While the expert has always been accepted in the liberal professions, it is only recently that he has come into his own in industry, not merely in technical, commercial and financial management but also in the very execution of work. Today the advantages and disadvantages of this tendency toward the specialization of every skill are about evenly balanced. It is probable indeed that the age of virtuosos has already passed its climax.

The development of specialization has been closely bound up with the introduction and perfection of machinery, the expansion of the industrial unit, the standardization of production and the growth of large scale combinations. The pragmatic interrelations among these trends within modern society are extraordinarily complicated, giving rise to a number of dialectical contradictions which require detailed analysis.

In the first place, it is evident that specialization is in some way functionally connected with the evolution of the machine system. The important question is how the two movements are related. In general it may be said that the specialization of labor is conditioned by the size and constancy of the market and is a function of increased demand. The principal effect of machinery is to diminish the cost and to increase the accuracy of labor performances which were specialized even without machines. As was demonstrated by Boulton and Watt in the Soho works or by Abbe in the Zeiss works, considerable specialization can be achieved through the training of labor virtuosos, particularly where an industrial operation has become so uniform that the same thing must be done over and over again in precisely the same manner. By making manual dexterity superfluous the machine wiped out some of the chief advantages of the division of labor; but it more than compensated for this destruction of labor skill by complicating and broadening the range of the industrial unit and therewith the opportunities for the application of the principle of specialization, particularly in the field of management. The machine makes more flexible the boundaries between the various crafts, so that general ability becomes more important than specialized ability.

It is clear furthermore that specialization is functionally related to the development of large scale industrial enterprise. First, the larger the industrial unit, the more easily can the tendency toward specialization be realized. Secondly, specialization is one of the indications of growing industrial units, of the transition from small to

large scale enterprise. Finally, specialization is itself a means of rationalization within a large unit and thus, like the spread of machinery, is a rationalizing factor of primary importance.

Throughout the late nineteenth century and the early twentieth specialization of work and of material apparatus paralleled the development of large industrial units, and except in so far as trade union provisions prevented easy shifting of workers labor forces began to evince a remarkable adaptation to specific tasks. Specialization within large units made possible also the adjustment of material means of production to the productive process. The result was a steady increase in the size of the typical factory unit, once the chief obstacle to such expansion, the lack of capital, was overcome. After a certain point, however, the importance of technical details for an increase in the size of units declines, since specialization and the substitution of mechanical for human power tend to make possible standardization of the product. Where this occurs, there is a retrogression to earlier conditions, in that growth of enterprise or of factory unit depends not on technical considerations but on the marketing situation. Thus standardization, itself both result and cause of specialization, provides a powerful incentive to mergers and combinations.

It is, however, incorrect to infer that only large units are susceptible of specialization. On the contrary, specialization, standardization and factory organization today offer to middle sized and small industrial units their great opportunity of survival. The development of interchangeable parts for machines ushered in a new era of industrial specialization and organization, which greatly augmented the range of application of machines and in many cases made it possible for the small manufacturer to carry on a given production task quite as well as his giant competitor. If the small producer concentrates on the production of a limited class of commodities, he can specialize his labor forces and machines almost as efficiently as can the owner of the largest unit. Indispensable to the effectiveness of such specialization is constructive cooperation between firms within an industry, either through custom, as in the Lancashire textile industry, or on the basis of voluntary agreements or under state direction and control, such as prevailed during the World War and after the war in connection with the standardization movement.

It is nevertheless true, as has been pointed out, that specialization is a leading factor in the

merging of enterprises. The agreements which it fosters are not merely of a temporary and transient nature, like those concerned with limitation of output, but are rather contractual arrangements as to production schedules, enabling each unit to devote itself to the specialized production of one or more items. Such agreements may provide also for the joint use of marketing institutions or include a sales guaranty for factories incurring unusual risks. Where it does not result in complete mergers, specialization encourages the growth of manufacturing associations and production coalitions, which attempt to achieve the full technical and economic benefits inherent in a combination of specialized units in order to compensate for the marketing disadvantages incidental to specialization. The aim is to create a perfectly functioning productive organism for competitive struggle; the result is a transformation of the structure of industry.

In the production of raw materials, particularly agricultural products, conditions are quite different with respect to specialization. In so far as spatial juxtaposition or the synchronization of the productive process is involved, agriculture is able to achieve the major prerequisites for rational mass production only imperfectly or not at all. There has been in modern agriculture a progressive specialization in work, but this goes no farther than the separation of field work from managerial work in large agricultural units and the cooperation of relatively few persons in small units. It is to be noted that, in distinction from industry, agricultural machine engineers are constantly striving to construct universal agricultural machines or combines whose permanent skeleton is equipped with a number of changeable working parts. Apart from specialization in truck farming, with its many subtypes of stock cultivation, plant cultivation and the like, the great advance in rationalization of agriculture has come about through standardization or grading of quality production. The conscious orientation of agriculture to the demands of the market has gone farthest in agrarian countries and for agrarian products which are marked for export trade. The vehicles of specialization in agriculture have been primarily the agricultural marketing cooperatives and particularly the specialized sales cooperatives.

One of the most important forms of specialization is that with respect to territory, sometimes called localization of industry. This includes division of labor among nations and

territories, among localities and, finally, between city and country. The advantages of the localization of economic activities are similar to those of specialization in general: it fosters hereditary skill, opens up side lines, introduces highly specialized machinery and furthers the establishment of a local market for specialized labor talents. The disadvantages of localization suggest also the limits of specialization in general; chief among them is the fact that a localized industry usually makes use of only one kind of labor talent, thereby subjecting a whole region to the dangers of shifts in specialized demand. The remedy is to be found in the setting up of complementary industries in the vicinity.

A peculiarly significant aspect of specialization, and one which is far more complex than is generally recognized, is the local segregation of industries within an urban area. This phenomenon is not adequately explained either by the juristic theory, which would make it a consequence of the corporative form of organization—since legal forms are always the result or expression of economic organization and not its cause—or by physico-technical theories, which are all too particular to explain the universality of the result. More exact study shows that the dependence of particular branches of industries on physical factors varies according to social types and economic systems, being always to some degree conditioned by social causes. Nor do economic causes ever exercise exclusive control over the localization of industries. Thus the vocational group is not only the organ of an economic function but a society which establishes a genuine community of existence among its members. Every vocational group originally had its property, its duties, its feasts, its autonomous government. It constituted a rounded society which, while economically dependent on other groupings, was sufficient unto itself in respect to all other necessities of existence. Such a compact social body inevitably finds its own segregated area, but the need for such segregation is moral rather than economic. The local organization of industry is in one sense only an extension of the clan or the caste form of social organization.

Adam Smith indicated how the division of labor enables an ever greater number of persons to live under conditions of increasing well being in a limited area, and how the pressure of population upon the means of subsistence has a tendency to wipe out those peoples deficient in rational organization or incapable for some other

reason of utilizing to the full the advantages of their environment. In contrast with many of his popularizers, however, he always pointed out the limits of this tendency as a factor in economic organization and indicated the many evils inherent in specialization. He was naturally far less disturbed than modern students by the possibilities of discord between individual and collective interests and well being. Adam Smith's statements were supplemented and corrected in important respects by Wakefield; and the whole theory was greatly enriched by Babbage, the forerunner of Taylor and the scientific management school, in *On the Economy of Machinery and Manufactures* (London 1832, chs. xix-xx). Babbage emphasized certain advantages to be found in specialization in particular branches of industry and showed that increased efficiency is only one condition for the successful introduction of the specialization of machines and labor. The constancy of employment of labor and capital, he demonstrated, is an equally important condition. It remained for Marx to illumine the social and economic concomitants of the technical division of labor. The increasing knowledge of conditions among primitive peoples derived from ethnographic and anthropological studies led to a shift of emphasis away from the purely economic aspects of division of labor. About 1890 Schmoller, Simmel, Bucher, Durkheim and Maunier were all writing of the religious and sociological forms of specialization—an emphasis which has never since been lost. Additions to the theory since the World War have been largely interwoven with theories of scientific management and rationalization.

In general it may be said that specialization has a tendency to insure the best possible adaptation and exploitation of the special endowments of men, things and areas. Specialization is human or objective or spatial onesidedness, the shifting of the center of gravity of what may be called a personality to a partial field, to a specialty, to a type of work requiring the creation and existence of other onesidednesses for its completion. Standardization as the limitation, or specialization, of an artifact to a few typical forms is simultaneously the antithesis and the perfection of specialization. The advantages of the specialization of labor as they have been pointed out by the various students of the subject may be summarized thus: first, the dexterity amounting to virtuosity acquired by one-sided practice of a particular process tends to improve

the quantity and the quality of the resultant product; second, specialization makes possible the arrangement and the classification of work according to capacities and of material capital according to its greatest productive force within a particular unit and within an entire economic system; third, specialization saves time and difficult labor; fourth, the mechanizing of work through specialization facilitates the invention of new machines and procedures, since the cumulative effect of many small improvements made by those working at a machine or process is very great; fifth, since the division of labor is an essential condition for the employment of machines or real capital, the growing dominion of man over nature is intimately linked with the development of specialization.

Both the advantages and the disadvantages of specialization are frequently exaggerated. The most frequently cited disadvantages fall into three groups: physical, the shortening of the life span, industrial diseases, the industrial worker's vocational fate; mental, the monotony of labor; and social, the misery of urban existence, the material dependence of workers and so forth. Occasionally pointed out by Adam Smith and even by his predecessor Ferguson, these evils of specialization were movingly portrayed by Ruskin and his school. But it must not be forgotten that the cradle of personal liberty was the city and not the open countryside, or that the degradation of labor is greatest in those crafts where there is the least division of labor, or that the monotony of the machine system has helped to make labor more mobile and broadened its horizon.

In other words, debate about the advantages and disadvantages of specialization in general is fruitless. A genuine scientific problem would be rather the determination of the limits of specialization under all imaginable concrete conditions; thus it would be profitable to attempt to discover how far specialization can be carried on with profit as measured, for example, in terms of money return. To define these limits concretely, however, is an extraordinarily difficult task.

According to the usual definition the division of labor is limited by the scope of the market. A condensed formula of this sort is always only a partial truth, which in most cases can be inverted without appreciable loss of its validity. Regarded historically, the formula is certainly open to question. Certainly it does not apply to the historical development of vocational specialization, for at least until the time of the mediaeval

European city vocations developed by and large according to laws other than that of the simple exploitation of human capacities for money gain. Nor is the formula more than roughly correct when applied solely to technical specialization within an individualistic capitalist market and a commercial economy. Even in this historically unique economic system, specialization is dependent not only on market relations but also on the state of technical knowledge and learning at any given moment. It might be said that the limits of the technical specialization of a product are reached when a further standardization of the component involves a loss of technical efficiency, and when all the machines in use are specially designed to produce an article more cheaply and better than would be possible by any other method of production. The critical point centers around the introduction of a machine which must temporarily lie idle, for continuity of employment is decisive if the specialization of both labor and capital is to be profitable. Inherent in specialization, especially for products with a complex composition, are not only certain technical and social disadvantages but also merchandising difficulties, among which the most serious are fluctuations in demand, whether these grow out of changes in fashion and taste or result from seasonal or cyclical influences. Fluctuation in demand materially increases the business risks inherent in one-sided specialization. Too much or too little specialization means a waste of effort. What is the correct amount depends on the object in view: in modern economy, profit measured in money terms. And here the competitive situation plays a determining role. This is not to deny the importance of the market for the extent and limits of specialization. Adam Smith correctly said that the one great advantage of foreign trade is the resulting augmentation of industry in the home market. This applies also to agriculture and to intangible services. It suggests, however, certain necessary amplifications of the older theory.

And if specialization, especially so-called international and interterritorial division of labor, is today regarded as of minor significance even by some of the most brilliant economists, this view overstresses the momentary economic situation and ignores certain basic economic judgments still to be refuted.

SPECIFIC PERFORMANCE. As commonly applied in Anglo-American law, the doctrine of specific performance is confined to attempts to force a person who has made a contract to carry out specifically the resulting legal obligation. The specific performance of non-contractual obligations is usually dealt with under injunctions, including the so-called mandatory injunctions (see INJUNCTION).

The complete history of the specific performance of contracts in English law remains to be written. This form of relief was long believed to date only from the middle of the sixteenth century. Later research, however, has shown that in the fifteenth century the chancellor decreed the specific performance of agreements of various kinds. Indeed petitions asking for his intervention were presented as early as the reign of Richard II (1377-99).

Specific performance is normally the natural expectation of parties to a contract. Compensatory damages for breach may or may not be

satisfactory. In the early history of legal systems, however, specific forms of relief are likely to be either very limited or non-existent. The emphasis then is rather upon composition for injury to forestall resort to self-help. The court is disinclined to impose its will upon the party to the extent of undertaking the supervision which may be necessary to enforce specific reparation. Even in mature legal systems such enforcement may be considered impracticable under certain circumstances.

While the limitations upon specific performance in English law are thus not unique, they have taken on peculiar forms and survived to a greater extent than in other legal systems. This has happened because of the dual nature of English law, which was divided into law and equity. Specific performance developed as a purely equitable doctrine. Now in exercising his jurisdiction the chancellor employed only the so-called procedure in personam, ordering the defendant to do or to refrain from doing certain specified acts, under pain of imprisonment if the order were disobeyed. In the case of affirmative acts the imprisonment might continue until the order was complied with. The chancellor himself would not take direct steps. The theory was that a decree in equity could not act in rem; that is, pass title to property. The result of this cumbersome procedure was to condition the grant of specific relief.

Most, indeed almost all, of the specific performance cases have had to do with contracts for the conveyance or creation of interests in property, especially land. In these cases if the defendant refused to execute the necessary instrument, pressure was exerted upon him. The recalcitrant defendant was committed to prison, there to remain until he complied with the court's order. If he did comply, the fact that he had executed the necessary instrument under duress was ignored. If he did not, the chancellor by means of a writ of assistance would order that the complainant be put into possession of the property and the defendant permanently enjoined from interfering with the possession of the complainant. Since the latter was in possession he had, according to the common law itself, "title" as against "all the world except the rightful owner." Thus while theoretically the defendant was in the eyes of the common law the rightful owner, in fact he was not in a position to take effective action to disturb the complainant's possession, since any lawyer who attempted through the machinery of the common law to

act for him would himself be guilty of contempt.

Today by statute in practically all states—apparently by judicial legislation in one or two—the need to resort to this circuitous method of giving relief has been abolished. Courts have been authorized to vest title either directly by their decrees or indirectly by appointing some court officer as an "agent" to execute a deed in the name of the recalcitrant defendant.

In its origin the right to specific performance of a contract is obviously contractual, but the legal consequences which are associated with it in equity are such as almost completely to alter its character. In the case of land the right to specific performance of the contract has become so well recognized that the purchaser is often said to have become the "equitable owner" of the land as soon as the contract is signed. Although the accuracy of this designation is challenged by many, the fact remains that the court of equity treats the vendor much as it does the holder of a security, especially if, as in the case of instalment contracts, the purchaser has been let into possession. Under the prevailing doctrine the vendor is said to hold the "legal title" as security for the payment of the purchase price and may remain in possession if the contract so provides; if the purchaser defaults, the vendor may "foreclose" the rights of the purchaser. The purchaser is entitled to a conveyance not only against the vendor but also against any transferee of the latter except as purchaser for value without notice; or, if he prefers, the purchaser may compel the vendor to account for any profits derived from a sale to a third person, as in the case of a transfer by a trustee in breach of trust. According to the English and more usual American view the risk of loss by fire usually associated with ownership passes at once to the vendee as soon as the contract of purchase and sale is signed. Many of the other incidents of ownership are also ascribed to him.

Certain general principles running through equity find particular application in the specific performance cases. One is that equitable relief will be denied unless the remedy at common law is inadequate, which results in the rule that ordinarily a contract for the purchase and sale of specific chattels will not be specifically enforced, as theoretically the promisor can purchase equally good chattels elsewhere and recover by way of money judgment at law the excess cost, if any. A decree will be granted, however, where the chattels are unique for one reason or another. A parcel of land is ordinarily without any other

showing treated as unique. The principle that equity will not act where it is not feasible to do so is exemplified by the rule that specific performance of a contract for personal services will not be ordered. Nevertheless, if the services are of a unique character, such as those of a famous opera singer, they may be indirectly enforced if their performance is restrained for anybody else. The amusing spectacle is sometimes presented of an artist or performer who is constrained to argue that his talents are not unique. The rule of feasibility also leads to the rule that ordinarily, and subject to certain notable exceptions, a building contract or a contract which requires a long continued series of acts, such as running a railroad, will not be ordered. There are other limitations, such as mistake, misrepresentation, hardship and "lack of mutuality"—a highly technical and involved doctrine.

In the Roman and modern civil law there are more resemblances to the Anglo-American law of specific performance than writers have commonly supposed. To be sure, there is no imprisonment to compel performance. But there are other methods of coercion. For example, in the Roman law under the formulary procedure the so-called *clausula arbitraria*, or arbitrary proviso, resulted in the condemnation of the defendant in an indefinite sum, which was either a multiple of the damages or an amount to be determined by the *judex* as a penalty. This device apparently was employed in some actions to put pressure on the defendant to perform specifically, since he could, it seems, avoid the penalty by prompt performance. Apparently, however, it was not available for the enforcement of a contract to convey property. In an action on a formal contract, *stipulatio*, the plaintiff asked performance without the alternative of damages; but in fact he received a judgment entitling him only to damages, to be obtained by the usual methods of execution.

In French law, while the maxim *Nemo potest praeiudicium cogi ad factum* is accepted as a theoretical principle, in practise it is not so important as some writers, notably Holland, have supposed. The French law divides contracts into obligations to convey (*à donner*) and obligations to do or abstain from doing (*à faire ou à ne pas faire*). The former class in general covers all contracts to convey the ownership of or interests in specific or determinate things. The *Code Napoléon* treats contracts of this type very differently from those of the second type. Like Anglo-American law it attaches to the obligation

to convey as between the parties the effect of an immediate conveyance, unless indeed the purely preliminary character of the contract is expressly set forth. In the second group, obligations to do or abstain from doing, the principle may be stated to be that as a rule a breach of obligation gives rise merely to an obligation to pay damages for non-performance. It thus appears that as to the vast majority of contracts to which the English doctrine is applicable—contracts to convey—the French law reaches much the same result as the Anglo-American. In French law, however, the law itself always operates to vest the ownership or the interest in question directly in the person entitled, without attempting to enforce "specific performance" of the obligation to execute the deed or other instrument. As the person entitled to the benefit of an "obligation to convey" is thus as between the parties given the rights of a grantee, he is able to bring a "real action" to recover possession.

The statement made by some writers that French law knows nothing of specific performance relates then not to obligations to convey but merely to obligations to do or abstain from doing. Even as applied to the latter it is misleading, since the French courts have in some cases adopted a practise of imposing in advance, apparently upon threat of breach, damages on the basis of a certain sum payable for every day's delay in compliance with a judgment ordering the specific execution of a contract or other personal obligation to do or abstain from doing. In some cases these *dommages intérêts moratoires*, or moratory damages, are not measured by the pecuniary loss suffered by the plaintiff, but are penal in character and calculated to induce specific performance. One striking group of cases has to do with custody of children in judicial separation. The practise of the French courts in enforcing strictly penal clauses in contracts also does much to bring about specific performance. When the reluctance of Anglo-American courts of equity to order the doing of acts other than those involved in conveyances of property is recalled, it becomes apparent that the similarity of the two systems is at least as striking as the difference.

Although details and procedure may vary, similar statements are true of German law. The primary remedial right under German law, where an obligation is involved, is a right to performance; but on grounds of public policy certain claims cannot be specifically enforced—claims for personal service and for the perform-

ance of a mere promise to pay money—which are likewise not specifically enforceable under Anglo-American law.

SPECULATION The term speculation is used with many shades of meaning, the cataloging of which would serve no useful purpose. There are, however, two fundamentally different types of speculative activity which it is important to distinguish. The first is the investment of resources in the effort to create wealth under conditions which involve more than ordinary uncertainty as to the results; the second is the buying and selling of commodities, securities or land in the hope of realizing a profit from fluctuations in prices. Speculation in the first sense differs only in degree from ordinary business enterprise. It is an integral part of the economic process and its performance is indispensable to progress. The second type of speculation is primarily competitive and acquisitive. It is only incidentally productive, although its economic by-products are of considerable value.

The first type of activity is synonymous with private initiative in the development of new technical methods of production and marketing, the opening up of new regions to civilization and the popularization of new forms of consumption. Speculation in this sense is as old as the history of human progress and has played a dominating role in the direction of economic effort since the rise of the commercial cities in the twelfth and thirteenth centuries. Speculation on price fluctuations, on the other hand, has attained major importance in comparatively recent times with the appearance of more elaborate marketing mechanisms, the development of the corporation with limited liability and the prevalence of an enhanced degree of confidence in the honesty of corporate officials and business associates.

Speculation in the second sense occupies the border territory between conservative investment and gambling. Investment is the purchase of property with a view to its productive use or the increase of its value by a manufacturing or merchandising process, or it is the purchase of a security which represents a claim to the income accruing from the manufacturing or merchandising process carried on by another person. It is predicated upon the future flow of value from

economic activity. Although a speculative transaction is the same in form, it looks not to income yield but to capital gain, which may result from revaluation or from the capitalization of an altered earning capacity.

Gambling is an attempt to secure capital gain purely as a result of the assumption of an opposite risk by someone else. Speculative investment aims to control the direction of human effort and the resulting flow of income; speculation shifts the incidence of a loss or gain from economic changes which would take place in any case, while gambling creates a loss and a corresponding gain which would not occur in the absence of the gambling transaction itself.

In an organized speculative market certain characteristics of the modern capitalistic system emerge in clearest form, and much of the current hostility toward speculation really represents a reaction against the whole system of organizing productive effort under the stimulus of private profit. In an exchange economy the control of the labor forces and the other natural resources of the community is allocated to competing enterprises as they outbid one another for this control. The competing enterprises appeal to those members of the social group whose incomes include a margin of saving, by the offer either of a guaranteed rate of interest or of shares in the future profits of the enterprise, against a present advance of liquid funds. To enhance the attractiveness of investment in particular enterprises there has been developed a system of issuing certificates of ownership of equities in the business which can be freely bought and sold. Such negotiability is of great advantage to the individual investor, since it enables him to make an investment in permanent fixed capital used by a given industry without committing himself permanently to the future of that industry. Of course this device does not in any way increase the liquidity of the invested capital of the community as a whole. It merely facilitates transfers of ownership between individuals.

The introduction of negotiability of securities makes it necessary for each individual who has savings to invest to choose between the market for old securities and that for new. This does not mean, however, that addition to the flow of savings can be diverted away from the new capital market and absorbed in the purchase of old securities. No matter how many times incoming funds change hands against old securities, they must finally be accounted for either by

some form of investment in new capital goods or else in an addition to the stock of hoarded funds.

Speculative markets thus have a threefold function. They enable the individual with a minimum of lost motion to carry out his decision to invest his savings in new or in old securities. Second, they influence the flow of funds into particular industries and into particular firms by making possible a ready comparison of the relative results of different past investments as expressed in relative prices on the stock exchange. Third, they enable the community as a whole to express its judgment as to the desirability of more rapid or slower expansion of the rate of capital formation, this judgment being indicated by changes in the ratio between the valuations put on investment and on uninvested funds.

Competitive private enterprise involves an attempt on the part of society to capitalize the acquisitive impulse. It endorses the accumulation of private wealth through a process of successive exchanges of goods against goods and goods against cash, by which the successful trader gains at the expense of those who wrongly forecast the trend of relative prices. Admitting that no wealth is created by the process of "buying cheap and selling dear," the defender of private enterprise assumes that the indirect effect of such transactions is to facilitate the flow or resources into those uses which will in fact result in the maximum attainable creation of real income (as tested by the willingness of the community to buy).

Granting these assumptions, the case for the maintenance of speculation is very strong. The critique of this case, however, requires a detailed scrutiny of the forms of speculation. Types of price speculation may for this purpose be usefully classified in accordance with two criteria. First, with reference to the subject matter of speculative trade, the principal varieties of speculation are those concerned with changes in value of commodities, securities and real estate. Second, with reference to the type of price change anticipated, speculative activities either contemplate a change in the relative values of particular commodities, securities or pieces of real estate or depend on general changes in the price level.

In so far as the effect of speculation on the fortunes and character of the speculator himself is concerned, there is no particular difference between speculation in commodities, in securities and in real estate. In all three (and also in pure gambling transactions) the objective is

the same, to gain a relative advantage at the expense of the rest of the community either by superior knowledge or by superior luck. The probability of an individual's attaining success in an effort to make money continuously out of price fluctuations is very much the same as his chances of making money continuously by betting on horse races or election returns. In each case success depends upon relative ability to form a correct judgment as to the probable course of events; relative, that is, to the ability of the rest of the group to make similar judgments. The group as a whole cannot make money, but those who are most skilful or lucky will gain what the less fortunate lose. A general stepping up of the efficiency of the speculators would not increase their net gains, any more than enhanced efficiency on the part of gamblers would enable them to gain more at one another's expense.

There is indeed a close kinship between speculation and gambling. Both pursuits are apt to undermine the appreciation of the value of money and of the value of work. They involve the same unpleasing willingness to profit by the misfortune of others and the same temptation to risk more than one can afford to lose. A futures market entirely dissociated from the trade in a commodity would have to depend for its justification on exactly the same line of reasoning as does bookmaking on races or lotteries. Price speculation, however, is not dissociated from the actual trade in commodities, securities and land. Viewed from the standpoint of the general interests of the community, there are radical differences between the three types of speculation and also between all types of speculation and gambling.

From the social standpoint the case in favor of the maintenance of active speculation is strongest in the case of commodity trading. The argument here rests in part on the usefulness of the hedging (*q.v.*) contract as a form of insurance. In greater part, however, it rests on the usefulness of the speculator's activity in hastening a price change which would take place anyway. If there is to be a scarcity of wheat in the year to come, it is desirable that the price shall rise as soon as possible in order that the necessary curtailment of consumption and the desirable stimulus of production may take place in advance, thereby reducing the violence of the final adjustment. The speculator who correctly foresees the trend of events at the same time promotes the necessary readjustment of prices and

profits by that adjustment. Mistaken speculation, on the other hand, will tend to force the price in what is from a social standpoint the wrong direction, but such mistakes are at the same time penalized with the utmost severity.

The social interest in stock speculation relates to the need of a broad market through which securities may be bought and sold without the necessity of bidding them up in order to buy or forcing them down in order to sell. The capitalistic organization of society is based on a high degree of specialization, one important aspect of which is the specialization of those who save part of their incomes and turn them over to others to be spent in the creation of capital. Anything which increases the liquidity of investments decreases the risk. It frees the borrowing corporation from the risk which would result from agreement to repay the capital on demand, and it frees the investor from the risk of not being able to get his money back when he wants it. The mobility of investments is greatly facilitated by the presence of a body of speculators who stand ready to buy or sell on slight changes of price.

True, a very large proportion of securities which are outstanding against the existing mass of capital assets lack this attribute of mobility. Organized speculation is effective only in liquifying the securities of fairly large, well known corporations, and even in their securities there are wide differences in the extent to which an effective open market has been developed. Fashions in speculation change; securities which dominated the market ten or twenty years ago have in many cases become inactive, supplanted by new favorites. What the active speculator wants to trade in is a security in which many others are trading. The very fact that a security has become a popular medium of speculation makes it a better medium; hence the maximum benefits of liquidity are realized only by the issuers of a comparatively small number of securities.

A feature of the security market which has aroused particular antipathy is the "short" sale, or speculation for a fall in price. Under the European term settlement system this is done by selling for future delivery as in the futures market for commodities. On American stock exchanges the short sale is effected by borrowing certificates for immediate delivery. If the price falls, the short seller is able to "cover" by buying securities to replace those which he has borrowed.

From an ethical and social standpoint selling first and buying later appears to be quite as defensible as buying first and selling later. It is just as desirable that inflated prices be hammered down as it is that depressed prices be brought up to a normal level, and the bear profits which are obtained by foreseeing the readjustment to a lower level are no more predatory than the bull's profits obtained by foreseeing a readjustment to a higher level. True, rising security prices stimulate investment in productive activity while falling prices stimulate the withdrawal of investors from enterprises involving large capital investment and planning for the distant future. This is probably the underlying reason for the ineradicable public sentiment which regards the bear as a pirate and the bull as a constructive agent. But it is just as possible for investment to be overstimulated by speculative enthusiasm as it is for it to be depressed by unwarranted pessimism. What is needed is a steady flow of funds from savers to enterprises which are based on sound analyses of future needs. Speculative overenthusiasm leads to the initiation of enterprises which cannot obtain funds for their completion when the enthusiasm has passed; if bear speculation is based on correct anticipation, it may be as useful, although it can never be as popular, as speculation based on "constructive" but frequently misguided confidence in the future.

Land speculation has been a target of perhaps more learned criticism than has been directed against any other form of speculation. At the same time it has in practice found favor with large elements of the community who regard any form of speculation as pernicious. From the standpoint of the speculator land speculation presents several peculiarities: in the first place, the turnover is very slow, as there is no market in which land can be bought or sold at a moment's notice. As a result it calls for more capital than does organized speculation. Not only does it require a high degree of technical skill and special knowledge of local conditions, but individual skill in bargaining plays a larger part than in any other form of speculative activity. In an organized speculative market anyone may learn by glancing at a newspaper or a ticker the price at which his commodity or security is selling and may expect to buy or sell at the same price that anyone else would get. But in the land market no two units are alike; trades are infrequent, especially in periods of depression, and very often the prices actually paid are

not made public. There is no "short" side to the market. Those who believe that land is going higher can buy, while those who believe it is going lower but do not own land cannot influence the market situation except by refraining from buying. The behavior of prices in land booms lends some support to the argument that short selling serves as a brake on the market. Certainly prices of land rise as sharply as do prices in any other speculative market; and when the peak of the boom is past, the collapse of the market is usually more complete than in a stock exchange or commodity exchange.

There is no basis for the widespread belief that the land speculator is especially deserving of condemnation as a parasite. If land which is held by a speculator is fully utilized during the time it is being held for the rise, as is generally the case with agricultural properties, speculation involves no disuse of the resources. The productivity of the land is much the same as it would be if it were held by a permanent investor, although it may be used more wastefully. In the case of urban real estate which is held out of use by speculative holders, there is what looks like a waste of social resources; and this type of speculation has been particularly obnoxious to social reformers (see SINGLE TAX). Yet any social loss which results from the withholding of urban land from use pending a speculative rise in its value is due in the end to mistaken speculation and not to correct anticipation. If it does not pay the speculator to erect a building on his lots because he foresees that in a few years the land will be worth more for some other purpose and the building would have to be scrapped at a loss, then it is not advantageous to society as a whole to have such a building erected. Here, as in most types of speculation, the trader's activity may promote a more or a less effective use of social resources, but the action which results in social loss is also that which brings loss to the speculator himself.

The discussion thus far relates primarily to the social desirability of getting correct relative prices for different commodities, different securities and different pieces of land. In other words, it applies chiefly to price changes originating on the side of the commodity or the industry rather than on the side of money. In practice, however, a very large proportion of the speculation in all markets expresses a judgment as to a prospective change in the value of money rather than the specific commodity or security. Monetary inflations raise the prices of nearly

everything, and deflations pull nearly all of them down. Therefore, when major changes in the value of money are anticipated, speculation can be avoided only through avoidance of the ownership of wealth in any form.

The investor at all times must choose between two great groups of investment opportunities: those which will remain fixed in monetary value regardless of changes in the price level, and those whose prices are free to change. In the first group are money, government securities, call loans (viewed from the lender's standpoint), acceptances and bills of exchange and corporation preferred stocks, bonds or notes of a high degree of safety. Short sale contracts are also in this category. In the second group are all marketable commodities, business assets, land, common stocks and those preferred stocks, bonds and notes concerning the soundness of which there is serious doubt. Keeping wealth in any of the forms of the first group, which for convenience may be called dollar assets, will result in a gain if prices go down; while investment in the second group, the "non-dollar" assets, will benefit by rising prices. The choice between different standard media of speculation within one group is often less important to the speculator than is a correct choice between the two groups. Hoarding money and selling stocks and commodities short are extreme manifestations of a conviction that money is likely to increase in value, but they are not in this respect essentially different from the purchase of safe bonds of corporations or of governments. Vice versa, the purchase of commodities and securities on margin differs only in degree from the outright purchase of homes or of productive business assets or from a flight to foreign currencies.

The ways in which an individual can protect himself against the destruction of his capital by inflation or deflation are identical in form with the action by which he seeks to draw to himself an increasing share of the wealth of the community in times of comparative monetary stability. But whereas on the whole successful speculation on relative prices promotes the social interests, general changes in the price level do not initiate a process which it is socially important to have set in motion or hastened. As has been noted above, if the supply of wheat is going to be short within a year, it is highly desirable that the price should rise as soon as possible. But if an inflation boom is going to carry all prices higher, there is no discernible advantage

in having the price rise occur now rather than later. Speculation against anticipated monetary disturbance is purely acquisitive or self-protective and has no compensating social function.

This, however, is not necessarily a condemnation of the activity of the speculator; it is a condemnation of inflation and deflation. The evils of manipulated currency are not due to speculation, nor are they mitigated by speculation. In these cases successful and unsuccessful speculation are merely the processes through which the gains and losses of monetary instability are distributed over the community. The real social problem is to eliminate or minimize the disruptive swings in the value of the dollar rather than to interfere with the allocation of the losses resulting from inequality of skill or luck in forecasting them.

In view of the widespread distrust and antipathy which speculation arouses it is remarkable that it has been the subject of very little directly repressive legislation. The most ambitious effort in this direction was probably the German statute of 1896 which put stock and produce exchanges under strict government control and provided for numerous restrictions on their freedom of operation. Future trading in grain was prohibited, as were term settlement dealings in the securities of mining and industrial corporations and in those of all companies with capital of less than twenty million marks. All persons who desired to carry on exchange dealing were required to register as speculators and to pay a license fee. Opinions differ as to the working of this law, but the consensus seems to be that it failed to achieve its purpose of eliminating undesirable speculation. In 1908 the principal provisions of the law were repealed, including the registration of securities and the prohibition of term settlement in industrial shares.

In recent years, aside from numerous regulations intended to insure a close relationship between the commodity futures markets and the spot markets for similar commodities, the principal concern of public authority both in Germany and in the United States has been to prevent the stock market from competing too vigorously with industry and trade for the available supply of credit. In 1927 the president of the Reichsbank required the principal German banks to make a drastic reduction in the volume of their stock exchange loans. In 1919 and again with much more vigor in 1928-29 the Federal Reserve authorities in the United States under-

Specula

took to bring about a diversion of credit from security speculation to industry. These measures have given rise to a considerable body of controversial literature, the position taken by the newer school of critics being that it is impossible for the stock market to "absorb" any significant volume of credit, since it is only an agency for the exchange of securities against funds which are no more tied up in the hands of the sellers of securities than they were in the hands of the buyers. Since the collapse of the boom of 1929 the opposite complaint has become prevalent. That is, it is contended that instead of absorbing credit and making it dear for industry, what a stock exchange boom really does is to make credit obtained through stock issuance abnormally cheap, thereby fostering an excessive volume of investment.

toral constituency in the first six parliaments the commonwealth (1901-14). From 1914-16 : held cabinet office but in 1916 was expelled om the Labour party as a conscriptionist and ost his seat in 1917. After 1919 he retired from politics.

It was in the industrial rather than in the political field that Spence's activities were most noteworthy. Under his leadership the A. W. U. became the most powerful trade union in the country. As a general federation of rural and city laborers it was united by loyalty to a political outlook rather than based on any industrial grouping. The procedure of the Commonwealth Arbitration Court helped Spence's crusade by encouraging interstate federation among unions. Spence strongly deprecated craft unionism, even desiring to abolish sick and fraternal benefits; but he never urged revolutionary unionism and resisted the I. W. W. propaganda fiercely. His ideal was national Australian industrial unionism, and the A. W. U. has always supported the White Australia policy. In contrast to Lane, the other great contemporary leader, Spence was not a theorist; he was, however, the most efficient trade union organizer the Australian labor movement has yet produced.

SPENCER, ANNA GARLIN (1851-1931), American educator and social reformer. Anna Garlin Spencer's long career as a writer and lecturer on social questions commenced when he engaged in newspaper work for the Providence (Rhode Island) *Journal* at the age of thirteen. After her marriage in 1878 to the 'end William H. Spencer she was associ- 'her husband as an occasional preacher 'an churches. In 1891 she was ordained 'ed as minister of the Bell Street Providence, where she served for s; later she became associate leader York Society for Ethical Culture. many educational appointments ch she expressed her enduring con- ial betterment were her posts as associate director at the New York ulanthropy (1903-13), as Hackley sociology and ethics in the Theo- ' at Meadville, Pennsylvania (1913-

18) and as special lecturer at the universities of Wisconsin and Chicago. She was deeply interested in peace and women's rights and was a charter member of the Women's International League for Peace and Freedom and the National Council of Women. The last dozen years of her life were devoted particularly to the study of family relationships. She sought to formulate a program of education for women which would train them to function effectively not only as wage earners but as wives and mothers and would enable them to cope with the changing social and economic implications of the family in modern society. Her lectures at Teachers College, Columbia University, and her numerous articles in magazines gave impetus to the widespread introduction of courses on the family in high schools and colleges and to the movements for parent education and sex hygiene. She founded the Division of Family Relations of the American Social Hygiene Association as a center of study and information on problems of sex and marriage and served as its director until her death.

SPENCER, HERBERT (1820-1903) English social philosopher Spencer probably owed much of his independence of thought to his father's libertarian methods of training and to an education remarkably free from conventional discipline. Brought up in an atmosphere of philosophical radicalism, he was opposed to all forms of authority and held that individual happiness as achieved by the free exercise of faculty was the chief end of life. From childhood he was interested in natural history and biology and also in mechanical science, and he spent some ten years of his early manhood as a practising engineer. To his scientific training he owed *inter alia* the impersonal temper that pervades all his work. From his study of biology he derived the idea of organic evolution; that is, of the gradual progress of life from simple to more complex forms, from primitive homogeneity to ultimate heterogeneity. It is the extension of these ideas and their application to the social organism that lead to one of the chief logical difficulties in Spencer's theory of the state: for, while they

obliged him to regard the state as a natural and spontaneous evolutionary growth, he insisted also, in his role of philosophical radical, that it was a man made contrivance for the enforcement of economic contracts and for mutual protection.

The most important of Spencer's works dealing with social and political theory are *Social Statics* (1850), *Principles of Sociology* (3 vols., 1876-96) and *The Man versus the State* (1884). *Social Statics* is a description of society as Spencer conceives that it ought to be, the ideal condition of political organization being envisaged as one of static repose, in which a perfect equilibrium has been reached between man, the individual organism, and his surroundings. This equilibrium, Spencer maintained, should be brought about by a gradual delimitation of the functions of government and a correspondingly enlarged field for the exercise of man's "natural rights." Government he considers here and elsewhere to be a necessary evil, essential in the primitive, or military, form of society, in which violence is the chief enemy to man's happiness, but becoming less and less important as society progresses toward the industrial, or higher, form of state, wherein, once equilibrium of interest or perfect adaptation has been attained, the anarchy of utopia supervenes and governmental interference is no longer necessary. Spencer's description of the function of the state is little more than a list of the functions it should renounce. There must be no regulation of industry, which should be left to the free play of individual activities, since Spencer's ideal man is also an economic man. There must be no established, or state, church, no organized colonization, no poor relief, no social legislation, nothing in short in the way of collective organization to interfere with the law of natural selection. There must be no public mint and no state postal system, for those things are done best which men do themselves. Finally, there must be no state education, on the grounds, first, that a parent has a right to provide whatever form of education he chooses for his children and, second, that the child can be just as good a member of society without it, since the moral sense develops independently of education and ignorance has no connection with evil-doing. Education does not therefore protect society against crime. In sum the chief duty of government is to refrain from interfering with the wise severity of natural laws, for it is an essential principle of life that man's faculties develop and increase of individuality results from the effort of adaptation to environ-

ment. Poor relief and public sanitation are objectionable just because they interfere with the process of adaptation and tend to perpetuate the weaker type.

Spencer had conceived the ideas of natural selection and the survival of the fittest about six years before Darwin published his famous paper, but with this difference: that Spencer held throughout the belief in purposive adaptation, whereas Darwin's view was that accidental variations which happened to suit their environment were perpetuated and so tended to survive.

Spencer's social and political theories are open to obvious criticisms. Society can never reach a state of utopia conceived in terms of static repose any more than the individual organism can attain to a perfect and final adaptation to its surroundings; on the contrary, each adaptation opens up a new set of problems calling for fresh adaptations. Spencer's utopian ideal of a final standard of justice for all led to an unreasonably antagonistic view of existing governmental institutions: He lived in an age when free trade was everywhere accepted as an ideal and men looked for industrial prosperity as a result of the removal of trade restrictions. But he went much further in maintaining that universal happiness would automatically be achieved by the reduction of governmental control to the minimum necessary for keeping order and to the machinery for enforcing economic contracts. Such a view is vitiated by the assumption that whereas, on Spencer's own premises, the state considered as a social organism evolved gradually from primitive simplicity to an increasing complexity and differentiation, government could reverse the process and simplify itself almost to the point of non-existence.

Spencer's objection to everything coming under the head of what is now called the social services may seem ruthless and unfeeling. Yet the ideal he always had in view was that of human happiness. When his contradictions and inconsistencies have been discounted, it must be conceded that much remains that is wise and farsighted. But the influence of Herbert Spencer on the development of political theory has been out of all proportion to the original and intrinsic value of his ideas.

SPERANSKY, MIKHAIL MIKHAILOVICH (1772-1839), Russian statesman and political theorist. Speransky was the dominating figure in Russia at the beginning of the nineteenth century. The son of a village priest of the province of Vladimir, he at first taught at the seminary of St. Petersburg. Under the influence of the ideas of the Enlightenment, however, he entered the office of the procuror general, who at that time stood at the head of the entire civil administration of Russia. Under Alexander I, Speransky was appointed state secretary; after the introduction of "ministries" he served for a time in the Ministry of the Interior; in 1808 he became assistant minister of justice.

Speransky's career is interesting because of his idealistic attempt to introduce constitutionalism into Russia. As the closest and most trusted adviser of Alexander I he was commissioned to work out a plan for the reform of political institutions. According to his plan, completed in 1809, all free citizens were to be given equal civic rights and steps were to be taken for the gradual emancipation of the peasants. The principle of the division of power was to be applied to state institutions, and Russia was to become a constitutional monarchy with an elective representative assembly, the so-called state дума, and a responsible ministry. In order to assist and supervise local administration the system of representative institutions was to be introduced also into townships, districts and provinces. The courts too were to be organized on the basis of certain electoral elements. A state council consisting of members appointed by the czar was to be created for the purpose of unifying the imperial administration.

Although Speransky's plan was realized only in part—only the state council was established in 1810—he made numerous enemies among the conservative nobility by other measures of reform, which included the requirement of educational qualifications for important state posts and the increase of taxes. He was arrested and exiled by Alexander I, who was eager to gain popularity on the eve of his renewed struggle with Napoleon; and despite the fact that Alexander I made him governor of Penza in 1816 and governor general of Siberia in 1819, allowing him to return to St Petersburg in 1821, he was never fully restored to favor. Under Nicholas I, however, he was entrusted with the codification of the Russian laws. Speransky intended to divide this work into three parts: first, the collection of all the laws issued since the code of Czar Alexis in 1649; secondly, the compilation of all the extant laws; and, thirdly, the drafting of a new code. In compliance with the wishes of the conservative Nicholas I the enterprise had to be confined to the first two tasks, and these were promptly completed under Speransky's guidance. In 1830 there appeared 45 volumes of the *Polnoe sobranie zakonov* (Complete collection of the laws of the Russian Empire), and in 1832, 15 volumes of the *Svod zakonov* (Code of laws). Despite certain shortcomings the compilation eliminated legislative chaos and thus performed a positive service for its day.

SPHERES OF INFLUENCE. In the course of the imperialistic aggrandizement of the great powers in Africa in the 1880's and 1890's there developed a number of situations in which particular powers found it advantageous to assert vague political claims to areas which it was inexpedient to annex or convert into protectorates. These areas, which were usually contiguous to

territories already held and were often focal points of the conflicting imperialisms of two or more powers, came to be designated as spheres of influence. Since indefiniteness is purposely of the essence of such claims, it is difficult to define the phrase precisely. The difficulty is increased by the looseness of popular usage. For example, the expression has recently been extended to cover the relations between small European states and great powers seeking to control their foreign policies without the formality of an alliance or protectorate. Austria and Hungary were thus said to be within the Italian sphere of influence early in 1934. In general, however, the use of the phrase is restricted to oversea imperialism. A sphere of influence might be roughly defined as a backward territory over which an outside power claims hegemony, with a view either to transforming it ultimately into a colony or protectorate or to securing exclusive economic privileges therein for its own nationals without assuming full responsibility for local administration. In either case other powers are in effect warned not to trespass on the region thus earmarked. Claims are usually based upon general political or economic interests of the power claiming influence in the particular region. The interests may consist of leaseholds or concessions in coastal areas with an accompanying assertion of predominance in the hinterland, or they may involve economic or strategic objectives in a region contiguous to possessions.

Assertions of hegemony may assume the form of unilateral declarations of policy by a single state, acquiesced in by other states. The Monroe Doctrine is an example. When the American government, in the Lansing-Ishii agreement of 1917, which was revoked in 1922, conceded that "territorial propinquity" gave Japan "special interests in China," it sanctioned by agreement what had hitherto been a unilateral Japanese claim to hegemony on the Asiatic continent. Claims of this character are sometimes based on agreements with local authorities, either native chieftains or "backward" governments of feeble states. Such agreements, especially in Asia, have often pledged the native government not to alienate the territory involved to any other power. Spheres of influence have their basis most frequently, however, in agreements between the imperial powers themselves. In 1886 Great Britain and Germany agreed upon a line in the western Pacific on one side of which the British government would seek no further territorial acquisitions and on the other side of which

Germany accepted a similar obligation. Between 1890 and 1896 Great Britain, France, Germany, Italy, Belgium and Portugal concluded a whole series of such bilateral arrangements delimiting their spheres in Africa. United States Secretary of State Olney in a note to the British ambassador, Sir Julian Pauncefote, in 1896 spoke of these spheres of influence as "new departures which certain great European Powers have found necessary and convenient in the course of their division among themselves of great tracts of the continent of Africa, and which find their sanction solely in their reciprocal stipulations."

Most text writers on international law define spheres of influence in similar terms. Thus Oppenheim (*International Law*, 2 vols., 2nd ed. London 1912, vol. i, p. 297) asserted that they were "such territories as are exclusively reserved for future occupation on the part of a Power which has effectively occupied adjoining territory." Likewise Pitt Cobbett (*Cases and Opinions on International Law*, 2 vols., 3rd ed London 1909, vol. i, p. 113) declared: "A sphere of influence, so far as it can be said to possess a definite meaning, indicates a region, generally inhabited by races of inferior civilization, over which a State seeks, by compact with some other State or States that might otherwise compete with it, to secure to itself an exclusive right of making future acquisitions of territory . . . and, generally also, the direction and control of the native inhabitants."

These definitions, however, are primarily applicable to Africa. In the Caribbean region and in Asia assertions of hegemony by the powers have usually been made with an eye toward trading or investing privileges rather than with any thought of prospective annexation. The term sphere of interest has often been used to refer to such situations. Some commentators have used it synonymously with sphere of influence, while others have endeavored to distinguish between the two on the ground that influence implies political rights whereas sphere of interest refers only to economic privileges. In any case all such arrangements in Asia have had reference primarily to trading or investing privileges which each power has sought to monopolize for its own nationals within its own sphere.

The Anglo-Russian agreement of 1899 conceded exclusive Russian rights to railway construction in north China with Great Britain obtaining similar rights in the Yangtze valley. The Anglo-Russian agreements of 1907 recognized British influence in Tibet and Afghanistan

and divided Persia into a northern Russian zone, a southern British zone and a neutral zone between. The agreements of 1896 and 1904 divided Siam into British and French spheres. Early in 1914 a Franco-German agreement sought to map out spheres for railway construction in Turkey. During and after the World War a series of interallied agreements aimed at partitioning Turkey into British, French and Italian spheres. The clash of rival imperialisms in China during the last four decades has led to numerous arrangements of this type. Japan expelled Russia from south Manchuria in 1904-05, seized control of the German sphere in Shantung in 1914, attempted to convert all of China into a Japanese sphere in 1915 and transformed the Manchurian sphere in 1933 into the "independent" protectorate of Manchukuo.

In all of these instances diplomats have worked hand in hand with investors and concessionaires and have sought to secure preferential or exclusive rights for their own nationals as to loans, railway construction, mines, public works and other industries within determined areas. Such arrangements have frequently been accompanied by the appointment on the part of the imperial powers of advisers of various types to assist the local government. This technique has been widely employed by the United States in the Caribbean. The sphere of influence or sphere of interest is everywhere imperialism's halfway house in which the seekers after power and profits, thwarted by rivals or by the resistance of their victims, stop short of complete control of the coveted market area. This vague and unstable form of imperial power tends to break down as soon as the equilibrium is upset by native revolt or by a clash between competing exploiters. The result is usually the ultimate transformation of the sphere into a colony or protectorate, often involving war against the natives and diplomatic or military conflict between the powers.

In view of these inevitable concomitants of empire building various efforts, largely unsuccessful, have been made by the powers to mitigate their rivalries by joint action. The inability of the United States to participate effectively in the carving of Africa and Asia has caused the American government to seek to protect its commercial and financial interests by challenging the legitimacy of spheres of influence, except in the Caribbean, and by championing the open door. In his circular letter of September 6, 1899, John Hay, "animated by a sincere desire that the

interests of our citizens may not be prejudiced through exclusive treatment by any of the controlling powers within their so-called 'spheres of interest' in China," succeeded, in form if not in fact, in committing the powers to the policy of refraining from discriminating commercially against nationals of other powers within their spheres. This policy failed to check the further growth of areas of monopolistic exploitation in China, in part because Hay and his successors, with their attention centered on commerce, failed to appreciate the implications of monopolistic investment privileges. In the open door treaty signed at Washington in 1922 the powers agreed to refrain from concluding agreements designed to create spheres of influence in China. It was understood that the treaty should not affect existing spheres, and the only result has been that the carving out of new ones has gone on without written agreements in recent years. The provinces of Fukien and Inner Mongolia are at present Japanese spheres, Yunnan is a French sphere north of Indo-China and the Yangtze basin a British sphere.

The internationalization of spheres of influence is another unsuccessful effort in the same direction. In the diplomatic contest between France and Germany for control of Morocco in 1905 President Theodore Roosevelt urged the kaiser to accept a compromise whereby France would accept, jointly with Spain, "a mandate from all the Powers, under responsibility to all of them for the maintenance of equal rights and opportunities." The General Act of the Algeiras Conference of 1906 recognized the independence of Morocco and converted it into an international sphere, but in 1912 Morocco was partitioned between France and Spain. The mandate system of the League of Nations represents the most recent effort at international supervision of backward areas. Its results do not promise any general cessation of acute imperialistic rivalries for control of such regions. Monopolistic national control is of the essence of twentieth century imperialism. Its consequences are exploitation of its victims and war between the rival exploiters.

SPINOZA, BARUCH (BENEDICTUS DE) (1632-77), Dutch philosopher. Spinoza was born in Amsterdam of Marrano-Jewish parents. He developed heterodox religious opinions, which led to his excommunication by the Amsterdam rabbinate in 1656. Thereafter he settled down to lead the picturesque but difficult life of a philosophic saint, grinding lenses for a living and devoting the leisure of his short life to the composition of an *Ethics* "demonstrated in the manner of geometry." He interrupted his major work to prepare and publish a polemical *Tractatus theologico-politicus* (Amsterdam 1670), in which he defended the liberal secular policy of Jan de Witt against the theologians, who demanded a closer union between church and state and a censorship of opinion in the name of religion. At the time of his death he left also an unfinished treatise on politics.

Spinoza's philosophic system represents a bold attempt to combine the core of religious idealism with the new scientific rationalism in a unified and serene human outlook. In the *Tractatus theologico-politicus*, where he writes as a critic of the religious tradition—incidentally laying down the principles of what was later to be called the higher criticism of the Bible—he defines the development of religion as an imaginative educational process ending in the complete internalization of religious teaching. The divine law, which first appears as an external command operating under the sanction of rewards and punishments, becomes in the highest religious consciousness, which Spinoza curiously identifies with Christ, a spontaneous movement of the highest part of the mind reaching out for greater perfection and being. With such a conception of religion and ethics immanent in his thought Spinoza found remark

able support in the theoretical side of experience as interpreted by Descartes' philosophy of science. Carrying Cartesian principles a bit further than Descartes intended, Spinoza held that the norm of truth is provided by the direct intellectual intuition of simple mathematical relations, where the mind feels itself to be at one with the truths which it knows; and that whatever progress is obtained in the passage from the undisciplined and inadequate ideas of sense and imagination to discursive science, where sense ideas are organized in a framework of abstract intellectual concepts, it reflects the power of the mind in approaching, although in a very limited scope, nearer the intimate source of reality. If that process could be carried through to its ultimate term, all reality would be embraced in a single intellectual synthesis. But the intellect would no longer be the human intellect; it would be the intellect which is in and beyond the human intellect, that is to say, God. Similarly on the practical plane of will and desire the passage from animal instincts to a disciplined ethical life represents not an ascetic renunciation of life and power, but the spontaneous attachment of the mind to a deeper source of reality and the organization of the lower desires in the name of that attachment. Here again the final goal is God, the infinite source of all reality, who is reached not outside the individual but as the ideal term of the moral progress of the mind.

In his social and political philosophy Spinoza avoids both the murky, ascetic idealism of the theologians and the shortsighted realism of materialists like Hobbes and is able to ground the prevailing political liberalism in a clear appreciation of the complex forces operating in the human situation. He erects his political theory on the identification of right with power, holding that "every natural object receives from nature, for all purposes of being and working, exactly as much right as it has power." But by virtue of the fact that human nature does not exist on a single level of reality, a curious unfolding takes place. In a state of wild nature, where power is identical with individual physical force, everyone is checkmated by the universal play of force. Man's obscure consciousness of his own weakness in this state of nature and the hopes of gain from universal cooperation—which reflect of course a phase of human nature not recognized by the ordinary realist—lead to the social contract for the constitution of civil society as well as to contracts with rulers to govern society. Both of these types of contract are regarded by

Spinoza not as historical facts but as intellectual formulations of the obscure play of forces immanent in the situation. Under these contracts men resolve to "live according to the common will of all, to be guided as it were by one mind" and to obey the government, which is to express this common will. The illusory advantages of natural right and natural freedom are exchanged for the restricted but far more solid advantages of civil rights and liberty within the law of the state. The change is thus not a surrender of individual power but an expression of the growth of individual power. Spinoza does not disguise the cost of this transaction in the way of the surrender of individual liberty of choice as to external action, and commands absolute obedience to the sovereign in all except thought and opinion, which fall outside of the power of the state, not as an ethical duty but as the basic condition on which the mechanism of the state operates. The only protection against abuse of power by the government is the immanent "right" or rather inevitable resort to revolution whenever the government disregards the interests of its subjects.

Spinoza's radical religious philosophy so scandalized the people of his time that for a hundred years after his death he was "more execrated than read." Nevertheless, his political doctrines are known to have influenced Montesquieu and very probably affected Rousseau, whose doctrine of the general will is almost a paraphrase of Spinoza's conception. Thanks to Lessing and Jacobi, his general philosophy was at length resuscitated, and it came to exercise an enormous influence on Goethe and the romantic movement in German literature as well as on the post-Kantian philosophers, Fichte, Schelling and Hegel. Notwithstanding the modern loss of interest in "high ethics" and metaphysics Spinoza's works are still read, and with the exception of Pascal in France he remains the only seventeenth century philosopher who still exercises a direct influence on contemporary thought.

SPITTLER, LUDWIG TIMOTHEUS (1752-1810), German historian. Spittler, who was born in Stuttgart, concentrated his early studies upon theology. His *Geschichte des kanonischen Rechts bis auf die Zeiten des falschen Isidor* (Halle 1778) was responsible for his being called in 1779 to the University of Gottingen, which was strongly influenced by the Enlightenment and was at that time the best university in Germany. Dissatisfied with Protestant orthodoxy, he had already as a student developed a critical sense of the historical tradition and had devoted himself to the study of history. While he was affected by the Enlightenment of France and Germany, there is no proof that he was influenced in particular by Voltaire; his thought was shaped far more by Lessing, Klopstock, Herder and the young Goethe. In his *Grundriss der Geschichte der christlichen Kirche* (Gottingen 1782; 5th ed. by G. J. Planck, 1813) he showed his critical attitude in his incisive treatment of the papacy. But his best historical work was contained in his studies dealing with the history of German local states in the seventeenth and eighteenth centuries. His *Geschichte Württembergs* (Gottingen 1783) and his *Geschichte des Fürstentums Hannover* (2 vols., Göttingen 1786) were sympathetic appraisals of bourgeois life in the German local states. During his Gottingen period Spittler was both church and secular historian, and in 1782 his professorship was converted into a chair for political history. Several of his works were merely outlines for his academic work. Aside from his local histories of Württemberg and Hanover the *Entwurf der Geschichte der europäischen Staaten* (2 vols., Berlin 1793; 3rd ed. with continuation by G. Sartorius, 1823) is most important. In his political histories Spittler was concerned chiefly with constitutional matters. In general he was a pragmatic historian who let the facts speak for themselves. It cannot be said that he opened up new paths, but he did

reveal the character of the age in his increased dependence upon research and critical use of source materials. An excellent teacher, he exercised a strong influence on the younger generation. His political interests drew him into the service of the state of Württemberg in 1797. He was a member of the state council and in 1806 he became minister and president of the educational commission.

WALTER GOETZ

Consult Fueter, E., *Geschichte der neueren Historiographie*, Handbuch der mittelalterlichen und neueren Geschichte, pt. 1 (Munich 1911) p. 377-79; Schweizer, Josef, *Ludwig Timotheus Spittler* (Tübingen 1907).

SPOILS SYSTEM. The phrase spoils system has been in current use in the United States since its employment by Senator Marcy in 1832. Most frequently it designates the practise of making appointments to public office not on the basis of merit or fitness but on that of party or factional affiliation or personal gain. In this sense the meaning is essentially the same as patronage system. The expression is also used authoritatively to describe the profits of many types which the abuse of official power may extort, not only through appointments but also through the award of contracts, the grant or refusal of licenses, the enforcement or non-enforcement of the law and other means. In this sense the meaning is substantially equivalent to graft.

The primary form of the spoils system is the distribution of jobs in the public service, including even welfare and penal institutions, to party supporters. In large cities especially the number of these positions is far from adequate, and in some cases contractors on public works and managers of public utilities and other corporations subject to regulatory authority have been called upon to make additional positions available. Many of these jobs are temporary, being distributed merely for a few weeks prior to election. Secondary forms of the spoils system include such matters as favoritism in the award of contracts, especially crooked specifications which limit competition; perversion of public purchasing for the benefit of party workers; special treatment in public institutions, including jails and prisons; priority in securing relief in time of distress; special interpretation of the law in its administration either to favor a friend or to embarrass an enemy; differential assessment of property; special favors in franchises; tariff privileges; and pertunctory proce-

cution for violations of law. For all these favors interested persons are willing to pay generously in one way or another; and historically heavy payments have found their way into the party treasuries.

A somewhat different aspect of patronage is represented by nepotism, or the system of appointing relatives to public office. The term was originally used to describe the distribution of power and principalities by the pope to his natural sons, euphemistically termed nephews, and to his other relatives. The flagrant practise of nepotism served to undermine the prestige of the Catholic church and contributed to the coming of the Reformation. In democratic countries nepotism is less important than party patronage. The tendency of members of the United States Congress to appoint their relatives to secretaryships and similar minor offices in Washington is less a means of building a machine than of providing additional family income. In certain circumstances, as in the election of 1932 following the publication of the list of congressmen who had placed relatives on the federal pay roll, nepotism may prove a source of serious political weakness rather than of strength. On the other hand, in the more turbulent local politics the action of a political leader in building up the political status of his relatives by means of family appointments serves both to support his own position and to entrench his relatives in their political careers.

The spoils system in both its primary and secondary forms is not confined to government. John T. Flynn, an informed observer, wrote in 1931 that there is more graft in business than in political life. Banking scandals revealed by the crash of 1837, insurance scandals which long persisted in American history, railroad scandals chronicled in Charles Francis Adams' *Chapters of Erie*, business scandals which were denounced by the muckrakers at the turn of the century, racketeering, the crash of the Insull empire in 1932 and the elaborate system of stock favors revealed by J. P. Morgan's testimony before the Senate Committee on Banking and Currency in 1933 indicate the extent of the trail of graft and spoils in the American business world. Here is in fact an aspect of social life which an easy going, tolerant and busy community has allowed to invade many, if not most, forms of corporate activity. In business circles nepotism is exceedingly common, although it has often been concealed behind tales of owners' sons who worked their way up from the bottom. In England the

civil service is often spoken of as the principal career open to talent.

Although supported by no well considered philosophy in any other country, the elements of the spoils system can readily be identified over broad reaches of time and space. The sale of public office, which was apparently invented in China in a remote age to secure funds to relieve a national disaster, is a type of spoils which persisted in China and which was common in Europe until a century ago. In the Balkan countries the party system is bound up with a far reaching spoils system. Nepotism is still common in many countries, although it is frowned upon in communities with more advanced political morals. The grant of favors to political or other associates, all within the four corners of the law, is an embryonic but ubiquitous type of spoils.

In the immense public services of modern states the maintenance of rigid standards of neutrality in appointment, within certain limits, is of primary importance, in the interests of both sound administration and the stability of the state itself. Selection by lot, an ancient device which is still perpetuated in the modern jury, is feasible only in exceptional cases. Election at the polls, while essential in democratic countries with respect to authorities who must formulate policies, is unsatisfactory with respect to administrators. Their selection must rest for the most part on appointment under legally established conditions in the interest of impartial enforcement of the law.

The spoils system is predicated on the contrary assumption that such appointments lie within the discretion of the appointing power and should be drawn exclusively from the political friends of the appointing officer. The validity of this proposition, however, must be examined under at least two distinct situations. In a revolutionary movement the political neutrality of the public service is never accepted as sufficient. Washington required of his early appointees that they be loyal to the constitution, the Tories were in fact excluded from appointive positions. The Communist revolution in Russia swept the old officeholding class aside in favor of men whose political reliability was assured. The failure of the German Social Democrats to follow a similar procedure after the revolution of 1918 was at least to some extent responsible for their subsequent decline. Most recently the advent to power of the National Socialists in Germany has given proof of the fundamental necessity that a

revolutionary movement shall command the political loyalty of its official service. Insistence upon loyalty to the underlying philosophy and agencies of government is not considered an aspect of patronage, or the spoils system, although the desire for government positions may be an important motivation of revolutionary movements.

The problem of personal loyalty to a political program within the constitution is quite another matter. Here practise varies. In Great Britain fewer than 100 officials from among 300,000 civil servants are required to belong to the party in power; in the United States about 150,000 officials in the national government as well as large numbers in state and local government are still subject to replacement for political reasons. As a spoils system develops, loyalty to party tends to become identified with loyalty to the dominant group or faction within the party, so that a network of personal relations almost feudal in character envelops the system of public administration. Neutrality vanishes in the fog of influence.

Patronage appeared in some of the American states, notably New York and Pennsylvania, as early as 1800. In 1821 the New York Council of Appointment filled directly 8287 military and 6663 civil offices. Fish reports that by 1828 in every state throughout the north and west the spoils system was either already established or was likely to be introduced.

The tone of the federal public service was set for forty years by Washington, who declared it his purpose to "prefer those who seem to have the greatest fitness for office." Although Jefferson made some appointments for party reasons in order to redress the balance between the Federalists and the Republicans, he was undoubtedly sincere when he wrote that he would "return with joy to that state of things when the only questions concerning a candidate shall be, Is he honest? Is he capable? Is he faithful to the Constitution?"

These doctrines on the whole prevailed until 1829, when the spoils system took possession of the federal government during the administration of Andrew Jackson. Apart from a violent desire to reward his friends and to punish his enemies, Jackson was motivated by a considered theory of rotation in office, for which some defense was possible in his time. Addressing Congress in 1829 he expressed his fear of a bureaucracy, indifferent to the public interest, diverting government from its proper ends and making it

an agency for the support of the few at the expense of the many. He asserted further: "The duties of all public offices are, or at least admit of being made, so plain and simple that men of intelligence may readily qualify themselves for their performance; and I cannot but believe that more is lost by the long continuance of men in office than is generally to be gained by their experience." Jackson also undoubtedly reflected the resentment of the trans-Allegheny region against the leadership of New England and Virginia and was determined to bring this domination to an end by any means.

Spurred on by the example of the federal government, where for the next thirty years a rapid alternation of parties settled the spoils system deep in the political habits of the nation, the states and cities generally followed suit. Rotation in office became a symbol of democracy, patronage and spoils became the sinews of war in the battles between Whigs and Democrats, Democrats and Republicans.

The spoils system reached its height in the fifteen years following the Civil War. Since the enactment of the Pendleton Act in 1883 it has been in slow retreat before the merit system and more modern ideals of government. Patronage has been substantially eliminated from over 450,000 positions in the classified federal service. Ten states (New York, Massachusetts, New Jersey, Maryland, Ohio, Illinois, Wisconsin, Kansas, Colorado and California) have formal merit systems, and enforcement is reasonably satisfactory in most of them. Some have partial merit systems and others have a de facto arrangement whereby merit is recognized in many cases. Many cities and a few counties have merit laws, although their administration in the large metropolitan centers is still often unsatisfactory. The period of most rapid growth of civil service commissions was from 1906 to 1910.

The mechanics of the spoils system are still elaborate, exhibiting an organization which in some respects is more efficient than the organization of the public service itself. By the rule of senatorial courtesy which has become accepted in the United States, the president is expected to consult the appropriate senator belonging to his party or, failing such, a congressman of his party with reference to presidential appointments to federal positions in each of the states. The initiative is often taken in fact by the members of Congress. Federal appointments in the states and cities are thus geared into the local political organizations, since congressmen owe

much to these groups and use the patronage to pay off their political debts. Wholesome municipal and state administration is often retarded as a result of the exercise of this federal patronage; occasionally it has been employed to weaken notoriously corrupt local machines. Within the states governors and heads of departments and of institutions consult state senators, representatives and political committees in making their appointments. Within the cities the extensive power of appointment may be concentrated in the hands of a strong mayor or held by a junta of ward committeemen. In either case the whole governmental structure is handled as a unit. Whatever disorganization may exist in the legal make up of local governments, appointments are usually managed for all of them by a single agency under organized and, in a party sense, responsible direction. As Merriam has said, "With infinite patience and infinite skill this web is woven back and forth, until it covers every point on the political map."

The patronage system has had other defenses than that put forward by Jackson to defeat an emerging bureaucracy. It is said to be an indispensable asset in maintaining the unity and strength of political parties, which in turn are necessary adjuncts of a democratic government. It has played a part in nationalizing parties and in consolidating a country wide sentiment. Responsible officials often assert that personal appointments on a large scale are essential to secure proper loyalty to their policies. Others argue that small appointments serve to dispense to thousands of humble citizens rewards analogous to those which pass to the wealthy by means of tariffs, exemptions from taxation and other legislative favors. T. V. Smith suggests that without some antecedent humanizing of the economic life the pursuit of efficiency in government merely serves to close one more avenue of advancement for the poorer classes. He points out that civil service reform has proceeded from the top down, that the enemies of the merit system have been democratic heroes (Jefferson, Jackson, Bryan) and that the support of the movement has come primarily from those who by education and economic circumstances could disdain the jobs in question. "That the system increased efficiency may be granted; but not everyone can grant that efficiency should become the main criterion in politics until in daily life as economic success it ceases to be the main criterion."

The damage which the spoils system has wrought to American public life is beyond cal-

culated. Civil service reformers like George William Curtis, Dorman B. Eaton and Carl Schurz fought it primarily because it seemed to be causing a breakdown of democratic government itself. Powerful political organizations less and less amenable to public control fastened themselves upon the community by the use of patronage and spoils, diverting public office from a public trust to an insidious type of mass bribery. Controlling the power of public office, the party approached the position of master of the public rather than its servant.

The political party itself suffers heavily from the effects of the spoils system. Not only does party interest obscure the interest of the state, but personal and factional interests tend to submerge the party's interest. According to Merriam: "The spoils system, originally depended upon as a means of strengthening the party, leads to the destruction of the party itself, and indeed to the paralysis of the whole party system. As party principles and policies rise, the spoils system sinks. Party and spoils are incompatible; the stronger the one becomes, the weaker the other."

The greatest loss from the spoils system has undoubtedly developed in the field of public administration. Here may be observed not merely the breakdown of services destined for the public advantage, the nullification of policies of public regulation intended to safeguard popular interests, the bold use of power for private rather than for public ends or the alarming prevalence of common dishonesty. Still more serious in the long run has been the inevitable loss of confidence in government itself, either as an administrative agency capable of pushing forward large programs of social amelioration or even as an impartial umpire in an individualistic world. Government has been weakened by the spoils system not only as an instrumentality of progress but as a sovereign. "Only a strong government can either act intelligently or intelligently refrain from action. A weak government can do neither. For moderation in governments, as in men, is not the result of weakness and incapacity, but of strength and restraint."

Even in the heyday of the spoils system many officials were not involved in the periodic turnover of officeholders; they owed their permanence to the necessity of avoiding a complete breakdown of essential public services. A politically neutral, administratively informed and personally reliable inner circle kept the wheels moving and educated succeeding groups of

officeholders to their duties. The career of such officials as A. A. Adee in the state department is a case in point. In an age when public administration depends upon the slide rule, the clinical thermometer, the test tube and higher mathematics, it is manifestly impossible to continue according to the Jacksonian doctrine that the duties of all public offices are so simple that men of intelligence may readily qualify themselves for their performance.

The shift of emphasis from the moral iniquity of the spoils system to the greater efficiency of the public service, which has taken place since 1910, has coincided with the opening up of new avenues of growth of a reformed public service. Three significant changes have gone far to undermine the patronage system, although in no case has a formal civil service system been involved. Chronologically the emancipation of the schools from municipal machines is the first. This evolution is now substantially complete with a few striking exceptions and has greatly diminished patronage. A second development is found in the growing professionalization of the public service, which in turn eliminates the influence of partisanship through the standards enforced by the profession itself. Finally, the spread of the council manager form of government has had a powerful effect in some 450 American cities in favor of an active merit system. These trends are significant indices of the probable further decline of the spoils system.

SPORTS, which are now commonly classed with man's recreation, originally represented his training for the struggle for existence. The sports of the field, including contests between men and animals, were in primitive society and in pioneer communities not so much a diversion as a utilitarian pursuit, a major means of food supply. Later the hunt and the chase as well as combats between men served as preparation for war. Certain contests between animals directed by men, such as horse races, also belong in this category: the chariot races of ancient Rome grew out of the annual spring preparation of the Roman cavalry for the season of battles and out of the fall sacrifice of a winning horse to the god Mars.

In feudal society the sports of the field inevitably became a prerogative of the feudal usurpers of the field itself. The right to hunt, snare and fish was gradually taken over by the clan or tribe and later by the tribal chieftain or the king, just as man's fields and forests were declared the property of the crown or nobility. In France it was not until the revolution of 1789 that the *droit de chasse* was returned to the peasant together with other rights and properties originally his but for centuries withheld by the king and the seigniors. In England the usurpation of sports by the upper classes began soon after the Norman Conquest when William the Conqueror laid out the New Forest as a game preserve. Several centuries later, with the renewed movement for enclosures of common lands for the use of the upper classes, fox hunting, traditionally practised by communities as well as individuals of all classes, became the exclusive pastime of nobility. The sports activity of the lower classes was further restricted by the growth of industrialism, with its accompanying urban development, which deprived the populace of adequate space for indulgence in archery, quoits, bear baiting, cock fighting and other typically yeoman pastimes. Sport contests reflecting the spirit and practise of war became the prerogative of the ruling class, since war, par-

ticularly in the Middle Ages, was the rulers' privileged profession. In the early days of jousts and tournaments only those knights were admitted to the lists who could prove their noble origin for four generations, although later all the nobility were admitted as well as members of families of distinguished burgesses. A fleet horse being a valuable instrument of war, horse races also became known as the king's sport. Money, space and leisure were essential to proper breeding and racing of horses; thus the leisured class, possessed of land and gold, came into exclusive possession of the horse sport.

Despite the monopoly of king and nobles the lower classes were not without their sports. Seated on oxen and armed with flails yeomen held their own mock tournaments. Instead of jousts villagers and burgesses ran at quintains—posts erected on the village common, sometimes in the form of a human figure such as a Turk or Saracen—revolving around a pivot and striking back at a tilter when the latter delivered a clumsy blow at the side. Occasionally quintains were erected and maintained by the lord of the manor, who safeguarded the exclusiveness of his sports by requiring his tenant farmers to keep to their own forms of recreation. Out of this social cleavage in the domain of sports arose a situation which was to eventuate in the modern distinction between professional and amateur. What was the diversion of the upper classes often became the serious business of the masses, many of whose members, qualified by superior strength and physical prowess, took up the pursuit of athletics and sport as a means of livelihood. To prevent their eclipsing the records of their social betters, rules were passed forbidding them to compete with the amateur or aristocrat, to whom sport was merely a pleasurable pastime.

Almost any folk sport, however, was apt to be borrowed by the upper classes and to become "the king's sport." Thus handball was ennobled by French kings and transformed into "royal tennis." More than a century later the same game, as court tennis, became the vogue among newly rich Americans, who were attracted to the sport because of the high cost of building the necessary courts. Sporadically boxing and wrestling, traditionally plebeian sports, acquired numerous devotees among the upper classes. Similarly conquerors have often appropriated the sports of the conquered; thus from Asia English officers brought polo, now an aristocratic sport of western Europe and America, but

originally a pastime of Asiatic horsemen, while the American pioneers adopted lacrosse, the ball game of the Indians.

In all ages sport events have been associated with the release of pent up emotions—religious, sexual or patriotic. Races in ancient Rome and mediaeval Italy were run at religious festivals to celebrate a military victory or the deliverance of the community from pestilence or other perils. Not infrequently during the Middle Ages races in honor of a saint were followed by general licentiousness among the spectators. In the same way rowdiness often characterizes the modern English crowd at a boat or horse race or American spectators at a baseball or a college football game, a fact which has led frequently to widespread opposition to sports and sportsmen. Recognizing sport events, among other public shows, as a convenient safety valve for the emotions of the plebs, ancient Roman rulers organized large scale gladiatorial battles, chariot races and other contests, particularly during the troublous times of the great wars with Carthage. Between 1905 and 1914 English managers and owners of textile factories in Russia introduced and encouraged public football matches for their workers in an attempt to stave off revolutionary tendencies among them. It is generally recognized that in modern times the wide interest of Anglo-Saxon masses in horse racing, football, baseball and similar sports tends to allay social unrest and lessens the possibility of political uprisings.

Nevertheless, inexorable economic forces through new inventions and discoveries tend to change the character of the very sports with which the masses are to be kept in check, awed or distracted. The perfection of firearms brought to an end such exclusively upper class sports as tournaments and hawking. The discovery of the New World with the resultant spread of commerce and rise of the bourgeoisie made the swift horse a medium not only of battle but also of speedy commercial transportation. Agricultural profits having fallen off after the Napoleonic wars, many English lords could no longer afford the expense of breeding and racing horses or riding with the hounds; accordingly the nineteenth century witnessed the entry of the new barons of commerce and manufacture into these once exclusive sports. The spread of gambling and betting on horses brought from the lower classes nimble men for the new institution of bookmaking. These together with trainers and jockeys of similar plebeian origin often became

wealthy enough to keep and enter their own horses. Chiefly from this hierarchy of race track and sweepstakes participants arose the term "sporting man" or "sporting type". During the last quarter of the nineteenth century shopkeepers and small manufacturers in addition to the professional classes prospered on their belated share of profits of the industrial revolution and for their new leisure introduced or revived such typically mild and conservative sports as cricket, hockey and croquet as well as the more energetic tennis, golf and bicycling. Sporting enjoyment of the latest inventions, such as motor cars, motor boats and airplanes, called for mechanical genius and nerve, often found among men of the lower social strata. Through most of the nineteenth century factory workers, laboring from twelve to fifteen and even eighteen hours a day, had little or no time for active enjoyment of sports. The success of their persistent struggle for shorter hours, accelerated by the dearth of man power during the World War and the economic prosperity of the 1920's, resulted among other things in the formation of workers' sport organizations. In 1913 in Lucerne the first international confederation of workers' sport groups was formed; in its present form it is of moderate socialist tendency, affiliated in spirit if not in fact with the Second International. In 1921 in opposition to the Lucerne organization the Red Sportintern was formed, composed of Soviet Russian sport "circles" and left wing sport groups of workers of other countries. These groups make it a principle never to play opposite sport teams of non-workers' organizations or to take part in any general athletic meets. To counter the effect of the Olympic games they have their own Spartakiads, the first of which took place in Moscow in 1928.

The World War, showing as it did the relation of athletic games and pursuits to physical fitness, gave an enormous impetus to sports, mass participation in which was encouraged by governments and patriotic organizations. The spread of sports in Germany after the war was especially remarkable; it was generally explained by the Versailles Treaty prohibition of German armaments. With the rise of Hitlerism sports have again been relegated to second place, military parades and drills being given precedence. Similarly in Italy sports, widely promoted by the government, are justified solely on the grounds of military preparedness. In Anglo-Saxon countries, particularly in the United States, where mass production methods found

their way even into amusements, sports in themselves became industries profitable alike to impresarios and chief performers. The development of auxiliary industries in connection with sports is evidenced by the fact that in 1931 the aggregate value of sporting and athletic goods manufactured in the United States, exclusive of firearms and ammunition and sporting clothing and footwear, was \$49,257,447. Admission fees together with the sums from motion picture and vaudeville contracts, endorsements of merchandise for advertising purposes, royalties from books, magazines or newspapers and other profits direct and indirect make it possible for star athletes or sports performers and their managers to acquire annual incomes running into the hundred thousands.

Some estimate of the cost of organized sport may be gained from the figures in regard to horse racing, which became greatly accelerated during the period of financial prosperity following the World War. From 1920 to 1930 the total race track payments to winning owners of horses in the United States, Canada, Cuba and Mexico increased from \$7,773,407 to \$13,674,160. The yearly total of betting at race tracks in the United States, Canada and Mexico was said to be \$450,000,000. These figures are particularly significant in the light of the fact that many states have limited or entirely abolished horse racing because of its close association with gambling. Similar proscriptions have been applied to prize fighting because of its brutality. The adoption of boxing as part of the physical training program for soldiers during the World War served to mitigate this unpopularity, and by 1930 twenty-eight states had legalized the sport. The high point of professional boxing was reached in 1926-27, when heavyweight championship bouts were staged in Philadelphia and Chicago by Dempsey and Tunney. An attendance of 120,000 was recorded at the Philadelphia contest and gate receipts at Chicago amounted to \$2,650,000. Another example of the big business aspect of American sport is golf, which during the early decades of the twentieth century was regarded as an expensive sport and was played only by those able to afford membership in country clubs. Today it has developed into a commercial enterprise involving millions of dollars annually. Between 1916 and 1930 the number of golf courses increased from 742 to 5856, a gain of 207.7 percent. The total value of golf courses in the United States at the present time is said to be approximately \$800,000,000.

According to the United States Census of Manufactures the value of golf equipment in 1929 was over \$21,000,000, more than 37 percent of the total value of sporting and athletic goods manufactured in that year. It is significant, however, that the period of most rapid growth of organized sport coincided with the prosperous business cycle following the World War and that since 1930 there has been a slight decline in the annual expenditures for sport, notably in the fields of football, baseball, golf and tennis. On the other hand, there has apparently been no diminution in the mass appeal of sports. This fact is evidenced in the increasingly large amount of space which is given to sports by newspapers and in the extensive broadcasting of games, tournaments, boxing matches and other athletic contests over nation wide radio networks.

In the 1890's, to combat the rising professionalism and commercialism, certain European idealists introduced Olympic games, an imitation on an international scale of the ancient Greek athletic meets. Although open to amateurs only, the new Olympics quickly fell victim to many evils peculiar to professional sports: the cupidity and jealousy of opposing teams and the refusal to concede defeat even when apparent; big business tactics of the organizers; overburdening of the teams with a hierarchy of managers, trainers, referees, chefs, doctors, sports writers and publicity experts. The emergence of various associations of amateur sportsmen has in no wise succeeded in overcoming the evils of commercialism. Such associations and their members rapidly succumb to the temptation of commercial exploitation. Even though the so-called amateur stars do not receive outright salaries for their performances, they are paid traveling and living expenses by the clubs arranging the meets, and such expenses often reach an annual figure of \$15,000 per star. The same conditions prevail in college and other amateur sports, which in spirit and details of business organization differ very little from a major sport industry, such as commercial baseball.

The importance of sport in modern capitalistic society lies not so much in its value as a means of recreation, an educational or even a military discipline, but in its economic implications. The problem confronting students of leisure and recreation is chiefly one of regulation, whether through private, voluntary efforts or through legislation, of a large scale business, an

enterprise which is based on specialization and professionalism, ruthless competition, exploitation of performers and exaggerated publicity.

SSŪ-MA CH' IEN (145-c. 90-86 B. C.), Chinese historian. Ssū-ma Ch'ien was the compiler of the well known *Shih chi* (Historical memoirs), which constitutes the first general history of China and which became the model on which all succeeding dynastic histories were based. An autobiographical chapter contributes most of the known facts of the historian's career. He was born in what is now Han-ch'êng-hsien, Shensi province, and his father, Ssū-ma T'an, held the post of grand astrologer from about 140 B. C. to his death in 110 B. C. After the lapse of three years the son succeeded to the same post, thus fulfilling a last promise to his father to complete the history which the latter had begun. Ssū-ma

Ch'ien was qualified for this task by extensive travels over the empire, begun at the age of nineteen, and by his official position, which gave him access to the imperial archives. In 104 B.C. he took an active part in the reform of the calendar. In 98 B.C. he unwittingly offended the throne by pleading the case of a young general, a victim of adverse circumstances. For this the historian endured the humiliating punishment of castration; for the remainder of his life he was employed as a secretary and had scant time to complete the history. During the first three centuries of their existence the memoirs were not known to biographers as the *Shih chi*, but as the *T'ai-shih-kung shu* (Book of the grand astrologer). In this work of 130 sections, covering the period from remote antiquity to the first century B.C., the material is arranged under five broad categories: imperial annals; chronological tables; treatises (on music, rites, astrology and so forth); annals of feudal families; biographies of representative men. In the latter the personality and literary skill of the historian stand supreme. Already in the first century A.D. 10 sections were reported as missing. Others were supplied by less skilful hands, not necessarily with intent to deceive, but in order to bring to date what was regarded as a standard history. The historian's original plan was to end the narrative in 122 B.C., and in any case it is hardly likely that he carried it further than 104 B.C.; hence events that must be ascribed to 68, 30 and even 20 B.C. are obvious interpolations. The fact that the *Shih chi* is largely a compilation of ancient sources, whose original texts were only slightly altered, enhances its value as a historical document. No nation of antiquity has a history in which the facts are more scrupulously handled or which is written from a broader social viewpoint; and there is none more convincing to the modern reader.

ARTHUR W. HUMMEL

Works: *Shih chi*, 47 sections of which have been translated into French by Édouard Chavannes as *Les mémoires historiques de Se-ma Ts'ien*, 5 vols. (Paris 1895-1905). Several sections have been translated into English by Herbert J. Allen in Royal Asiatic Society of Great Britain and Ireland, *Journal* (1894) 269-95, (1895) 93-110, 601-15. Chapter ccxiii has been translated by Friedrich Hirth in American Oriental Society, *Journal*, vol. xxxvii (1917) 89-152, reprinted (New Haven 1917).

Consult: Chavannes, Édouard, Introduction to *Les mémoires historiques de Se-ma Ts'ien*, vol. i, ch. i; Warren, G. G., "Chavannes' Edition of Ssu-ma Ch'ien" in Royal Asiatic Society, North China Branch, *Journal*, vol. xlvi (1916) 12-38.

SSÜ-MA KUANG (1019-86), Chinese statesman and historian. Ssü-ma Kuang served as minister of state under the Sung and was head of the party which supported tradition in learning and in politics. He was opposed to the social reforms proposed by Wang An-shih and retired when the latter became minister. He continued his political activities, however, and after the death of Emperor Shen-tsung in 1085 returned to power and immediately began to reestablish the traditional regulations and institutions, in the hope of restoring order to the country and eliminating the confusion caused by the reforms. As a politician Ssü-ma Kuang is one of the most representative personalities during the Sung period of the Pleiad Hsing-Li school, composed of neo-Confucianist statesmen and philosophers through whose efforts Confucian theories triumphed in politics, literature and national thought.

Ssü-ma Kuang was also one of the foremost Chinese historians. His *Tzu chih tung chien* (abridged translation in French by J. M. de Mailla as *Histoire générale de la Chine*, 13 vols., Paris 1777-85), a vast compilation of the history of China from the fifth century B.C. to 960 A.D., is the first really homogeneous and complete study of its kind. Typical of the Sung period, an epoch of systematic, generalizing research and synthesis, this work was intended as a guide to the correct principles of government. It had a wide influence and was imitated and continued by numerous authors.

STABILIZATION, BUSINESS. See STABILIZATION, ECONOMIC.

STABILIZATION, ECONOMIC. The persistence of sharp fluctuations in economic activity, marked by wide swings in prices, profits, employment and income to nearly all classes of the population, has in recent years increased the discussion of proposals for economic stabilization and the trial of measures to achieve it. Cycles and crises have of course characterized the business order from the beginning. The persons most severely affected have always sought relief and have been ready to listen to proposals for preventing the recurrence of dislocation. But the climate of opinion in earlier

days helped to stifle the complaints. Orthodox theory held that the economic order was automatically self-adjusting if calculated interferences with its processes were avoided. The business cycle and the recurrence of crises were not recognized as normal accompaniments of the mores of production and exchange. In a youthful and expanding capitalist order the natural optimism of business opinion prevented the expectation of another severe depression, once prosperity had returned. Later study of the defects of the system, particularly the development of business cycle theory, somewhat changed authoritative doctrine.

In addition the number of persons affected by depression was increased as modern capitalism brought a greater proportion of the population within its orbit. A larger part of production was carried on in factories; more persons were employed in them as well as in establishments for commerce, transportation and finance. Fewer farmers were self-sustaining; the majority came to depend on industrial and urban markets. The credit system, fostering a growth of debt both for long and for short term, came intimately to affect the welfare of nearly everybody. Any disturbance to the industrial or financial complex now has a far more serious effect on the population at large than in the days when industrialism and banking were islands in the sea of an older and more stable culture, and when those who suffered in its spasms could more easily find opportunity in newer and less exploited areas.

The internal development of the industrial order itself has moreover intensified the effect of fluctuations of activity in a number of ways. For example, it is established by statistical study that those industries which make and distribute perishable consumers' goods suffer less variation in volume of business than those which produce durable consumers' goods or capital goods, especially of the durable type. With the advance of technology and the rise in the number and variety of articles manufactured for the market a larger proportion of activity is necessarily devoted to making durable consumers' and capital goods. At a comparatively low level of material culture, where food and clothing constitute a large part of the consumers' budget, there is less opportunity to create a great industry for the manufacture of such goods as automobiles. As production becomes more mechanized and distribution covers more extensive areas, the manufacture of capital equipment for factories

and transportation agencies naturally expands. Again, as a population becomes urbanized the importance of the construction industry and of the various supply industries dependent upon it is enhanced. Construction, like other capital and durable goods industries, suffers wide fluctuations. Thus whereas variations of economic activity used to be merely uncomfortable, in an advanced nation they are almost calamitous.

An influence increasing the pressure for stabilization is the larger role played by savings and capital investment, which are the natural accompaniments of large scale enterprise and finance. There are more rentiers dependent upon steady income, more universities, hospitals and the like—with larger staffs of employees—largely supported by the income of endowment funds. Savings banks, insurance companies, building and loan associations, mortgage and investment companies, become the guardians of immense capital funds and the source of security and advancement to large classes. Even commercial banks, which normally supply nine tenths of the circulating medium through their loans and deposits, have become more dependent for their solvency on the stability of earning power of long term securities as well as of short term credit. Automatic adjustment to wide fluctuations of commodity prices and production requires the free and unimpeded movement of interest and rent as well as of other prices; capital deflation may be necessary to create a new equilibrium on which revival can be based. But the immense social and political power surrounding the capital institutions naturally strives to protect the stability of capital income instead of yielding to the pressure for adjustment, whether of earnings or of principal. Thus a need for general stabilization becomes more evident.

Growth of the need for stabilization has been accompanied by the development of institutions capable of exercising some economic control. Labor organizations, becoming more widespread with the extension of machine industry, exercise an influence over wages, hours and conditions of employment. Large corporations, quasi-monopolies, trade associations and the like have more power over prices, production and commercial policies than the small competitors characteristic of a primitive capitalism. The banking system, with its central banks, is able to try experiments in credit policy. All these and other groups bring pressure on political government to assist their efforts by economic activity

of one kind or another. Projects for stabilization are more viable than in the days when the economic system was more atomistic and resistant to conscious control from any source.

Early efforts at stabilization are in the nature of the case partial ones aiming to find a refuge for particular groups amidst the general anarchy rather than comprehensive plans for stabilizing the entire industrial order. Investors in long term securities and mortgages have long attempted to stabilize their earnings by contract, as have real property owners through contractual rents. No matter how much competition exists in capital and real estate markets, contractual rights tend to retard price changes. An industry able to achieve some approach to monopoly will strive to limit the disturbing effect of competition in many ways; it will attempt especially to raise and sustain prices, limit output or divide the market. In addition to the horizontal organizations typified by cartels and trade associations which engage in these practices, there arise vertical combinations which aim to enhance the power and security of owners by extending operations backward toward raw materials and forward to the ultimate consumer or by the stimulation of a complex of by-product industries to buttress the main process. Such developments are comparatively old in the stabilization movement. Labor organizations in their turn have tended to sustain wage rates as long as possible even under depression, to limit apprenticeship and build up benefit funds for unemployment. Foreign competition has been excluded, by the influence of both capital and labor upon government, through protective tariffs and immigration restrictions as well as more recently through import quotas, currency depreciation and other trade barriers. Farmers' cooperative marketing associations have attempted to stabilize crop prices by controlling the markets for given commodities, storing surpluses and exercising collective bargaining. Railroads and public utilities have achieved a substantial measure of price stabilization through public regulation. Indeed the economic history of the past half century might well be written around the central theme of the efforts of various competitive groups not only to enhance but to stabilize their own rewards against the risks of a generally anarchic system.

In addition there have been made efforts at partial stabilization which are defended by social theory on the ground that they contribute to general stabilization. Social insurance of all

kinds is based on the assumption that it protects the more defenseless members of society, who belong to groups unable to obtain security by stabilizing their own incomes; for example, workmen's compensation, old age pensions, minimum wage laws. Unemployment insurance is defended not only by this argument but by the contention that it helps to soften the impact of depression by sustaining the purchasing power of labor in bad times. The theory of long range planning of public works is directly aimed not merely at stabilizing the construction industry itself but at helping to stabilize the system as a whole through the effect of construction activity upon other industries. There is an even larger volume of economic experiment and literature relating to the project of stabilizing prices in general through central banking policy or the control exercised by governments over currency and credit. There are the many attempts at agricultural stabilization to protect farmers against the extraordinarily wide price swings consequent upon the relative intensity of competition among agricultural producers and the relative inelasticity of the demand for their products. These projects too are defended by the argument that in an order in which so many other prices are stabilized in one way or another stabilization of farm prices will help to alleviate price disparities, maintain economic equilibrium and sustain general purchasing power. The same justification has become generally used for all types of restriction of production and price control in specific situations, like those embodied in valorization plans for raw materials, such as rubber, coffee, sugar and copper, and in industrial cartels and trade association activities. One of the most striking recent developments in partial stabilization assumed to be in the general interest has been the use of government credit to prevent deflation of capital, as in the Reconstruction Finance Corporation in the United States, which makes advances of public credit to banks, railroads and insurance companies threatened with insolvency.

Much adverse criticism has been directed against partial stabilization of these varieties. First of all, the attempt to stabilize prices in any one market may be unsuccessful because of the inability to control the output of all potential competitors. It is difficult to obtain agreement and honest fulfilment of agreement from all concerned. When prices go up as a result of output restriction, production is likely to be enlarged by recalcitrants, so that prices tend to fall again

Second, if output restriction and price control are even partially successful, they may result in such a diminution of the volume of business that the earnings of the industry concerned suffer more than if no control had been attempted. From the point of view of a general economic equilibrium the prices which are successfully stabilized may be the very ones which ought to fall if production is to be stimulated. Thus mechanized industries controlled by large corporations attempt during periods of declining demand to hold up prices and diminish output, but this intensifies the general decline by reducing purchases of raw materials and new capital equipment as well as by increasing unemployment. It is argued that social devices to maintain the purchasing power of labor during depression prevent a deflation of labor costs which would tend to stimulate employment. Also if unemployment compensation is paid from reserves built up during prosperity, the sale of the securities to obtain cash may depress capital markets at the very time when the fall of capital values is endangering financial institutions and helping to prevent new investment which would bring revival. If the compensation is paid from public funds, the money must be raised by taxation or must be borrowed; and either course may discourage new investment or raise costs of production.

Monetary and credit policies which aim to increase prices are likely to be ineffective at the trough of the depression, when they are most needed, because of the prevailing lack of confidence and the reluctance of banks to lend and of all to spend money and take risks. When inflationary policies do take effect, they are likely to become politically or economically uncontrollable and to lead to another crisis. It is uncertain also whether a general rise in prices successfully induced by expansion of currency or credit may not in the end enhance price disequilibrium by acting unequally on various kinds of prices. Expansion of public works is difficult to achieve promptly and in sufficient quantity to come anywhere near counterbalancing the decline of private construction. The larger it is, the more it endangers public credit. Governmental salvage of private long term debts may prevent an essential capital deflation or may, if this deflation cannot be avoided, saddle the government with the losses of private capitalism. In any case it tends to maintain the most inflexible elements in the price structure.

Not all these arguments against stabilization

projects are necessarily sound; some are mutually inconsistent on any theory which locates the cause of the trouble in a disequilibrium of prices and incomes. It may, for instance, be good public policy to maintain agricultural prices and stabilize wage earners' incomes while allowing prices of many industrial products to fall and while permitting capital deflation. But all these contentions together serve to emphasize the point that uncoordinated efforts at stabilization made severally by different groups in their own interests or even efforts made by government in the interests of separate groups may easily make the general situation worse instead of better. They may succeed in places where they ought to fail or fail where they ought to succeed; they may emphasize existing disparities of prices and incomes or temporarily solidify fundamentally unstable situations and so bring worse trouble in the end. In a competitive order, depending on the incentive of private profit, partial stabilization is likely to turn out to be a mere transference of the competitive struggle from small units to large groups and aggregations, among which economic warfare is even more disastrous than among small and weak competitors. This is especially true when each aggregation attempts to safeguard itself by limiting its output, and the net result is therefore a diminution of the means of life for all.

Belief that stabilization in order to be successful must be general rather than partial has grown rapidly in the past few years and has given rise to schemes for economic planning. Under this guise some of the older developments have been refurbished and tried on a larger scale than ever before, especially in the United States. The Swope plan, for instance, framed originally with the electrical equipment industry in mind, was recommended by its authors as a plan for other industries as well. This involved an organization of all the manufacturing units in the industry in a single association, setting maximum hours and minimum wages for the industry, establishing unemployment insurance and freed from the restrictions of the antitrust laws in order that it might establish fair trade practices. A plan put forward by the United States Chamber of Commerce involved some of the same features but in addition recommended the setting up of a national planning council by private industry to coordinate the efforts of the various groups. These and similar plans put forward by industrialists were criticized mainly on two grounds: first,

that they offered little or no participation in the administration of industry to organized labor in the form of unions independent of employers; second, that they did not visualize a sufficient participation in planning by the government, which would be necessary as a protection of the general interest, as a means of enforcing the decisions of the various industries upon recalcitrant members and as a protection of the consumer interest against unduly high prices. The Swope and Chamber of Commerce plans, with certain modifications, formed the basis of the organization attempted under the National Recovery Administration. This added, in legal formulae and in some features of actual organization, government enforcement and protection of labor and consumer; but such provisions resulted in relatively little concrete accomplishment.

Certain provisions of numerous planning schemes as well as of some of the codes adopted under the N R A. were calculated to limit the utilization of existing equipment in the industry and also to limit the investment of new capital in machinery and plant, on the assumption that the industries were overequipped to supply a normal demand. Nevertheless, questions were raised as to whether this assumption was true. Would not the demand be capable of increase if prices were sufficiently lowered? Could not prices be lowered without low wages or long hours if volume of production were increased, thus decreasing unit overhead costs, or sufficient capital deflation brought about reduced fixed charges or production were concentrated in the more efficient plants and the high cost establishments were either eliminated or made more efficient? What relationship did the calculation of overequipment bear to the inclusion of obsolete and high cost units? Sufficient information, whether of an accounting, statistical or engineering nature, was not at hand to provide reliable answers to such questions. Without this information, and decisions of public policy made in the light of it, it was impossible in practice to distinguish planning and stabilization from the habitual behavior of cartels and trade associations seeking to limit production in the interest solely of immediate profit. General limitation of new investment was of particularly dubious advantage at a time when the industries making capital goods were especially depressed and accounted for a large proportion of the prevailing unemployment. The resulting stabilization or increase of prices of manufactured goods also

tended, first, to maintain the price disparity between agricultural commodities and industrial products, canceling out the increases achieved by limitation of crops; second, to raise the cost of living as wage earnings were increased; and, third, to increase the cost of capital goods themselves, which were already too high in price to encourage new investment.

In view of difficulties like these numerous theorists of economic planning have pointed out that there is a wide gulf between the aim of stabilization of specific prices by specific industries, effectuated as a rule by limitation of output, and the aim of a generally stabilized and progressive advance in production for the purpose of a fuller satisfaction of human needs. Economic planning in order to increase the means of life for all must have a general program and must plan at least nationally rather than by separate industries. It might sanction decreases in output for certain industries in which conservation of limited natural resources was important or in which a genuine overproduction existed regardless of the selling price, but it would be obliged to seek increase in output for industry as a whole. Far from freezing the existing price structure, it would have to seek a better balance among various classes of prices and in comes by reducing some prices, stabilizing some and perhaps increasing some. These interrelationships would have to undergo continual change in a dynamic system as technical advance reduced costs unequally and altered habits of consumption, as some goods became more scarce and others became more plentiful, as some industries grew while others declined. Such planning might find it disadvantageous even to attempt to stabilize "the price level" as an average; the essential increase of general purchasing power might be easier to bring about through allowing most prices to fall gradually as technical progress reduced costs and enlarged supply, rather than entirely through raising wages and other money incomes. National economic planning with social purposes would also be obliged, even if it restricted overinvestment in certain industries or at certain times, to encourage expansion of investment in other industries and at other times; for without a steady growth of capital resources on the whole a steady increase in output and consumption is inconceivable. Sound stabilization would have to seek to establish not a static balance but a moving equilibrium.

A similar logical gulf exists between national

planning in the sense of exclusive nationalism, or self-containment, and planning which takes into account the interest of the various populations in a thriving international exchange of goods and services. Planning for stabilization on an exclusive national basis is analogous to the attempt of separate industries to stabilize their own prices and control their own output. It proceeds by a series of restrictions, such as tariffs, quotas and embargoes, the net effect of which is to raise costs and prices, decrease the volume of activity and output and thus diminish real incomes all round. Seeking to stabilize in particular it aggravates the general causes of depression and instability. It represents merely the transference of competition from smaller units to large national aggregates. When, as is the case with most nations, the physical basis for self-containment does not exist within the national boundaries, economic imperialism is intensified and even a direct motive for wars of conquest provided. A type of national planning, however, which is animated not by the desire of exclusive groups of profit seeking producers to safeguard their domestic markets against foreign competition but by a national purpose of supplying the domestic population with larger quantities of goods would seek not to diminish imports but to enlarge them. It would set out to buy abroad those desired articles which were most scarce at home or could be made at home only at a higher cost and would sell in exchange those things which it possessed in greater abundance or could manufacture more cheaply than others. Such an international trade might be planned and controlled by the several national governments, but its guiding principles would be quite different from those of capitalistic nationalism. An instance of a planned attempt to enlarge imports of goods which are believed most desirable in reference to internal planning, by means of selling goods which the internal plan can best spare, is the foreign trade policy of the Soviet Union.

International planning has been proposed to ration and regulate the use of basic commodities and to aid international stabilization of money and credit. Such planning is scarcely likely to succeed in a milieu of competing economic nationalism, but it could be worked out, once the desire to maintain closed national economic systems were eliminated or the equally disruptive aim of selling without buying were abandoned. It is possible, for instance, to conceive of the success of an international wheat

conference—one of the first of the areas in which this type of control has actually been attempted—if the wheat deficit nations were willing to abandon their attempts to import as little wheat as possible even though it must be grown at home at a higher cost, and if the wheat surplus nations were able not only to use all the wheat which was really needed by their own populations but also to allot the production necessary for export to the regions of highest efficiency and lowest cost. And these aims in turn could be achieved more easily if the wheat surplus nations were willing to buy from the wheat deficit nations enough goods or services of other kinds to balance the exchange.

All these considerations, both national and international, give rise to the doubt whether planned stabilization can succeed under the capitalist order. Can any national government achieve the necessary authority over privately owned industry and can it effectively express the purpose of serving the general interest in a higher standard of living so long as the political and social power of private capital exists? Will the separate and competing groups of private industry themselves desire or allow the adjustments necessary in the general interest? Or if other classes gain a sufficient share in political power to induce the government to use the necessary compulsion on a reluctant private industry, will not this very compulsion act in such a way on the habitual dispositions of business men, investors, speculators and financiers as to retard production?

There is of course a theoretical escape from the dilemma—to seek stability not through conscious control and planning but through automatic adjustments of a competitive system. But the evolution of capitalism itself would appear to prevent a practical trial of this theory. In many important parts of the system automatic adjustments are prevented or unduly retarded by the power of capitalistic aggregates themselves. Governmental restrictions are largely the result of the interferences of private industry. In order to remove the barriers to a sufficiently prompt operation of the laws of demand and supply, so that the necessary adjustments might be reduced in amplitude through being increased in frequency, strong central governments would have to interfere to break up monopolies and quasimonopolies, to augment the number and reduce the power of competitors, to decrease the resistance of creditors against changes in the interest rate and capital deflation, to break up con-

trols in financial and investment markets, to enforce on natural monopolies, patent monopolies and regulated industries an equivalent to competitive pressure, to create free trade internationally. It is just as difficult to imagine a government achieving these ends under modern capitalism as it is to imagine a government enforcing upon private industry a planned stabilization in the general interest.

Some theorists therefore flatly declare that stabilization under capitalism is impossible; that only after the establishment of socialism can true social planning be attempted. Others are merely skeptical and are willing to see the experiment of planned stabilization under capitalism tried, with fear that it cannot succeed but with hope that from the trial something may be learned which will be useful under collectivism. Some theorists reject planned stabilization altogether, in the hope that an equally drastic reorganization of the system in the interest of adjustment through more perfect working of competition can be made. Few if any competent authorities, however, believe that stabilization is possible without essential modification of the economic and political orders.

STABILIZATION, MONETARY. See MONETARY STABILIZATION.

STAEI-HOLSTEIN, BARONNE ANNE LOUISE GERMAINE NECKER DE (1766-1817), French libertarian and litterateur. Madame de Stael was the daughter of Necker, finance minister under Louis XVI; in 1786 she married the baron of Stael-Holstein, then attaché at the Swedish embassy at Paris. For a time after 9 Thermidor her salon served as a meeting place for the constitutional party. As a violent opponent of Napoleon, whose regime she looked upon as the negation of the glorious principles of 1789, she became a deeply nostalgic émigrée during the consulate and empire, taking intermittent trips to England, Germany, Poland, Russia and Sweden and spending considerable time at her home at Coppet on Lake Geneva, where A. W. Schlegel, Benjamin Constant and other writers made up an informal cosmopolitan academy. With a feverish energy accentuated by the frustration of her great political talents, which the prevailing attitude toward women prevented from finding active outlet, she produced during the period of her exile a steady succession of works, including besides the famous novels *Delphine* (4 vols., Geneva 1802; tr., 3 vols., London 1803) and *Corinne* (3 vols., Paris 1807; tr., 5 vols., London 1807) important studies on philosophical and historical problems.

A true daughter of the eighteenth century, Madame de Stael was at once a passionate lover of France and a cosmopolitan, and she adhered firmly to the current faith in the indefinite perfectibility of the liberated human spirit. Without countenancing all of its later phases she extolled the revolution as the birth of the free French nation as well as of the rights of all men, although in her posthumously published *Considérations sur les principaux événements de la Révolution française* (3 vols., Paris 1818; tr., 1 vol., London 1818) she also pointed out, in anticipation of de Tocqueville, how deeply the upheaval was rooted in French history. In *De la littérature considérée dans ses rapports avec les institutions sociales* (Paris 1800; tr., 2 vols., London 1803) she tried to show that the advent of democratic government, which she preferred in its Anglo-American form, necessitated a pure language and the development of a new oratorical tradition; French writers in particular

must look for fresh inspiration in republican manners and foreign literature. The principal theme of the work was the dependence of literature upon social environment. On this subject, however, she had little to add to what had already been said by Abbé Dubos, Vauvenargues and Voltaire. Even her theory of the influence of geography and her antithesis between northern and southern literatures had had considerable currency since the time of Dubos, while the Scotchman Hugh Blair had already portrayed Homer and Ossian as the typical representatives of antiquity and the north respectively. Despite her enthusiasm for the then fashionable Ossian and her early sympathy with certain English romantic currents she was repelled by Chateaubriand and kindred writers, and it was not until her trip to Germany that she became sufficiently freed from the ideas of the Enlightenment to appreciate the aesthetic appeal of the new Christian romanticism. Her change of outlook became fully apparent in her famous treatise on the Germany of her time, *De l'Allemagne* (3 vols., London 1810; tr., London 1813). Although destroyed in France during the Napoleonic period, this work ultimately exerted a revolutionary effect on French literature. Madame de Staël was concerned not only with bringing new sources of poetic inspiration into a France still largely dominated by the neoclassical tradition but with propagating the French ideas of national self-determination and national rights in Germany. If she was not the first to awaken a sympathetic understanding of Germany in France—she owes much in particular to Charles Villers—she at least occupies a select place among the cultural mediators between the two countries.

STAHL, FRIEDRICH JULIUS (1802-61), German political theorist. The son of Valentin Jolson, a Jewish merchant of Wurzburg, he assumed the name Friedrich Stahl upon his conversion to Protestantism in 1819. He received a thorough humanistic education at the Wilhelmsgymnasium of Munich and studied law at Wurzburg from 1819 to 1821. He went to Heidelberg in 1821 and the next year to Erlangen, where he became acquainted indirectly with the philosophy of Schelling. He taught at the universities of Munich, Wurzburg and Erlangen and came into contact with the problems of contemporary politics as responsible editor of the official government paper, *Thron und Volksfreund*, and as contributor to *Inland*. In Erlangen, the only Protestant university in Bavaria, there had developed under the influence of Schelling and Krafft a German center of Protestant theology. Here too Stahl's Lutheran Protestantism and his Christian conservative political views were confirmed.

In 1849 he was called to Berlin by Savigny and Frederick William IV. His political and juristic ideas had already been formed when he left Bavaria for Prussia. The intellectual foundations of his theoretical and practical work had scarcely changed from those of his *Die Philosophie des Rechts nach geschichtlicher Ansicht* (2 vols., Heidelberg 1830-37; ed. by H. von Arnim, 1 vol., Tübingen 1926). His legal and political doctrines aimed at nothing less than a counter attack upon European thought as it had developed since the sixteenth century. Since that time theistic personalism had been increasingly pushed aside by an impersonal view of the world which was either pantheistic or mechanistic. Political and juristic thought was dominated by the belief in the impersonal orderly character of a rational natural law, independent of any divine revelation and with absolute validity for all times and all peoples.

Stahl was one of those counter-revolutionary thinkers who attributed the outbreak of the detested French Revolution to the unhistorical rationalism of natural law. Since antiquity natural law had always and everywhere attempted to explain and justify political sovereignty, at least in part, as emanating from the will of the governed. Even where the ultimate conclusion of popular sovereignty was rejected decisively, the doctrine of the social contract with its basic idea of an impersonal law remained the point of departure for all rational explanation and legitimation. Stahl undertook the grandiose task of overcoming the impersonal juristic thought of rationalism by a personalistic theism, of supplanting the abstract command of duty of rationalist ethics and jurisprudence by the command of a personal God, thus legitimizing the state transcendentally; that is, downward rather than upward. In his *Die Philosophie des Rechts nach geschichtlicher Ansicht* he still revealed the influence of the liberal and historical concepts of his time. In the second volume of this work, entitled *Rechts- und Staatslehre auf der Grundlage christlicher Weltanschauung*, he finally came to elevate theology to the central point of philosophy. He attacked the historical school as well as the entire German idealistic school for having failed to recognize that there was a power superior to nation and national spirit by which law was to be measured and directed. Stahl's political philosophy is not, as is often claimed, theocratic. In contrast to the theocrats of the Middle Ages he never viewed concrete political events as the immediate expression of divine will; he considered that the service of Protestantism to world history lay in its constant emphasis upon the earthly and human character of political life. Stahl's Christian state was to be constituted according to Christian doctrine but was not to set itself any religious goals. It was to remain always a secular institution. Equality was to be granted to the two great Christian churches but not to other Christian and non-Christian faiths and sects.

When Stahl began to expound these ideas at Berlin he immediately aroused wide interest. Leading political leaders, generals and councilors attended his university lectures. Outside the university he soon developed very important political and clerical activities as a counter-revolutionary legitimist. He presented his views on the important political problems of the day in a series of pamphlets and after 1848 in the *Kreuzzeitung* (*Neue preussische Zeitung*).

In 1848 he was elected to the upper chamber, where he joined the extreme right. In 1850 as a member of the Erfurt parliament he coined the phrase which today has again come into its own, "authority not majority." Stahl exercised his greatest influence, however, as the undisputed leader of the conservative party in the period of reaction after 1848 and as intimate counselor to Frederick William IV. Practically all the important reactionary constitutional enactments in Prussia owed their origin to his collaboration.

Stahl was prominent also in ecclesiastical affairs. In 1846 he was appointed by the Berlin faculty to the General Synod, in 1848 he became a member of the Upper Consistory, in the same year president of the Berlin Pastor's Conference and in 1852 member of the Upper Church Council. In addition to his influential *Die Kirchenverfassung nach Lehre und Recht der Protestanten* (Erlangen 1840, 2nd ed. 1862) his polemical work *Wider Bunsen* (Berlin 1856) should also be mentioned as well as his *Die lutherische Kirche und die Union. Eine wissenschaftliche Erörterung der Zeitfrage* (Berlin 1859, 2nd ed. 1860), in which he took an energetic stand against the union of the Lutheran with the Reformed church.

STAMBOLIŒSKI, ALEKSANDŪR STOIMENOV (1879—1923), Bulgarian statesman and agrarian reformer. StamboliŒski studied at the agricultural college of Halle in Germany and upon his return to Bulgaria joined the editorial committee of the *Zemledelsko zname* (Agrarian banner), the organ of the Agrarian National Union. From 1902 to 1923 he served as its editor in chief. As a representative of the Agrarian Union he was elected in 1908 to the Sobranje, where he ably opposed the misuse of the urban parties and the autocratic practices of Prince Ferdinand. The Agrarian Union continued to grow in strength; and StamboliŒski, who was one of its outstanding leaders, was particularly active in his opposition to the government from 1913 to 1915, when he headed a strong parliamentary group. In 1915, when King Ferdinand's intention to join the Central Powers became known, he helped to organize and lead

the opposing parties. Stamboliški's outspoken disapproval of the king's course resulted in court martial and a sentence of life imprisonment. In 1918 he was pardoned, whereupon he initiated a revolt against Ferdinand. Although Stamboliški's troops were crushed, the king was forced to abdicate, and early in 1919 Stamboliški entered the coalition cabinet, becoming premier the same year.

He remained in power for four years and by twice dissolving the Sobranje and eliminating his political opponents, largely through dictatorial measures, he obtained an absolute parliamentary majority and was thus able to apply the principles of the Agrarian Union. His legislation was definitely intended to better the condition of the peasants and to break the power of all other classes, including the industrial workers. His most important acts were the limitation of land-ownership to a holding of peasant size and a law enforcing compulsory labor service for the government. Because of his prestige in international affairs Bulgaria's position was much improved during his premiership. Reparation payments were reduced and friendly agreements were made with Czechoslovakia, Rumania and Jugoslavia. In 1923 Stamboliški's government was overthrown by the bourgeoisie, who allied themselves with former army officers and Macedonian revolutionaries, and he himself killed.

Stamboliški was the author of several works explaining the original principles of the Agrarian Union; the most important is his *Političeski partii ili súslozni organizatsii?* (Political parties or class organizations?, Sofia 1909; 2nd ed. 1920), in which he holds that all the non-producing classes are doomed to extinction. Political parties, which, because they were composed of persons with heterogeneous interests, played such an important role in building up true democracy, have become cliques, the tools and the sole support of the autocratic monarchical regime. New organizations based upon vocation and identity of economic interests are needed. The future democracy will be economic, not political; parliament will truly reflect social conditions when political representation is replaced by class representation. The Bulgarian peasantry must be organized into an agrarian union to defend its own interests and to provide a force capable of checking the existing autocracy. Stamboliški hoped to establish a "green international" of all peasant parties in Europe.

STAMBULOV, STEPAN NIKOLOV (1855-95), Bulgarian statesman. Stambulov attended the University of Odessa and, inspired by nihilist and nationalist doctrines, soon became a leading figure in the Bulgarian revolutionary circle at Bucharest. In 1875 he was especially active in the revolutionary committee which was preparing a general uprising and took part in the unfortunate revolts attempted at Stara Zagora, Giurgiu and Trnovo. After the emancipation of Bulgaria he became a lawyer and a deputy to the Sobranje. He favored a liberal constitution and was one of the leaders in the secret committee of the Liberals who attained power in 1881 and worked for the union of Eastern Rumelia with northern Bulgaria. In 1884 Stambulov became president of the National Assembly, and in 1886 as head of the council of the regency he opposed the Russophile party. In 1887, when Ferdinand became prince of Bulgaria, Stambulov was appointed prime minister.

During his premiership he established the independence and unity of Bulgaria. Despite the intrigues of Russia and the Russophile trend in his own country, he achieved diplomatic recognition for the new ruler and thus stabilized the internal position of the prince and his dynasty. The political and military foundations of the new state were set up on pro-Turkish, anti-Russian lines with the support of European diplomacy. Stambulov increased the prestige of his country by wiping out the brigand bands, establishing an efficient, dependable army, fostering agricultural and industrial production, arranging for networks of railroads and highways and improving the national educational system. He succeeded in 1890 in achieving official Turkish recognition for the Bulgarian schools and religious communities in Macedonia, in spite of the strong opposition of the Greek patriarch, and in 1892 and in 1894 won from Turkey important concessions concerning the autonomy of the Bulgarian church and schools.

Stambulov was forced by the counter-revolutionary activities of the Russophile groups and the chaotic condition of the country to assume

the role of dictator. His political decline began when the opposition was reenforced by young intellectuals who systematically attacked the Stambulov regime under the motto, "For freedom, down with the terror." Moreover his differences with the prince, who felt that he should have some influence over the army and diplomatic activities, became increasingly sharp. In 1894 Stambulov's government fell.

STANDARDIZATION implies a limitation of the number of varieties or types composing a given class, a close degree of likeness among the individuals of each type and exclusive or at least general currency or use of these varieties or types. It has been pointed out that there is an analogy between intentional standardization as practised by man and the process of natural selection. Although an infinite number of forms can occur in nature, certain types, the individuals of which closely approximate one another, do survive, and it is this fact which makes possible classification and generalization. A similar process of selection takes place in the development of social institutions, even where conscious direction plays a minor role. Social standardization is manifested in language, fashions in dress, systems of morality, military organization, customs and habits of work. Indeed from a broad point of view all social institutions may be regarded as examples of standardization.

Such standardization differs in a number of essential respects from technical or scientific standardization. The latter implies directed choice of norms; it substitutes artificial for natural selection, sets definite social or economic objectives, rests its decision as to the number and nature of the types chosen for survival on scientific investigation of the forms best fitted to facilitate the attainment of these objectives and then attempts to eliminate all significant variations among the individuals of each type chosen.

Technical standardization is often confused in popular discussion with the sameness or monotony which may arise in any society through the normal human tendency to follow patterns and adhere to systematic customs. A person interested in handicrafts, comparing the

variety and originality of different pieces of handmade furniture or pottery with the undistinguished character of that turned out by large scale production, may generalize from such observations and conclude that machine standardization has a deleterious effect on all modern products and habits, even on personality itself. If such a person were set down in any single primitive community, he would find not only rigorous patterns covering behavior, arts and crafts but in general an even greater degree of sameness than in modern society. In order to enjoy the range of variety which he now finds in primitive arts and crafts he would have to move from society to society and from period to period, a feat which would be impossible for any member of a single primitive community. Indeed the preference of some persons for life in primitive societies must be attributed to the very absence in them of the wilderness of meaningless variety with which the modern world is filled and to the fact that in primitive society there is no need to exercise so much choice.

The modern purchaser is embarrassed not by a limited number of kinds of things for sale but rather by the danger of poor quality and un-serviceability which arises from the lack of proper social use of standardization, from the very excess of variety which makes it difficult for the individual purchaser to judge among competing products and increases the wastes and costs incidental to the distribution of these products. The more standardization is extended back to basic materials, units and processes, the larger becomes the possible number of combinations of these basic elements in the finished product. A row of undistinguished, identical houses may result from a standard architectural plan, even though the materials from which these houses are made are chosen from an array of building materials in which standardization has made little progress. But a large variety of house plans and styles may be elaborated from building materials which result from highly standardized manufacturing processes.

Conscious technical standardization probably began everywhere with the determination of exact units of measurement and weight. Considerable standardization of products and methods must have gone into the great construction works of antiquity. Indeed it was the gradual accumulation of a variety of technical standards of performance and method which made possible the development of modern machine technique. Further application of the principles of

standardization accompanied the development of machine production; and without at least an elementary use of these principles mass production would be impossible. One of the first to attempt standardization in its modern form was Eli Whitney. In 1793 Whitney received a contract for 10,000 stands of arms; finding the old process of manufacturing each part by skilled handicraft too slow and uncertain, he supplemented the division of labor by simplification of operations and introduced drilling by templates, or patterns, filing by jigs, or guides, and mulling irregular forms, with the result that less skilled labor could be used and parts were identical and interchangeable. This not only facilitated manufacture of the separate parts but simplified the task of assembly and repair. Further impetus to standardization came in the course of railroad building, as it was realized that agreement on a standard gauge and on sizes of box cars and couplings was a prerequisite to easy transshipment over different lines. Before 1914, however, the trend of industrial development had been toward a constant multiplication of new products and new methods, with temporary standardizations of forms or devices pushed aside by the stream of new inventions. Combinations and cartels attempted to concentrate production, but such standardization as was achieved was haphazard and scattered. The World War forced on every country a gigantic program of standardization as basic to the economic utilization of resources and efforts. The technical lessons learned during the war years were too valuable to industry to be neglected at its close; the general economic situation during the post-war years moreover was encouraging to any movement promising reduction of costs or aids in marketing. The only national agency interested in standardization before the war was the British Engineering Standards Association, founded in 1901. With the close of the World War national standardizing bodies were organized in all the larger and many of the smaller countries of the east as well as the west: the Deutscher Normenausschuss in 1917, the American Engineering Standards Committee in 1918, the Japanese Engineering Standards Committee in 1921, the Russian Standards Committee in 1925 and an International Standards Association in 1929.

As the names of these organizations suggest, the first concerted efforts toward standardization were in the fields of engineering and basic producers' goods. With the growth of the movement, however, the technique of standardization

has been applied in an increasing number of fields. The *Yearbook* of the American Standards Association for 1931 lists the following as the more important forms of standardization: first, uniformity in dimensions necessary for interchangeability of parts and supplies and for the interworking of apparatus; second, standard nomenclature, covering definitions of technical terms used in specifications, abbreviations, symbols for quantities used in equations and formulae and graphical symbols; third, ratings of machinery and apparatus which establish test limits under specified conditions or requirements as to performance under operation; fourth, provisions for safety; fifth, rules for the operation of apparatus and machinery in industrial establishments; sixth, quality specifications for materials and equipment; seventh, methods of test; and, eighth, concentration on the optimum number of types, sizes and grades of manufactured products. This final type of activity is sometimes called simplification and thus differentiated from true standardization, since in the former case the criterion for the selection of types is relative commercial demand rather than utility or suitability for specific purposes as determined by scientific research. All standardization may be said to involve simplification, but not all simplification is in accord with the best technical practise. However, there is as yet no agreement upon terms; and some writers, particularly in England, use simplification to include all forms of standardization. There is some disagreement also as to whether grading (*qv*) should be regarded as a form of standardization; certainly it must be considered in any broad treatment of the movement.

Standardization has been most effective in the basic producers' goods industries. Even here the emphasis has varied from country to country. In Germany the standardization movement was closely tied up with the rationalization movement, and effort was devoted chiefly to the determination of optimum quantitative standards for goods and parts. In both Great Britain and the United States, under the influence of the scientific management movement, much attention has been directed also to the establishment of standards of performance; standard specifications, however, have tended to be fixed as a result of simplification rather than of scientific determination of optimum qualities.

Far less progress has been made in the standardization of consumers' goods than in that of other products, partly because individual con-

sumers have not been so well able to exert pressure in its behalf and partly because they have not been educated to appreciate its benefits or to make use of its results. Attempts to standardize products like sheeting or hosiery have fallen afoul of the reluctance of manufacturers to give up brand and trade names, covering unspecified and unstandardized products, without some assurance of a favorable reception of standardization by the consumer. The success of Henry Ford, however, is indicative of what can be done through mass production of highly standardized consumers' goods.

When it is most complete, standardization involves first research to determine exactly the qualities and attributes of the article best suited to the purpose in view, then the statement of specifications by which these attributes may be defined. Thus the basis is given for exactly comparable bids on goods of predetermined quality and competition is limited to price alone. When delivery takes place, the goods may be tested for compliance with the specifications. Both sides may benefit by the process, the buyer by a lower price for a given quality, the seller by the elimination of useless varieties and by lower costs in manufacture and selling. Nevertheless, it is obvious that this technique interferes with customary practices of salesmanship and advertising, the exploitation of brands and trade names and similar devices. For this reason the effort to extend standardization by cooperative and voluntary agreement of business agencies has made slower progress than it might otherwise have done. Most advance in this direction has been made where the buyers themselves are organized and powerful and able to exert pressure on the sellers, as in the case of governments or large industrial concerns. When this is not the case, standardization, if it occurs at all outside the individual concern, is likely to degenerate into mere simplification benefiting the manufacturers or dealers by a reduction of unnecessary varieties but failing to assure the purchaser that the varieties retained will best serve his needs.

Starting from its application in individual firms and plants, then through trade associations or other agencies over whole industries, standardization has tended to expand to national and even international scope. With wide variations in detail the national standardization agencies mentioned above have been organized on a common pattern. In general they represent a form of voluntary cooperation among business, professional and governmental agencies. For in-

stance, the American Standards Association (organized in 1928 as an outgrowth of the American Engineering Standards Committee) was composed in 1933 of 37 member bodies, including 9 national engineering societies, 21 trade associations and 8 departments of the federal government. In addition there are a large number of sustaining bodies, chiefly trade associations, which cooperate in its support. Parallel with the work of such bodies are the activities of the central governmental standards bodies—such organizations as the National Physical Laboratory in Great Britain, the Physikalisch-Technische Reichsanstalt in Germany and the National Bureau of Standards in the United States. These bodies are concerned chiefly with the scientific research basic to the establishment of standards; some serve also as the agency for drawing up specifications and testing materials bought by government bodies. In contrast with that of the United States, other governments have done little in the way of attempting to secure the adoption of standards by industry, leaving such activity to the non-governmental committees. The United States Bureau of Standards, on the other hand, has devoted considerable effort to the promulgation of national commercial standards and to the development of a certification plan by which it is hoped that certain "master specifications" will be brought into general commercial use.

Much has been written of the gains and the costs of standardization. Until a more revealing system of cost accounting becomes standard throughout industry, it will be impossible to calculate even financial gains and losses with any accuracy. Undoubtedly demonstrable savings have been made by individual business concerns through standardization: savings in plant and equipment, savings due to reduction of inventories, to increased productivity, to elimination of breakdowns, to a widening of the market or the cutting of marketing costs. There remains the question as to how far such savings have been passed on to individual consumers in the form of lower prices. On the other hand, consumers, such as government bodies, universities and other institutions, who have been able to purchase standard goods on the basis of quality specifications have achieved immediate and great savings. From one point of view both the general benefits and the costs of mass production may be charged to standardization, since standardization is so essential a part of the process. It should be noted, however, that such identification is

more applicable to the earlier forms of standardization than to the recent planned attempts to introduce standards. It is by no means clear that the movement in its later stages has always worked to the disadvantage of the small scale producer. In so far as standardization does imply mass production, it may be charged with certain indirect results: the widening of markets with the consequently increased interdependence of occupations and areas, both socially and economically; the speeding up of technical change; the elaboration of plants, machinery, equipment and administrative staffs accompanied by a decrease in the direct labor required for each unit of product. These factors in turn cause an increase in the importance of overhead and fixed costs, a greater risk arising from fluctuations of output, more acute problems of unemployment and greater attention to the desirability of distributing purchasing power in such a way that the output of mass production may have a steady and growing market. At the same time within a particular industry or group of industries standardization may result in an appreciable regularization of employment and stabilization of working conditions.

Standardization raises both for the individual producer and for society the problem of the maintenance of balance between the introduction of improved methods and the conservation of old systems and ways. If applied in any but the most superficial way, it raises fundamental questions as to the ends toward which it is to be directed—for what it is best and for whom—questions which might lead to a reevaluation of the entire concept of a standard of living for a nation or for the world.

STANDARDS OF LIVING. The concept of standard of living has yet to be worked into definitive form. It was used by the classical economists largely in discussions of the cost of labor as one of the factors of production; the Austrian school gave formal expression to the importance of the standard of living for a theory of consumption; but it was not until the influence of historical and anthropological studies had led economists to adopt a broader approach that there occurred any real analysis of the concept itself. The difficulties of such analysis hinge largely upon the existence of two main contrasting aspects or definitions of standard of living. The distinction was suggestively formulated by Alfred Marshall (*Principles of Economics*, 8th ed. London 1920, bk. vi, ch. xiii, sect. i) in his discussion of the difference between the "standard of life . . . taken to mean the standard of activities adjusted to wants" and the "standard of comfort . . . a term that may suggest a mere increase of artificial wants, among which perhaps the grosser wants may predominate." The former term implies the individual's entire social and moral outlook; the latter emphasizes his

material well being, which may be related in a variety of ways to his manner of living. It is the standard of life which is the progressive force. The same distinction between a dynamic and a static standard was made, in very different terms, by Simon Nelson Patten. Patten resolved the classic dilemma as to whether high wages cause or are caused by a high standard of living by pointing out that the answer must depend upon whether the laws of production or of consumption are taken as the basis of reasoning. He himself conceived of the "enterprising or higher classes" as driven to exertion and invention just by their primary standard of consumption, in other words, by the stimulus of more ambitious wants; while the more intelligent laborers have only a secondary standard determined partly by their consumption and partly by their relations to the enterprising class, and the standard of the mechanical laborers depends wholly upon conditions objective to them. In spite of their different and limited historical perspectives each of these distinctions does go to the root of the problem of standards—the various ways in which wants and activities, consumption and production may be interwoven in the circle of economic life.

The concept of a standard of living has been elaborated in modern economics as a parallel to discussions of standards of value, especially the value of money. Just as commodity standards and labor standards of value are taken to mean the value of a unit or units of some currency as expressed in terms either of frequently demanded commodities or of average labor services, so the underlying idea of a standard of living would seem to be that of a particular system of wants as connected with a specific system of productive services designed to transform these wants into efficient demand in the market. It follows merely from this formal description that, contrary to much popular opinion, such standards of living, besides representing the natural or physical conditions of certain minima of existence, derive their greatest economic and social significance, first, from the ways in which these conditions are reacted upon and developed, so that they result in cultural instead of natural minima, and, second and even more important, from the productive contributions that societies or groups are able and willing to make in order to attain such minima. The concept of an absolute minimum for every society or for mankind generally involves an assumption of equal human wants and efforts, at best differentiated by

property and education, and becomes the basis for an ideal of increasing the social product and dividing it with greater equality. On the other hand, to those starting from the recognition of unequal and mutually dependent human gifts and wants society will appear to be naturally constituted as a pyramid of relative minima, one of which can only with difficulty be raised unless at the same time the others also are raised or an entirely new equilibrium between wants and services is found.

Under static conditions of economic life therefore, whether in primitive societies or in those exhibiting the characteristics of the occidental Middle Ages, a stable standard of living is usually prominent in the public consciousness. It is not, however, a single and equal standard but rather a stable relation of different standards belonging to the diverse social groups placed in vertical or horizontal order. What has been called the mediaeval ideal of the sufficiency (*Nahrung*) to be won by each of several estates therefore by no means referred only to the adaptation, largely through limitation, of production and enterprise to definite immovable standards of living. It included a conception of immobility and consequent stability in the whole graded system through the coordination and interdependence of all productive services. Under such conditions the rule of "not spending beyond one's means" is never literally applied; on the contrary, the consumer credit enjoyed by the upper classes during the later Middle Ages has come to be recognized as one of the outstanding characteristics of feudalism. This in itself is an indication that the essence of the sufficiency ideal is not so much the complete correspondence between income and wants for each single estate or group—overconsumption of one having actually become the sustenance of others—as the conservation of the whole system by the prevention of sudden new forms either of consumption or of production.

The various ways in which such departures can bring about the break up of societies may be illustrated by two widely different examples: the rise of capitalistic enterprise and its extension to colonial areas. In the emancipation of enterprise from the mediaeval system a leading part, despite all theoretical arguments against the abstinence concept, was undeniably played by departure from sufficiency in the negative direction; that is, by voluntary neglect of traditional standards of consumption in favor of saving and investment. And, on the other hand,

the recruiting of the labor forces of early capitalism would hardly have been possible without the development of new standards of wants capable of attracting workers away from old surroundings and dependencies. This is the most general explanation of the continuing flight to the city not only of landless and depressed farm laborers but of farmers and their children, who are by no means necessarily in search of a quantitatively or otherwise absolutely higher standard of living but may move simply in response to higher nominal wages more than counterbalanced by higher costs of living and to the hope of "freedom"; in other words, they may be attracted by a qualitatively different arrangement of consumptive and productive acts.

The same development has occurred, in a fashion still more marked because of the existence of racial as well as social differences, in the process which capitalists have called "overcoming the inertia" of colonial natives, and which colonial politicians have more correctly referred to as raising their standard of living. The change generally takes place in several different stages. The recruiting of a labor supply in most cases involves serious changes in the existence of the natives, both as producers and as consumers. As producers they are ordinarily coerced through forced labor, the dissolution of their collective systems of landholding or other economic rights and customs and poll taxes, which force them indirectly into the money economy and the labor market. But no less important is the transition from coolie levels of habits and demands to more ambitious and civilized standards that usually follows. Here the wide range between healthy and artificial comforts and wants in the Marshallian sense, including the spread of intoxicants and other degenerating influences of civilization, offers a warning against the danger of overintensifying the problem of standards. At this point moreover a second stage appears, when the interest of employers in keeping wages low becomes definitely opposed to that of humanitarians who insist upon equalization of working class conditions; while the interest of white or otherwise superior groups of labor is divided between keeping outsiders down to lower standards and admitting competitors only on conditions of equality.

A final complication is introduced into the discussion of standards of living by the growing influence of what J. M. Keynes has called the money economy; that is, by the increasing reac-

tion of unstable currencies on the relative position of social groups. The appearance of groups deriving their income chiefly from creditor or debtor relationships, from long or short term, rapidly or slowly moving labor contracts, introduces new and relevant social divisions cutting across the older divisions which correspond to the classical doctrine of the factors of production. The expropriation of a large part of the middle classes by inflation after the World War, the opposite interest of the small and middle sized entrepreneur and especially the farmer in easy money and rising prices, the position of the average laborer uncertain of his interests in the face of possible compression of the labor market through deflation and the effect on real wages of rising prices under inflation—these are only the most obvious instances of the multiplicity of conflicting standards so characteristic of the age of late capitalism as distinguished from the early capitalistic background of classical economic theory.

The theory of standards of living has acquired a peculiar significance for the theory of wages, because of the relation between the supply price of labor and objective and subjective standards. Here too it is hazardous to turn economic and social relations into absolute concepts. Thus the fight of social reformers for a living wage to be paid to every working man or woman, however useful in combating sweating systems, was based on neglect of the fact that a living wage can logically be related only to the person of the laborer and not to any particular piece or time of labor. This difficulty has been brought into particular prominence by post-war complications of the labor market, such as the shortening of hours because of unemployment and the effect of this on wages; the increasing combination of industrial with household, farming or gardening labor; and the question of cumulative employment, particularly the secret employment of those who receive unemployment benefits. Thus from the practical as well as from the theoretical side attention is being shifted from the idea of absolute and static standards to the concept of the standard of living as an organic element in the social process.

STANFORD, LELAND (1824-93), American railroad promoter and philanthropist. After studying law in New York and practising in Wisconsin Stanford was lured to California in 1852 by the discovery of gold. As a Sacramento merchant he accumulated a fair sized fortune within a short time. Captured by the dream of Theodore D. Judah, an engineer who was urging a transcontinental railroad, Stanford with three other Sacramento merchants, Charles Crocker, C. P. Huntington (*q.v.*) and Mark Hopkins, organized in 1862 the Central Pacific, the western part of the first transcontinental railroad, which was built eastward to join the Union Pacific at Ogden, Utah, May 10, 1869. While Huntington lobbied in Congress, using money freely, and secured a land grant and subsidy, Stanford, who in 1861 had been elected governor of California, used his political influence to secure state financial aid for the railroad project. In addition bonds were sold to the public and towns were levied upon for contributions. A separate construction company was organized, in which Stanford and his three associates were the only stockholders and directors; construction costs were excessive and the promoters' profits high. Stanford was also promoter of the Southern Pacific, the second transcontinental railroad, which became the center of his transportation empire. In spite of public opposition to many of its policies and struggles for control with Jay Gould and other eastern interests the Southern Pacific for years dominated California economically and politically. As a memorial to his only child Stanford in 1885 founded Leland Stanford Junior University, to which his large fortune was devoted. Without any well rounded philosophy of education he insisted that his university be non-sectarian, that it be designed for students of small means and that the education of the sexes be equal—the latter on the theory that as the early years of the child are intellectually the most important, the education of the mother must be adequate. As United States senator (1885-93) Stanford advocated government aid to education, legislation to promote cooperative societies and government loans

to farmers on real estate mortgages. Although he was an ardent Republican, he often voted independently, and except for his opposition to the Interstate Commerce Act of 1887 he usually sided with the liberals.

STANLEY, SIR HENRY MORTON (1841-1904), British journalist, explorer and empire builder. Born at Denbigh, Wales, Stanley was brought up in a workhouse. In 1859 he worked his way to New Orleans, where he was adopted by a cotton broker, whose name he assumed. After seeing service on both the Confederate and the Union side in the Civil War, Stanley developed a talent for journalistic exploitation of the adventures into which his strong bent for action led him. His assignment by the New York *Herald* in 1869 to "find Livingstone," the Scottish missionary who had disappeared in the Lake Tanganyika region, resulted in a memorable newspaper story and opened a career of exploration and acquisition in central Africa. Successive books chronicling his experiences, *How I Found Livingstone* (New York 1872), *Through the Dark Continent* (2 vols., London 1878) and *The Congo, and the Founding of Its Free State* (2 vols., London 1885), dispelled effectively the major geographical mysteries about the heart of the continent and stirred the imperialistic desires of the industrial powers. From 1878 to 1884 Stanley was agent for the Comité d'Études du Haut Congo (afterward the Association Internationale du Congo), King Leopold's device for achieving empire. He opened roads along the lower Congo, established commercial posts, wharves, administrative agencies, and concluded more than four hundred treaties with native chiefs, which formed the local basis for the authority of the Congo Free State. Stanley's expedition in relief of Emin Pasha in Uganda (1887-89) pursued even more complicated objectives with disturbing consequences. The negotiation of native treaties of which the British East Africa Company became beneficiary was the most positive of these.

Stanley's career, which was profitable to himself chiefly in its literary aspects, was attended by successive controversies as to his treatment of natives, his severity to subordinates, his connivance with slave traders and his gift for coloring statements of fact. No one has done more to diffuse the view that there are vast riches to be realized by the development of central Africa or to arouse international rivalry for their acquisition.

STANTON, ELIZABETH CADY (1815-1902), American feminist. Following her graduation in 1832 from the seminary in Troy, New York, where she studied under Emma Willard, Elizabeth Cady received thorough if informal grounding in the law in the office of her father, Judge Daniel Cady. In 1840 as the bride of Henry Brewster Stanton, the abolitionist, she attended the World's Anti-Slavery Convention in London, only to be excluded from active participation because of her sex. Together with Lucretia Mott, who had suffered the same fate, Mrs. Stanton in 1848 called the first woman's rights convention at Seneca Falls, New York, at which she secured the passage of a resolution demanding the franchise for women. For more than fifty years thereafter she was a recognized leader of the American suffrage movement, bringing to it her charm as a speaker, her ability to write easily, a legal training and a ready sympathy with the less popular phases of social reform.

In 1869 Mrs. Stanton founded the National Woman Suffrage Association (later the National American Woman Suffrage Association) and served as its president for more than a quarter of a century. She was editor of the *Revolution*, a woman's rights magazine, and joint editor of the first three volumes of the *History of Woman Suffrage* (6 vols., New York 1881-1922). Her contributions to the daily press and current peri-

odicals as well as to the early feminist journals, her drafting of the convention calls, the resolutions and appeals at each phase of the suffrage campaign, together with her nation wide popularity as a lecturer, kept the feminist cause continually in the public eye. With Susan B. Anthony, her closest associate from 1852 on, she carried the suffrage cause to every corner of the United States. Her coworkers looked to her at crucial moments: in 1854, when the New York legislature was for the first time to hear a woman plead the cause of married women's rights, and at other times to present legal arguments before state constitutional conventions and legislative and congressional committees. The ultimate recognition of her leadership in the struggle for equality of the sexes—political, social and economic—far outweighed the ridicule she suffered in pioneer days.

Blatch, 2 vols (New York 1922). *Consult: Harper, I. H., "Suffrage and a Woman's Centenary" in North American Review*, vol. ccc (1915) 730-35.

STARČEVIĆ, ANTE (1823-96), Croatian politician and political theorist. After studying in the theological seminary of Pest, Starčević worked in a lawyer's office in Zagreb, engaging also in literary activities. He went into politics upon the revival of constitutionalism in the Austro-Hungarian monarchy in 1860: he founded the Croatian Party of the Right (*Stranka prava*) and was a member of the Croatian assembly in 1861, from 1865 to 1867 and from 1878 to his death.

During the early nineteenth century the idea of a Croatian nation was current only among the nobility and the clergy. Starčević became the mouthpiece of a new social class, the secular intelligentsia, which had sprung from the peasantry and the petty bourgeoisie; the contradictions in his political views reflect the equivocal position of that group. Accepting both patriarchal and liberal principles, he based his demands as much upon the ideas of 1789 as upon the law of legitimacy.

A fanatical pan-Croat and an extreme Austrophobe, Starčević took a leading part in the opposition to Magyarization, envisioning Croatia-Slavonia-Dalmatia as a triune, independent kingdom. His greatest concession was his expression of willingness to recognize the Haps-

burgs as kings on condition that they be crowned in Zagreb and to negotiate a defensive alliance with Hungary on an international basis. While his obstinate refusal to compromise gave a tremendous impetus to the movement for liberation, it rendered Starčević's parliamentary activity entirely sterile. The basis of his pan-Croatism was an untenable racial theory. The Slovenes were "mountain Croats" and the Serbs, as "orthodox Croats," were their brothers. Certain Serbs, however, he repudiated charging that these, as the descendants of Albanians, Rashkanians, Wallachians, Greeks, Illyrians and gypsies, were an inferior race. He was impatient both with the linguistic reforms of Vuk Karadžić and the South Slavism of Bishop Strossmayer. Nevertheless, since Starčević maintained that the peoples who had settled between the Danube and the Adriatic and from Carinthia to the Boyana were united in their history, blood, language and community of interests, his pan-Croatism reveals a basic conception of South Slav unity.

STASZIC, STANISŁAW WAWRZYNIEC (1755-1826), Polish social philosopher and statesman. Staszic was born of a merchant family. He received his early education in a theological seminary and later studied philosophy and natural sciences, particularly geology, at the universities of Leipsic, Göttingen and Paris. At the Collège de France he came under the lasting influence of Buffon, whose *Époques de la nature* (2 vols., Paris 1778-90) he later translated into Polish. After his return to Poland he was unable to obtain a public post because of his humble birth and became a tutor and companion to the children of the famous Polish statesman and chancellor, Andrzej Zamojski, in whose home Staszic had an excellent opportunity to learn about the practical workings of the machinery of the state. An involuntary Prussian subject from 1772, Staszic became intensely patriotic; from his early youth his thought and effort looked toward the reconstruction of the disintegrating Polish state. His appeals to the

ruling classes and his concrete constitutional proposals designed to strengthen the state evoked a powerful response from his countrymen, but they failed to halt the process of political disintegration. After the collapse of Poland Staszic was most active in the Towarzystwo Przyjaciół Nauk (Society of the Friends of Learning), which had for its aim the conservation of the cultural heritage of the Poles, now threatened by foreign conquest. Under the short lived Duchy of Warsaw, the diminutive Polish state created by Napoleon, Staszic was in charge of education. In the Kingdom of Poland which was established at the Congress of Vienna in 1815 he continued his educational activities, and as director of the arts and crafts division in the Commission for Internal Affairs he contributed to the economic and cultural development of the Polish provinces. Toward the end of his life he emancipated his serfs and organized them into a cooperative group as the collective owner of his land.

Staszic's intellectual career was shaped by two distinct forces. On the one hand, he was a typical product of the eighteenth century; he was a thoroughgoing rationalist, a utilitarian, an enthusiastic believer in the perfectibility of mankind and an adherent of the theory of social contract with all its republican, democratic and equalitarian implications. An ideal government, he held, reflects the general will of the people—the source of all sovereign power—and guarantees the right to liberty, property and pursuit of happiness. In descending, however, from the plane of theory and social philosophy to that of political realities, particularly as these obtained in contemporary Poland, Staszic did not hesitate to advocate measures which were in direct contradiction to his theoretical postulates if only they gave promise of saving Poland from the impending collapse. Thus Staszic the republican and advocate of peace urged a hereditary monarchy with strong executive authority and the maintenance of a permanent army powerful enough to withstand the annexationist plans of the neighboring states. He revealed a similar compromising attitude in his discussions of social reform: while he launched a severe attack on the privileged status of the nobility and presented an excellent defense of the rights of the peasantry, demanding at the same time broader civic rights for the mercantile classes, the provision of some measure of emancipation for the peasants and the granting of limited rights to certain categories of Jews, he stopped short of

demanding complete equality as envisaged by his social philosophy.

STATE. The modern use of the word in the sense of a body politic first appeared in Italy (*stato*) in the early part of the sixteenth century; earlier meanings of *status* and its modern cognates had been estate, an assembly of estates, government or rulers collectively and constitution or form of government. The use of the term as a generic name for a body politic, whether republican or absolute, was probably fixed by Machiavelli (*Prince*, ch. 1). Its earliest use in English in this connection occurs in Thomas Starkey's *England* (1538), a book based on Italian authorities. The meaning became common in France and England during the sixteenth century and was adopted into official language in the expression secretary of state, an office held by Robert Cecil under Elizabeth. During the seventeenth century *Staatskunst* became the German equivalent of *ragione di stato* and somewhat later *Staatsrecht* acquired the meaning of *ius publicum*. In English the use of the word was probably extended as the older commonwealth was limited to non-monarchical government; but, as Maitland has pointed out, state never became a technically precise term in English law. As a technical term it belongs to jurisprudence and political theory.

As a generic term the word included from the start a reference to a land, a people and a government. In its present usage it implies some lower limits of size and civilization, as compared with tribe or gens, and also some degree of political independence, although it is widely applied to governments which do not claim sovereignty. Its employment has been carried back beyond its date of origin to cover words such as *polis* or *res publica* and forward to federal and parliamentary governments, which did not exist in the sixteenth century. At the same time it is used rather indiscriminately for non-European political units which never had the historical development more or less common to the states of the European culture area. As a result the word

commonly denotes no class of objects that can be identified exactly, and for the same reason it signifies no list of attributes which bears the sanction of common usage. The word must be defined more or less arbitrarily to meet the exigencies of the system of jurisprudence or political philosophy in which it occurs.

Even now the word state is occasionally employed by semipopular writers as synonymous with society, as when Spengler says "State is history regarded as at the halt"; but scholarly opinion agrees that this is a gratuitous confusion. In general the distinctions drawn have followed two main lines. Theorists with what may be called roughly a sociological background have conceived the state as a grouping or organization of persons acting together for common ends. Its extent would therefore be less than that of society and the definiteness of its ends would distinguish it from communal life in general, which can hardly be said to have any end beyond itself. This distinction is marked by MacIver with the terms association and community; the state is an agency for social control having as its object the regulation of "the outstanding external relationships of men in society." Such a view is now generally associated with some type of utilitarian theory of the state. Writers strongly motivated by considerations of valuation, whether metaphysical, ethical or juristic, are inclined to distinguish state and society as a matter of point of view rather than of grouping. The state would then be an aspect of society rather than a subdivision of it. Thus Hegel ascribed such everyday functions of government as police duties to civil society (*bürgerliche Gesellschaft*) and not to the state. The English Hegelians, who largely gave the word currency in English political theory, thought of the state as an immanent intelligence directing social change rather than as a social agency. The jurists, especially those with a Kantian point of view, have made this type of distinction most explicit. Thus Kelsen rejects altogether a sociological theory of the state; availing himself of a radical distinction of *sein* and *sollen* he identifies the state with the legal order or system of legal norms itself. The distinction would lie therefore in the difference between a causal system of human beings as biological and psychological entities and a system of obligations or norms of conduct.

Although the state included from the beginning the implication of a people as well as of a sovereign, it carried no precise indication of the relation between the two. The modern analogue

of people, the nation, is often used almost interchangeably with state, although the frequent existence of minorities with differing cultural nationality under the same government and the failure of a political unit to include all its nationals have prevented the terms from becoming identical. Where the terms are distinguished, nation refers to a unity of culture: a feeling of loyalty for a common land; common language and literature; identity of history and common heroes; and common religion. Most distinctive of all perhaps is an aspiration to political self-determination. State, on the other hand, refers to a unity of legal and political authority. Although state and nation have not become identical, the belief has grown steadily that national unity is the proper basis for political authority and that the national aspiration for self-determination creates the presumption of its own justice. National states may therefore be called the distinctively modern type, at least on the side of political ideals. It is impossible, however, to generalize about the incidence of nationalism on the actual structure of states. In its earlier history nationalism tended to aid parliamentary liberalism, at present it is more likely to be definitely illiberal.

The fact that the word state usually emphasizes political organization makes it especially difficult to draw a clear line between state and government. In the era of royal absolutism the distinction was not important, since the sovereignty of the state was embodied in the person of the monarch, while the land and the people figured as his patrimony. The distinction is of fundamental importance, however, for a juristic theory of the state. Indeed a series of German theorists from Seydel to Jellinek broke down the patrimonial conception largely by setting up the state as a juristic entity—a legal relation or a corporation—defined precisely by the possession of underived, although possibly non-sovereign authority. The monarch and his government are therefore merely organs of the state. In the most consistent form of juristic theory Kelsen has argued that even the juristic personality of the state is a confusion, the invention of a fictitious entity to embody what is really only a property of law itself. From this point of view a theory of the state would be distinguished sharply both from politics (social ethics or technology) and from sociology, the causal explanation of social fact. For theorists who regard the state as an association, on the other hand, its distinction from government has less importance. Thus to

Laski "the State is, for the purposes of practical administration, the government."

¹ Because of the uncertain meaning of the term it is unprofitable to attempt a classification at large of types of state; and because political institutions follow no generally fixed order of development, it is misleading to speak of the evolution of the state. If, however, the inquiry be limited to the culture area of western Europe and if choice be made in the light of what has been most important for political theory, several types of state which may be said to have characterized various periods may be distinguished.

Of these the first is the city-state of antiquity, within which began political theory, more or less as it has since been understood by Europeans. The special features of this type of state were closely connected with its small size and the consequent intimacy of its political life. This intimacy, on the one hand, resulted in a particularism too restricted for effective government at home and too belligerent to insure peace over the whole range of Greek commercial and social relationships. On the other hand, it produced the conception of free citizenship and free government founded on cooperation rather than force. The Greek theory of citizenship was ethical and educational rather than legal, since to Greek thinkers the state appeared as the arena in which alone a highly civilized life was possible. But the very richness of the ideal tended to restrict it to a small and selected class.

The inclusion of the city-state first in the Macedonian and later in the Roman Empire destroyed its political significance and produced a sense of isolation which for the first time made the individual as such an object of political thought. In the absence of national or class consciousness the correlate of the individual was humanity at large. In the Roman Empire citizenship became world wide, and the bond between citizens was the law rather than the highly cultural achievements of the city-state. The prevailingly legal cast which political theories still retain is a heritage of Roman thought. The warrant of the magistrate's authority and of the citizen's rights was law, and law was conceived both as cosmic in its applicability and as embodying justice and right. This ideal of relations within the universal state was perpetuated in the face of the fact that the emperor's authority often flowed from mere military power.

In the Middle Ages political institutions and thought about them were dominated largely by feudal relationships. The combination of p

litical authority with the control of land tended to destroy any clear distinction between public and private relations. The relation of lord and vassal was more analogous to a contractual one than to that of sovereign and subject. The effective units of power tended to be estates, or classes having like social status and economic interests. A mutual responsibility of rulers and subjects and the right of the latter to assent to legislation and taxation were normal conceptions in such a society, and representation became the usual institution by which these conceptions sought realization.

The modern period of European political history has been characterized most obviously by a closer centralization of political and legal authority, correlated with an increasing range of commercial operations, the loss of local independence and the disappearance of guilds and ecclesiastical corporations. Such centralization was fostered by the need to offset divisions between hostile religious sects and by a growing sense of national unity, which provided a secular basis for political power. To this type of state the conception of sovereignty—the reduction of the political tie to the relation of sovereign and subject and the delegation of authority from a single source—was peculiarly appropriate. In its earlier stages the king was the chief beneficiary of this increase of power, but in England it proved to be compatible with the evolution of Parliament from an assembly of estates into a national legislature, which became the prototype of the sovereign lawmaking body elected by territorial constituencies and by virtually universal suffrage. With innumerable local variations this became the typical form of organization in the national democratic or liberal state.

Down to the present time it cannot be said that this type of state has been superseded, although it seems not improbable that some new type is in process of formation. A unitary state is obviously unsuited to a far flung imperial organization and in consequence the British Commonwealth of Nations, although keeping the form of parliamentary sovereignty, has reduced it to a legal fiction. Either a closer system of international relations will make national independence more fictitious than it is or social and economic relations will have to be curtailed to fit the theory of independence. On the whole, however, developments within modern states seem to provide the strongest forces making for changes of type. There is, on the one hand, the unavoidable necessity of governmental regula-

tion—whether in the interests of owners, workers or consumers—of commercial, financial and industrial relationships and, on the other, the evident inaptness of legislatures as now constituted for dealing effectively with the problems thus presented. The question appears to be whether adequate agencies for such regulation can be created while a general function of coordinating and supervising is left to elective legislatures, or whether a still further centralization of authority is required, involving the disappearance or drastic curtailment of representative government as now understood.

The second alternative, given effect in the fascist governments of Italy and Germany, has produced what is called the totalitarian conception of the state, the doctrine that the state is not only sovereign in a legal sense but has also the function of regulating every department of social life—education, religion and art as well as capital and labor and the whole national economy. Communist government in Russia is not very different in its conception of the state, although it is by profession a dictatorship in the interest of the working class, while fascism seems to be in substance, although not avowedly, a capitalist dictatorship. Both systems involve the abolition of opposition parties and the substantial elimination of parliamentary institutions. Both, however, profess to retain the principle of representation through other agencies, chiefly confederations of producers, although it seems doubtful how far this is an important part of the systems. It is impossible to tell whether these experiments indicate the emergence of a new type of state. In the case of Russia it is possible that communism is dependent on conditions peculiar to that country, the absence of which makes it improbable that other states will develop along similar lines. In the cases of Italy and Germany it is difficult to say whether fascism is a new type or represents a reversion in modern disguise to the old type, dictatorship. What passes for a theory of the fascist state seems in part psychological compensation for social distress and in part an ad hoc mixture of nationalism, Hegelianism and Machiavellianism.

The crux of any general theory of the state has always lain in the relations to be assigned to fact and value. Ultimately there seems to be no way to establish any value except to postulate it and no way to bring value into a series of inferences except to derive it from another value. Yet political phenomena are a tissue of valuations in the light of facts or of facts which consist largely

of valuations. An uncritical combination of the two leads to scandalous examples of wishful thinking, and a radical distinction produces clarity at the cost of formalism. Effective political philosophies have usually been those which have clarified values obscurely postulated in popular thought or which have aided in adjusting valuation to new conditions of fact.

The traditional philosophy of the state addressed itself largely to an ethical justification of the coercion which all states practise either toward their subjects or toward other bodies. Although the older theories of contract and divine right have long been outmoded, the essential distinction between them has persisted. This distinction is to be found in the kind of intrinsic value postulated. If it be assumed to lie in some form of individual life, whether happiness or personality, coercion must justify itself in terms of welfare; if it be assumed to lie in some form of social life, freedom must be defended as contributing to social well being. The difficulty of being faithful to either point of view has led some thinkers to bridge them with a theory of corporate personality and a refusal to distinguish sharply between the liberty of individuals and that of groups. Following Gerke, Maitland together with the political pluralists has made this theory an argument for the limited authority of the state, which would be only a species of the genus corporation. Maitland does not seem to have convinced jurists of the juristic importance of this theory. Gray has argued that, so far as positive law is concerned, it makes no difference whether corporations have a real or a fictitious will and that jurisprudence is equally well served if the state is defined as an artificial entity presumed to give unity to the organ of government. Vinogradoff has urged that on any grounds the comparison of the state to a corporation is analogical.

A juristic theory of the state is a special case of the type of theory conceived in terms of value; it need have no reference to ethical valuation and may be wholly positivist so far as the reality of corporate will is concerned, but legal competence itself is evidently a value, having no necessary relation to actual power. The relation of the state to law assumed in such theories has been various and not very clear. Theories with a political bent, even though they admit a unique relation between the state and law, have commonly admitted functions to the state, such as policy making and administration, which are not strictly juristic. Theories that have regarded

legislation as the distinctive function of the state have usually viewed law as a norm and the state as a personality, real or fictitious, corporate or otherwise, from which law emanated. In this type of theory it seems to be possible to say indifferently that law presumes a state and that the state presumes law; Vinogradoff asserted that it was idle to derive one from the other. The most advanced position and formally the clearest seems to be Kelsen's, that the origin of law in this sense is a fictitious and meaningless problem.

Even theorists interested chiefly in the validity of public authority have not as a rule distinguished such questions very sharply from factual and causal considerations. From the time of Machiavelli there have been scholars interested chiefly in the mechanics of political and legal relations; the prototype of all such studies is Aristotle's *Politics* (books IV-VI). Treatises of this kind have received enlarged importance from modern investigations into social and political psychology, cultural anthropology and the effects on institutions and ethical valuation itself of physical conditions and economic arrangements. While such studies are perhaps rarely undertaken without some oblique reference to valuation, their weight is on the side of description and causal explanation. Probably their most obvious effect has been to show the enormous variety that obtains in all branches of civilization, political organizations and institutions among the rest, and to indicate the need for caution in the extension of generalizations from one culture area to another. Even within a limited area wide discrepancies have been revealed between the categories commonly used for analytic purposes and those required for historical explanation.

In the political discussion of the recent past an especially important instance of these theories of social change has been the type which attributes them largely or wholly to the struggles of economic classes. This theory is associated with Marxian socialism, although it is not confined to socialists. Indeed the importance of this factor in politics is now generally admitted, although the weight attributed to it varies. From this point of view the state is an agency of the class in power whereby it protects its interests and exploits other classes—in modern times it is capital which exploits labor. It is a corollary of an extreme form of this theory that the state would disappear from a classless society, a bit of utopianism still cherished by some socialists

A theory of social classes, however, is a highly complicated problem and a two-class explanation is obviously an oversimplification. Moreover the propaganda value of the class struggle is modified or destroyed when complicated with nationalism. The practical implications of the class struggle have given rise to many differences among socialists. The question was canvassed in all its phases in the controversy between orthodox Marxists and revisionists, and since the rise of communism in Russia the dictatorship of the proletariat and other revolutionary aspects of Marxism have had a renewed emphasis. The class struggle has figured equally as an explanation of social change and as the rallying cry of a party. From the standpoint of method the distinctive feature of Marxism is the claim that dialectic affords an intellectual device for uniting these apparently independent purposes. In this association of causal explanation with valuation Marxism retains at least one fundamental identity with the Hegelianism from which it originated.

STATE BANKS, UNITED STATES. State banks are banking institutions operating under a charter issued by the state government as distinguished from national banks chartered by the federal government. On June 30, 1932, there were in the United States 6150 national banks and 13,013 state banking institutions. The latter group included commercial banks, trust companies, savings institutions and a small number of private banks. Their total resources were \$34,877,420,000 as contrasted with \$22,367,711,000 for the national banks. Capital, surplus and net undivided profits amounted to \$4,961,603,000 and total deposits to \$27,929,356,000 as compared with \$3,130,929,000 capital, surplus and net undivided profits and \$17,460,913,000 total deposits for the national banks. While state bank deposits were more subject to time restrictions than those of the national banks, their combined demand deposits actually exceeded those of the national banks by almost \$1,000,000,000. Contrary to the general impression the state banks are not merely small institutions. In many cities the most influential banks will be found under state control. Geographically the state institutions show a marked concentration in the southern and middle western states, 8275 of the 13,013 banks being in these sections. The sharp functional differentiation which for a long time existed between state and national banks is passing away. Restrictions imposed upon the latter with respect to real estate loans, savings deposits and fiduciary functions gave the state systems opportunity for

growth; but at the present time national and state institutions carry on to a large degree the same kinds of business.

The dual structure of banking in the United States has been a result of political and historical factors. Until the Civil War, with the exception of the First and the Second Bank of the United States, all banking was under state control. During this period there was much bungling and inefficiency but also a great deal of useful experimentation. Smaller units and somewhat more personal control have made it possible to try out projects not feasible on a national scale. Much of present day fundamental banking theory and practise was hammered out in the state banking systems prior to the Civil War; since that time bank deposit guaranties, agricultural relations and many kinds of unofficial adjustments of struggling banks have been sponsored by the states.

In New England under the leadership of the Suffolk Bank there was worked out an effective plan for testing banknotes by frequent clearance. In New York the Safety Fund of 1829 tried out the plan of protecting creditors by a guaranty fund, and in 1838 there was initiated a system of charters under general law together with protection of note issues by deposit of bonds, a plan which was later to acquire country wide scope in the National Bank Act. The Louisiana law provided fixed reserve requirements and a type of supervision rigid beyond anything practised before or perhaps since. In Indiana the state bank developed a plan of central control which was subsequently to become the nucleus of the Federal Reserve regional organization. In Missouri a state bank demonstrated the possibility of conservative banking under a joint system of public and private ownership. And later in that state there grew up a branch banking system under private ownership which, except for the accident of the Civil War, might have given the country a great lesson in banking efficiency. In Mississippi, Kentucky and other states there were unforgettable examples of how banking ought not to be conducted. In all this pre-Civil War experimentation there was much variation but a considerable tendency to build state central banks on the model of the Second Bank of the United States. In general these were branch systems, often with a state wide monopoly of circulation. Some were owned wholly by the states; others represented both public and private capital. The practises of the best of these state banks, such as those of Indi-

ana, Ohio, Virginia and Missouri, pointed the way to a solution of the banking problem much superior to the unit bank idea which developed during and after the Civil War.

The greatest defect of the state banking system, however, was that it failed to provide the country with a currency of uniform value; it was in part to remedy this defect that the National Bank Act was passed in 1863. The imposition of the 10 percent tax on state banknote circulation seemed to be a death blow to the state systems. The check book was not largely in use, and no one had conceived the possibility of satisfactory commercial banking without the note issue privilege. The immediate result was the concentration of banking under federal power, the state banks being either liquidated or converted into national banks. This process, although it provided a uniform banknote circulation, did not in other ways drive toward centralization, for the branch systems were destroyed and the new unit national banks were not subjected to such control as would abate substantially their independent action. Until the early 1880's state banking continued to be of minor importance. Gradually, however, it came to be recognized that note circulation was not a necessary part of every profitable bank, and the states began to make more and more liberal provision for state chartered institutions. In general the codes were modeled after the National Bank Act with note issue provisions omitted, and often with decidedly less control of original incorporation and subsequent operation. The unit bank idea became dominant, and in an effort to give facilities to the whole population units became too small for safety or efficiency. Not a little of the growth of the state systems is to be ascribed to an effort to evade even that modicum of capital investment and public supervision demanded by the national law. With every legislature working independently on the banking problem lack of uniformity was inevitable; but with continued copying of the banking codes from state to state and through the example of the better state systems and the national banks substantial progress was made before the passage of the Federal Reserve Act, and not a few states had arrived at a standard of banking efficiency comparable to that of the national banks. Since 1913 the Federal Reserve System has been able to bring considerable pressure for higher standards for both state and national banks. Unlike the National Bank Act, the Federal Reserve legislation was not intended

to destroy the state systems. Its facilities have been offered freely to such state institutions as can meet membership requirements comparable with those imposed on the national banks. It was hoped that in this way some semblance of uniformity might be brought into the banking system; but up to the present time, partly because of failure to meet requirements and for other reasons, the state banks have tended to remain aloof from the Federal Reserve System. At the end of 1931 there were only 878 state bank members and a substantial number, about 3200, were even refusing to use the check collection facilities of the system.

The state systems as they exist today are based fundamentally on the principle of free banking. In general any responsible group meeting the requirements of the law may organize a bank. Charters are granted under general laws, often but not always subject to the discretion of the supervisory authority. Notwithstanding the increasing caution in the organization of new banks, it seems fair to say that the states have offered charters much more freely than has the national government. As to the capitalization requirements, there has been a marked tendency to place the minimum low enough to make possible the existence of a bank at the smallest crossroads trading point. In larger towns more capital is required. Usually there will be found definite regulations providing for the withholding of dividends until a certain surplus fund has been created, and also in case their payment should impair the existing capital. In many cases, but not in all, double liability attaches to the stock. State commercial banks receive deposits subject to check and on time payment agreements. In some states, particularly in the east, savings accounts are in large measure carried in special savings institutions; but in other sections this business is done by commercial banks and trust companies. The states have engaged largely in plans for deposit protection. Beginning with Oklahoma in 1907 deposit guaranty schemes were set up by Washington, North Dakota, South Dakota, Nebraska, Kansas, Texas and Mississippi. These ambitious efforts have without exception ended in disaster, leaving behind millions in unsettled debts. Definite reserve requirements are generally imposed on state banks, and these on paper are often in excess of the requirements set for national banks. In many instances, however, the definition of what constitutes reserve is quite liberal. Restrictions on loans and investments are ordi-

narily less rigid than those of the National Bank Act, especially in respect to real estate loans. Public supervision varies considerably in effectiveness from state to state, but with a few notable exceptions it has not yet reached national bank standards. Generally examinations are greatly hampered by lack of funds, and in far too many cases political influence still affects the selection of examiners. In certain states, particularly California and Michigan, the unit bank is rapidly giving way to branch banking.

In other states where laws have been unfavorable to branch development there has been a large growth of group and chain organization. While many states are still officially committed to the maintenance of unit banks, branch, group and chain banking have found better opportunities under state than under national law. Group and chain banks, however, may cut across state and national systems, and therein lies an added opportunity for confusion in public supervision. When the Federal Reserve Act was passed, it was found that laws of most states usually required amendment before their banks could join the system. These changes were obtained without much difficulty, although some banking departments offered little cooperation. Aside from the larger institutions few state banks have cared to join. Many cannot meet minimum capital requirements, others object to various restrictions; while still others see no advantage which cannot readily be secured from correspondent banks.

The state banks have had a less favorable solvency record than the national banks. From 1921 to 1932 inclusive 10,484 state banks with deposits amounting to \$3,738,624,000 and 1571 national banks having deposits of \$1,143,857,000 were reported by the United States comptroller of the currency as having failed. In any attempt to account for the larger proportion of failures among state banks, however, it should be remembered that small unit size, less chance for diversification and concentration of location in agricultural sections with special and in recent years overwhelming hazard have been more characteristic of state than of national banks.

The future of state banking is uncertain. There has been insistent demand for concentration of all banks within the Federal Reserve System and under federal charter. Such demands will doubtless be strongly resisted by the states and will be slow of realization. In the opinion of some writers it is small scale unit banking rather than dual state and national con-

trol which has been a major cause of trouble. The state banking systems have played an important part in the economic development of the country, and it is not unlikely that they will continue to do so. While perhaps few competent bankers would advocate dual banking as a matter of abstract theory, it must not be forgotten that the system as it stands represents a historical development and that it is often more effective economics to improve and utilize what exists than to destroy and build anew.

STATE GOVERNMENT, UNITED STATES

The governments of the states play a double role in the United States. From the point of view of the government of the union they are instruments of local government. From that of the peoples of the several states they are organs of separate bodies politic and instruments of central government. In the beginning this latter aspect was dominant. It was reflected in the description of the states in early state constitutions as "free, sovereign, and independent" commonwealths. It was confirmed in the distribution of powers between the states and the union under the constitution of 1787. Some carefully limited powers were delegated to the federal government and a few others were expressly denied to the states. All the remaining governmental powers were reserved to the states respectively or to the people. However, the identity of the people mentioned in the dis-

tributive clause of the federal constitution was not wholly clear. One opinion was that the people referred to were the peoples of the several states. In 1861 this opinion was explicitly incorporated in the Constitution of the Confederate States of America. Another was that the word meant the people of the United States. The logic of events dictated the ultimate acceptance of the latter opinion, which signaled the triumph of the national point of view. As a result the state governments have come to be regarded primarily as instruments of local government.

The powers of the states appear to be of great importance from either point of view. In the first place, they have the powers appropriate for the organs of vigorous bodies politic. These include: the power to make and alter institutions of government within the state, subject to the condition that they be republican in form; the power to regulate the suffrage in federal as well as state elections provided, since the adoption of the Fifteenth and Nineteenth amendments in 1870 and 1920 respectively, that no citizen be denied the right to vote on account of race, color, previous condition of servitude or sex; the power to levy and collect taxes, except upon interstate and foreign commerce and upon instruments of the federal government; the power to make and enforce police regulations of all kinds, provided, since the adoption of the Fourteenth Amendment in 1868, that no person be deprived of life, liberty or property without due process of law or be denied the equal protection of the laws; the power to promote the general welfare by fostering religion and education and supplying public services of every kind except the few, notably the postal service, which are entrusted to the federal government; and the power to deal with the whole subject of private law, including the regulation of the vital institutions of modern civilization, the family and the system of private property. In addition the state governments may exercise further powers as agents of the union through the adoption of suitable measures by the federal government. There is nothing in the federal constitution to prevent the utilization of the state administrative machinery for national purposes, as was attempted in the case of the first federal Fugitive Slave Law; and there seems to have been in the early years of United States history a widespread expectation that the federal government would use the officers of the state in this way.

Circumstances have prevented the state governments from maintaining an importance corresponding to the extent of their powers. As agents of the union they failed to give satisfaction because they proved incapable of administering national measures in a national spirit. The federal government has consequently been obliged to develop its own administrative agencies. As instruments of central government in the states they have been disappointing, because the tasks confronting them have tended to outgrow the boundaries of the states and to overtax their resources. At first the subject matter of government within the states was chiefly local business. The original state governments were comparatively inactive and inexpensive. At present the improvement of the means of communication, the rise of large scale capitalistic industry dependent upon a nation wide market, the development of interstate commerce, the growth of a national literature and a national self-consciousness, all contribute in giving the public affairs of the states a national character. In addition the state boundaries unfortunately have been determined by the accidents of history and the convenience of public surveyors rather than by the needs of the people. The financial resources of the states, although they have grown with the increase of population and of wealth, have not kept pace with the cost of state government. The practical capacity of the states to meet their responsibilities is consequently unequal to their powers. The state governments should be much more active and expensive than they have been or are likely to be.

The position of the states in the federal system has been greatly altered in response to changing circumstances. In recent years the federal government has taken over a portion of the burden of the state governments by means of grants out of the national treasury in aid of state activities. These federal grants-in-aid (*q. v.*) have been most generous in connection with the improvement of public roads and recently with the relief of the victims of economic depression. But the federal government has not shared the burdens of the state governments without also encroaching upon their powers. More important have been the inroads upon the powers of the state governments through the growth of the custom of looking to Washington for the solution of problems which the states have found too difficult. The fostering of agriculture and of urban industry affords numerous illustrations of this tendency, which has been confirmed by

the practise of giving a broad interpretation to those provisions of the federal constitution which regulate the distribution of power between the federal and the state governments. Actual amendment of the federal constitution so as to restrict the powers of the states has been surprisingly infrequent. Apart from the reconstruction amendments adopted at the close of the Civil War, formal amendment has been of much less consequence in the development of the federal system than the informal changes resulting from the organization of national political parties and the domination of American politics, state as well as national, by the presidential elections. But the reconstruction amendments, especially the due process clause of the Fourteenth, have profoundly altered the position of the state governments in the American constitutional system.

The constitutional history of the states is closely connected with that of the United States. The original principles of American government were derived from three sources, the political philosophy of the English Whigs, the law and custom of the English constitution and the practical experience of the American people under the colonial governments. Hence arose the general belief in natural rights and written constitutions, the separation of powers, trial by jury, representative government and frequent elections. But there was little uniformity in the actual forms of government in the original states. Most of the original state constitutions provided no effective checks upon the authority of the legislative branch of the state governments, and the boasted balance of the constitutional systems was very imperfect. In all the states, despite the clamor about the rights of man, the owners of property, especially of land, possessed special privileges in connection with elections and the holding of public office. The dominant political ideas were worked out most logically in the original constitutions of New York (1777) and Massachusetts (1780), which in turn greatly influenced the framers of the federal constitution (1787). The latter established a standard form, which was faithfully copied by the framers of state constitutions; and at present, despite the increasing diversity in the circumstances of the states, there is an impressive uniformity in the structure of their governments. There is much more variation in the distribution of powers among the departments of state government. In general the constitutional history of the states, like that of the United States, has been

characterized by the strengthening of the executive and judicial branches at the expense of the legislative, and of popular control over them all. In most of the state governments, however, these developments have gone much further than in the federal government.

At present all the forty-eight states possess governments with bicameral legislatures and independent executives, and most of them also have an independent judiciary. The state senates differ from the more popular legislative chambers chiefly in the smaller number of their members. Members of the lower chambers are usually elected for terms of two years; senators, for two or four years. Governors and various other executive officers are elected at the same time as legislators for terms of two or four years; and in most states judges also are elected by the voters, although for longer terms. State elections are almost universally held on the same days as the federal elections. Unconditional universal suffrage exists in about half of the states; in the others there are literacy, property or poll tax requirements. The state governors generally possess a much more drastic veto power than that of the president and also wider powers over the appropriation of public money. In most states the state judiciary has a more extensive power than that of the Supreme Court of the United States to declare the acts of the coordinate departments of government unconstitutional. This results from the greater development of constitutional limitations upon legislative power in the state constitutions, limitations both of a substantive and of a procedural nature. The powers of the electorate are also more numerous and effective in the state governments. In nearly all the states constitutional amendments may not be adopted without the approval of the voters, and in about a third of them such amendments may be initiated directly by the voters and ratified by them without the intervention of their representatives. In a larger number the voters may initiate ordinary legislative measures and adopt them without legislative approval or may require that such measures which have received legislative approval be referred to them for final action. In a few states the voters may call constitutional conventions without any action by the ordinary legislatures, and the whole process of constitutional amendment and revision is brought within the range of popular control.

The working of the state governments, like that of the federal government, is greatly de-

pendent upon the operations of political parties. The rigid separations of the legislative and executive departments, the peculiar distribution of powers among them and the large number of public officers to be elected by the people create a need for more organization than is provided by the written constitutions. This need is increased by the decentralization of state administration and the independence of state administrative officers. The response is a system of elaborately organized political parties and the infusion of the spirit of partisanship into the entire political structure. The voters themselves are enrolled in the parties under the authority of law, and the whole electoral system, federal, state and local (with the exception of municipal elections in a growing number of cities), is dominated by partisan interests. The superior importance of federal, especially presidential, elections compels the subordination of state to federal issues and exaggerates the inevitable distinction between party government and popular government in the states. Party management becomes an essential element in the process of government and the recruiting of party workers and the financing of party activities become a kind of public enterprise. All the states have gradually assumed a greater responsibility for the conduct of elections and most of them have experimented with the regulation of party organization and party finance. But the profession of politics in the states continues largely to escape public control and the power of extraconstitutional political machines remains a striking feature of state government.

The product of government in the states is very unequal. The personnel in some is much superior to that in others and compares not unfavorably with the staff of the federal government, but in most states it is manifestly inferior to that of the federal government. Some states have shown initiative and enterprise in the making of laws and the administration of public affairs. Others have lagged far behind. In general the federal government has displayed greater resourcefulness and competence in dealing with the urgent problems of a changing world. Yet the states have demonstrated their usefulness as laboratories for experimenting with novel measures of social and industrial policy. Many are handicapped by their limitations as political and administrative areas. All are burdened with an ancient system of local government in counties and townships, ill suited to the requirements of a high powered machine age. The growing

centralization of local administration in the state governments, however, should bring them new opportunities of public service and tend to offset in some measure the loss of power and prestige which results from the steady encroachment of the federal government upon their original field of action.

STATE LEGISLATURES. *See* LEGISLATIVE ASSEMBLIES, section on UNITED STATES, STATE LEGISLATURES.

STATE LIABILITY. The responsibility of the individual in contract and tort is almost an axiom of mature legal systems. State liability, however, still constitutes a distinct problem. As long as the state's sphere of activity was very limited, the problem was not pressing. But with the rise of the industrial era and the consequent necessity for expert regulation which a congress or a parliament could not supply and with the growth of governmental control and supervision of enterprise, there has come into existence a sphere of governmental activity known as administration, which embraces all three of the traditional aspects of governmental powers—legislative, executive and judicial. As administration has expanded to extraordinary proportions, the need for the protection of the individual against it has become intensified.

Starting from varying historical foundations and premises the German, French, English and American systems developed in the beginning of the nineteenth century different forms of control over those who wielded governmental powers. Encroachments upon individual liberty were in all these systems designed to be kept, in

principle, within the limits of social necessity. Yet who was to draw the line? Who was to judge whether the line had been drawn properly? Here indigenous history and tradition determined the answer. In one country suspicion of the executive, in others suspicion of the legislature and in France suspicion of the courts produced varying institutions designed to achieve control over the governmental machine. Germany by statute and France by the practise of its Council of State have admitted governmental liability to the injured individual to a far greater degree than has England or the United States. Within the past few years, however, the last two countries have witnessed legislative movements designed to make the government suable for the torts of its officers and employees, as they had already been suable in contract. But while on the continent governmental tort liability is regarded as a belated recognition of a self-evident obligation, for the Anglo-American mind it constitutes something of a legal revolution.

On the continent jurists began with liberal premises. Steeped in juristic conceptions of corporateness, they construed legislative silence as the equivalent of consent to suit. Perhaps this continental development owed much to Roman political theory. Its most important advance over Greek thought lay in its conception of positive law, of legislation, of an abstract state as distinguished from society in general, the idea of legal personality or corporateness and possibly the idea of sovereignty. The state and the individual were distinct and their respective obligations and claims were the subject of legal regulation, practical administration and theoretical speculation. The state was deemed necessary to law and to social existence; but the individual and his protection, even against the group, constituted the principal *raison d'être* of the state—an idea at the basis of public law and of modern democracy.

There were also moral props of irresponsibility—royal prerogative, divine right, sovereign infallibility—but with their weakening there came into being in the eighteenth century two important political factors, the constitutional recognition of certain rights of the individual and the broadening activity of the state. To be sure, political and limited judicial guaranties had long been known in England; but up to the present time it has been assumed in England and the United States that in the main pecuniary protection against invasion of private rights on the part of officials was secured adequately by

conferment of a right of action under limited circumstances against the officer.

On the continent and indeed in most of the British dominions the obligation to assume liability in tort has long been recognized. The concern of the statesman in these countries has been with the scope and extent of the obligation the state should assume; the concern of the jurist has been with the legal explanation. It has been conceded universally that for highly important governmental acts, such as legislation, judicial decisions and exceptional executive determinations, state responsibility for error or injury cannot be assumed. Even within these fields the continental courts have sought to discover an administrative act within the broader state function and, apart from legislation, have thus made inroads on the area of irresponsibility.

But there never has been complete agreement on the theories supporting state responsibility. Continental jurists had been familiar with suits against the state in "corporate" matters, and in contract and property relations. In property relations unlawful acts of officers imposed liability, under the rules of the civil code whereby a principal is liable for the acts of his agent. But with the institution of eminent domain before them, requiring compensation for formal lawful acts imposing disproportionate sacrifice on the individual, questions began to be raised by the jurists as to the validity and rigidity of the classical distinctions between "corporate," or non-sovereign, acts on the one hand, and so-called "governmental," or sovereign, acts on the other; doubts were expressed as to the propriety of the distinction between acts lawful and unlawful, commanded and uncommanded, contractual and tortious. If the individual sustained an undue burden or loss at the hands of the governmental machine, it seemed to many, including both individualists and socialists, that the community rather than the individual should bear it. Thus it happened, mainly in the last generation, that legislatures and jurists began to break down traditional classifications and to regard at least the administrative activities of the state as subject to approximately the same legal rules and judicial control in behalf of injured individuals as applied to the activities of any other corporation.

The courts and jurists of the early nineteenth century found an adequate explanation for this conclusion in the customary rules of private law, particularly in the theory of agency. By characterizing the officer as an agent and the state,

government or group as the principal, rules of private law readily supplied a theory of governmental responsibility for wrongful acts of the officer—either implied negligence in selection or supervision or the principal's guaranty of the good conduct of his agent or the rule which imposes automatic vicarious responsibility based on identification or representation.

The supposed inadequacy of the private law theories was suggested by those courts and writers who had become impressed with the intrinsic validity of the classical distinction between corporate and governmental acts. While private law conceptions were deemed sufficient for corporate acts, they were considered insufficient for governmental acts. Responsibility for the latter, indeed, usually depended upon express legislation. These views, based upon public law explanations, were strengthened by the decision of the French court in the celebrated *Blanco* case, in which it was held that responsibility could not be based on any general rule but was to be explained by the equitable reconciliation of the interests of the state and of the individual. As the courts began to assess damages upon the state for many injuries, such as stray shots by policemen and explosion of munitions, without proof that any officer was at fault, many jurists became convinced that the classical conceptions of the private law could not fit the new jurisprudence. Possibly they did the private law an injustice. At all events innumerable legal, political and philosophical theories were advanced from many quarters to explain or to rationalize the new developments. Thus there were advanced the theories of social contract, social insurance and quasi-contract, which either have been abandoned or else have been absorbed in the broader legal theories of "administrative fault" or "fault of the service" and governmental "assumption of risk"—theories in which the individual officer's tort becomes tenuous or fictional or is openly discarded with the greater emphasis upon the operative fact of individual injury inflicted by the governmental machine.

The cycle from eminent domain had now been virtually completed; and while the older tort theories still sustained most of the cases, the new developments concentrated attention upon the effort to find broader political and philosophical foundations to support this modern legal structure. Thus there were advanced the doctrines of "equality of burdens" or equal protection of the laws, of "vested rights," of "equity" and of "special sacrifice" regardless of

tort, all of which were designed to demonstrate that special sacrifices imposed upon or borne by the individual in the pursuit of the common aim, the administration of the public service, should be spread over the community as a whole instead of being made to rest, as is generally the case in Anglo-American practise, solely upon the injured individual.

The reason for this long continued and growing injustice in Anglo-American law is to be found largely in a mediaeval English doctrine that "the king can do no wrong," which without sufficient understanding was introduced with the common law into the United States and has survived mainly by reason of its antiquity. The fact that the theory of absolutism which kept it alive in England never prevailed in this country and has since been discarded by most monarchical countries of Europe has nevertheless failed to secure any effective legislative reconsideration of the propriety and justification of the rule that the state is not legally liable for the torts of its officers.

But whatever explanation, historical or un-historical, may have justified the English crown in asserting and obtaining immunity in tort, no such monarchical aid could legitimately be invoked by American courts. Indeed in the famous case of *Chisholm against Georgia* (2 U.S. 419), decided in 1793, the Supreme Court of the United States held that the supposed grounds of immunity of a state from suit were without application in this country and that a state could be sued in the federal courts by a citizen of another state. As a result of this decision, which created consternation in the states, since they were heavily in debt after the revolution and feared that payment might be exacted judicially, the Eleventh Amendment to the federal constitution was adopted, prohibiting suit against a state in the federal courts by a citizen of another state. With this setback to democratic notions of responsible government there came a great revival of political metaphysics, and the American courts outdid those of England in emphasizing the validity and immutability of the antiquated maxims.

The doctrine of irresponsibility is not only a historical anachronism, but under present rules works gross injustice to all parties concerned and evidences an inefficient public policy. The non-responsibility of the employing state, accompanied by the theoretical responsibility of the mistaken or wrongdoing subordinate employee—the limit of the vaunted "rule of law"—is un-

fair to the victim of the injury, to the subordinate officer or employee and to the community. If the underpaid, subordinate employee is alone responsible in law, the risk of accepting public employment is unduly burdensome upon all except the financially irresponsible, and the detriment to the public service is great. Small pay with large risks induces a fear to enforce the law. It is not a defense to the subordinate that he acted under orders of a superior, even the highest executive officer, if the order proves for any reason to have been illegal. It is at the same time obvious that the alleged remedy of the injured citizen will in most cases be altogether illusory.

The recognition of any liability of the state in Anglo-American jurisdictions has been very slow. The English system of subjecting the crown to suit by petition of right (*Petitions of Right Act, 1860*) has, however, been deemed a proceeding not of grace but of right, although in theory the fiat may be withheld at any time and is indeed withheld in claims arising out of tort. Practise has, however, developed the rule of law that the petition of right lies to obtain from the crown restitution of lands or goods; or, if this is impossible, then money damages for wrongful detention or damages for breach of contract, including goods supplied to the crown or to the public service. Curiously enough it was not until 1874 that it was definitely established that damages could be recovered for breach of contract [*Thomas v. The Queen, (1874) L.R. 10 Q.B. 31, 36*]. In England damages for torts were recoverable against the wrongdoing officer, who generally at least could not plead in defense either reasons of state or command of the crown, or king. But even this limited protection to the citizen has now been much qualified by the growth of administrative justice with its recognition of discretionary acts immune to judicial review.

As for claims against state governments in the United States, the conviction is deeply settled that only by the most specific language will the legislature be able to impose liability in tort. Indeed when the California legislature made an appropriation to pay compensation to an individual injured by a tort of its prison officials, the statute was held unconstitutional as a "gift" to a private individual [*Bourn v. Hart, 93 Cal. 321, 28 Pac. 95 (1892)*]. Special statutes, however, have occasionally been construed to admit the American state's liability for torts of its agents or officers. Constitutional provisions in four states (*Alabama, Arkansas, Illinois, West Virginia*)

prohibit any suits against the state, although this does not prevent the legislature from appointing a board of claims to pass upon claims, with recommendations to the legislature. On the other hand, in some twenty-one states suits against the state are authorized constitutionally, but with possibly two exceptions these provisions are not self-executing and in only a few of the states has the necessary legislation been passed. In most cases the determination of the board of claims is recommendatory only, requiring a legislative appropriation, although this is also necessary where the determination is final.

In the United States the reluctance to abandon the discredited doctrine of state infallibility may be due to the fact that it appears to be tempered by other rules of law permitting suit against corporate bodies created by the state for the conduct of state functions and, as has already been observed, against state officers as well, although the courts have long and unsuccessfully sought to determine when a suit against an officer is a suit against the state.

Not much more satisfactory results have been achieved in the attempt to decide when the governmentally owned corporation is the alter ego of the state and when it is not. While local subdivisions of the state, like counties, school districts and municipalities, are suable, this fact has not served generally to make them legally responsible to an injured member of the public. On the contrary, counties and school districts, having been held to be subdivisions of the state for governmental purposes, share the state's irresponsibility for torts, if not its immunity from suit. Cities, on the other hand, present to the courts the problem of determining when the function or activity in issue is governmental and when corporate, on the familiar theory that when acting in the former capacity the city is but the agent of the state and hence immune from the rule of *respondet superior*, whereas in the latter capacity responsibility for torts is admitted. But the duty of stating when the function is governmental and when corporate, a distinction which in theory has a certain justification and is applied in Europe to all political groups and not merely to cities, has resulted in the United States in innumerable but metaphysical distinctions and in anomalies without parallel. There is a fair degree of unanimity that police duty and fire fighting are governmental, and that the supply of water, gas, electricity and transportation is corporate. But learned courts have

differed as to whether the collector of garbage, the street sweeper or the driver of an ash cart is engaged in the sovereign governmental duty of caring for the public health or in the modest corporate function of caring for the streets and highways. Why the cleaning or management of the streets or the operation of public buildings or public improvements or utilities is less governmental than the operation of schools, parks, playgrounds, hospitals, city garbage dumps or vehicles or why the extinguishing of fires or the management of schools and public vehicles generally is less corporate than supplying gas, water and power is not easy for the layman to understand. Many courts have admitted that it is vain to attempt to resolve the problem and, refusing to indulge in metaphysical distinctions, have justified their decisions solely on the rule of *stare decisis* in the particular jurisdiction.

Thus the Anglo-American system is not impervious to considerations of social justice in imposing upon the community the risk and burden of certain types of loss and injury falling upon innocent individuals. This is evidenced also by the statutes which impose upon cities or counties liability without fault for losses sustained through mob violence (see R107). The New York Court of Appeals in 1933 conceded liability for injury resulting from stray shots by policemen, and three states, as will be shown, recognize liability for errors of criminal justice.

The federal government has to a limited extent opened the door to suit against itself, beginning with contract cases, and since 1922 in tort cases up to \$1000. Although the constitution provides that private property shall not "be taken for public use without just compensation," there was no judicial means of making the requirement effective until 1855 and claimants were compelled to adjure Congress to redress their grievances. The defects of this system, both for the claimant and for the members of Congress, led to the establishment of the Court of Claims, with jurisdiction in claims founded upon a "law of Congress, or upon any regulations of an executive department, or upon any contract, express or implied." By the Tucker Act of 1887 there were added "claims founded upon the Constitution of the United States," a clause which has been held to be meaningless, and claims "for damages, liquidated or unliquidated, in cases not sounding in tort."

These jurisdictional clauses have been construed most strictly against the claimant. The owner of property taken by government officers

for public use must prove that it was taken under an express or implied promise to pay for it. Not only will a promise to pay not easily be implied, but the physical act of "taking" must interfere so seriously with the private use that the injury and deprivation are permanent and substantial and not merely temporary or consequential and therefore tortious, and there must also be an intent to take. Thus denial or questioning of the owner's right to the property—except in patent cases under statute, an exception created in 1910—by the government's assertion of an adverse claim or denial of an intent to pay will defeat recovery, for the taking is then tortious. Consequently the more flagrant and unjustifiable the government's act, the less its liability becomes. Moreover the circumstances must not negative the owner's open or tacit acquiescence, for otherwise the plaintiff will defeat that consensual relation which is supposed to underlie the implied contract. Mere evidence of governmental enrichment is insufficient to raise the implication of payment; a quasi-contractual obligation will not be recognized unless, as in tort cases, it is covered by a special act of Congress ad hoc conferring jurisdiction. There are many other legal hurdles placed by judicial construction in the way of claimants. Unless a claimant is fortunate enough to be able to surmount them all, he is likely to find his claim dismissed as "sounding in tort."

In recent years the force of circumstances has induced a growing disposition on the part of Congress to authorize suit in tort against the United States or to provide administrative machinery for the determination of legal responsibility under customary rules of law. Since 1900 special statutes have been passed with increasing frequency, either appropriating funds, after committee investigation, to compensate for tort injuries of various kinds or referring such claims to the Court of Claims or United States District Courts for determination and judgment. A federal Employer's Liability Act has been passed (*see* WORKMEN'S COMPENSATION) In taking over the railroads and certain collateral services during the World War, with the curious exception of the telegraph system, and in establishing a Shipping Board for the operation of merchant ships the government placed itself in the position of a private operator with respect to legal responsibility. On March 3, 1925, a comprehensive Suits in Admiralty Act was passed, authorizing suits against the United States in the federal district courts for damage caused by and

salvage services rendered to public vessels of the United States; this extended materially the scope of the act of March 9, 1920, relating to publicly owned merchant vessels.

Congress has also passed a number of statutes, mainly since the war, conferring a limited administrative jurisdiction on the heads of the various executive departments to settle claims for tort injuries arising in their departments. Even prior to the general act of December 28, 1922, conferring power on the head of each executive department and independent establishment to settle claims for "damages to or loss of privately owned property" not over \$1000, "caused by the negligence of any officer or employee of the Government acting within the scope of his employment," numerous acts had been passed conferring on the heads of certain departments, mainly War, Navy and Post Office, a limited power to settle tort claims. Some of the provisions of these acts, renewed in annual deficiency appropriations or otherwise, extend the scope of the act of December 28, 1922, to personal injuries and dispense with proof of negligence.

Since 1925 there has been before Congress a general bill to make the federal government suable for the negligent or wrongful acts or omissions of its officers and employees. The bill has undergone numerous changes, mainly procedural. Having now received the almost unanimous support of all the departments and the comptroller general, it seems likely soon to pass and receive presidential approval. Its main provisions are an admission of liability for damage to property, up to \$50,000, and for personal injury or death, not exceeding \$7500. In addition to negligence "defect or insufficiency" of "machinery, vehicle or appliance" is the source of liability for personal injury or death. Corporations in which the government owns 51 percent or more of the voting shares and securities are assimilated to the executive departments and independent establishments.

The procedure for settlement is administrative if the claimant accepts the settlement offered, and judicial if he does not. The General Accounting Office, headed by the comptroller general, is authorized to settle claims, in agreement with the claimant and after receiving evidence from the claimant and government department and, if necessary, subpoenaing witnesses. If the settlement is under \$1000, the comptroller general can pay the claim out of the appropriation of the department whose em-

ployee is at fault. Settlements above \$1000 must be certified to Congress for special approval and appropriation. If the claimant is dissatisfied, he can file an original suit in the Court of Claims, within one year of the unaccepted decision of the comptroller general or, if decision is delayed, within six months after filing the claim. Many types of tort claims are, however, excepted from the bill, including claims arising from loss or miscarriage of mail matter; assessment or collection of taxes; losses of persons in military or naval service; merchant marine and navy acts for which liability is provided by statutes of 1920 and 1925; acts of the Alien Property Custodian; administration of the quarantine laws, flood control and river, harbor and irrigation activities; injuries to vessels and cargoes passing through the Panama Canal; injuries by military or naval forces where relief is otherwise provided; injury to or death of a prisoner; negligence of physicians or employees of a government hospital, dispensary or institution; injuries or death arising from assault and battery; false arrest or imprisonment, malicious prosecution, libel, slander, misrepresentation, deceit, interference with contract rights or any criminal act or the alleged effect of an act of Congress or executive order. Tort claims not enforceable under the act must be directed, as of old, to Congress, where they are referred to the Committee on Claims. Contributory negligence, to which intoxication and wilful misconduct are assimilated, is a bar to relief. Lawyers' fees are limited.

The proposed English Crown Proceedings Act, presented in 1927 by a committee appointed by the lord high chancellor (Cmd. 2842), also involves revision and amendment of the law governing proceedings by and against the crown. Its most striking features are the proposed repeal of the Petitions of Right Act, 1860, the liability of the crown in tort and the provisions governing procedure. Suits against the crown are under the act to be assimilated so far as possible to suits against subjects. Suits, whether in tort or in contract, would no longer be dependent upon his majesty's fiat that right be done.

Most European governments have long recognized that when an innocent person has been erroneously convicted of crime, whether tortiously or by mistake, the state owes the injured person an indemnity. Several governments extend the liability to cases of wrongful arrest and detention. In the United States, as in England, the principle that judicial errors are in the highest degree governmental and hence cannot be made

the subject of state pecuniary liability has prevented the admission of the liability of either state or judge, except in the states of California, Wisconsin and North Dakota. Yet in England a century ago Jeremy Bentham and Samuel Romilly led a movement for legislative recognition of the state's obligation to indemnify the victims of such errors in the administration of justice. While no general bill has thus far been passed, individual appropriations have been made by Parliament in numerous cases. American legislatures have done the same.

The American statutes are strictly limited. The California act of 1913 requires evidence that the crime was not committed at all or if committed that it was not committed by the accused. North Dakota (1917) and Wisconsin (1913) merely require that the claimant be "innocent." California limits the compensation to \$5000 as a maximum, regardless of the length of the unjust imprisonment. North Dakota and Wisconsin provide that the rate of compensation shall not be greater than \$1500 a year; in North Dakota there is a maximum administrative award of \$2000 and in Wisconsin of \$5000, but with provision in both states for recommendation by the compensation board to the legislature of a greater amount if the board considers the statutory limit inadequate in a particular case. In all three states the procedure for compensation is by petition to an administrative board with appeal, on questions of law if not of fact, to a court.

STATE SOVEREIGNTY. *See* SOVEREIGNTY; STATES' RIGHTS.

STATE SUCCESSION is the acquisition, by one or several states, of sovereignty over territory which previously belonged to another state. The record of changes in territorial sovereignty together with that of other changes in rulership constitutes the history of the major historical convulsions. State succession differs from revolution in that it concerns international, not domestic changes and from migration and naturalization because it involves jurisdiction over territory and all persons entering it, not merely over a certain number of individuals.

Since international personality requires rulership over territory, a state ceases to exist as a member of the family of nations if its entire territory is annexed by another state. The annexed state may either lose the qualities of independent statehood altogether, as in the case of the Napoleonic conquests of many western, central and southern European states; the absorption of small German states in 1801, 1815 and 1866 and of small Italian states from 1859 to 1871; the British conquest of South Africa in 1902; the incorporation of Montenegro into Yugoslavia in 1918; and the numerous annexations of native states in the several continents. Again, formerly independent states may become member states of federal states. Illustrations are the states of the United States of America in 1789, Texas in 1845, Switzerland in 1848 and Germany in 1866 and 1871. The same effect may be produced by so-called dismemberment, i.e. the simultaneous complete absorption of the territory of a state by several other states, which may result either from the disruption of a centralized state, for instance, Poland in 1795 or Westphalia and other Napoleonic states in 1815, or from the dissolution of a federation or real union, such as the Holy Roman Empire in 1648 and 1806, a few republics in Central America during the nineteenth century, Sweden-Norway in 1905, Austria-Hungary in 1918.

Partial losses of territory not affecting the international identity of the ceding state have represented the most common type of state succession. In the case of cession the surrendered territory is acquired by other existing states.

Thus German territories were secured by France and Sweden in 1648, Belgian territory by France in 1697, Swedish Pomerania by Prussia in 1720 and Austrian Silesia in 1742 and 1763, Turkish and Polish territories by Russia and Austria at various times, French territories in America by Great Britain in 1713 and 1763. Other examples are the cessions to Napoleon and the retrocessions of 1815; the Louisiana and the Alaska purchase and the acquisition of Florida, California, the Philippine Islands and Porto Rico by the United States in 1821, 1848 and 1898 respectively; the acquisition of Austrian possessions by Italy in 1859 and 1866; of Schleswig-Holstein and Alsace-Lorraine by Germany in 1866 and 1871; of Peruvian territory by Chile in 1884. There may be cited also the Japanese gains from China and Russia since 1895 as well as the many cessions under the peace treaties of 1919, the numerous cessions by native states and the great number of minor boundary adjustments. A secession takes place when a part of a state's territory becomes an independent new state or a part of a newly formed state. This occurred when Switzerland withdrew from the empire, Holland from Spain, the United States from Great Britain, Belgium from Holland, the Latin American states from Spain and Portugal, the Balkan states from Turkey, and when new states emerged following the World War. In some cases less than full sovereignty is transferred and the ceding state may retain a restricted overlordship called suzerainty, as, for instance, Turkey in Bulgaria prior to 1909; or a whole state may remain partly independent under a so-called protectorate (*q v*).

Most major territorial changes have been caused by the single or joint operation of many factors. Proselytizing directed toward the spreading of religious or political dogmas and institutions was once important. Regionalism was partly responsible for the absorption of small feudal units into national states and may in the future account for the liquidation of intercontinental empires as well as the absorption of national states into larger and economically more efficient units, perhaps federations or empires of continental size. But nationalism combined with imperialism has been the most potent force in recent times.

The precariousness of the political equilibrium may be seen from the fact that hardly any decade since 1648 has passed without some major territorial change. While the results have usually been sanctioned by or embodied in treaties, most territorial changes of significance, with the

exception of some territorial purchases and several formations of federal states, have actually been effected by the use or threat of force and have in the main followed wars or insurrections; the desire of states to increase their territory is commonly regarded as one of the major causes of war. International regulation of state succession has remained inefficient and international attempts to prevent future territorial changes have been of limited effect and duration in the past, no matter whether they have been directed against international aggression alone or, as in the case of the Holy Alliance, against domestic resurrections and secessionist tendencies as well. Moreover international principles providing for territorial changes without force have on the whole remained restricted to demands for so-called self-determination and the application of local plebiscites. These demands are still doctrines, neither generally applied nor recognized nor possessing the force of international law. An international regulation of state succession based on a consideration of all just reasons and vital factors would hardly take cognizance of the desire of local populations as the only decisive factor, would lead to results which could not be embodied in a few abstract rules and would need for its application the machinery of a superior world body interfering with national sovereignty to a degree not regarded as admissible by the present members of the family of nations. This would seem to be true also of attempts to diminish the demand for territorial changes by the international regulation of migration, access to raw materials and sales possibilities. It is easier to envisage the desirability than the possibility of regulation of the occurrence of state succession in a calculable future.

International regulation of the effects of state succession has likewise remained limited in scope and effect. The successor state acquires jurisdiction in the transferred area, including legislative power. While customarily recognizing as valid the old common law of the area until it is expressly modified, the successor state is free to introduce its own laws or to create special laws at any time. The nationals of the losing state inhabiting the transferred area become subjects of the successor state, as a matter of course in the case of complete annexation or under special treaty provisions and the laws of the successor state in the case of cession, secession and dismemberment; former inhabitants domiciled outside of the transferred area are not necessarily affected by the change. Even

resident inhabitants may be exempted by special treaty provisions or laws of the successor state; or, as has happened more frequently in recent times, the inhabitants may be given the right to opt for citizenship in either the ceding or the successor state. Whether or not the transferred population acquires full citizenship status in the successor state depends entirely upon the latter; nor does any rule of international law guarantee their interests against their new rulers: an international bill of rights exists for transferred populations as little as for other populations. Provisions in treaties safeguarding property rights have, however, been frequent, and until recently there was a growing tendency to limit the power of the successor state by so-called minority treaties designed to protect a variety of individual rights as well as special organizations; treaties containing minority provisions apply to a number of central and southeastern European states; but the system has not been extended to western powers or colonial areas.

The effects of state succession on relations with foreign states and individuals have been the subject of extended controversy. As to treaties concluded by the ceding or annexed state the general rule would seem to hold that such treaties cease to apply and that those of the successor state begin to extend to the transferred area or the annexed state; there is some precedent, however, for the continued application of treaties concluded by the ceding state and concerning specifically the transferred area. While the successor state may expropriate property of the transferred population—this is, however, contrary to usual custom—private property belonging to neutral foreigners remains protected under international law; the successor state acquires immediately or may appropriate the public property of the losing state situated in the transferred area; in case of cession the treaties sometimes provide for compensation to the ceding state for such property. According to the prevailing opinion, supported by established practise, the rules protecting foreign private property in the case of state succession apply also to property rights consisting of debts or contracts; debts must not be canceled because of state succession. It is not established, however, that the annexing state succeeds to the debts of a totally annexed state, and there is increasing objection to rules which would burden a territory forever with financial obligations regardless of amount, benefit derived from proceeds or consent on the

part of the population. If a debtor state loses a part of its territory, it is not mandatory that the successor state must contribute to the amortization; but such contributions have been frequent, and assumption of debts secured specifically on assets in the transferred area has been the rule rather than the exception. However, creditors have not infrequently incurred losses through the impairment of the paying capacity suffered by a debtor state through loss of territory. In the case of concessions frequent difficulties and controversies are caused by doubts concerning the private character of the right, its legitimate origin and the fulfilment of obligations incumbent upon the concession holders.

Theories according to which the acquiring state is the legal successor of a totally annexed state are increasingly abandoned on the ground that they fail to conform to the practise of nations; even the term "state succession" is being attacked and at times replaced by the more correct term "changes in territorial sovereignty." In reality the legal effects of state succession cannot be explained by the application of any general theory of a metaphysical character.

STATES' RIGHTS. The phrase properly comprehends but one aspect of the autonomous sentiment that congeals around the nucleus of neighborhood or geographical proximity. The word rights indicates that a legal claim exists or

at least may be assumed to exist. States' rights in any exact sense of the term are therefore associated with federal types of organization. The word state, derived from the peculiar terminology of government in the United States, indicates that the political units around which the autonomous sentiment rallies are substantial in extent and accordingly excludes the claims that are set up in connection with attempts to maintain semi-independence in local government, whether its basis is a statutory one bulwarked by long practise, as was true in Prussia, or, like "municipal home rule" in many parts of the United States, involves constitutional arrangements that are partly federal in character. States' rights of course need not be concerned primarily with the units of government in the name of which they are espoused. In the United States, for example, regions have been more important than states at all periods in the country's development. The rights of the latter have been utilized as the only available legal support upon which to rest the broader purposes of sections.

The emphasis that belongs to the geographical ingredient essential to states' rights must be qualified in the light of the disposition of competing groups of all kinds to look for legal pegs upon which to hang their claims and grievances. The history of any federal system offers many instances in which controversies that are ostensibly regional are found to involve geographical factors only secondarily and incidentally. States' rights in the full sense, however, require a quickening of the awareness of locality. The outlook of the region may be colored by the predominance of some economic or social element, but it is followed by class collaboration. This condition is apt to attend either the pioneering stage of a new society or, at the other extreme, the situation of some racial or religious group pocketed in a national environment to which it feels alien. Separatism of the latter sort usually rests upon bases that cut across the industrial and class stratifications of the general body politic. During periods of agitation and revolt, to be sure, the discontents of geography and of class may unite in a common cause. Thus the socialist movement in Spain in 1931 was aided by the long fermenting autonomous spirit of Catalonia. Despite concessions made in the revolutionary constitution this spirit survived to trouble and to weaken the new regime.

The federal experience of the United States has not only furnished most of the ideology of

states' rights but has also illustrated the slow interchange of sectional attitudes that accompanies the massing of personality in a once predominantly agricultural economy. In the early stages of littoral colonization there existed incipient centers of what might have become genuinely divergent cultures. These were overlaid by rapid settlement in the nineteenth century. The sectional friction that remained was increasingly economic. Even as early as 1787 James Madison found reason to remark in the constitutional convention: "Look to the votes in Congress, and most of them stand divided by the geography of the country not according to the size of the states." At the same time he predicted that "the great danger to our general government is the great southern and northern interests of the continent being opposed to each other" ("Yates's Minutes" in Elliot, Jonathan, *The Debates of the Several State Conventions on the Adoption of the Federal Constitution*, 5 vols., 2nd ed. Philadelphia 1806, vol. 1, p. 465-66). The rise of cotton culture, with its deepening dependence upon slave labor and the fixing of attention upon the export market, brought autonomous and finally separatist sentiment in the south. Facing a future in which north and west would command a majority in the country as a whole, southern spokesmen sought a legal basis of defense. The federal union was portrayed as a compact among the state populations as entities. A corollary early developed was the doctrine of nullification, under which state governments were attributed a veto on the enforcement within their borders of national acts deemed by them to be *ultra vires*. This was justified on the ground that no organ or group of organs within the central government was competent to construe the scope of its powers. Resort to nullification, at least in the form of non-cooperation, was not confined to one section. Jefferson's embargo program, for example, was declared invalid by three state legislatures in New England, and in 1809 Connecticut refused to aid in its enforcement by the use of militia; while in the War of 1812, following the same general tendency, the authorities of Massachusetts declined to comply with a requisition for troops. On the eve of the Civil War, at a time when national legislation for the return of fugitive slaves was still favorable to property interests in the south, views akin to nullification were officially proclaimed in Wisconsin.

It was in the south, however, that the theory was most thoughtfully reasoned and most dra-

matically asserted. The original provocation was not slavery directly but the policy of protective tariffs. This seemed prejudicial to the agricultural economy which southern leaders, especially after the second decade of the century, viewed as the destiny of their region. The congressional act of 1828 evoked the South Carolina Exposition (in original form a report drafted by John C. Calhoun for a legislative committee), which expounded the right of nullification; still higher duties in 1832 called forth the formal ordinance of nullification. In the years that followed Calhoun elaborated the idea, articulating it in a broader philosophy regarding the protection of minority interests. His theory treated the national government as the mere agent of associated states, in the population of each of which resided indivisible sovereignty. The compact by which the states cooperated through a common instrument was qualified by the right of withdrawal; secession was legal. Such a conception of states' rights, at once so drastic and so careful, has hardly had a counterpart in the literature of other federal systems. It was faintly echoed in the writings of the Bavarian jurist Max von Seydel, but although he denied that secession was treason, he was willing to describe it as breach of treaty.

When the north and west by arms successfully resisted secession, the intellectual edifice of states' rights collapsed. The vague slogan that survived, although still influential in constitutional interpretation, was political rather than legal. In the postbellum south white supremacy replaced slavery as the "peculiar institution." From this standpoint alone did the new alignment regarding states' rights resemble the old. The agricultural sections of the country were increasingly conscious of dependence upon the national Treasury. Confronted by industrial integration, they were more and more disposed to invoke the corrective of centralized governmental control. On the other side states' rights began to draw lip service in regions of concentrated personality. The proclamation of the Sixteenth Amendment in 1913, permitting income taxation without apportionment among the states according to population, signaled more than a revolution in national finance. In conjunction with the unlimited "spending power of Congress," it was implicit with far reaching and bitter controversy. Although fundamentally a conflict of classes, the frictions were first manifested on regional planes of cleavage. It was significant that a state like Massachusetts should

break a lance in behalf of the new type of states' rights, when its legislature instructed the state's legal representative to bring an action in the Supreme Court in an effort to enjoin a congressional act of 1921 whereby financial aid, apportioned according to population, was offered to cooperating states in a combined attack on the maternal death rate. The resulting decision [*Massachusetts v. Mellon et al*, 262 U.S. 447 (1923)] apparently placed beyond effective challenge the power of Congress to support non-mandatory services, whether conducted directly or facilitated by grants-in-aid to state or local units of government.

Broadly therefore the uneven ripening of urban industry was reversing the position of the major economic elements regarding states' rights, bringing in its train a shift in the political attitudes of the geographical sections. Several incidental factors contributed to these tendencies in the decade after 1920. The osmotic disturbances engendered by national prohibition, especially in northeastern urban centers, threw humble people on the side of wealth in confused opposition to centralized government. In the same region and among the same elements also Catholic anxieties, beginning with concern for the safety of parochial schools in a preponderantly Protestant country, ramified obscurely into various issues connected with family and church influence; the result was an attitude that spread from agitation against any increase of national educational activity to a defensive position in federal relations generally. The confluence of all of these streams was illustrated in the wave of disapproval that engulfed the constitutional amendment for national regulation of child labor submitted by Congress in 1924.

Crosscutting within regions, however, seemed likely to prevent the realignment on states' rights from becoming clear cut on either side. In the south, in addition to the inveterate preoccupation with the hazards of white control, the incipient manufacturing centers were disposed to view proposals to equalize the conditions of competition by means of national labor standards as evidences of the "covetousness of New England"—to recall a phrase from the allusion to child labor in the message of Governor Bickett of North Carolina in 1917; in another part of this same speech he referred to the good roads which the federal aid road act passed by Congress in the preceding year had at last put within reach of his state. In the urban states wealth in personality, although glib in talking

states' rights as a foil both to heavy taxation and to inconvenient regulation, had too much to gain from uniformity and from the promotional activities of the national government at home and abroad to attack centralization seriously. Least of all did those connected with this interest care to assail the most cramping restriction on state autonomy; that is, the due process clause of the Fourteenth Amendment. The rights talked of were less those of states to act than of individuals and of groups to be let alone both by nation and by states.

Still further elements of internal conflict may be traced. Thus while personality was beginning to take up the slogan of states' rights, real property everywhere, in city as well as countryside, was tending to favor governmental forms and relationships that promised to alleviate the tax burden upon real estate by tapping new sources of revenue and by utilizing larger areas of administration. The situation in the public land states, comprising eleven in which the national domain still constituted a large part of the surface, further illustrated the blurring of sectional attitudes. Common problems and grievances had long made these states self-conscious as a group. They were at once irked by their dependence upon the central government and at the same time thoroughly confirmed in their close relationships with national administration. Such a question as the apportionment of the water resources of a single river basin, like that of the Colorado, moreover might lead the people of one state to favor development at the hands of Congress, while the spokesmen of a neighbor talked bitterly about the invaded prerogatives of sovereign commonwealths. These were some of the inconsistencies attending the broad shift in the basis of states' rights. The underlying pattern of the change was sufficiently marked, however, to constitute an important clue to contemporary politics and political theory.

The *volte-face* traced in the United States may be considered a normal expectation in any federally organized country that develops important concentrations of capital. These need not be industrial in the narrower sense of the term. Thus in Brazil the rich coffee growing section, centering in the state of São Paulo, was originally an axis of centripetal tendency in national affairs. In the constitutional revision under way in 1933 and 1934, however, this relatively advantaged part of the country revealed a spirit of defensive particularism. Special conditions of course may preclude such a de-

velopment. In Argentina, for example, the province of Buenos Aires has so preponderated in population as well as wealth that it has continued to favor action through the central government.

It may not be assumed that the growing sense of dependence upon the national government normally characteristic of the less developed or inherently poorer areas in federal countries is not interrupted on occasion by gusts of autonomous, even secessionist, feeling. The realization of dependence itself engenders irritation on the ground that the support given from the center is inadequate. An illustration has been afforded in Western Australia, where the circumstances of the protracted depression after 1929 led to official declarations in favor of withdrawal from the federation. The same phenomenon could be noted in lesser degree in the prairie provinces of Canada. It was the paradoxical result of the belief that the general government, if sufficiently energetic, might offset the disproportions of economic advance.

What has been said about the recrudescence of states' rights as a protective movement on the part of capital does not mean that it can be more than a gesture. Quite apart from the needs of industry and finance for large scale treatment, the sentimental forces of the modern world militate against provincial or even regional autonomy. The quickened national feeling that accompanied the World War and was further exacerbated by the peace drew the passions of men into larger vortices. Unless there was present some element of so-called race amounting to nascent nationality, centripetal movements seemed likely to prevail in any crisis. Proof of this may be read in the ease with which Bavarian particularism was overridden in 1933, despite the fact that its foundations were both cultural and religious and that it had long operated through a sectional party.

Where ethnic factors are strong, however, they cannot be lightly brushed aside. Contemporary socialism, although cosmopolitan in outlook and favorable to country wide action in its practical approach to functional organization, has learned to make terms with the autonomous spirit of language groups. It treats its compromises in this direction as a phase of the process of lifting submerged elements and thereby releasing self-respect and personality. Soviet Russia's federal scheme, with its several constituent republics, numerous autonomous divisions and council of nationalities represented in the central executive

committee, has offered an object lesson in the integration of loyalties.

In all societies, as the activities of government grow, the problem of reconciling organization by function and by region increases in importance. The ideals of each, although both are largely preached by the same persons, have been advanced with little reference to the other. Their combination is a critical part of the vast administrative task of the future.

STATESMANSHIP may be considered either as a branch of applied philosophy, involving knowledge of the true ends of political society and the means by which they may be attained, or as a practical art, the objects of which are the achievement and retention of political power. If for Plato statesmanship is part of the knowledge of the wise and virtuous man, for Machiavelli the necessary equipment for the would be statesman is *virtu*, the knowledge and successful practise of the art of becoming and remaining a ruler. The popular concept of statesmanship combines these two points of view.

Theory and practise both demonstrate the mixed nature of statesmanship as a science or an art. The great political philosophers all wrote with an eye on the subject—for Plato, Syracuse; for St. Thomas Aquinas, Cyprus; for John Locke, Carolina—and all were or hoped to be practitioners in the same sense that James Madison, planning a constitution for the United States, or Lionel Curtis, the beginnings of one for India, were practitioners. The test of a statesman has never been his power of analysis but what Cavour called his "sense for possibilities." When Solon said that he had given the Athenians not the best laws but the best laws they would stand, he exemplified the fundamental character of statesmanship; and when Cicero reproached Cato the younger for acting as if he were in the Republic of Plato instead of in the dregs of the commonwealth of Romulus, he illustrated the great sin against statesmanship, the making of the best the enemy of the good.

There are in every society not only institutions—religious, social, political—which must be utilized by the statesman, but persistent traditions and tendencies of action, what Pareto calls residues. These the mere theorist will assail, the mere politician slavishly serve, but the statesman use. He will, for example, consent to the survival of anomalies if the pain of transition to a new form of organization will thereby be assuaged. The early Tokugawa shoguns who preserved the dignity of the imperial house had their reward as statesmen if not as founders of a dynasty, when the great revolution in modern Japan was made easier under the plausible guise of a restoration. When circumstances are at all equal, the statesman will, in Jefferson's words, display "a decent respect to the Opinions of mankind," even when he does not share those opinions. Even a leader who makes a violent breach with the past will wisely pay attention to forces worth conciliating, like Lenin, he will adopt a New Economic Policy or, like Lenin's successors, make of the dead leader's mausoleum a shrine of a kind familiar to the national tradition. The putting of new wine into old bottles is a permanent task of a statesman.

On the other hand, statesmanship must be distinguished from mere politics. When Boss Tweed described himself on the prison register as a "Statesman," he was confusing a trade with a profession. A statesman, like a doctor, must have cure in mind as well as fees; and whether he is a consultant or a practitioner, he has a responsibility to his employers which is different from the obedience due from a servant to a master, from a courtier to a king, from a demagogue to a people. A statesman owes the ruler (king or electorate) not merely his voice but his opinion. This is not to say that he is excused from the duty of making his advice as palatable as is consistent with its character. The absolute monarch himself is never so absolute that he can forego the practise of the art of persuasion, the tactics of statesmanship.

The problem of responsibility in a democracy, ancient or modern, is far from being solved. If the people be regarded as the immediate source of political decision, like a jury before which politicians argue as does a lawyer, then the demagogue may be relieved of all responsibility. On the other hand, it seems fairly obvious that a statesman who allows his hand to be forced by outside pressure to do something which he thinks unwise, or even which he considers of doubtful wisdom, to some extent shares re-

sponsibility for the result. Thus a politician who voted for the Eighteenth Amendment because of political pressure is not entitled to transfer all responsibility to the Anti-Saloon League; and when a British statesman admits that he concealed his skepticism about the possibilities of making Germany "pay for the war" because he found expression of such skepticism resented, he cannot claim credit for his intellectual clarity in a time of passion. That he knew the better although he said the worse is an aggravation not a palliation of his failure to meet the reasonable claims of responsibility in a democracy.

What, apart from the general duty to give the best possible service in advice and action, is to be expected of the statesman? A specific answer to this question will depend of course on the historical context. There are, however, certain general concepts of a statesman's duty which are, if not permanent, very long lived. Chief among these is what has been called the concept of expansionism. A philosopher might think that a city or state could be too big or too rich or too powerful for its moral health, but most men approve of the test of statesmanlike greatness which Bacon drew from the anecdote of Themistocles at the Persian court, who when "desired at a feast to touch a lute, said, He could not fiddle, but he yet could make a small town a great city." The rise of nationalism has both intensified this view and given added chance for the display of capacity in its realization. Men will indeed prefer to belong to their own national group in a small state rather than to be members of a great but alien community, but they are few who rejoice in the smallness of their own state as a good in itself or who are not willing to pay a high price for its extension.

This general test of expansion or the narrower criterion of success or failure which it was possible to apply to limited tasks of statesmanship, such as fell to the lot of a Greek *aisymnetes*, a Roman *dictator* or a mediaeval Italian *podestà* or as fall at the present time to a high commissioner of the League of Nations or an American city manager, does not suffice for an assessment of the success of a statesman in the task which is now generally imposed on him, that of securing economic growth. There has never been a time indeed when the prosperity of a state has not been regarded as a test of political skill. But today most statesmen must profess to find their chief glory in real or apparent economic successes. That foresight which Thucydides thought marked Themistocles as a statesman of genius is still in

demand, but it is the foresight of Joseph preparing for the seven lean years of the trade cycle which is now wanted, more than the old foreknowledge of "what the Swedes intend and what the French." Whether the statesman is the servant, the ally or the master of the great economic forces of the state, he must stand to them in a closer relation than was possible in the days when he could choose between a policy of power and a policy of plenty. Indeed he now dare hardly admit that he separates them in his mind.

The success of the statesman has thus far been discussed pragmatically, as judged by the standards of his own age. It is convenient for a ruler to be able to assert with some possibility of being believed, as did Seleucus I, that that "is always just which is decreed by the king"; but in the Hellenistic and later Roman worlds, with the growth of independent ethical standards, the problem of the morality of statesmanship began to arise in a new form. Statesmanship was no longer, as it had been to Plato and Aristotle, necessarily ethical in character. To Marcus Aurelius and to St. Augustine alike the duty of a statesman was a part of his general duty as a man, to be performed "ever in the great taskmaster's eye." It was indeed an especially dangerous sphere of activity for the Christian, since a ruler had duties to perform and a statesman advice to give which might involve what were for a private citizen sins: the making of war or the execution of criminals. There might easily be a clash between his necessary duty as a Christian and what seemed the obvious interest of the community he ruled or served. Out of this dilemma arose the doctrine of *raison d'état*, with its rigid discrimination between the public and private life of the statesman. When Richelieu on his deathbed said he had had no enemies save those of the state, he had advanced a little beyond Sulla, whose epitaph boasted that the dictator had done more good for his friends and evil to his enemies than any other man; there was still an implication that the Ciceronian maxim "the safety of the state is the supreme law" was a valid rule for the public man. When Philip II or Queen Elizabeth planned the private "removal" of inconvenient subjects or enemies, the moral problem became acute. It is in reaction against such doctrines that attempts have been made to bind the statesman to the same rule of conduct as the individual. This in its turn leads to excesses and to the assertion of a more rational view, that the circumstances of a states-

man alter cases. "Political probity," says Croce, "is political capacity." The moral obligations of a statesman are not merely those of a private individual writ large; it is vain to assert that justice must be done though the sky fall if in fact society has adopted a utilitarian view of justice in which support of the sky is the first consideration. One who believes with St. Thomas or with Jefferson that certain essential values or inalienable rights are attached to the individual and that the state exists to foster and protect them will regard it as obvious that a state which can survive only by their destruction has failed in its primary object. But if it is held that a state or society is the vehicle of values and rights which do not exist outside it, then the duty to the whole may override the duty to the part. Today, with the assertion of the supremacy of class or national justice, there is small enough danger that the evil which Henry Taylor reprobated, of the conscience of a statesman being tender rather than strong, will be too widespread.

There is a danger, however, lest the role of statesman appear too onerous or insufficiently attractive, in spite of the fact that political ambition, in the western world at least, has long been regarded as legitimate to a degree that would be considered excessive in the case of another appetite. The Platonic guardians were, as Plato knew, part of a pattern laid up in heaven; and Utopia, Sir Thomas More knew, was nowhere; but man must live in an irrational and imperfect world. If there is a common inclination to despise the best that the most fortunate and wisest statesman can do, it would be profitable to reflect upon the works of rulers neither wise nor fortunate.

STATICS AND DYNAMICS. The terms statics and dynamics serve sometimes to divide the fields of economics or sociology into two major fields, and sometimes to mark off two stages in a certain method of approach. The conscious use of the distinction began in the middle of the nineteenth century—a time when mechanical analogies were freely used in social thinking—but types of study whose assumptions or limitations were of a static character were in existence much earlier. The eighteenth century idea of the natural order gave a prevailing

static tone to the social thinking of which it formed the background. Such thinking became a search for the conditions of an order in harmony with fixed external nature and basically fixed human nature, and hence permanent. This was supposedly found in the static mechanism of free exchange, to which was added a conception of the material conditions of a "stationary state" in which quantitative progress, under the free exchange system, would have gone as far as it could go.

How this static color spread through the treatment of different problems may be seen in the case of Adam Smith. His first interest lay in the economic system best adapted to promote "the wealth of nations"; and here he looked to continued quantitative improvement in efficiency of production within an unchanging framework of private property and whatever approach to "natural liberty" humanity might achieve. Next in point of emphasis was his search for the "natural levels" of price and of its "component parts"—a clearly static problem presupposing the existence of such natural levels. Departures from these levels received secondary attention. The origin and justification of private property he discussed in terms of "hypothetical history" rather than of evolutionary development. Even the order of development of different forms of production he found to run surprisingly parallel to the order of their natural superiority. Ricardo's treatment shows far less historical perspective than Smith's. His economic laws are conceived as timeless, and in the main as independent of human institutions. Bentham's "felicific calculus" was based upon the conception of a static human nature adapted to a system of free exchange which seemed to require no radical alterations.

There were of course early exceptions to this static view of economic institutions and processes. Sismondi did notable pioneering work in the evolution of economic institutions, which, as he treated it, was far from suggesting a mere process of groping toward the fixed, predestined and beneficent system of natural liberty as the ultimate term of the process. But the significance of Sismondi's work was not appreciated, especially by economists, until much later.

It was Comte who made the idea of evolution a "master idea" in the science, or philosophy, of human society. He envisaged an orderly development proceeding by discoverable laws. Statics he distinguished as the abstract theory of social order as distinct from social progress: the

structural nature of society as distinct from its laws of development. This structural nature is common to all times and places and is founded on the "social instincts"—sociability, benevolence, labor, family life, cooperation. Dynamics and statics tend to unite; the laws of order are explained by those of progress and the laws of progress by those of order.

Herbert Spencer, like Comte, made evolution a dominant idea and marked off statics as a field of abstract theory. He conceived it as the study of the equilibrium of a perfect society, dynamics that of the means of advance toward perfection. Lester F. Ward gave still a different turn to the distinction. For him statics had as its problem "the condition or status of society at the present time or at any past time." And he distinguished two kinds of dynamics: passive or negative dynamics, dealing with the purely spontaneous changes which society has undergone; and positive dynamics, dealing with purposive change. John Stuart Mill applied the term statics to the first three books of his *Principles of Political Economy* (2 vols., London 1848); he described them as dealing with the economic laws of a stationary and unchanging society and added, "We have still to consider the economic condition of mankind as . . . undergoing progressive changes." In what follows, however, Mill seems to devote his main attention to one aspect of change, its effects on prices and the shares in distribution.

Very different was the contribution of Karl Marx, who not only made trenchant studies of the past development of western institutions but propounded a law of development, the boldest as well as the most potent in its influence, of any similar effort of the human mind. This law of the inevitable catastrophe of capitalist society was not presented as indicating a development toward perfection, but rather as an unavoidable eventuality. To Marx the economic laws which others accepted as those of the natural or perfect society were merely the laws of a particular set of institutions.

The most rigorous use of statics as a conscious methodological device was made by J. B. Clark. The classical laws of the "natural levels" of prices and shares in distribution he found to be static in the sense that they describe not what comes to pass in any actual society, but what would come to pass in an unreal society devoid of change. He held this to be not only a justifiable but a necessary step in approaching the study of actual (dynamic) society. With John

Stuart Mill he believed in isolating causes in a complex situation, studying them one at a time, since what is true in the abstract is true in the concrete, with the proper allowances. "The world from which change is excluded is unreal, but the static laws which can be most clearly discerned by creating such a world have reality" and are in fact "as efficient in a society which is undergoing rapid transformation as in one that is altogether changeless" (*Essentials of Economic Theory*, New York 1907, Preface, p. vi, vii). Apparently he considered that it was because they had not used this approach that early dynamic studies were descriptive and historical rather than in the form of laws. Having worked out static laws of value and distribution, he proceeded to take account, one by one, of increasing population, growth of capital, improvements in technical methods and in industrial organization and the development of consumers' wants. He failed to treat the evolution of underlying institutions in his later and larger works, although his early *Philosophy of Wealth* contains suggestions in this field. It was the omission of such studies and the large attention given to effects of change (new levels of equilibrium), as compared with causes or processes, which led Veblen to characterize Clark's dynamics as only a modified statics. Indeed it did not purport to be exhaustive, and was confined to material which could be treated by the method of proceeding from static laws and making allowances for one dynamic factor after another. The far reaching qualitative changes involved in the evolutionary process in which Veblen's main interest lay are hardly suited to this method of treatment.

While Alfred Marshall's economic views were very similar to those of Clark, he did not create a thoroughgoing static system separate from the dynamic, preferring short chains of deduction to long ones. In place of one set of static norms, he spoke of different norms applicable to different periods of time. He distinguished broadly three grades of periods: those too short for the supply of goods to be materially altered; those permitting adjustment of output but not of the supply of the productive factors; and those long enough for effective adjustment of factors of production. Prices necessary to equate normal supply and demand over these longest periods are for practical purposes identical with J. B. Clark's static norms. Shorter periods exhibit what Clark called "dynamic friction."

Conceptions of normal differ not only in respect to length of period involved, but according

to whether normal is conceived as an average of fluctuations or as a level toward which prices are tending to "gravitate" (i.e. move under the influence of selected forces which would if isolated produce equilibrium). This latter, or tendency-goal, type of norm may logically differ from any observable average, and it is, as above defined, a static concept. A dynamic norm of this type, itself necessarily moving without definable limit, is such a difficult concept, to say the least, that it has not yet appeared as a working tool of analysis. Classical norms were of the average-of-fluctuations type, while those of J. B. Clark are tendency-goals.

It is to this latter type of norm that W. C. Mitchell refers when he says that he has discovered no evidence of its existence in his studies of business cycles. In other words, he finds no evidence of forces which act toward some equilibrium level and stop when this is reached. But he does find certain characteristic relations between prices and expenses of production on the average of prosperous and depressed periods. Both these results might be said to be inevitable in the nature of the case. Since both prices and expenses are moving, a normal of the average type must be expressed in terms of trends and departures from trends, although the average relation between prices and expenses of production might be stable over long periods.

There has lately been a movement to put the abstract mathematical formulation of conditions of equilibrium in such form as to permit it to be filled in by quantities derived from statistical studies. A demand schedule, for instance, becomes a surface of three dimensions, produced by a momentary (or in that sense static) demand schedule moving through time, usually with an upward secular trend. Only one point of any one momentary schedule can be observed. The rest are deduced from observations made at different times, on the assumption that the shape of successive momentary schedules remains the same. If the effect of price on demand is to be isolated, the effect of the observed trend through time must be eliminated. Thus departures from trends take the place of absolute quantities in this modified formulation, the dynamic factor being measured and eliminated before the static schedule can be isolated.

While the demand curves revealed by such methods may be little if at all different from those conceived as operating in a completely static state, the same could not be said of the

results which would be yielded by similar studies of such things as volumes of production and employment. In the complete static state plants would work at full capacity and there would be no unemployment. Such a condition is obviously far from any possible average of actual fluctuations in prosperity and depression. In this field, then, these two types of normal differ radically and fundamentally, so that theory approached via inductive study of business cycles and other dynamic processes must needs differ from theory approached via rigorous static standards with subsequent offsets and allowances.

One result of dynamic changes in economic conditions is that they bring into prominence the inelastic character of many costs of production, sometimes spoken of as overhead costs. The result is a wide divorce between long term normal price and the normal short term results of competition, the latter often tending to cut-throat levels and leading to conditions intermediate between complete monopoly and free competition and not obviously conforming to any kind of static norm.

The discussion thus far has dealt with quantitative departures from static norms, leaving untouched questions of qualitative evolution of the basic legal institutions of property, personal liberty and contract, of forms of business organization and of competition; or dynamic changes or long run evolution in human nature itself. These matters, emphasized by those sometimes called institutionalists, may be regarded as a second level of dynamics, more far reaching than the quantitative effects of movements within the market framework. Or if the mechanical connotations of the term "dynamic" make it seem appropriate to limit it to quantitative changes, then the more qualitative changes may be called evolutionary. In either case, an economics which takes these latter conditions as fixed is still working within limitations of a static character. For many purposes this may be necessary and legitimate so long as the limited or provisional character of the results is fully realized. But these static conceptions so work their way into the groundwork of the student's thinking that they are likely to be carried over unconsciously into fields where different conceptions are called for. Utilitarian standards of evaluation persist, despite the fact that they are based on a static view of human nature and should be radically modified or superseded when a dynamic view is adopted. Private property is too often judged as

if it were a fixed unit character instead of an evolving thing. The student may easily fail to recognize that the concept of capital as a self-replacing fund of material means of production is a static concept and needs to be broadened into a whole family of related concepts for purposes of dynamic study. Here discrepancies between savings and investment in capital goods may be vital to a theory of cyclical movements, while pecuniary yield and physical productivity may be well nigh divorced from one another. Criteria of evaluation and judgment need to be searchingly scrutinized to see that they are not invalidated by implicit static assumptions.

Quantitative changes may be analyzed into fluctuations—sometimes catastrophic—and relatively slow secular trends, usually thought of as capable of continuing without definable limits. Qualitative changes do not easily fit into such a scheme; and there is always the question as to how far they can go without necessitating a basic shift in the institutional system. The Marxian theory of inevitable cataclysm is not widely held outside of Russia; but Veblen's views point toward what may be called (after his biological leanings) a social mutation; while Sombart's theory is framed in terms of a limited number of organically possible economic systems, the new growing up within the framework of the old, becoming dominant and then declining while a still newer system develops within its obsolescent framework.

Some modern economists regard static systems of theory as discredited, since they furnish neither a true picture of the economic world nor a useful approach to dynamics. Only the latter criticism of course is pertinent. It seems evident that for certain problems the static approach persists while for others a fresh inductive start is necessary, both to give more accurate pictures of actual behavior and to suggest fresh component factors in the situation which may serve to interpret the more dynamic features of observed behavior. Dynamic conditions are too complex for deduction to yield a complete and definitive pattern of behavior to which they must necessarily lead, as static conditions bring about the equating of prices with the supply prices of productive factors. The role of the deductive process is commonly, although not always, reduced from that of designating the necessary results of certain isolated or assumed factors to that of suggesting natural and probable results. A beginning is being made, however, in the deductive treatments of rates of change in market quanti-

ties; in this field there are certain mathematically necessary relationships which can yield a useful type of dynamic law.

Demarcation of the line between statics and dynamics inevitably depends largely on the investigator's discretion. There may be dynamic problems of some importance within a state which is, in its main outlines, static. Statics refers to unchanging patterns of action, of which economic "levels of equilibrium" form a special class of cases. It might be defined as concerned with movements which are repetitive within such compass that the observer can sense them—as he feels the vibrations of a musical note—merged in some such concept as a "level" of price. But the observer may easily focus his attention on elements which merge and ignore others which do not. Different patterns have different durations, and the longer disturb the shorter. A market as a whole may show a stable pattern while its parts do not. The important question may be whether the individuals or businesses affected can absorb the changes into a regular and predictable scheme of life or of trade and industry. The harvest season gives rise to a fairly regular pattern of labor; but the casual harvest worker is not able to adjust himself to it so that his labor shall follow an unchanging pattern without serious uncertainties. As a result the labor market as a whole contains elements of a casual character not contemplated in any thoroughgoing "static state." Business cycles, less regular than the seasons, a fortiori, give rise to dynamic instabilities. And any study may be termed dynamic which focuses attention on processes of change, even if these are of the sort supposed to tend to an ultimate static equilibrium.

| HISTORY..... | WALTER F. WILLCOX |
| STATISTICAL PRACTISE..... | ROBERT M. WOODBURY |
| STATISTICAL METHOD..... | OSKAR N. ANDERSON |

HISTORY. The term statistics is derived from the debased Latin phrase *ratio status* and its Italian equivalent *ragione di stato*, both of which were coined in the later Middle Ages to designate the study of practical politics, or the statesman's art, as distinguished from the history and philosophy of the state. One of them gave rise to the word *statista*, signifying a person versed in public affairs or, in Elizabethan English, a statish; and from *statista* Achenwall in the mid-eighteenth century coined *Statistik* as the German equivalent of *ratio status*. The exact connection between the two, however, is not quite certain.

Lectures describing the states of contemporary Europe were delivered in Latin by Hermann Conring at the University of Helmstedt as early as 1660 under the title *notitia rerum publicarum*, and a book on the subject by H. Politano called *Microscopium statisticum* appeared in 1672. Two generations later Martin Schmeitzel offered a course of university lectures which he termed *collegium politico-statisticum* and in 1748 Gottfried Achenwall, often called the father of statistics, began to lecture at the University of Göttingen on the same subject. In the preface to his *Abriss der Staatswissenschaft der europäischen Reiche* (Göttingen 1749) Achenwall defined statistics as "the political science of the several countries," and in the body of the book he described Spain, Portugal, France, Great Britain, the Netherlands, Russia, Denmark and Sweden. Lectures on statistics soon came to be offered also at other universities, especially in Germany, and many books on it

were written by university teachers. The entire Conring-Achenwall tradition, systematized into a form appropriate to academic lectures and almost devoid of figures, is now known as German university statistics.

At the close of the eighteenth century *Statistik*, Anglicized as statistics, spread to England and to the United States. The earliest reported instance of the use of the English word is to be found in W. Hooper's translation of J. F. von Bielfeld's *Elements of Universal Erudition* (3 vols., London 1770), one of the chapters in which, entitled statistics, defines that word as "the science that teaches us what is the political arrangement of all the modern states of the known world." This book had little influence; but when John Sinclair in *The Statistical Account of Scotland* (21 vols., Edinburgh 1791-99) endorsed the term because he thought "that a new word might attract more public attention," it was quickly accepted. Sinclair's new word crossed the Atlantic along with his idea as early as 1811, when Timothy Dwight's *Statistical Account of the City of New Haven* was published as the first of a projected series of statistical accounts of the towns and parishes in the state of Connecticut by the Connecticut Academy of Arts and Sciences.

Statistics as understood today is far removed from the applied political science of the early statisticians. The content of the discipline, like the definition of the term, underwent profound changes during the nineteenth century and cannot be regarded as fixed even at present. In 1869 at the International Statistical Congress held at

The Hague the German statistician Engel declared that he had collected 180 definitions of statistics and that no one at the congress could explain its meaning. Since then definitions have continued to multiply, but there has been some progress toward agreement. Today the word has at least two significations, in both of which, unlike all the early definitions, it is conceived as essentially numerical. The addition of that characteristic excludes the whole series of writings in the Conring-Achenwall tradition, because they had little if any numerical content. It eliminates also definitions by Quetelet, probably the most influential statistician of the nineteenth century, who wrote in 1829 that "among the elements which statistics should comprise, some can be expressed in figures and others can in no way be reduced to a numerical expression. To adopt only one or the other of these two types of elements is to see only one side of statistics" (*Recherches statistiques sur le Royaume des Pays-Bas*, Brussels, p. v-vi). These ideas of Quetelet were reflected in the original definition of statistics by the Statistical Society of London as the ascertaining and bringing together of those "facts which are calculated to illustrate the conditions and prospects of society" and in the almost identical definition offered by the American Statistical Association at the time of its organization. This type of definition survived for about fifty years; thus the president of the London Statistical Society proposed in 1885 to define statistics as "the science which treats of the structure of human society." That conception has not since reappeared and may now be regarded as obsolete.

It was not until the term had been used on the continent of Europe for nearly a century that modern definitions began to introduce the numerical element which later became dominant. This element derived from political arithmetic, which may fairly be regarded as the taproot of modern statistics. Political arithmetic originated in the scientific spirit fostered in England soon after the middle of the seventeenth century by the Royal Society. Its main source is a tiny book by John Graunt, *Natural and Political Observations . . .* (London 1662), which was not an attempt at state description but rather an honest and intelligent effort to interpret by inductive methods the figures showing the number of deaths in London during the preceding third of a century. The data were in many respects crude and defective but the study was informed by the spirit of modern science.

Graunt's friend William Petty named the new study political arithmetic and increased its popularity, but far from giving it a firmer basis he led it aside after strange gods. In 1692-93 the astronomer Edmund Halley brought it back to safer paths by publishing the first life table ever made (in the *Philosophical Transactions* of the Royal Society of London). The new study spread to the continent of Europe, especially to the German states. The Berlin pastor J. P. Süssmilch, who derived his inspiration from Graunt, presented in the second edition of *Die göttliche Ordnung* (2 vols., Berlin 1761-62) an admirable systematic compendium of what was known at the time about vital statistics. In the following century political arithmetic, supported by such continental writers as were then using figures, competed with statistics in the German university tradition. The former won, slowly displaced the latter and even usurped its name.

With this change of content came a change of definition. It was demanded on theoretical grounds by Karl Knes (*Die Statistik als selbständige Wissenschaft*, Cassel 1850), who argued that the statistics of the Conring-Achenwall school had no intrinsic connection with political arithmetic, that the two should be divorced and the name statistics reserved for the latter. Gradually this conviction found expression in the modern definitions of statistics, beginning with that of A. C. Moreau de Jonnés in 1847 ("the science of social facts expressed in numerical terms" in *Éléments de statistique*, Paris, p. 1) and the transitional one of K. F. W. Dieterici in 1851 ("a statement in figures and facts of the present condition of a state") As the idea of number received increasing emphasis the idea of the state or of society receded into the background, until there was formulated a series of modern definitions according to which statistics is the numerical study of groups or masses through the study of their component units, whether these units be human or subhuman, animate or inanimate. At present statistics has a broader meaning, the numerical study of groups, and a narrower one, the numerical study of social groups; whether both will survive or one will supplant the other is still a matter of conjecture.

Statistics is not only a methodological science like microscopy or spectroscopy but also a practical art which is much older than either the science or the term. As such it has always

stressed the importance of enumerating every member of the group; if the group is numerous, the cost of this procedure is such as only a government can support, and that only if it greatly needs the information. For this reason the history of the art of statistics must concern itself mainly with its practise by governments primarily for purposes of administration.

Whenever a populous and well organized state has arisen, statistics have been used. In antiquity they consisted usually of lists of citizens liable for taxation or military service; but for the Middle Ages, although local and irregular enumerations of inhabitants were common, emphasis must be laid on registers of landholdings or land transfers. These records indicated the liability of the subject to the state and conditioned the amount and regularity of state revenues; the state therefore had a primary interest in the accuracy and completeness of each of them. But the few summaries of these records made at the time are much less trustworthy than the individual entries. Sometimes they were exaggerated to gratify the ruler, as in a notorious case in China in 1775 when the annual population returns increased over those of the preceding years by 48,000,000, apparently because the emperor had expressed surprise that the population was not greater. Little weight can be attached therefore to the early reports of Chinese, Japanese or East Indian populations unless the supporting evidence has been subjected to critical analysis. But for Egypt, where records were kept on papyrus or parchment, and for Babylonia, where clay tablets were used, the many original documents which have been preserved may probably be trusted. For these countries as well as for Greece and Rome the main problem is whether the records which have survived are a representative sample of the whole. Often the motives of the writers must be taken into consideration. Thus the Helvetians needed to know the number of their fighting men and used a sound method by which to estimate it. Caesar, on the other hand, sought to exalt the glory of his victory; and perhaps in this case, as certainly in many others, he exaggerated the reports he had received or selected the most impressive among them. The significant statistical data for any country outside of western Europe and for western Europe itself before the seventeenth century are meager. Few have been interpreted adequately, although great progress has been made through the work of Karl Beloch and his school for antiquity and in recent years

economic historians have been paying increasing attention to a proper evaluation of mediaeval price records.

While Graunt more than any other deserves the title of founder of statistics, it must not be forgotten that he needed straw for his bricks. The registration of christenings, marriages and burials upon which he drew began with the dawn of the sixteenth century. Starting with Augsburg (1501) and London (1517) registration quickly extended to the better organized states of Europe—France (1539-79), England (before 1547), Brandenburg (1573) and the Netherlands (1590)—being carried from the last named country to the New World (Massachusetts Bay, 1638). But the records are not in every case unbroken from the earliest date, and in several places the evidence does not show whether it was the birth or the christening, the death or the burial which was registered.

In America the early efforts at registration apparently were almost abortive. The oldest continuous record in the western hemisphere is believed to be that of New York, beginning in 1804. That city was followed closely by New Orleans in 1810 and by Boston in 1811. The first state to start effective registration was Massachusetts in 1843; a registration law had been passed in that state in 1842, in frank imitation of the English law of 1837. The results of the latter had begun to be interpreted by William Farr in a series of letters which, with his comments on the results of the decennial censuses of 1851, 1861 and 1871, make up a statistical output perhaps equal to that of any other nineteenth century statistician.

The early interest in vital statistics sprang from a widespread fear of the devastating epidemics and a belief that population is the most important element of state power, particularly of its military strength. Somewhat later with the general adoption of mercantilist policies attention was directed to economic questions and attempts were made to obtain statistics on such subjects as foreign trade, food supply, manufactures and the like. Whereas facts of birth and death are comparatively simple, so that in observing them governments might rely upon the parish clergy, economic phenomena, which are much more complex, easily escaped the scrutiny even of the most conscientious French intendant or Swedish provincial governor. For this reason the more satisfactory early statistical records of an economic character are those relating to imports and exports, which in England date back

to 1696. In the following century much progress was made in gathering statistics pertaining to agriculture. In addition to enumerations of livestock states like Saxony and Prussia undertook to collect annual data on areas planted to various crops and on yields and stocks. Prussia introduced also the so-called historical tables, which attempted to summarize within the space of twenty-five columns information on the industrial pursuits and taxable capacity of the population in each administrative division.

The transformation in the economic and political structure of Europe during the generation following the French Revolution and again in the period 1848-71 furnished a tremendous impetus to the accumulation of all kinds of statistics. With the democratization of government the popular distrust of statistical inquiries abated and the method of exhaustive enumerations which previously had yielded unreliable results was employed with greater confidence not only for demographic but also for economic investigations. Treatment of statistical information as a state secret gradually gave way to wide publicity, an important factor in improving statistical records and enhancing their practical usefulness. Rationalization of official statistics was aided by the organization of special statistical bureaus, which although limited at first to the collation of material gathered by the regular administrative agencies, in some countries slowly extended their control to the primary stages of investigation.

Statistical progress in the nineteenth century was aided by statistical societies and international statistical organizations. Many of the earlier associations, some of which were rooted in the agricultural societies of the eighteenth century, made it their main purpose to describe particular localities or countries, largely but not entirely in numerical terms; others were concerned with factual studies to assist in the solution of social problems like poverty and alcoholism. In some instances, as in Saxony in 1831-50, the society, which consisted of a central organization with many local branches, actually had charge of government statistics. Also in the Netherlands in 1884-92 a private association of statistical experts took the place of the official central bureau of statistics abolished some years earlier.

In Great Britain statistical societies became numerous in the 1830's. The movement was started by Quetelet, who attended the 1833 meeting of the newly organized British Associa-

tion for the Advancement of Science. Dissatisfied with the rule that the inquiries of the statistical section of the association should be restricted "to facts relating to communities of men which are capable of being expressed by numbers," he proposed the organization of a separate statistical society not limited to numerical facts. The suggestion was adopted and the Statistical Society of London was established in 1834. A few months earlier a statistical society had been organized at Manchester, which still survives although with diminished importance. Other and less enduring societies were set up at Bristol, Leeds, Birmingham, Liverpool, Glasgow, Aberdeen and Belfast. The American Statistical Association, organized in 1839, apparently was initiated also by one man, Lemuel Shattuck, in real though not open imitation of the London society.

International statistical organization first took definite form in the International Statistical Congress held at Brussels in 1853. This congress too owes its existence to Quetelet, who at the London international exhibition in 1851 conferred with a number of British statisticians and later proposed an international congress. The congress was attended by many leading statisticians, who discussed their common problems, above all the production of uniform, contemporaneous and comparable statistics. The Brussels congress was the first of a series of nine held between 1853 and 1876 in the various capitals of Europe. These made a notable start in attacking their problem, but its solution still lies far in the future. The congresses in deciding on their main purpose did not reject the minor aim of fostering a widespread interest in international statistics, perhaps the best that could then be done. Because of this, however, the few technical experts were lost in the increasing number of amateurs or interested bystanders. To remedy this situation a Permanent Commission was set up in 1872, but within a few years the international jealousies bred by the Franco-Prussian War ended the activities of both the congresses and the commission.

The attempt at international organization was renewed at London in 1885 at the Jubilee Meeting of the Royal Statistical Society, when the International Statistical Institute was created to succeed the short lived Permanent Commission but freed of governmental entanglements. Its membership is limited to 250, its meetings are biennial and its recommendations have only such weight as the governments choose to assign

them. The work of its committees has been very uneven and lacking in focus. Perhaps the chief service of the institute has been to foster friendly relations among official and academic statisticians in the various countries. These relations proved intimate enough and the structure to which they gave life sufficiently vital to keep it from foundering with the other wreckage of the World War. Holding meetings since the war in Cairo, Tokyo and Mexico city as well as in various European capitals, it has become much more truly a world organization, although it may have purchased its increase in range with some loss of thoroughness.

International statistics are now published not only by the Permanent Bureau of the International Statistical Institute, established in 1913, but also by the International Institute of Agriculture, by the statistical division of the League of Nations and by the International Labor Office in cooperation with the supporting governments. During the 1920's these offices cooperated with existing international associations in the appointment of a number of mixed commissions to report upon statistical problems of common interest. How far and in what ways these two types of international statistical organization will continue to cooperate is not yet clear. Perhaps the institute will come to hold a relation to the statistical offices at Geneva and Rome somewhat similar to that of various national statistical societies with respect to the statistical offices in their own countries.

WALTER F. WILLCOX

STATISTICAL PRACTISE There has been an enormous increase in the scope and variety of statistical inquiries, which steadily expanded during the nineteenth century as the promotive, regulatory and control functions of government grew in number and extent. A powerful stimulus was given by the World War, which placed a new emphasis upon economic and industrial statistics as an aid in planning for the requirements of the army and of the civil population. Since the war much attention has been devoted to statistics of business in the search for methods of predicting and controlling business cycle fluctuations. In the Soviet Union statistics have been recognized as a fundamental instrument in planning and control and are closely coordinated with the central planning agency. In the United States the creation of the National Recovery Administration, the Agricultural Adjustment Administration and similar instrumentalities ex-

pressive of the partnership of government in business has called for more intensive statistical surveillance to provide an adequate check on current performance and a basis for long range planning.

Along with this development there has been a rapid growth in the number of agencies gathering statistical material. Each new government bureau organized to deal with a specific problem or group of problems has had its own statistical office and staff to supply its administrative arm with basic information, to keep it posted on current developments and to collate data for periodic reports on its own operations. Not only the agencies of the national government but also local bodies have created their own statistical offices to keep themselves informed about the problems they face and the effects of their efforts in meeting these problems. This holds true not only of autonomous units, such as states in a federation, but also of administrative divisions in a centralized state. Even the cities, especially the larger ones, have a whole series of statistical offices in the departments of health, education, housing and the like, whose work is sometimes coordinated and brought to the attention of the public by a central statistical agency of the municipality, which may undertake also independent inquiries. In addition the numerous special purpose associations which have sprung up since the beginning of the nineteenth century—trade unions, trade associations, cooperative organizations of all kinds, professional societies—collect statistical information about their internal operations and the status of their membership, which in the aggregate furnish a comprehensive statistical reflection of the contemporary pluralistic society at all its levels. The large business corporations—railroads, steamship companies, banks, insurance companies, public utility concerns and the gigantic industrial combinations—also gather and often publish data summarizing their activities, which by reason of their great economic importance are of considerable public interest. Finally, the gaps in the field of economic or social information are sometimes filled by research organizations, operated for profit or attached to foundations and educational institutions, which not infrequently collect statistics at first hand.

Although the statistics published at the present time in the United States have a few significant lacunae, such as data on morbidity, old age, invalidism and unemployment, yet they are as comprehensive and detailed as in any other

country, with the possible exception of the Soviet Union, the statistics of which are probably less accurate. The following account of American statistics will illustrate therefore the variety of information available and the multiplicity of agencies engaged in its preparation.

Data on population, its geographical distribution, its settlement in the open country or in towns and cities of various sizes, its composition by sex, age, marital conditions, color, nativity, citizenship and occupation, as well as on school attendance, illiteracy and tenure of home are gathered in decennial censuses by the federal Bureau of the Census. The population census was first taken in 1790, although on a much shorter schedule than is indicated above. A number of states have also carried out censuses in their territory during the federal intercensal period; some of them, notably those of New York in 1855 to 1875, of Massachusetts in 1875 to 1905 and of Michigan in 1874 to 1904 have constituted significant statistical investigations. The registration of births and deaths is in the hands of the civil subdivisions of states, but the Bureau of the Census obtains copies of the records for compilation on a national scale.

The agricultural censuses, which have been quinquennial since 1920, cover crops, personnel, farms, farm families and equipment and are taken by the Bureau of the Census with the assistance of experts from the Department of Agriculture. Except for the annual data on production and ginning of cotton collected by the Bureau of the Census, current agricultural statistics are concentrated principally in the Bureau of Agricultural Economics of the Department of Agriculture. It provides estimates of crop conditions, prospects and production; it gathers statistics of stocks, compiles market information, engages in price analysis and attempts a statistical coverage of the social aspects of farm life. Many of the states have departments of agriculture, which collect and publish relevant data. Some state offices are responsible for significant statistical studies; California, for example, has published a series on special crops. Privately gathered statistics in this field are limited mainly to stocks and production data for particular commodities compiled by commercial agencies.

Statistics on manufactures have been gathered at the decennial censuses of 1810, 1820 and 1840; since then they have been collected decennially and great advances have been made in wealth of detail and classification. From 1900 to 1920 the censuses of manufactures were quin-

quennial and after 1920 biennial. Statistics of mines and quarries also are obtained in connection with the decennial censuses; current production data are published by the United States Bureau of the Mines. Surveys of individual industries have been conducted by the Bureau of the Census, the Federal Trade Commission, the Tariff Commission and commissions created for specific purposes, such as the Coal Commission and the Industrial Commission. Reports on current activity of individual industries are compiled by trade associations and journals, commercial agencies and in some instances by the Bureau of the Census, the Bureau of Foreign and Domestic Commerce or the Bureau of Labor Statistics.

Statistics of foreign trade are gathered by the Bureau of Foreign and Domestic Commerce. The first census of domestic distribution was carried out in 1930 by the Bureau of the Census. Private sources of statistics in this field include trade associations and chambers of commerce, besides the statistical offices of certain large corporations. An important field of market statistics is the statistics of prices. These are collected by the United States Bureau of Labor Statistics for its compilations of retail and wholesale price indices and for its cost of living studies. Extensive analyses of agricultural prices with reference to factors in price variation are prepared in the Bureau of Agricultural Economics. Valuable collections of price data are made also by various trade associations.

Transportation statistics, especially in relation to railroads and electric railways, are centralized in the Interstate Commerce Commission. Private sources of similar data are the railroads themselves; the Bureau of Railway Economics, a private organization financed by the carriers, publishes some statistical material. Statistics of shipping are collected by the Bureau of Navigation of the Department of Commerce. Shipping on internal waterways is treated in reports of the chief engineer of the War Department. Data on motor vehicle registrations are published by state bureaus charged with this duty and are compiled by private associations.

Statistics of banking are centered in the United States Federal Reserve Board, the twelve Federal Reserve banks and the office of the comptroller of the currency. Statistics on money and currency are issued by the Treasury Department. Data on state banks and other financial agencies operating under state charters are collected and published by the state depart-

ments charged with their supervision. State supervisory offices publish also insurance statistics. The division of agricultural insurance in the Department of Agriculture has carried out special studies of these branches of insurance. Private sources, notably the insurance companies themselves and the rating bureaus, provide a relatively important part of the available data in these fields, especially all information relating to the application of insurance principles, coverage, risks and loss ratios.

The principal source of income data is income tax statistics gathered and tabulated in the Bureau of Internal Revenue of the Treasury Department. Data on wealth (the value of tangible property) are compiled decennially by the Bureau of the Census mainly from state reports on property assessments for taxation purposes. Another source of property statistics is the federal estate tax returns for estates exceeding a minimum figure (formerly \$100,000); other inheritance data are available in local county probate courts, but no central collection of data is provided. Statistics of farm mortgages have been gathered in connection with the agricultural census, and statistics of mortgages on homes were collected in connection with the population censuses in 1890 and 1920. An estimate of national income and wealth was made by the Federal Trade Commission in 1926 and of national income for 1929-32 by the Bureau of Foreign and Domestic Commerce. A more important source is the National Bureau of Economic Research, an unofficial body which has made estimates of national income for a series of years supplementing available data by special studies of its own. Similar estimates have been compiled also by other private agencies.

Business cycle statistics are summarized in the *Survey of Current Business*, published monthly by the Department of Commerce. Industrial production series, commodity price series, statistics of construction, of employment and of factory pay rolls and similar data drawn from numerous public and private sources are brought together to provide a statistical description of the movement of business. A considerable part of these basic data is prepared in the statistical offices of the Federal Reserve Board and in the Bureau of Labor Statistics. University bureaus of business research have made important advances in this field, notably the Harvard Bureau of Economic Research, which publishes current data on economic conditions in the quarterly *Review of Economic Statistics*.

Statistics relating to all phases of labor are concentrated mainly in the federal Bureau of Labor Statistics and in the labor departments of the industrial states. The bureau collects wage data for a list of specified industries by special investigations of pay rolls in selected establishments. Current changes in pay rolls are collected monthly in cooperation with state labor bureaus for selected industries. Union rates of wages are published once a year. Data on wages for selected occupations, including common labor, are published from time to time. The bureau also compiles data on the cost of living, on the basis of which an index of real wages is computed. Wage data are secured also by certain state labor bureaus, notably that of Ohio, which takes a weekly wage rate census every few years. Extensive inquiries into wages and wage changes have been made from time to time. The Census Office published in 1885 a special report covering mainly the years 1860 to 1880, followed in 1905 by an important survey of certain industries between 1890 and 1900. Similar extensive studies have been made by the Bureau of Labor Statistics, the United States Coal Commission and the Immigration Commission. Other wage data are secured by the Children's Bureau and the Women's Bureau, both in the Department of Labor, through special studies for children and women respectively; by the Department of Agriculture for agricultural labor; and by the Interstate Commerce Commission for railroad labor. In addition a mass of material is collected by private agencies, notably the trade unions. The National Industrial Conference Board, an employers' association, collects and publishes data on wages and cost of living, showing trends in real wages in selected localities for different occupations and industries. Similar data are gathered by certain trade associations for use in negotiations with labor.

Employment statistics presenting the number of persons employed on the fifteenth of each month are included in the biennial censuses of manufactures. Monthly employment data are gathered by the Bureau of Labor Statistics, working through the state labor bureaus, for a current index of changes in employment in selected industries and states. In 1930 the Census of Occupations included also a question relative to lack of occupation or unemployment. Some unemployment data are collected by the trade unions with regard to their own membership.

Statistics of industrial accidents are collected

by the Bureau of Labor Statistics by special investigations in selected industries, notably iron and steel manufacture, by state labor bureaus usually as a by-product of the administration of workmen's compensation acts, by the Interstate Commerce Commission for railroads and the Bureau of Mines for mines and quarries.

Child labor statistics are derived from state employment certificate offices and from the decennial census, which includes data on occupations of children classified by ages. Numerous statistical studies of problems in the field of child labor have been made by the Children's Bureau. Similarly statistics on the labor of women are included under occupations in the decennial census, while numerous special studies are made by the Women's Bureau.

A considerable body of social statistics is compiled by federal agencies, state departments of health and of correction and by private foundations. Thus the Bureau of the Census publishes annual data on the insane, feeble-minded and epileptics in state and federal hospitals and on inmates of federal and state prisons; it also covers in special surveys the population of almshouses and in decennial censuses the work of child care institutions (including juvenile reformatories) and of child placement agencies. State offices publish data on insanity, feeble-mindedness and pauperism. Data on federal prisoners and persons on probation are presented in annual statistics compiled by the Department of Justice, which also publishes a series covering state offenses derived from reports of city police departments. Annual statistics of child dependency in a number of cities and of cases brought before juvenile courts are collected currently by the Children's Bureau, which compiles also data on mothers' aid and has published important special investigations on institutions for child care and a report on illegitimacy. Data on the latter topic are collected by the Bureau of the Census and the local offices of vital statistics. Data on prostitution are available through private agencies, such as the Bureau of Social Hygiene, and through local enforcement offices. In the general field of statistics of social work important contributions are made by the Russell Sage Foundation.

Statistics of churches were collected at the decennial censuses from 1850 to 1870. In 1890 a census of religious bodies was taken in connection with the population census, and since 1906 investigations, even more comprehensive in character, have been repeated at decennial

intervals. The Institute of Social and Religious Research deserves mention in connection with this and other topics in the field of social statistics. Data on education are centralized in the United States Office of Education, which publishes biennial surveys on the basis of reports of state and local boards of education as well as numerous studies on special topics.

This brief survey of American statistics may give the impression of haphazard development. In fact, however, several distinct trends can easily be discerned in the field of federal statistics. One is the tendency to concentrate major statistical undertakings of a censal character in the Bureau of the Census, which was established as a permanent organization in 1902 and which has at its disposal a large permanent staff adequately equipped with efficient tabulating machinery. The other tendency exemplifies the familiar principle of natural growth. Each bureau or office entrusted with administrative or research duties requires statistical data, and the natural course is to set up a statistical office to provide this material; these statistical branches begin usually in a small way but frequently develop into large independent offices. A final development is the trend toward centralization. A central statistical body was established during the World War; and in July, 1933, an executive order created the Central Statistical Board, which consists of representatives from the principal statistical offices and is authorized to make recommendations in relation to all statistical schedules and inquiries.

In many countries the organization of the statistical services of the national government is subject to greater centralization than in the United States. In a number of them—the Netherlands, Denmark, Sweden, Italy, Spain, Germany, several Balkan and South American states—central statistical offices were created in the third quarter of the nineteenth century. At first these may have been limited to statistics of a general character, and special statistics easily gathered as a by-product of administrative operation were left in the hands of the several ministries. Nevertheless, such offices exercised a coordinating influence over the entire sphere of government statistics and mainly through two channels. One was the statistical commission or council, the chairman being in many instances the head of the central statistical bureau and the membership including representatives of the principal statistical services as well as outstanding statisticians and economists in private life.

Moreover the central offices enjoyed a certain amount of power through the publication of annuals or series collating the statistical output of all government divisions. An important decentralizing tendency became apparent at the end of the nineteenth century and the beginning of the twentieth, when separate departments created to handle labor problems and to administer social legislation took over or organized de novo the collection of a considerable variety of labor statistics. A late manifestation of this trend was the transfer of labor statistics in Germany from the central office to the Ministry of Labor in 1920. In general it may be observed that the smaller the country and the newer its political organization, the greater has been the extent of statistical centralization. Most of the states created after the World War, for instance, have entrusted the statistical function to a central authority accountable in many cases directly to the cabinet and operating either through local branches or through the statistical divisions in the several ministries under its direct control. Yet no matter how centralized the statistical organization, certain subjects remain as a rule outside the competence of the central office; these are generally the statistics of banking, transportation and communication.

The account here presented of American statistical organization also raises the question as to the relation between the federal statistical services and those of the states. The statistical competence of the United States government has been circumscribed from the outset because of its limited powers. The states have had a much wider sphere of action; in providing for statistical services they have sometimes duplicated the work of the federal government, as in state censuses, and sometimes paved the way for it, as in the creation of bureaus of labor statistics, the first of which preceded by fifteen years the organization of the federal Bureau of Labor. As the federal government acquired an increasing number of departments with functions overlapping those of state agencies, two tendencies became apparent: one is that toward cooperation, notably between the United States departments of Labor and Agriculture and the Bureau of the Census and the corresponding agencies of the state governments; the other is the atrophy of state statistics where the federal statistics cover the ground more fully and expertly, as in the case of state censuses. In other federated states, such as Germany and Canada, the degree of geographical centralization tends to be great-

er than in the United States. The German Statistisches Reichsamt collects statistical data either directly or through the state offices upon forms approved after consultation with state statisticians and uniform for the entire country; considerable scope is nevertheless afforded the state statistical offices for state or local studies in connection with or independently of national investigations. In Canada the Dominion Bureau of Statistics has charge of the major statistical work for the country as a whole—the census, imports and exports, agricultural, manufacturing and mining production and so on. In Australia, on the other hand, less centralization prevails and there is a certain duplication of work between the commonwealth and the state offices, each of which publishes a yearbook of statistical data.

The material required by statistical offices is obtained through registration of the relevant facts as they come to light or through enumeration at a particular moment of time. The results of registration are usually summarized for fairly short periods and yield current statistics. These may also be derived from enumerations, if the latter are repeated frequently. Enumerations may attempt to include all cases which fall within the definition of the subject of enumeration (census); an alternative procedure is to take merely a large enough sample of the cases to give a sufficient basis for statistical conclusions. The difficulty with sampling, however, is that unless great care is taken the sample may not be representative; a random sample does not insure an unbiased selection. For example, in a survey of current manufacturing employment and pay roll changes it is not sufficient merely to accept returns from 20 percent of the total manufacturing concerns; these concerns must be so selected as to represent fairly the several industries, the several parts of the country and the large and small establishments in each industry. Even then a sample of material selected so that it shall be representative for some characteristics may or may not be representative for others. It is so difficult to insure representativeness of the sample that in most inquiries relative to population complete enumeration is preferred. In the field of economic data and in many social problems exhaustive enumeration is, however, out of the question; here therefore care as to the methods of obtaining data is of primary importance for the validity of the results.

Whether obtained by registration or by

enumeration, most statistics of the present day derive from the individual schedule, which may be a separate card or sheet or in some cases, as in the population census, a separate line on the enumerator's sheet. The preparation of the schedule is a very important phase of the work of any statistical undertaking. Each question on the schedule must be considered very carefully with respect to its form; in an inquiry of any magnitude the number and complexity of the questions are matters of profound influence upon the expense of collecting the data and tabulating the material. The questions must be so phrased that neither the enumerator nor the person interrogated can misinterpret them or give an answer based upon misunderstanding. For example, the age question may be asked either as age at last birthday or as age at nearest birthday or as date of birth; the first form is commonly used in census statistics, although the last was recommended by the International Statistical Congress of 1872 and is often employed in European countries. The questions must be phrased more clearly or explanations must be appended to the questions if the subject is to fill in the answers himself. Even where trained enumerators are employed, they must be given definite instructions, which in order to insure uniformity of interpretation should attempt to clarify any doubtful points in regard to the specific questions. These instructions therefore must be as complete as possible and yet brief, for if the instructions are too lengthy and detailed they will not be read or remembered.

In conjunction with the preparation of the schedule must go the precise delineation of the coverage and methods of the inquiry. It must be determined in exact detail for whom the schedules shall be taken. Thus in censuses of population schedules may be required only for residents (*de jure* population) or for all persons present on the day of the census (*de facto* population). In the case of enumerations it must be decided whether the schedule is to be filled out by the individual interrogated, by trained enumerators or by selected correspondents. In the German census it is the custom to distribute the census blanks in advance; the enumerators merely collect them, filling them out only where doubt is raised as to the meaning of the questions. In the case of agricultural inquiries in many countries schedules are sent to selected correspondents, whose replies report the facts for a whole country or other area. However the schedules are filled, they are usually checked at the field office

or at the central office for completeness and consistency; if omissions or obvious errors are discovered the schedules may be returned for correction.

When the schedules are all in hand, the subsequent processes include editing, coding and tabulating. Editing consists in reviewing the answers which will be used in tabulation and translating them into such terms as will be useful in the particular inquiry. Since most of the major statistical offices now work with mechanical tabulators and punch cards, the editing usually is closely connected with the mapping out of the punch cards, which consists in dividing the cards into fields, each assigned to a particular topic, and with coding; that is, writing the entries in code for subsequent punching on the cards. In deciding upon the divisions for editing, coding and on the punch cards the final tables and hence the purposes which these tables will serve must be kept in mind. The planning of the tables therefore must precede or go forward concurrently with the editing.

The planning of the tables includes the provision for suitable correlations between the various items on the schedules, such as age and sex, age and occupation and the like. It requires also decisions as to the particular classification to be shown; whether, for example, it is to be by individual years of age, by five-year age groups or by ten-year age groups. In many cases a preliminary study of the schedules or of a sample group of schedules may be necessary for a decision as to the appropriate classifications. Thus if practically all the schedules for a particular study fall in the older age groups, the code and the punch card can be adapted to this fact. In general the classifications should be so adjusted as to give uniform intervals (if of a continuous variable) and a reasonable distribution over the field. The limits of the class intervals should not be so far apart as to cause a heavy concentration in one or two classes nor so close as to give an uneven result with alternate classes full and empty.

In the publication of the results of an inquiry a number of questions must be settled, particularly how much derivative material in the form of percentages and ratios is to be included and how comprehensive the textual interpretation of the tables should be made. A growing tendency has been to publish basic tabular matter as promptly as possible with a minimum of text and to follow it later with an adequate analysis. One feature which should be empha-

sized is that essential details about methods of collection and material relevant to appraising the margin of error should be presented with the results. Elaborate statistical analysis which goes far beyond mere relatives and averages has become of increasing importance for government statistics in many fields. In the publication of price and wage data and of other economic time series the use of index numbers is widespread; and in many statistical offices correlation and similar advanced techniques are coming into increased favor. It remains true nevertheless that with the great mass of official statistics attention is still centered primarily on collection, tabulation and publication of the basic data.

ROBERT M. WOODBURY

STATISTICAL METHOD. Modern statistical method derives from the work of seventeenth and eighteenth century political arithmeticians and from the calculus of probability developed at about the same time by a number of distinguished mathematicians. The first practical statistician of note who fused the two into a theory of statistical method was Quetelet. He envisaged statistics as a tool whereby social disciplines could be turned into exact sciences aiming at the discovery of natural laws relating to man. These he believed were expressed in relative numbers and averages measuring the characteristics of the "average man" whom nature tends constantly to produce; the individual deviations he traced to the presence of numerous but unimportant disturbing factors whose influence on the empirical data could be eliminated with the aid of the law of large numbers and the theory of errors adapted from probability theory.

Quetelet, however, was only a pioneer. His phraseology about "nature" and "laws of nature" sounded suspiciously like a secularized rendering of Sussmilch's "divine providence" and "divine order." Nevertheless, he was fairly circumspect in dealing with the problem of free will; in one passage he even maintained that events depending upon free will would show a greater regularity than those governed by physical causes alone. But his disciples went much further and came to regard the statistical conformities to law, which of course have not the slightest bearing upon this problem, as evidence in support of absolute determinism. Queteletism met with very violent opposition, mainly on the part of German theologians, economists and statisticians, which was largely an expression of moral indignation against its extreme determin-

ism. Of the statisticians Wilhelm Lexis alone approached Quetelet's doctrines from the objective standpoint of probability theory; he pointed out the analogy between the stability of statistical numbers and the stability of certain relationships in purely accidental phenomena, such as the results of the drawing of balls from an urn. For practical purposes the controversy was ended in the 1870's with the defeat of the school of Quetelet. The following twenty years were a period of stagnation for theory but one of marked improvement in the technique of statistical observation and rapid accumulation of concrete statistical material; only Lexis and his few pupils continued the study of stability of statistical series. In this period statistics came to designate the science of mass phenomena in social life.

The new era in statistical theory dates from the last quarter of the nineteenth century. A group of English biologists engaged upon certain aspects of genetics came to the conclusion that mass observation was necessary for a successful solution of their problems and turned to the statistical method. Fortunately they found in Karl Pearson a scholar combining high mathematical ability with a taste for meticulous empirical investigation. Probability calculus, which had made no progress virtually since Poisson, now began to advance and became in Pearson's hands the principal tool of statistical methodology. He attracted numerous pupils and followers, among whom there soon appeared statisticians as well as biometrists. His ideas steadily gained in ascendancy and at present may be said to dominate statistical theory in the English speaking world. Their influence has also largely shaped the progress of statistical thought in the Latin countries, especially in Italy, and in the Scandinavian states, although in some of them the importance of certain national tendencies must not be underestimated. Germanic countries, despite the work of Lexis and his eminent pupil Ladislaus von Bortkiewicz, still continue under the influence of Georg von Mayr's empirical school, whose outlook is characteristic of the period which followed the discard of Quetelet's system; only in very recent years has a faint start been made toward the acceptance of the English theories and, in economic statistics, of American methods. In Russia A. A. Chuprov made a brilliant attempt to synthesize the ideas of the English school and of Lexis-Bortkiewicz with the philosophical system of Wilhelm Windelband and Heinrich Rickert. This approach has been influential in Russian theoretical sta-

tistics and is becoming important in a number of other Slavic countries.

Biology is not the only natural science in which the statistical method is used at present; it is coming to be increasingly employed in physics and there is a fair prospect of its extension to other exact disciplines. As in other fields, progress in statistical theory is conditioned in the last resort by practical requirements; the growing popularity of the statistical approach therefore stimulates a rapid though not entirely coordinated advance in statistical methodology. Under these circumstances no more can be attempted than a tentative statement of the general outlines of the theory of statistical method.

In his *Essai philosophique sur les probabilités* the French mathematician Pierre Simon Laplace offered the following classical formulation of the ideal of scientific knowledge: "Given for one instant an intelligence which could comprehend all the forces by which nature is animated and the respective situation of the beings who compose it—an intelligence sufficiently vast to submit these data to analysis—it would embrace in the same formula the movements of the greatest bodies of the universe and those of the lightest atom; for it, nothing would be uncertain and the future, as the past, would be present to its eyes" (tr. by F. W. Truscott, New York 1902, p. 4). The attainment of this ideal obviously depends upon three conditions, a perfect knowledge of all "forces," or laws, of nature; an equally perfect knowledge of the distribution of all "beings," that is, of all elements of the universe at some given moment past or present; and an infinitely powerful reason capable of embracing all this in one formula and submitting it to calculation. The first type of knowledge has been called nomographic (by Louis Couturat), and the second idiographic (by Windelband). At present it is generally accepted that the nomographic type and the idiographic are equally indispensable and hence equally legitimate elements of science; without either of them no prediction or, more generally, no practical application of science is possible.

Since no exhaustive knowledge, whether nomographic or idiographic, is attainable, scientific investigation is selective, concentrating upon what is presumably of the greatest interest. In practise the necessity of selection is reenforced by the limited amount of ability and material resources available for scientific work. In idiography the selecting interest, according to Chup-

rov, may be directed toward the individual traits of a particular object in all their multifarious complexity and change through time or it may center only upon such properties as the object has in common with others. Furthermore the interest in common attributes may refer to a specific position of the object in space and time, in which case stress is laid upon the most precise determination of these coordinates; or the space-time reference, while not entirely eliminated, may be comparatively broad. The resulting types of idiographic knowledge are historical, geographical and statistical, these terms being used in their broadest sense.

The subject matter of a statistical study is thus not a particular object but the entire collection of objects distinguished by certain properties, and its method is one of enumeration. The characteristic steps in all statistical investigations are: the assignment of broad but clearly marked space-time limits to the area of observation; the definition of the unit of observation by certain external attributes; the enumeration of all such units within the area and the recording of a limited number of attributes for each of them. The units may be counted up either for the area as a whole or by several groups, in the latter case the definition of the unit of observation must be supplemented by a statement of the group criteria. The enumeration itself may consist merely of ascertaining the number of units falling into each group or else of cumulating into a group total the measurements of the quantitative attributes for the several units. The groups so enumerated may be either natural, in the sense that they represent real associations of individuals—a household, a city, a prison—or they may be pure constructs of the statistician, having no existence outside his tables, such as the group of inhabitants of the United States who reached the age of forty in 1930.

Statistical knowledge always refers not to particular individuals but to the "universe," or "population," of individuals having one or more attributes in common as well as a number of other attributes specific to each individual or to smaller subgroups. No matter how large the number of groups in the field studied and the number of attributes recorded within each group, the statistical observer deliberately overlooks a vast amount of information about each of the units of observation. Every person comprised in the population of a given country is unique in the complexity and individuality of his characteristics, to the census statistician, however,

that person is of interest only as a peg from which may be suspended the ten to twenty specific attributes with which the census schedule is concerned. The statistician is of course quite aware of the fact that each person possesses in addition a vast number of other traits and qualities; but all these lie outside the boundaries of statistical observation and hence beyond the ken of the statistical method. The fact that this type of simplification is necessarily implied in every application of the statistical method is important, since it justifies the reliance of statistical inference upon the theory of probabilities. The punched card, which incorporates the data collected in the course of a statistical survey and constitutes the raw material of statistical tabulation, affords a perfect analogy to those numbered tickets or balls the drawing of which from an urn so often absorbs the attention of the probability theorist. Here too each of the balls has its own individual attributes and "personal" history; wooden balls, for instance, may have come from different trees or have been turned on different lathes.

As a purely idiographic method statistics is concerned with two sets of problems. The first involves such questions as how to form groups, how to enumerate units comprised therein and how to compile the data so obtained into statistical tables. Logically these questions appear to be simple enough; in practise, however, they present many difficulties whose solution must be uniform if statistical totals are to have any value and if their comparison over time and space is to be made possible. Moreover, in view of the magnitude of many statistical undertakings, such practical considerations as economy and efficiency loom here much larger than abstract analysis would lead one to believe. Problems of the second type relate to the condensation of statistical data for purposes of scientific analysis, the transformation of long statistical arrays into relatives, averages, measures of stability, graphs and the like. Whereas in the first stage of statistical work a universe of units of observation is transformed into a pile of statistical schedules and later into volumes filled with statistical tables, in the second stage these are compressed into a much smaller number of figures and pictures easy to survey and memorize.

Statistics is not an exclusively idiographic discipline. Its nomographic aspects have been steadily gaining ground and at present the value put upon statistical generalization is probably greater than that attached to statistical descrip-

tion. The statistical method involves elements of nomography because statistical enumeration is seldom exhaustive. In order to establish even so elementary a datum as the size of a country's population the political arithmeticians were compelled to resort to complicated calculations based upon data which covered only a minute portion of the population. As statistical observation was extended during the nineteenth century, indirect methods became superfluous. For a time it was believed that any type of statistical study could be organized along the lines of an exhaustive enumeration; thus a scholar as eminent as Mayr incorporated the principle of exhaustiveness in the very definition of statistics and regarded non-exhaustive observation, or sampling, as merely a substitute, the use of which should if possible be avoided. The subsequent development of statistics, however, did not follow the course anticipated by him. It became apparent that even in the social sphere there are many instances in which exhaustive observation of mass phenomena is dispensed with, most often because merely approximate results are adequate for practical purposes or because a complete enumeration would be too costly and time consuming; the latter consideration is of particular relevance to economic statistics. Moreover the statistical method of mass observation has come to be applied in the natural sciences, such as biology and physics, where the statistical universe often comprises an infinite number of units and is therefore not susceptible of exhaustive enumeration. The greater part of the statistical material now available is thus secured through non-exhaustive observation. The principal exception in this respect is population statistics, the data of which are obtained through general censuses. It is important to note in this connection that even census figures lack absolute precision, inasmuch as certain elements of the population, for reasons best known to themselves, escape observation altogether or supply misleading information; the margin of error in exhaustive enumeration may be as high as 10 percent or more.

It is clear that one of the main tasks of statistical theory is to devise methods for inferring from a comparatively small number of observations conclusions as to larger universes of which the observations in question form a part or a derivative. These larger universes may comprise an infinite number of units (open universes), a finite but very large number or only a limited number. If the number of units drawn into the

sample is large in relation to the total number of units in the universe, then, regardless of the methods used in selecting the sample, it is not difficult to ascertain the highest arithmetically possible limits of deviation of the characteristics of the sample from those of the universe. In all other cases only special rules of sampling will secure satisfactory results. The simplest of such cases is that where the units in the universe have been thoroughly mixed before the sample is taken; then the drawing of units into the sample will closely resemble probability experiments with balls drawn from an urn. If, however, such preliminary mixing does not occur automatically in the process of formation of the universe or cannot be induced artificially, the selection of units for the sample must be so organized that the result shall be as representative as that obtained in the previous case. The larger the number of units drawn into the sample, the more frequently and the more closely, in accordance with the law of large numbers, will the various characteristics of the sample approach the corresponding characteristics of the universe.

It is to be noted that under the theory of sampling may be subsumed also such cases as are usually treated with the aid of the theory of errors. It may be asked, for instance, what the wheat crop of the United States would have been in 1933 if it had not been affected in that year by accidental deviations of climatic conditions from the "normal." If it be assumed that the wheat acreage, the methods of its cultivation and in general all factors other than climatic conditions which influence the size of the crop remain constant, then the annual crop fluctuations may be regarded as the resultant of climatic variations only. If it be assumed further that climate is not subject to secular change and that observation has been extended over an infinitely long period of years, then the mean of the wheat crop series would furnish the answer to the question posed above. An empirical approximation to that mean is the average for the several years centering about 1933, which may be considered as a sample. It should be emphasized, however, that conclusions based upon this type of hypothetical sampling vary according to which factors are assumed to remain constant and which do in fact remain unchanged during the period included in the sample.

Directly connected with sampling is the complex of ideas associated with the application of the theory of probability. Since 1654, when the chevalier de Méré submitted to Pascal his fa-

mous questions, probability theory has had a long history; from a calculation of hazards in the various games of chance it has evolved into the logical foundation of statistics, actuarial science and many of the natural sciences. The traditions established in its early stages, however, can still be traced in certain elements of the theory, such as the concept of probability itself, which has been the subject of lively controversy. The more prominent of the several views represented in the literature are those of Laplace, the German physiologist Johannes von Kries, the English logician John Venn and the English economist J. M. Keynes. Laplace regarded probability as a substitute for causality where knowledge of underlying objective relations is insufficient. Kries, although admitting in general the subjectivist basis of probability, maintained that a judgment of equal probability must be supported also by knowledge that the events in question are actually equal in extent and are not directly derivative. Venn went even further in the direction of objectivism by identifying probability with empirical frequency. And Keynes shifts the discussion to a different plane by asserting that probability arises out of the existence of a specific relation between premise and conclusion in those cases where it is not possible to argue demonstratively from the former to the latter. It is worthy of note that the differences described above scarcely affect the mathematical content of the theory, more particularly the mathematical aspects of its theorems—a striking indication of the lack of congruity between the logical foundation of the science and the mathematical structure erected upon it. The elimination of this fault has generally been attempted along philosophical logical lines. Another approach to the problem, more congenial to the professional statistician, is that of mathematical axiomatization; that is, the selection of a necessary and sufficient number of definitions and axioms to afford the easiest and the most convenient way of deducing all theorems by means of "tautological transformations." From this point of view the most acceptable definition of mathematical probability—allowing the widest scope for the application of probabilities in statistics and approximating most closely the statistical formulation of problems—resembles the construction offered by Venn, adopted by Pearson and in recent years improved by Richard von Mises. It identifies the probability sought for in the study of a sample as the corresponding frequency in the universe

from which the sample has been derived; and it regards the mathematical expectation of a characteristic in a sample as the weighted arithmetic mean of all values of the characteristic in the universe. The "axiomatic" concept of probability seems to be best suited to the requirements of theoretical statistics; whether it is also the most adaptable to the requirements of other disciplines is still uncertain. Even in application to statistics it is not yet completely developed; for instance, no definite solution has been evolved thus far for the case, which occurs frequently in economic statistics, where the number of units in the universe is not infinite as is generally assumed but finite and not very large. Nor does axiomatization touch upon the philosophical problem as to the meaning of mathematical probability in general and particularly as to its potentially profound significance in connection with certain epistemological questions pointed out by Chuprov.

The universes which are approached by the study of samples may be transitory and unique or stable and recurrent. In the first type the task of statistics is more or less idiographic; only in the second type is statistics faced with nomographic problems, one of the most obvious of which is that of classifying such universes into several homogeneous groups, of establishing separate kinds of recurrent universes. Further inquiry into the internal mechanism of their recurrence, however, is outside the field of statistical theory in the proper sense of the term.

The characteristics of stable universes are also stable and may therefore be regarded as a "law," or "norm," which the characteristics of the successive samples drawn from such a universe will tend to follow, in accordance with the law of large numbers. The first of the laws of each stable universe is its law of distribution; that is, a table of all possible numerical values of its units together with their frequencies (which figure as probabilities in relation to the samples drawn from the universe). It is sometimes possible to proceed one step further and to devise a simple equation in which the numerical value of the units comprised in the universe is related to their frequency. The best known example of such an equation is that of the normal curve. A further development along the same line is to be found in the method of moments and in such attempts to devise distribution equations of other than the normal curve type as have been made by Pearson, T. N. Thiele, C. V. L. Charlier, F. Y. Edgeworth, Heinrich Bruns, "Stu-

dent," R. A. Fisher and others. The problem of so utilizing the samples as to arrive at the best possible approximation to the characteristics of the universe is one of "stochastics" in Chuprov's sense and is closely related to the problem of inverse probability. It is in this field especially that intensive scientific inquiry is proceeding at present, a prominent part being played by R. A. Fisher. He has achieved notable results also in dealing with the problem of small sampling, a topic of prime importance for biometry and vital statistics.

Apart from universes of a transitory and stable type there is also an intermediate type of universe which appears to change in time more or less rapidly and more or less regularly in a certain direction. Such evolving universes occur most frequently among social phenomena and find their statistical reflection in time series. In dealing with the latter a question always arises as to the nature of the successive items: are they samples drawn from the same universe or has the universe been developing with the passage of time? There are several devices which facilitate the answering of this question, such, for instance, as the Lexis criterion of stability and certain generalized forms of the variate-difference method. The attempt to formulate a single law of distribution for the entire time series may be compared to the rearrangement of the several pictures of a motion picture film in accordance with some criterion which has no direct relation to time, such as the postures of the characters. This procedure overlooks an essential type of information, a knowledge of the sequence of variation which is usually not at all accidental. Another problem peculiar to time series is that of segregating the several types of variation which are reflected in its figures.

A special complex of problems is involved in the utilization of statistical procedures for the establishment of causal associations. For a long time these procedures were identified with the classical methods of induction as expounded in textbooks of logic. Gradually, however, it became clear that "in the empirical sciences the statistical method comes into play only where induction, the inference from one typical instance to other instances, fails" (Rümelin, *Gustav, Reden und Aufsätze*, 2 vols., Tübingen 1875-81, vol. i, p. 267). The fundamental peculiarity of the statistical search for causal associations arises from the fact that it relates cause universes to effect universes, both of which include in addition to cause elements and effect

elements other components having no bearing upon the cause and effect relationship. Moreover, since it is of the very essence of the statistical method that separate elements or individual units in the universes are disregarded, interest is centered entirely upon their common, or "average," interactions. These considerations account for the fact that statistical inferences as to causal associations belong to the realm of probability and lack the incisiveness of classical induction.

In the natural sciences statistical methods of establishing causal associations are becoming ever more prevalent. This is particularly true of theoretical physics, certain of whose divisions are already purely statistical in character; in recent years the very law of causality has come to be questioned here, and physical laws are being revised along the lines of the statistical theory of gases. In the social sciences, however, the statistical approach to the study of causal associations remains subordinate. Much greater importance is still attributed here to the idiosyncratic functions of statistics; it is as descriptive statistics that the statistical method is now being extended to history, social psychology, political science and similar disciplines. A possible explanation is that most of the universes in the social scientific field as well as their characteristics are comparatively unstable. This would account also for the uncertainty as to the accuracy of results achieved by extrapolating time series, an indispensable procedure for practically every type of business forecasting. It is scarcely to be doubted, however, that even in the social sciences the use of nomographic-statistical methods for the establishment of causal associations can be greatly expanded if they are applied correctly and cautiously.

The social science in which the nomographic aspects of the statistical method loom largest is economics. Here the relation between statistical analysis and economic theory is analogous to that between experimental and theoretical physics, which is indeed quite unlike what Bacon once imagined it to be. In physics conclusions deduced from hypotheses, which may be formulated on the basis of experimentation or a priori considerations or even analogy and intuition, are verified with the aid of experiments. In economics the place of physical hypotheses is taken by the several special theories, such as the quantity theory of money; while for experiments are substituted statistical investigation and analysis which "verify" theory and give it

concrete substance by means of averages, index numbers, combination tables, correlation coefficients, trends and the like. It should be noted, however, that the results of physical experiment are as a rule much more precise and subject to much smaller errors of observation than those of its statistical substitute in economics; and that the stability of statistical measures in physics exceeds by far that in economics or in the social sciences in general, because physical universes consist of an incomparably greater number of units than economic collectives. This, by the way, signals a complete reversal in current thought as to the function of statistics in the natural and social sciences; not long ago the mass character of social phenomena was contrasted with the typical character of individual phenomena in the natural sciences and statistics was generally regarded as a method peculiar to the social sciences, because in the social field generalization based on individual cases was considered impossible. By virtue of the roughness and instability of results in social statistics an inquiry into causal relationships among social phenomena usually implies distinct questions concerning the existence of a relationship between the series compared, the form of that relationship and its distortion by extraneous and disturbing factors. The answer to these questions in most instances is supplied by the theory of correlation and association. The formulae derived by this theory serve also to describe the law of distribution of correlated attributes for the members of a universe; in these instances coefficients of correlation appear as universe characteristics of the product-moments type.

However inexact statistical verification in the social sciences may be, it is better than none. A consideration of the several antagonistic tendencies always operative in the social field, with no attempt to measure the intensity of their pull, can lead to no definite conclusions. When conclusions are reached, the soundness of the quantitative comparisons that must be implicit in them will be much more certain if they are grounded in statistical observation and analysis serving as a check upon intuitive and biased judgments.

STATUS is essentially a legal term and connotes the sum of the legal capacities of an individual, his powers to enforce legal rights and obligations either for himself or for others. The term has its fullest meaning in societies in which law has been more or less differentiated from religion, morals, politics and economic organization. Since that differentiation has never been complete, however, the status of a member of a

community is never wholly distinguishable from other group relations; and the terms citizen, paterfamilias, patrician, villein and clerk are often used to describe both legal status and a political, religious or domestic relationship.

Equalitarian states may be described as those which recognize only one status—membership in the community, or citizenship. The equalitarian theory has never been realized fully in practise and even as a theory has been accepted only in such purely ideal constructions as the stoic cosmopolis or the primitive concept of the Christian church, in which membership was open to all, no distinction being drawn between freeman and slave, Jew and Gentile, man and woman. Historically all known communities have at times and in varying degrees admitted and generally emphasized differences in status. These differences have had certain correlations with other systems of classification. They have depended upon membership in age grades, common descent from known or supposed ancestors or initiation into specific cult organizations. Such systems of classification have had widely differing origins and functions, but they have sometimes involved what is in effect a legal status or have played a predominant part in determining it. Most frequently, however, it is economic class which is found to be correlated with status, although only rarely does this correlation approach anything like completeness, if only because changes in legal status tend to lag behind changes in the social system.

Pure democracies are not common, but they do exist among some primitive peoples. Property qualifications for the exercise of private and political rights, however, appear frequently. Under the Solonic constitution and the older Roman constitution privileges, in effect legal, depended in part upon the amount of property possessed. The controlling factor was possession of certain types of property, such as herds, slaves and land. This is also quite common, although not universal, among primitive peoples. The property on which classification depends may occasionally be highly specialized and from the modern point of view quite overvalued. As late as the nineteenth century the possession of land in England gave real legal prerogatives that other forms of wealth did not create.

But economic class lines are not necessarily reflected directly in status. The influence may be indirect, and de facto situations must be distinguished from the legal theory that creates and recognizes status. Almost everywhere in the

European culture areas the owners of great herds became almost automatically the masters of broad lands and many men and inevitably the masters of the state as well. There seemed nothing morally objectionable in associating legal privilege with economic power. But a moral objection arose when wealth was acquired by former members of the lower orders. A new test, that of good birth, established itself and the status of the well born became different from that of the lowly born.

When birth becomes a test of status, two conflicting tendencies appear. Good birth and wealth are still commonly associated, but impoverished members of the privileged classes are frequently forced into the lower rank. On the other hand, wealthy members of the unprivileged group push their way up. In fact in any status system there is a fairly constant tendency for the members of any one grade to attempt to enter the grade immediately above them and to strengthen the barriers which block the grade immediately below. Only in rare instances do such grades with their concomitant status succeed in creating really insurmountable barriers. When that happens, there is developed a caste system such as that which has long prevailed in India.

In a caste system the primary idea of status exists in its most complete form: possession of a particular status is conditioned by birth or external assignment, not by choice. In some societies with similar castelike tendencies there still remains an element of preference for the individual. Thus in mediaeval Europe a man became a clerk usually by his own voluntary act, and the status of clergyman consisted of a complex of peculiar legal relations fixed by law and custom and different from those of other statuses. Again, in the monarchy of Diocletian the compulsory guilds were at their height, but in the army a new status might be obtained by deliberate choice.

Differences in status were taken for granted in older communities. A very ancient analogy likened the body politic to the human body, in which there was obviously a high degree of specialization among the constituent members. Most of the Greek communities except the pure or nearly pure democracies recognized several grades: a privileged citizenship, which alone was eligible to the council or the magistracies; an unprivileged citizenship; and the slaves. Frequently there was another grade, that of clientage, higher than slavery and ordinarily com-

posed of emancipated slaves or resident aliens. Each of these grades conformed with a real status, since legal rights depended upon the classification. Private slaves were theoretically without rights; aliens and freedmen, while they enjoyed certain well defined private rights, could exercise them only through a patron. Citizens alone were accorded full legal rights (*soma*). But there were in fact many more gradations than those mentioned. Free women had regularly a subordinate and limited status as compared with men. There were further total or fractional degradations which were imposed on public debtors, on certain types of offenders and on persons engaged in infamous callings. Moreover privileges and immunities were granted to particular groupings of persons.

Caput was the term used in Rome to designate full legal status and was at first synonymous with citizenship. *Caput* consisted of *libertas*, *civitas* and *familia*—freedom, citizenship and membership in a family. A loss of *caput*, a *deminutio capitis*, was equivalent to what at Athens was called total or partial *atimia*, that is, degradation in status. Toward the beginning of the empire three stages of such a loss of *caput* were noted and each stage was separately named: *capitis deminutio maxima*, *media* and *minima*. In each the person affected lost some element of his full legal status. Later schematists said that he lost one of his three *capita*. The idea of three *capita*, however, does not appear in contemporary discussion, where *capitis deminutio maxima* and *media*, like *atimia*, are thought of generally as penalties, while *capitis deminutio minima* was often not a reduction but a change and frequently an improvement in legal status.

In Rome, just as in the Greek states generally, there were also minor degradations for citizens, involving changes in the complex of legal capacities and consequently in status. One of these changes made a man *infamis*, excluding him from certain political positions and from entering into specified contracts. Another made him *intestabilis*, whereby he could not be a witness to or a beneficiary under a will or a witness to other transactions; and perhaps could not make a will.

Such developments took place against a background which continued theoretically to be timocratic. The Roman census listed classified citizens by their property holdings, which still created a real political status. In the last century of the republic only the first three census classes and under Augustus the first four census classes

possessed the valuable privilege of being *judices* and as such had important functions in the judicial process.

Again, at Rome, as in Mediterranean societies generally, free women were under disabilities which, while less severe than the tutelage imposed on women at Athens, were still not wholly insignificant. While most of these disabilities became obsolete in practise, newer ones were established during the empire, notably the restriction on a woman's right to become surety, so that there continued to be a definite status for women as such. Slaves, of which there were many, had no private rights, but the later law afforded them a limited protection.

Outside of the census classifications and the possession of *caput* the status of freedmen was a special one; for although freedmen might enjoy citizenship, they suffered from political disabilities, could not marry a free born person and had duties which might occasionally prove extremely burdensome. There were further legal as well as political disabilities attached to Latin as distinguished from Roman citizenship. The colonialy Latins were governed by the Roman law but could not contract a Roman marriage or enjoy the rights of succession arising from such marriages. The members of the Latin-Juman rank were even more restricted in their rights.

The difficulties of administering an empire under a complicated system of political statuses led to the gradual elimination of grades of citizenship. The last surviving class of limited political and civil status, that of the *dediticii*, seems to have been specially saved by an enactment of Caracalla which granted Roman citizenship to all freemen within the empire and was not abolished until the reign of Justinian. This class, with which the *capite censi* of the eastern provinces have been somewhat rashly identified, acquired a definitely legal and social rather than a political status, and membership in it amounted in effect to almost complete loss of civil rights. It was the status particularly of freedmen convicted of crime.

During the empire, however, a new form of status was created by the differentiation of people into *honoratiores* and *humiliores*, a classification important chiefly for criminal law; the *humiliores* were regularly more severely punished. There were also marriage restrictions which prevented a senator from marrying a *humilior* and there were further procedural privileges accorded the *honoratiores*. The distinction

was accordingly not a vague concept of upper and lower classes but a real and substantial discrimination of status.

The eastern provinces, especially Egypt, had from time immemorial known an agricultural class attached to the soil. The *colonus* was theoretically a free person and a citizen having all rights not expressly barred. His status was hereditary; from it there was practically no release. This status spread in the later empire and fitted in very well with the system of compulsory guilds into which citizens were assembled. The latter system broke down in the west during the decay of imperial authority in the fifth and following centuries, but the *colonatus* took firm root and was developed into the villeinage of the Middle Ages.

In the centuries after the barbarian invasions status was almost lost in the welter of national laws. To know a person's real position it was first of all necessary to know "the law by which he lived." But within these national laws distinctions of status also existed and were incorporated into the feudal system, when the personality of law receded and the basis of society became more and more territorial.

Generally speaking, the prevailing distinctions provided for three classes: the free, the half free and the slave. The half free formed a group in a dependent relationship to some superior. As the feudal system formed, enormous variations in the actual complex of rights of groups and individuals, which were at first based on the voluntary or apparently voluntary agreement of the persons affected, became transmitted to their descendants; and status could be said to be a man's position in a complicated network of relations that were generally but not strictly hierarchical. To these were added as a separate rank the ministerial officialdom of administration and the great landowners, who together formed the new nobility. There were also the clergy, whose status was determined by their special membership in the supranational corporate church and who were subject only to its laws. The clefs between these various groups were often talked of as impossible barriers. In fact they were far from being so, largely because of the church organization, in which secular rank was to some extent ignored. In the later Middle Ages, when feudal displaced territorial law, the early divisions according to degree of freedom gave way in general to groupings of knights, burgesses and peasants, which were real blood estates based upon occupation. Ser-

vile restrictions, however, remained and were associated primarily with the peasantry.

Status in the feudal system was of course dependent upon membership in the Catholic church. Christian non-conformists were heretics and as such criminals, so that the only important mediaeval status dependent on religion rather than on position in the feudal arrangement was that of the Jews. The position of the Jews differed from all others. In all Christian communities they were aliens but not in the same sense as other foreigners. Frequently they were, as in England, classed as "personal serfs" of the sovereign or of the corporate community, but this serfdom apparently attached itself only to their property rights and not to their bodies. In many instances they were protected by royal or papal charters, which generally ran for short periods and could be renewed only on payment of considerable sums. The right to "have Jews" might itself be granted by charter to feudal lords or to towns. In nearly all cases, however, the status of Jews was precarious and could be terminated arbitrarily by a general edict of expulsion. They were not, properly speaking, members of the state at all.

The breakdown of the feudal system as a form of political organization was not immediately accompanied by the abolition of feudal status. A real break in the mediaeval idea of elaborate classifications and minute discriminations was initiated by the Enlightenment of the seventeenth and eighteenth centuries, which stressed natural law and with it the hypothetical equality of mankind. A strong emotional tone was given to the movement by such philosophers as Rousseau, and equalitarianism became a powerful solvent of categories during the revolutionary movement. It was generally assumed that progress in political reforms moved only toward a state in which there would be but a single status. The prerevolutionary state had a hierarchy of ranks; the new communities would know only the status of citizen and comrade.

In France the revolution saw the end of the servile restrictions and disabilities of the peasants, which had been in process of disappearance for a number of centuries. The north German peasants did not cease to be serfs until the reforms of Stein and Hardenberg in 1807; and it was only in 1861 that the emancipation of the Russian serfs was decreed. Other vestiges of mediaeval status lasted even longer. Not only did the division of clergy and laity remain, but in countries which, like England, resisted and

finally overcame absolutism the status of noble was still marked off from that of commoner by slight legal differentiations. More important, a *de facto* status founded on the possession of land carried with it the almost exclusive privilege of active and passive electoral franchise and eligibility to judicial function.

With the revival of equalitarian doctrines in the period of the Enlightenment religion seemed, even more than birth or property, an irrational criterion of status. After the Reformation very few states succeeded in being totalitarian in religion. In most of them there was a state church and in theory no one could be a full citizen who was not a member thereof, a situation which obtained until recently in a number of the South American republics as well as in Spain. In fact, however, every state tolerated a number of religious dissidents; and in some cases their status was fixed by law, independently of the fluctuating discretion of administrative officers. As a rule religious non-conformists were possessed of only limited rights. In most cases, when there was an electoral franchise, non-conformists were not included in the privilege and nearly always were debarred from public office, sometimes by specific regulation and sometimes because, the duties of public office involved participation in the rites of the official religion.

The reform movements of the nineteenth century struggled, not for toleration but for comprehension. It became axiomatic that religious conscience must be free, and that subject to limitations of morals and public security it was fundamentally inadmissible that a citizen's legal rights should depend upon the rites he practised or the religious beliefs he entertained. Before the World War this theory was accepted either entirely or with some modifications everywhere in Europe except in Russia, Turkey and Spain.

But while the single status system was developing in Europe, a severe setback was given to the movement when the conditions presented by the exploitation of newly discovered areas in America, Africa and Asia revived in a particularly cruel form the status of unqualified slavery. The usual shock of the process was softened by the fact that the new class of slaves were members of races differing in unmistakable physical characteristics from those of the white exploiters, so that their common humanity could conveniently be disregarded. Considerable sophistical dialectic was expended to show that Negro and Indian slavery did not really contravene the principle that in nature all men are equal. But

the humanitarianism which had been one of the main constituents of the Enlightenment ultimately triumphed, and after a struggle of some centuries the institution of slavery and with it the status of practical rightlessness was abolished almost everywhere. Slavery still exists, however, in Abyssinia and various corners of Asia and Africa, sometimes with the shamed recognition of various western powers.

The development of a single status system has progressed fairly steadily in democratic countries. Legal classifications which depend upon heredity or into which persons are regimented have become fewer, but the process has not been uniform. Status based upon social class has virtually disappeared; and although the laborer today, by reason of his pecuniary situation, may be unable to avail himself fully of his legal rights, his position in the law is the same as that of every other citizen. Vestiges of older status arrangements affecting political rights, such as property qualifications for the franchise, have become relatively unimportant. Limitations upon or special provisions for the private rights of aliens have also diminished to a great extent; the mediaeval *droit d'aubaine*, by which the property of a deceased alien escheated to the king, was abolished by the eighteenth century. The chief restrictive features affecting the status of the alien at present touch upon his ownership of property, especially landed property, and upon his political rights. The inferior legal position of women has persisted perhaps longer than that of any other group, and although great progress has been made toward equalizing their rights with those of other citizens, numerous disabilities are still retained in continental and American law.

Certain complexes of rights, obligations and privileges determined by present law exist of course, but the acquisition of such complexes is voluntary. Thus a marital relationship affects the legal position of the parties in private law, and there is accordingly a status of being married. Those who assume the status, however, do so voluntarily. Again, workmen's compensation, minimum hour and wage laws seem to make the status of employment a definite one; but it too depends upon a contractual relation and terminates whenever the relation ceases.

Special positions in the law for certain categories of persons are inevitable. In a state in which individual rights can be asserted and individual responsibilities assumed, the presence of persons who are mentally incapable, in whole or

in part, of such assertion or assumption must be recognized as a fact. Children therefore as well as mental incompetents must be given a special status for their own protection. Similarly a great many forms of limited or reduced status are established as penalties. The assertion of rights and privileges moreover is restricted when their exercise appears to constitute a general danger.

Since the World War there has been a revival in antidemocratic countries of the older principle of status based on economic class, occupation and other criteria. In Soviet Russia merchants, persons living on income and others not in the working class are disfranchised and subjected to restrictions; nor is it easy for their children to attain the status of a worker. In Germany classifications based upon race are again creating a special status for the Jew. The status of non-workers in Russia does not in principle conflict with the ideal of a single status enjoyed by all adult, sane citizens, for the denial of rights to particular groups is predicated upon a belief that they will either be absorbed or eliminated. The position of the Jew in National Socialist Germany is in popular feeling, if not in official pronouncement, justified by the hope that the Jews will ultimately migrate. The proposal to embody two types of citizenship in the new German constitution, limiting to a small privileged group the right to hold office, does, however, seem to be in direct contravention of unitary status. The attempt to revive corporate status in the corporative state of fascist theory is still in an incipient stage. But essentially the type of status which seems likely to become most widespread is the secondary type, in which economic or social relations voluntarily entered into will be grouped in clusters, so that many of them will have correlatives of which those who are affected will not always be conscious.

STEAD, WILLIAM THOMAS (1849-1912), English journalist. Stead is one of those most responsible for the "new journalism" in Britain. He was educated by his father, a Congregational minister, except for two years at a small boarding school, and then apprenticed to a Newcastle merchant. He contributed to the *Northern Echo* of Darlington, was appointed editor in 1871 and made that newspaper known for its advocacy of Gladstonian Liberalism. From 1880 to 1883 he served as assistant editor of the *Pall Mall Gazette* under John Morley and was editor until 1890. Although under his editorship the circulation rose only to about 13,000, the "P.M.G." was read by people of influence and had a profound effect upon British journalism. Stead made it the vehicle of his moral zeal and wide range of interests but shocked his public with many of his topics and methods, notably his

campaign against prostitution. He emphasized the interview, the signed contribution, the special article, maps and illustrations and the journalism of the "stunt," with its moral excitement, discontinuity and human interest. Thus he agitated for sending Gordon to the Sudan and espoused an imperialism that led him to a close friendship with Rhodes; yet he opposed the Boer War. He led the press in a "big navy" campaign but advocated the cause of peace and the calling of the First Hague Conference; and he interpreted sympathetically subjects as varied as Russian policy, the Vatican and civic regeneration in Chicago. He became a believer in and advocate of spiritualism. In 1890 he founded the *Review of Reviews*, a new type of magazine of short articles on current events; American and Australian editions were established in 1891 and 1892 respectively. Characteristic of Stead's writings are his "Letters from Julia," "Truth about Russia" and "The Maiden Tribute of Modern Babylon."

STEEL INDUSTRY. *See* IRON AND STEEL INDUSTRY.

STEELE, SIR RICHARD (1672-1729), English journalist. Although his reputation rests in part on his essays, plays and political pamphlets, Steele is notable chiefly as one of the pioneers of eighteenth century social journalism. Between 1709 and 1720 he founded, edited and in large part wrote nearly a dozen periodicals, of which the most important were the *Tatler* (1709-11), the *Spectator* (1711-12), the *Guardian* (1713), the *Englishman* (1713-14; 1715) and the *Theatre* (1720). An ardent party man, he could not refrain from frequent excursions into political controversy, and in the *Tatler*, which began to appear while he held the post of gazetteer under the Whig ministry, he maintained for a time a department of news. But from the first he took as his special province the everyday life, manners, morals and tastes of contemporary middle class society. Some of the possibilities of this field had been realized by earlier journalists, notably John Dunton and Daniel Defoe; but Steele bettered nearly all their hints and in the end, thanks partly to his own ingenuity and partly to the assistance of able collaborators

(especially Swift and Addison), he succeeded in developing a new technique of periodical social comment which, imitated widely both in England and on the continent, influenced journalistic writing to the end of the century.

In the history of social ideas Steele's role was less distinctive. But the energetic propaganda which he conducted in his periodicals and elsewhere for such causes as the abolition of the duel, the purification of marriage, the improvement of the moral tone of the theater and recognition of the dignity of trade undoubtedly had a share in forming the new public opinion on these and similar questions which prevailed in the eighteenth century.

J., *English Literary Periodicals* (New York 1930) ch. II.

STEFAN DUŠAN (1308-55), the greatest of the Serbian monarchs. Like Theodoric the Great, Stefan was educated at Constantinople, living there in exile until 1320. When his father, Stefan Dečanski (Uroš III), was crowned king of Serbia in 1321, Dušan was crowned as underking of Zeta, and ten years later when the father was deposed (with no clear evidence of the son's participation) the latter became king and reigned for a quarter of a century. His policy of territorial expansion was inherited from his predecessors; he was among the first of the Christian rulers to realize the gravity of the Turkish menace and he sought to forestall it by occupying Constantinople and effecting an alliance of the other eastern nations against the Turk. His death, in the midst of intensive preparations for the final move on the imperial city, changed the course of history.

But Stefan's activities were not exclusively military or external. Indeed his achievements as lawgiver and statesman were more permanent. To appease his turbulent kingdom he made efforts to raise the status of the serfs and to establish the reign of law. In 1349 he laid before the Sabor (National Assembly) the first draft of the celebrated code which has since borne his name, the *Zakonik Dušana*. In its very arrangement it shows evidence of the use of Byzantine models. In beginning with provisions relating

to the church and clergy it imitates the Byzantine *Basilica*, from which, it may be assumed, it copiously borrowed. In certain respects its provisions are noteworthy: thus it anticipated modern ideals by declaring that justice should be done according to "law and the Christian religion" and that it should be equal to all. The provisions governing judicial organization and procedure show an attempt to give the Serbs a centralized system of royal justice.

Nevertheless, there must have been much dissatisfaction with the course of judicial administration, for in 1354 Stefan submitted to the Sabor a supplement to his code containing provisions relating to crimes and criminal procedure; later hands have added other articles. Although the *Zakonik* is notable as constituting a long step toward the reception of Roman (Byzantine) law in Serbia, much of its material was doubtless basically native. Moreover it proved to be one of the most enduring of compilations. Despite the Turkish conquest it continued to be observed in old Serbia down to 1830, when the code adapted by Vuk Karadžić from the *Code Napoléon* displaced it. In Montenegro it remained the basic law until Bogićić's code of 1888.

STEFFEN, GUSTAF FREDERIK (1864-1929), Swedish sociologist and economist. Steffen studied chemistry in Aachen and was an instructor at the Bergakademie in Berlin from 1885 to 1887. In Berlin he attended Schmoller's lectures and became definitely interested in eco-

nomics. As foreign correspondent for Swedish newspapers from 1887 to 1902 Steffen traveled and studied economics in England, Italy and Germany. In 1902 he received the degree of doctor of philosophy from the University of Rostock, offering as his thesis *Über die Kaufkraft erwachsener männlicher Arbeiter in England (1760-1830)*. The following year he was appointed professor of sociology and economics at the Goteborg Hogskola.

Steffen served from 1911 to 1916 as a socialist deputy in the upper chamber of the Riksdag. He was a great asset to the Social Democratic party, for the rich background in economics which he had acquired as a foreign correspondent strengthened his reputation as an enlightened interpreter of the social scene and added to his prestige in parliament. Like other Swedish liberals who had joined the Social Democrats in order more effectively to further social reform, Steffen did not accept orthodox Marxism. Instead he advocated the adaptation of socialism to the existing social order. Private initiative should be retained but the evil effects of capitalism should be corrected by social legislation. At the outbreak of the World War Steffen unequivocally supported Germany and defended that country in his *Krig och kultur* (4 vols., Stockholm 1914-17; vols. 1-11 tr. into German, Jena 1915) The Social Democratic party by expelling him in 1915 publicly expressed its adherence to Branting's policy of opposing all pro-German activity. Steffen was later reinstated and became a member of the Swedish Commission for Socialization.

Steffen was one of the leading Swedish sociologists and the author of a number of scientific studies, many of which reflect the influence of Bergson's theories. In *Sociologi* (4 vols., Stockholm 1910-11) he defined society as the psychological relationship between individuals, envisioning sociology as a science very similar to social psychology. His *Sociala studier* (7 vols., Stockholm 1904-12) was a critical sociological study of special problems connected with modern culture, including democracy. In the field of historical sociology Steffen wrote *Världsåldrarna* (3 vols., Stockholm 1918-20), a study of the evolution of fundamental types of social organization from the earliest period to modern times.

STEIN, FREIHERR HEINRICH FRIEDRICH KARL VOM UND ZUM (1757-1831), German statesman. In 1780 after several years' study of jurisprudence, political science and especially history Stein entered the service of Prussia, attracted by the dominant personality of Frederick the Great. In his administrative activity in Westphalia he made significant contributions to the development of mines and forests, the building of roads and the stimulation of commerce and industry. His true career as a builder of the state began, however, when King Frederick William III transferred to him the ministry of commerce and shortly afterward that of finances. Because of his outspoken objection to the king's "cabinet administration" he was abruptly dismissed, but after the Jena disaster he was unanimously recalled. He devoted his entire skill to the internal regeneration of the state through unprecedentedly broad legislation, which was attacked by older factions as "revolutionary." The "king's subjects" became "citizens of the state," the serfdom and hereditary subjection of the peasants were abolished, the jurisdiction of the landed proprietors was revoked and self-government was provided for the cities. No less significant was Stein's role in foreign policy as organizer of the struggle for freedom against Napoleon. As minister of finance he made repeated efforts to settle the enormous reparations with which France had saddled Prussia, but at the same time he was intent upon throwing off the foreign yoke. At this time a letter was intercepted in which Stein urged spiritual preparation for the liberty which was to come. The king, who in his distress had made an alliance with France, was forced to dismiss the great statesman. Napoleon ordered him to be exiled and his property confiscated.

Shortly afterward Stein went to Austria; and when in 1809 that country was also subjugated, he accepted an invitation of Czar Alexander I and went to Russia to serve German interests in the impending Russo-French war. In St. Petersburg he organized a German Committee, to which Ernst Moritz Arndt was appointed; it was from Russia that Arndt dispatched to the German countries his songs which kindled enthusiasm for the War of Liberation. When the French forces were defeated on the icy steppes of Russia, Stein returned to Germany to become the herald of German freedom and union. In the headquarters of the allies he sought constantly to preserve the harmony between them and demanded the overthrow of Napoleon. Far beyond the borders

of Germany he was hailed as Europe's deliverer from French tyranny. After Waterloo he urged the reunion of Alsace with the German mother country. At the Congress of Vienna he insisted, likewise to no avail, upon a strong centralized Germany. Disappointed he retired to his country estate. Stein did not live to see the fulfilment of the great desire of his life—a united strong German empire. But his ideas continued to exert an active and widespread influence, and in 1871 they were partially realized.

STEIN, LORENZ VON (1815-90), German social philosopher and economist. Stein was born in Schleswig, and after a course of training at a cadet school he studied jurisprudence at the University of Kiel. In 1841 he went to Paris to continue his legal studies; here he served also as a correspondent for the *Deutsche allgemeine Zeitung*. At Paris he came into contact with the leaders of the French social movements Louis Blanc and Cabet, and in 1842 he published his epoch making book, *Der Socialismus und Communismus des heutigen Frankreichs* (Leipzig 1842), which in its last edition bore the title *Die Geschichte der sozialen Bewegung in Frankreich von 1789 bis auf unsere Tage* (3 vols., Leipzig 1850; new ed. by G. Salomon, Munich 1921). After his return from Paris he taught at the University of Kiel and advocated the independence of Schleswig. This led to his dismissal and he went to Munich to follow the profession of journalist. In 1855 he was appointed professor

at Vienna, where he remained until his death.

Lorenz von Stein's work was of decisive importance for several fields of social science. With Robert von Mohl he was the founder of the science of public administration which replaced the older science of cameralistics. With Roscher, Adolf Wagner and Gustav Cohn he was one of the leading figures in the development of the science of public finance in Germany. His chief significance, however, rests on his social theories and his influence on German sociology, and it was this aspect of his work which invested his many activities with unity.

Although he began his career as a jurist, Stein soon perceived that social problems had come to supersede political and legal problems and that the social movement in France was but a prelude to similar developments in other lands. Stimulated by the combined influences of German idealism, Fichte's idea of personality, the Hegelian concept of development and the doctrine of Saint-Simon that industry was the real force of the modern age and that modern history represented the struggle between feudal and industrial economic systems, Stein developed the concept of the proletariat as a product of industrial capitalism, the economic foundations of class structure and the beginnings of an economic and class interpretation of history. The working out of these ideas in Stein's *Geschichte der sozialen Bewegung* antedates the first Marxian publications on the same subjects, but the question of Stein's influence on Marx is still far from settled. Stein's social theories led him to views on social policy quite different from those espoused by Marx. In order to pave the way for a solution of the social question Stein demanded a reform from above carried out by a social monarchy. He urged the amelioration of the conditions of the lower classes but held that this should be accomplished by the state. His was a conservative socialism which sought to do away with classes and looked to the realization of social harmony through the development of a broad bourgeoisie in an ideal state of moral persons and ideas. The state, standing above and outside the classes, was to bring about a reform of society. The ruling interests in society should be subject to the forces of the state and contradictions and conflicts within society were to be solved by the assurance of freedom to every individual, bourgeois or proletarian, through legal equality and increased possessions and education.

STEIN, LUDWIG (1859-1930), German publicist and sociologist. Stein was born in Hungary of Jewish parents and studied in Holland and at the University of Berlin. In 1890 he became professor of philosophy at the University of Berne. With Hermann Diels, Wilhelm Dilthey, Benno Erdmann and Eduard Zeller he founded the *Archiv für Geschichte der Philosophie* in 1886.

Stein's sociological works, influenced especially by Comte, Spencer and Lester F. Ward, propounded a popular, non-systematic, evolutionary social philosophy which he called social optimism. He stressed the importance of environmental cultural factors as opposed to racial elements in history, but contended that the civilization of the white race was destined by virtue of an immanent evolutionary process to rule the world. With his election to the Institut International de Sociologie he began to be active in politics. He wrote several memoranda for Bernhard von Bulow in which he developed a middle of the road policy, which he maintained also in his subsequent mediations between Entente and allied statesmen. He had been outspoken in his internationalist views as early as 1893 and subsequently became a permanent member of the Bureau International de la Paix in Berne. In January, 1912, he acquired possession of the monthly journal *Nord und Sud*, which he used as a propaganda organ for an Anglo-German rapprochement and for creating sentiment against the impending war. He was owner for a time of the *Vossische Zeitung* and was a regular contributor to the *Berliner Zeitung am Mittag*. As a liberal he sought to bring his influence to bear on events during the World War, and when the war ended he served as liaison diplomat between the German delegation to

the Genoa conference and Lloyd George. Among his many organizational activities was the founding of the Mittwoch-Gesellschaft, a political club to which many of the leading German statesmen of all parties belonged. In 1923 Stein lectured in the United States at Columbia, Harvard and Wellesley. He was one of the few persons in politics and journalism who represented an alliance between German and Anglo-Saxon intellectual life and politics.

STEINER, RUDOLF (1861-1925), German philosopher and occultist. Born in Kraljevic, Hungary, of Catholic parents, Steiner went from technical secondary schools to the Polytechnic Institute of Vienna before he turned to literary and philosophical studies. He was especially attracted by Goethe's conceptions of organic nature and devoted the years from 1890 to 1897 at Weimar to the study and editing of Goethe's scientific writings. After venturing for a few years as editor of the *Magazin: Monatsschrift für Literatur* to promulgate independent views of natural organization and evolution by way of discussing the theories of Darwin, Haeckel and Nietzsche, he became in 1902 general secretary and a leading lecturer of the German section of the Theosophical Society. He continued to follow his own intuitions, however, and after 1907 conflict with Mrs. Besant's increasingly pro-Hindu policies led to his withdrawal from the society. In 1913 he founded an independent esoteric movement under the name of anthroposophy. Since the World War this movement has maintained headquarters near Basel at Dornach in Switzerland and not only has grown in Germany but has spread to England, the United States and other countries.

Steiner's complete doctrine, which he announced as "spiritual science," represents an extraordinary synthesis of theosophical material, fresh occult intuitions and certain motifs

of nineteenth century German thought. The science of nature, hitherto predominantly mechanical, must develop the organic idea (which Goethe "saw in the primal plant") of a self-evolving and self-directing organism. But furthermore all nature is to be seen as one manifestation of spiritual reality, which can also reveal itself more directly in thought and art. Evolution has thus far been a progression of bodily organizations into which "pure spirit" descends through successive reincarnations with the aim of producing individual self-consciousness. This development reached its apogee in the Renaissance and in nineteenth century individualism showed its dangerous limitations. In future stages of evolution spirit, without the loss of self-consciousness, must ascend again through knowledge of its cosmic relations, its universality and its transcendence over matter. Special organs of cosmic insight ("the lotuses") must be cultivated to apprehend the higher worlds of spirit and the traces left by their events in the cosmic ether; for example, the anti-Lucifer impulses given by Buddha, Zarathustra, Plato and Christ and the regenerative, solar influence of the blood shed in the mystery of Golgotha. The higher aim of Steiner's pedagogy and exercises is to develop these special powers of insight; a prerequisite is the cultivation of moral balance, a harmony of virtuous dispositions intermediate between excesses and defects.

With respect to social reconstruction Steiner declared in 1919 that while individualism was inadequate, the remedy was not a monistic collectivism or a totalitarian state but rather a "threefold social organism" in which the economic, juridical and spiritual spheres of life are independently organized as three autonomous, interacting systems. These systems are not estates or classes; each embraces the whole democracy in a certain aspect and each has transnational relations. Equality is a concept applying particularly to the juridic sphere of rights, liberty to the spiritual domain and fraternity or voluntary cooperation to the economic. It is evident that Steiner's own interest lay primarily in the liberty of the spiritual sphere, and anthroposophy became a ferment in post-war Europe chiefly among certain groups of yeasting intellectuals, artists, physicians, students and dislodged officials.

The influence of Steiner may be attributed in large measure to his enterprise in giving concrete, practical form to his strivings for a new "Goethean" culture. He was especially con-

cerned with expressing his spiritual insights in the arts. For the anthroposophical center at Dornach he built the Goetheanum, a temple rendering the organic idea according to his own designs. He developed "eurhythmic movement as a visible song and speech of the soul." He wrote and performed new mystery plays. His conceptions of organic nature have also led his associates and followers to experiment with new principles of agriculture and of therapy. Most notable of all have been the applications of Steiner's organic view of individuals and their relations to the general education and development of children in a number of remarkable schools, not limited to anthroposophists, the chief of which is at Stuttgart with an enrolment of about twelve hundred.

HORACE L. FRIESS

Consult Steiner, R., Mein Lebensgang (Dornach 1925), English translation (New York 1928), Vom Lebenswerk Rudolf Steiners Eine Hoffnung neuer Kultur, ed. by F. Rittelmeyer (1st-3rd ed. Munich 1921), Hauer, J. W., Werden und Wesen der Anthroposophie (Stuttgart 1922).

STEINHAUSEN, GEORG (1866-1933), German historian. After the completion of his university studies in 1888 Steinhausen adopted the profession of librarian. In 1892 he became first librarian at the University of Jena and in 1901 director of the Murhard Library in Cassel. At the same time he carried on active scientific work, chiefly in the field of cultural history. Steinhausen's most important work is the *Geschichte der deutschen Kultur* (Leipzig 1904, 3rd ed. 1929). He treated individual aspects of German culture in smaller monographs and in the larger works *Germanische Kultur in der Urzeit* (Leipzig 1905, 4th ed. 1927), *Kulturgeschichte der Deutschen im Mittelalter* (Leipzig 1910, 3rd ed. 1921) and *Deutsche Geistes- und Kulturgeschichte von 1870 bis zur Gegenwart* (Halle 1931). Steinhausen did not identify intellectual with cultural history. He also ignored completely the state. Unlike Karl Lamprecht, he regarded cultural and political history as two mutually exclusive fields. In his treatment of cultural history moreover Steinhausen adhered to the older concepts of culture. Although *Volkskunde* had become an independent science, he still included it in the sphere of cultural history. Nevertheless, he did attempt to enter into the general interrelations of historical events and to give some appraisal of economic, social and political influences. Steinhausen followed in the tradition of Jacob Burckhardt, Wilhelm

Heinrich Riehl and Gustav Freytag and published several studies of their work. He was closest to Freytag in his ability to describe in minute detail all aspects of life, even eating and drinking. Riehl, however, had based his work on keen observations during wide travels through Germany, while Steinhausen clung to the collected materials. He was still further removed from Burckhardt, whom he never approached in intellect and artistic spirit. In 1894 Steinhausen founded the *Zeitschrift für Kulturgeschichte*, which has been continued since 1903 as the *Archiv für Kulturgeschichte*.

WALTER GOETZ

Consult. Die Geschichtswissenschaft der Gegenwart in Selbstdarstellungen, ed. by S. Steinberg, 2 vols. (Leipzig 1925-26) vol. 1, p. 233-74.

STEINKELLER, PIOTR ANTONI (1799-1854), Polish industrialist. Steinkeller's activity, begun in the year 1826, coincided for the most part with the exceptionally difficult times following the Polish uprising of 1831, when Congress Poland was deprived of the right to control its own economic policy and was separated from the Russian Empire by very high customs duties, which led to the collapse of certain branches of industry. During this period Steinkeller organized a whole series of large scale industrial enterprises, among which the following may be mentioned: a steam mill, a brickyard, a tile factory, the manufacture of drain pipes, a sawmill, a factory for wood veneers and inlays, foundries producing steam engines as well as machines for use in mining and agriculture and in sawmills, a cotton spinning mill and a carriage factory. For the benefit of the state monopoly of salt he arranged for the transportation of salt by water from the Galician mines to Congress Poland. On the state post routes he reorganized and improved travel, using coaches manufactured in his own workshops after English models. He was the initiator of the first Polish railroad, which connected Warsaw with the coal mine districts and with the Austrian and Prussian railroads. Steinkeller's proposal to establish a direct rail and water route to the Baltic, which would avoid Prussia and its high transit duties, and likewise his plan to connect Warsaw by rail with Nizhni Novgorod in order to facilitate the exportation of industrial products to the east failed because of the opposition of the Russian bureaucracy.

Steinkeller played a very important part in putting Polish zinc on the international market.

He contracted for the entire production of the Polish zinc smelters and in cooperation with various bankers and trading firms in England, France and Germany carried on an international trade in this commodity. All these enterprises were backed by the credit of the Bank Polski. Financial difficulties resulting from losses in certain of his enterprises led to a close control by the bank of all Steinkeller's activities and finally in 1853 caused Steinkeller to assign all his enterprises and almost all his property to the bank, which assumed all the obligations undertaken by these enterprises.

JAN RUTKOWSKI

Consult Radziszewski, H., and Kundelski, J., Piotr Steinkeller (Warsaw 1906)

STEINTHAL, HAJIM (1823-99), German-Jewish psychologist. Steintal studied at the University of Berlin from 1843 to 1850, when he was appointed *Privatdozent* in philosophy and psychology; in 1863 after a sojourn in Paris he was made assistant professor. It was at Berlin that he came in contact with Wilhelm von Humboldt, whose philological views exercised a profound influence upon him. In 1860 he founded together with Lazarus the *Zeitschrift für Völkerpsychologie und Sprachwissenschaft*. His Jewish activities began about 1872 with courses of lectures on the philosophy of religion at the Lehranstalt für die Wissenschaft des Judentums in Berlin. After his death his articles on Jewish subjects were collected by Karpeles in *Über Juden und Judentum* (Berlin 1906; 3rd ed. by N. M. Nathan, 1925).

Steintal's literary output was vast. Although the philosophy of language was his chief interest, he also made valuable contributions to all of the *Geisteswissenschaften*: to mythology, comparative religion, philosophy, psychology, ethics and logic. The doctrine of a group mind as distinct from the minds of the individuals constituting the group was fundamental to his system of psychology. It was on this account that both he and Lazarus were criticized in academic circles, where the group consciousness concept was regarded as mystical. In reality, however, Steintal did not posit any supersoul or extra-individual entity, but understood the group mind or collective psyche to be an integration of the individual minds functioning as a unit.

Steintal's style was facile but trenchant in controversy, as is indicated, for example, in the preface of his *Grammatik, Logik und Psychologie* (Berlin 1855). An erudite scholar, he was at the

same time a social reformer. In his *Allgemeine Ethik* (Berlin 1885), in which he discussed socialism and pleaded for absolute academic freedom and for the recognition of atheism as a religion, he displayed a liberalism unusual for a German professor of his time.

STEPHEN, GEORGE, *See* MOUNT STEPHEN, FIRST BARON.

STEPHEN, SIR JAMES FITZJAMES (1829-94), British legal and political theorist. Stephen was called to the bar in 1854 and began to write for the *Edinburgh Review*, the *Saturday Review* and the *Pall Mall Gazette*. From 1858 to 1861 he was secretary to the Commission on Education and from 1869 to 1872 legal member of the Viceroy's Council in India, in which capacity he did important work in the codification of contract, evidence and criminal procedure. His work in India confirmed the antidemocratic ideas which he owed partly to his temperament and partly to the experience of 1848, and in his *Liberty, Equality, Fraternity* (London 1873) he appealed from the new utilitarianism of Mill's essay *On Liberty* (1859) to the old utilitarianism of the *Logic* (1843) and *Political Economy* (1848). Stephen's dispute with Mill was as much a matter of temperament as of mind. Whereas Mill was an agnostic, a feminist and an advocate of persuasion as a substitute for force, Stephen was a Puritan, no more a feminist than Doctor Johnson himself and profoundly convinced of the need of force to secure civilization. Like Maine's *Popular Government* (1885) his book was a reconsideration of English political experience in the light of his Indian experience. His central thesis was that force is good when the end to be attained is good and when the means to be employed are efficient and not excessively costly in their application. He felt that government could have no real justification unless the rulers made themselves responsible for the moral welfare of those they governed.

On his return from India he failed of election to Parliament. His distrust of democracy was

still further confirmed by the failure of the parliamentary machine to find time for the projects of codification he had at heart, and which were in fact very necessary. In 1875 he became a professor of common law at the Inns of Court and in 1879 a judge. In the latter office he considered himself to be not merely a logical machine but an organ of the moral indignation of mankind. In 1883 he published *A History of the Criminal Law of England* (3 vols., London), which, while it did not show the genius of generalization possessed by Maine or a love of the past for its own sake, was an impartial study of the movement of law from complexity to comparative simplicity and of society toward humanity and justice.

K. SMELLIE

Consult Stephen, Leslie, *The Life of Sir James Fitzjames Stephen* (London 1895), Birkenhead, F. E. S., *Fourteen English Judges* (London 1926) p. 299-326; Wedgwood, Julia, *Nineteenth Century Teachers* (London 1909) p. 201-24, Barker, Ernest, *Political Thought in England from Herbert Spencer to the Present Day* (London 1915) p. 167-73; Ilbert, C. P., "Sir James Stephen as a Legislator" in *Law Quarterly Review*, vol. x (1894) 222-27.

STEPHEN, SIR LESLIE (1832-1904), British philosopher and man of letters. After graduating from Cambridge, Stephen took holy orders in 1855 and from 1856 to 1862 was a tutor at Trinity Hall, Cambridge. In 1865 he founded the *Pall Mall Gazette* in London and subsequently became editor of the *Cornhill Magazine*. His contributions to the *Cornhill Magazine* were later republished under the title of *Hours in a Library* (3 vols., London 1874-79). In 1882 Stephen, already known as one of the leading writers of the day, became editor of the *Dictionary of National Biography*, the greater part of which appeared during the thirteen years of his editorship. In his biographies of Samuel Johnson, Pope and Swift as well as in his monumental *The History of English Thought in the Eighteenth Century* (2 vols., London 1876; 3rd ed. 1902) he upheld the classical virtues of poise, clarity, balance and common sense as against the florid, the sentimental and the enthusiastic. The editing of the *Dictionary of National Biography*, which brought a series of lives within the limits of a unified literary scheme, put a premium upon the qualities of clarity and conciseness, of which Stephen's writing was a model. Although dry, his work is never dull, being lit throughout by the steady glow of a luminous common sense.

Resigning his priesthood in the year 1875 Stephen became a formidable critic of orthodox religious beliefs and revelation. His agnosticism regarding the fundamental tenets of Christianity was based on empirical rather than on a priori grounds, and in *An Agnostic's Apology* (London 1893, 2nd ed. 1903), written in reply to Newman, he denied the validity of the historical evidence which religion was reputed to have revealed.

In politics Stephen's presuppositions were deeply tinged with the philosophy of the utilitarians. In all of his writings, particularly in *The English Utilitarians* (3 vols., London 1900), he extolled the liberal ideals of freedom for the individual in the matter of speech, thought and writing and assigned strict limits to the right of the state to interfere with individual development. At the same time he was considerably influenced by Darwin's work, which affected his attitude not only to religion but also to politics. His *The Science of Ethics* (London 1882) takes as its basis a theory of "social tissue" as distinct from mere "atomic individuals" and represents the preservation and improvement of this organic society as the ultimate ground of moral action. In this respect Stephen marks a transition from the laissez faire doctrines of early nineteenth century liberalism in which he had been trained to the newer school of social liberalism ushered in by T. H. Green. Stephen enthusiastically supported the North on the slavery issue during the American Civil War and at one time contemplated visiting America in order to assure the North of the support of English liberals.

Consult: Maitland, F. W., *The Life and Letters of Leslie Stephen* (London 1906); Benn, A. W., *The History of English Rationalism in the Nineteenth Century*, 2 vols. (London 1906) vol. II, p. 384-87; Robertson, J. M., *A History of Free Thought in the Nineteenth Century* (London 1929) p. 405-07.

STEPHENS, ALEXANDER HAMILTON (1812-83), American statesman and publicist. Stephens was elected to Congress in 1843 as a Whig representative from Georgia. From that date until his death he was either an active participant in or a keen observer of the course of public events. His career presents some interesting contrasts. As a Whig he was naturally devoted primarily to the protection of those vested interests, including property in Negro slaves, for which the federal government had been formed. He was therefore in theory and

practise a strict defender of the letter of the constitution when this was in the interest of his group; on the other hand, he found no difficulty in urging the implied right of the government to annex Texas by the questionable method of joint resolution. When it seemed, as in the crises of 1850 and 1860, that the government would not extend to slave owners the same protection which it gave to other propertied groups, he was willing in theory to fall back on the reserved powers of the states; on neither of these occasions, however, did he agree that secession was expedient. But when Georgia resolved to quit the Union, Stephens had no doubt that his primary loyalty was to his state. To conciliate his faction he was given the office of vice president of the Confederacy, but his part in affairs during the Civil War was negative and devoted mainly to bitter criticism of President Davis' policies. For example, he opposed Davis on the questions of finance, the method of oversea disposal of the cotton surplus, conscription and the suspension of the writ of habeas corpus and the establishment of martial law; and his leadership of the state rights group in the Confederacy was responsible for divided counsels, thus seriously weakening the cause of southern independence. During enforced political inactivity from 1866 to 1870 he busied himself in writing his monumental *A Constitutional View of the Late War between the States* (2 vols., Philadelphia 1868-70), which despite its dull literary form is generally considered to be the most logical and coherent defense of the southern position ever written.

STEPHENS, HENRY MORSE (1857-1919), Anglo-American historian. Stephens' career and influence are divided into two parts by his appointment to a professorship at Cornell in 1894. His English period was devoted primarily to journalism and to the writing of history. His

History of the French Revolution (2 vols., London 1886-91), although it goes no further than the Terror, is important in the historiography of the subject. Stephens had a gift for narrative and a pleasant, if not distinguished, style which gained him a wide audience in English speaking countries. To this audience, whose ideas of the French Revolution had derived mostly from Burke and Carlyle, Stephens brought the first fruits of the late nineteenth century school of French historians led by Aulard. His book is a competent synthesis of the work of the official French republican historians up to 1890 and is fairly free from the patronizing tone in which nineteenth century Englishmen usually wrote about French political experiments. It is now outmoded, not only by the tremendous accumulation of new materials but by the present distrust of purely political history. Stephens' *Portugal* (London 1891) remains perhaps the best short history of that country available in English. At Cornell and subsequently at the University of California Stephens virtually abandoned the writing of history for teaching. The promised third volume of the *French Revolution* never appeared. Yet his influence may actually have been greater than in his more productive period, for he became one of the leading figures in the world of professional academic historians in America and helped to form and mold that world, unorganized and unprofessional until the 1880's. Stephens was a popular teacher with both graduates and undergraduates and brought to his academic work an insistence on form and ideas, on standards of judgment, which helped to counterbalance a good deal of the superstitious reverence for crude facts then prevalent among teachers of history.

STEPHENS, URIAH SMITH (1821-82), American labor leader. Stephens, who was of Quaker descent on his mother's side, was educated for the Baptist ministry. The panic of 1837, which dislodged so many of the middle class, led him to join the tailoring trade as an apprentice. In 1845 he moved from New Jersey to Philadelphia, where he worked as a tailor until 1853, when he began a five-year tour of the West Indies, Central America and the Pacific coast. In 1856 he assisted in the election cam-

paign of Frémont and in 1860 he actively supported Lincoln's candidacy. He attended the working men's convention of 1861 which opposed the Civil War. In 1869 Stephens, with eight other former members of a garment cutters' union which had disbanded in the post-war depression period, organized the first local assembly of the Knights of Labor in Philadelphia. He became head of the first local assembly, of the first district assembly and in 1878 of the first national assembly, resigning the latter post the following year. He was an unsuccessful candidate for Congress on the Greenback Labor ticket in 1878.

Actuated by humanitarian idealism, Stephens sought to unite all wage earners in one "brotherhood" bound together by common interests, ritual and experience. Although he recognized the necessity for trade union action under a capitalist regime, he looked forward to its replacement by a cooperative society of producers, for which the workers would be prepared by self-education and ultimately by political action. It followed therefore that the original craft basis of the Knights, the trade assembly, should be broadened into the general assembly which would include all workers, manual and intellectual. Stephens, who was a member of several fraternal societies, placed great emphasis on the ritual and secrecy of the order, and when because of a conflict with Roman Catholic authorities his successor, Powderly, expunged the oath and a part of the ritual, he was deeply offended, allied himself for a while with the socialist opposition and shortly thereafter withdrew from active participation.

STEPHENSON, GEORGE (1787-1848), the outstanding name in railway history, was born at Wylam in Northumberland, the son of a colliery fireman. As a child he tended cows or horses, until at fourteen he started working under his father at a shilling a day. By dint of laborious concentration on his tasks and helped by great physical strength, he was soon able to do a man's work and was put in charge of a pumping engine, the care and study of which gave him a thorough knowledge of the principles of steam power.

At eighteen he began attending a night school to learn reading and writing, and continuing to overcome one handicap after another with dauntless perseverance, he rose to the position of enginewright at Killingworth colliery in 1812. Two years later he built his first locomotive engine for work at this colliery, and in 1815 by introducing the steam blast made the engine a practical success for the regular conveyance of coal trains. Ten years later, with the opening of the Stockton and Darlington Railway on September 27, 1825, he at last emerged into public fame and saw his locomotives running on a railway which he had largely surveyed and planned.

He went straight on to his still greater dual triumph, the Liverpool and Manchester Railway, where his skilful constructional work was only rivaled by the success of his famous engine, the *Rocket*, at the trials on this railway in 1829. In the years that followed he was chief engineer to many of the railway companies that were being rapidly promoted and was consulted on railway questions in England and on the continent. Before he retired in 1845, such progress had been made with the construction of the main trunk lines that he was able to travel in nine hours from London to Newcastle by rail.

Stephenson did not invent either the railway or the locomotive steam engine. But he did so much to establish the two as a practical combination that he may well be regarded as the inventor of the railway system. The rapidity and comparative ease with which it developed after 1830 were chiefly due to his genius in evolving a reliable locomotive and in establishing his hard won principle that the railway must be specially designed to avoid gradients.

STERILIZATION. See EUGENICS.

STERNBERG, LEV YAKOVLEVICH (1861-1927), Russian ethnologist. Sternberg began his ethnographic work in 1891 among the Giliaks on Sakhalin island while an exile for activities in the *Narodnaya Volya* party. In a series of contributions he founded Giliak linguistics and raised the question of the close relation of the Giliak tongues with American languages. His

monograph, *Gilyaki* (The Giliaks, Moscow 1905), established the existence of Giliak phratries, revealed the essential character of the Giliak gens and clarified general problems of social organization. Under the influence of Lewis Henry Morgan, Sternberg designated the classificatory system of relationship, which he discovered among the Giliaks and later among several Tungus peoples, as the most primitive form of the Turano-Ganowanian system and proved its connection with their family relations and group marriage. The religion of the Giliaks he interpreted as arising logically and naturally from their social relations, of which he believed it was a fantastic reflection. He studied the Ainu and declared them to be of Australasian origin.

In his theoretical outlook Sternberg was a social evolutionist, the Russian counterpart of Morgan in America, Tylor and Rivers in England and Wilken in Holland; he supported the hypotheses of the unity of mankind and the unilinear development of society in conformity to law. He elaborated upon some of the conceptions of earlier evolutionists; thus, in contradiction to Tylor, he distinguished three stages of animism: first the animation and anthropomorphization of nature; then the development of the concept of spirits; and finally that of the concept of the soul. Limited by the schematic, mechanistic method of the classical evolutionary school, he failed to conceive of evolution as a dialectical development.

As professor of ethnography and founder of the first ethnographical school, Sternberg was instrumental in developing higher education in ethnography in the Soviet Union. Together with Radloff he reformed radically the Museum of Anthropology and Ethnography of the Academy of Sciences in Leningrad. Throughout his life he advocated ideals of social justice, freedom and brotherhood and worked actively for the cultural advancement of the primitive peoples in the U.S.S.R.

STERNE, SIMON (1839–1901), American railroad economist and political reformer. After his admission to the bar in New York in 1860 Sterne entered upon a varied career as editor of the *New York Social Science Review* (1865–66), cofounder of the American Free Trade League and the Personal Representation Society and secretary of the Committee of Seventy, which was largely responsible for overthrowing the Tweed ring. A disciple of Thomas Hare, Sterne was the first outstanding American proponent of proportional representation, advocating it for both corporation directorships and governments.

His most important work, however, was as railroad economist, investigator and reformer. Sterne was among the first Americans to comprehend the monopolistic character of railways and the wastes of railroad competition. He realized that railway companies had acquired vast power and had become masters of legislatures and that many of their directors were as corrupt as the local government officials he had been fighting. In 1879 as counsel for the Chamber of Commerce and Board of Trade and Transportation of New York City he conducted the famous Hepburn Committee (New York State Special Committee on Railroads) investigation into alleged abuses in railroad management. He uncovered considerable evidence on local and personal discrimination, rebates, the virtual oil transportation monopoly of the Standard Oil Company, stock watering and misleading accounting. This investigation was the most far reaching attempt that had been made to deal with America's growing transportation and corporation problems. The first New York state railroad commission bill was passed three years later and was almost identical with a bill Sterne had been advocating since 1874. Sterne also worked closely with the Cullom Senate Select Committee on Interstate Commerce and drafted its bill containing the essentials of the Interstate Commerce Act of 1887.

STEUART, SIR JAMES DENHAM (1712–80), British economist. Steuart's interest in economic problems seems to date from the years

which he spent in exile following the Jacobite revolt, and which resulted in the publication of his *A Dissertation upon the Doctrine and Principles of Money Applied to the German Coins* (Tubingen 1758). In 1763 he was allowed to return to Scotland, where he devoted himself to his great work, *An Inquiry into the Principles of Political Oeconomy* (2 vols., London 1767). The book has been variously appraised; popular for a few years, it was completely overshadowed after 1776 by Smith's *Wealth of Nations* but was rediscovered in the nineteenth century by German scholars, who even hailed Steuart as the real founder of economic science. This claim is not wholly invalid. He was the first to set out with some pretense at system the principles of economic policy and to analyze their theoretical basis; and he was also the first writer in English to name his study "Political Economy," i.e. "the science of Domestic Policy in free Nations." Moreover, recognizing the danger of verbal misunderstandings in economic discussions, he set out to elaborate a precise terminology for his science. At many points he made contributions of real interest to economic theory—notably in his discussion of population problems, in his distinction between price and value and his analysis of the component parts of the latter and in his investigations into the "balance of demand" and labor supply, or "work," and the nature and function of competition. But his outlook was mercantilist. The object of his reasoning was to indicate how a state might increase its monetary wealth, and an excessive proportion of his book is devoted to discussions of the supply and circulation of coins and banknotes. He showed too an inability to grasp the distinction between money and capital and a misunderstanding of the nature of interest. He was thus essentially behind the times in which he wrote; subsequent economists looked rather to Hume and to Smith for their inspiration, so that Steuart's system remained a foundation without a superstructure.

LINDLEY M. FRASER

STEVENS, JOHN (1749–1838), American engineer and transportation pioneer. After 1787 Stevens, who had been a colonel in the revolutionary army and treasurer of New Jersey, be-

came a leading steamboat inventor, operator and advocate. Prevented by the Fulton-Livingston monopoly from operating in New York waters, he sent his *Phoenix*, the steamboat which he had built and launched shortly after Fulton's *Clermont*, to the Delaware River, where for several years it engaged in commercial transportation. Planning to join the Delaware and Raritan rivers by a railway, thus linking Philadelphia and New York with steam, Stevens in 1815 secured from New Jersey the first American railroad charter. He failed, however, to raise the necessary capital for this venture or for the construction of the Philadelphia-Columbia railroad eight years later. In the meantime Stevens' *Documents Tending to Prove the Superior Advantages of Rail-Ways and Steam-Carriages over Canal Navigation* (New York 1812, reprinted in *Magazine of History*, 1917, extra no. 54, p. 77-114) was published; this was the first treatise on railroads in the United States. With plans and estimates he tried to persuade the New York commissioners that a steam railway was preferable to a canal for connecting the Hudson with Lake Erie, arguing that it would cost less in money and time to build, that it would be open all year and would afford quicker, cheaper and safer transportation. He understood the inadequacies of the existing facilities, especially for remote farmers, and predicted that if railways connected every section, the states would truly be joined in "indissoluble bonds of union." Although the commissioners called him impractical and proceeded to build the Erie Canal, South Carolina's first railroad, begun in 1830, successfully followed Stevens' plans. Disgusted with the indifference of governments and private investors, Stevens in 1825 built a circular experimental railway on his Hoboken estate and, with a locomotive of his own construction, demonstrated the mechanical practicability of steam railroads. Six years later one of the first railroads to be constructed (the Camden and Amboy) started operation under his sons' leadership.

Stevens was largely responsible for the first United States patent law (1790), was an ingenious naval architect and an early advocate of sanitary engineering.

GEORGE MARSHALL

Consult: Turnbull, A. D., "The Stevens Family, Inventors and Engineers" in *Newcomen Society for the Study of the History of Engineering and Technology, Transactions*, vol. vi (1925-26) 169-83, and *John Stevens* (New York 1928), McMaster, J. B., *A History of the People of the United States*, 8 vols (New York 1883-1913) vol. iii, p. 487-95, vol. v, p. 138-44.

STEVENS, THADDEUS (1792-1868), American statesman. Although Stevens had taken some part in local and state politics in Pennsylvania and had served two terms in Congress as a free soil Whig, his political career did not begin in earnest until 1859, when at the advanced age of sixty-seven he reentered the House of Representatives as an antislavery Republican. When the southern states began to secede, Stevens not only opposed all compromise measures but also employed his remarkable gift for satire and vituperation in denouncing the secession leaders. He made no attempt to conceal his delight that at last the issue was to be decided by an appeal to arms, from which he had no doubt the Union would emerge victorious. During the Civil War he was always in advance of his party. Long before President Lincoln issued the Emancipation Proclamation Stevens urged that the proper policy for the government to pursue with respect to slaves found in Confederate territory occupied by the Union armies was to give them their unrestricted freedom and enlist the able bodied Negro men into the army, where they could fight for the freedom of their fellows. He disagreed with Lincoln's policy of reconstruction and enunciated his "conquered province" theory as an alternative. By this he meant that the ex-Confederate states should be treated as conquered provinces subject to the will of the conqueror limited only by common humanity and the laws of nations. He argued that the whole secession movement had been an aristocratic rebellion against a democratic government and that before being readmitted into the Union the rebel states should be forced to become democratic. This involved the full enfranchisement of the Negroes in civil and political rights, the confiscation of the estates of the large landowners, the division of some into farms of forty acres to be allotted to heads of Negro families and the sale of the remainder in small parcels to actual cultivators. As leader of the Radical Republicans in the House, Stevens was able to block the reconstruction policy of President Johnson; but he did not obtain the adoption of his own theory nor could he bring his colleagues to enact his confiscation scheme. It therefore follows that the view generally taken by historians that Stevens was responsible for reconstruction as actually carried into effect in the South is not wholly in accord with the facts.

BENJAMIN B. KENDRICK

Consult: Woodburn, J. A., *The Life of Thaddeus Stevens* (Indianapolis 1913); McCall, S. W., *Thaddeus*

Stevens, American Statesmen series, vol. xxxi (Boston 1899); Kendrick, B. B., *The Journal of the Joint Committee of Fifteen on Reconstruction*, 39th Congress, 1865-1867, Columbia University, Studies in History, Economics and Public Law, no. 150 (New York 1914)

STEWART, IRA (1831-83), American labor leader. As leader and theoretician of the eight-hour movement of the 1860's Stewart played an important role in the trade union movement and in the enactment of labor legislation. A mechanic by trade and entirely self-educated in economic theory, Stewart, who himself had worked twelve hours daily, regarded the movement for shorter hours not merely as an ameliorative measure, as did his trade union contemporaries, but as the strategic basis for changing the wage and profit system. The shorter workday and greater leisure would increase the wants of labor, force up wages—Stewart was no believer in the iron law of wages—and simultaneously through a greater demand for goods would release the impounded technological powers. This chain of sequences, cumulative and perpetual, would result in an accumulation of capital by labor, which it could invest in productive industry and thus displace capitalism.

Stewart converted the national convention of the Machinists' and Blacksmiths' Union in 1863, to which he was a delegate, to his program and line of strategy. He was the titular head of the eight-hour leagues both state and local over the greater part of the northern United States; these leagues succeeded in obtaining the passage of eight-hour laws for public employees in states as widely separated as Wisconsin and New York. Stewart's standing in the Massachusetts legislature between 1864 and 1870 resulted in the setting up in that state of the first Bureau of Labor Statistics. In 1876 he became a member of the Working Men's party in Massachusetts and the following year joined with a group of trade union Marxian socialists to found the International Labor Union.

Although the American labor movement did not remain concerned either with Stewart's economics or with his goal, it has accepted on faith the conclusion that wages are bound to rise when hours are reduced.

SELIG PERLMAN

Consult: A Documentary History of American Industrial Society, ed. by John R. Commons and others, 10 vols. (Cleveland 1910-11) vol. ix, ch. iii; Douglas, Dorothy S. W., "Ira Stewart on Consumption and Unemployment" in *Journal of Political Economy*, vol. xl (1932) 532-43.

STEWART, ALEXANDER TURNEY (1803-76), American merchant and pioneer of modern merchandising. Stewart was born and educated in northern Ireland, emigrated to the United States in 1823 and taught school in New York City. In 1824 he took over the small bankrupt dry goods store of a friend to whom he had lent money and developed it into one of the great department stores of the world. Complementary to his retail establishment, he conducted a wholesale dry goods business in New York with branches in Philadelphia and Boston and agencies in most of the leading countries of the world and many factories in America and Europe manufacturing exclusively for his stores. Stewart introduced four significant techniques in American merchandising: the one-price system, putting an end to higgling between salesmen and customers; the systematic departmentalization of a large store; building stores particularly to fit the needs of selling; and making them resemble palaces, in order to satisfy the tastes of an increasingly wealthy middle class public. He was an outstanding representative of the Puritan tradition in American business, advocating honesty, frugality and "honorable profit" through the good bargain. By superior organization, large scale cash purchases, avoiding credit transactions, securing railroad rebates and giving relatively good value to customers he readily outdistanced and crushed competitors. During the Civil War he made large profits from government contracts by acquiring virtual control of textiles essential for equipping the Union army. His clerks were paid the lowest market wage for a sixty-six-hour week and worked under a system of vexatious rules and espionage. Stewart was among the first Americans to attempt to counterbalance ruthless business practice with large gifts for the relief of distant famine and flood victims. After his death the business was absorbed by John Wanamaker, who built upon his predecessor's methods and added thereto a recognition of the importance of advertising in modern merchandising.

GEORGE MARSHALL

STILLMAN, JAMES (1850-1918), American banker. Although he was the son of wealthy New England parents, Stillman had but a meager education and at sixteen he entered the office of commission merchants in cotton and hides. Six years later the firm was reorganized as Woodward and Stillman, and as a merchant with ever widening financial interests Stillman continued until his election in 1891 as president of the City Bank, later the National City Bank, of New York. This office he retained until 1909 and then remained as chairman of the board until his death, exercising dominating influence during all of this period. In an age of rapid expansion, corporate development and easy wealth, with commercial banks usurping the functions of investment bankers, who in turn secured control of commercial banks to facilitate their operations, the conservative traditions of the merchant-banker type seemed antiquated; like the elder Morgan, Stillman was ceaselessly on the alert to discover new profits for himself and his bank. This new conception of the banker, playing the double role of promoter and lender, was given prestige by Stillman's position as president of the largest bank in America and was extensively emulated. It was made possible by the Rockefeller millions and was carried out by close affiliations with Harriman, Schiff, Frick, William Rockefeller and other well known promoters and speculators of the period. The National City Bank was represented widely in the system of interlocking directorates and was attacked as a part of the "money trust." In two other ways Stillman represented the newer tendencies in American banking. He was convinced, particularly after the outbreak of the World War, that American banks should assume a more active position in foreign trade and investments; and he insisted that his own bank should take the leadership in an aggressive extension of American interests throughout the world. He and his lawyers seem also to have been responsible for the invention of the security affiliate, in his case the National City Company, a concern owned by the bank but chartered by the state and authorized to exercise functions prohibited by the parent bank. (Security affiliates were forbidden by law in 1933.) Despite these questionable if not dangerous innovations Stillman, by his reticence and by his avoidance through long residence abroad of giving testimony before congressional investigating committees, established for himself a reputation for conservatism and, by maintaining large cash

assets, he easily carried his bank through succeeding economic crises and was able continually to enlarge its resources. The part he played in American banking was almost as important as that of the elder Morgan.

STINNES, HUGO (1870-1924), German industrialist and financier. Stinnes was for some years the most widely known figure in German industry, enjoying powerful international economic and political influence by reason of his interests at home and abroad. His business activity began in the Ruhr coal industry, in which the Stinnes family had been important for several generations. He soon branched out into the iron and steel and electrical industries and became interested in the mining and selling of coal and in navigation. By 1914 he was one of the most influential financial capitalists in the Ruhr and consequently in Germany.

The World War and its outcome disrupted many of Stinnes' existing business arrangements. At the same time the great stress on production, the rapid fluctuations in prices and the difficulty of securing raw materials in war time brought about a change in emphasis from the horizontal to the vertical combination in Germany. This tendency was enhanced by the profound alterations, particularly in the iron and steel industry, resulting from the post-war territorial changes. These factors, coupled with the opportunities offered by inflation for purchasing properties with bank loans repayable in a steadily depreciating currency, prepared the way for combinations like that of Stinnes. His interests were extended both to raw materials, such as coal, iron, lumber, oil, and to finished products, including automobiles, machinery, paper, newspapers, even hotels, as well as to inland and oversea navigation and banking and insurance. These interests were grouped around a few key enterprises. The constituent companies, hundreds of them at the height of the concern's power, in most cases retained their legal autonomy; their relationship to the chief enterprise varied from a very loose connection, resting on a community of interest agreement and small stockholding, to complete amalgamation. Control or influence over banks was a

powerful factor in the growth and maintenance of the concern's enormous power.

Stinnes' financial domination and personal influence were the only unifying factors in his vast, agglomerative and loose jointed concern. By 1924 he had already begun a rationalization process to place his enterprises on a permanent basis, to give them more than merely a financial and personal unity. It is uncertain whether even his capacity would have carried Stinnes successfully through stabilization to normal times. His death in 1924 together with the process of currency stabilization made inevitable the breakdown of the concern, which went on with tremendous losses until little was left beyond the original family holdings. The whole experience helped to shape public opinion and subsequent economic policy in Germany away from such agglomerative enterprises in the direction of more compact organizations.

STIRNER, MAX (Johann Kaspar Schmidt) (1806-56), German social philosopher. Stirner was born in Bayreuth. Except for a short period during which his chief work, *Der Einzige und sein Eigentum* (Leipzig 1845; tr. by S. T. Byington, New York 1907), enjoyed popularity Stirner's life was spent within the narrow confines of his profession, first as a teacher in a girls' school and later as a translator. With the period of reaction following 1848 Stirner and his work were forgotten, and it was not until forty years after his death that interest in him was revived by the work of John Henry Mackay. An individualistic anarchist, Mackay presented Stirner as a spiritual forefather of individualist anarchism, and he is known as such among the general public. No statement, however, is farther removed from a genuine understanding of the place of Stirner in the history of ideas. Anarchism in the true sense of the word, as a separate political theory and historical movement, did not appear until long after Stirner, and it gained its political and his-

torical peculiarities through its opposition to the Marxist movement. Naturally Stirner could be counted as a father of anarchism by virtue of his advocacy of external freedom and inner autonomy of personality, but on the same basis so also could Kant, Fichte and Karl Marx. If anarchism is defined as the idea of a free, undominated, classless society, then all socialism too is anarchistic. If, however, it is considered only as a definite political trend within the socialist labor movement as it has existed since Bakunin and Kropotkin, then Stirner was as far from anarchism as was Saint-Simon, Fourier or Marx.

The impression that Stirner was an anarchist, even a nihilist, arises from Stirner's complete rejection of all political, moral and traditional ties of the individual and his attack on all general concepts—such as right, virtue, duty and the like—as erroneous appearances and "spooks." There is only one single reality and that is the independent individual who is aware of this fact and who has made it his principle of thought and action. In this way the individual becomes a "unique" or "single one" (*Einziger*) for whom his own egoism is all determinant and who looks down on all concepts of religious, moral, political, cultural or any other kind of duty as a sort of belief in ghosts. The single individual sets his own tasks and thereby becomes his own master. He is no longer the property of some strange "higher" entity but belongs to himself. All the manifold human relations, family, friendship, daily intercourse, public and private activities, are now determined consciously and freely by the egoism of the individual and they thereby become "his possessions."

Stirner's conceptions of the "individual" and "egoism" have been grossly misinterpreted. The worst platitudes and prejudices usually associated with the word egoism have been applied to Stirner's ideas. Stirner's idea of egoism is in no way to be conceived as a mere self-seeking and narrowminded selfishness. Egoism, for Stirner, involves no moral element of character but is merely the psychological fact that all acts are related to the ego, and that it therefore can be directed only to that which an individual sets up as his goal and either desires as pleasant or as unpleasant. In this sense the egoism of Stirner really signifies simply the demand for full self-consciousness and education to self-determination in man's thinking and acting. Furthermore Stirner's idea of the individual does not involve complete isolation and aristo-

cratic presumptions for the individual. It is a mistake to look upon Stirner as a forerunner of the Nietzschean concept of the superman. On the contrary, Stirner's individual is of a democratic character. This feature represents the revolutionary influence of the book, which was indeed written primarily for proletarians. Every person was to become an individual in this sense, particularly the masses of poor and oppressed, who had not yet found the courage to make their interests a matter of their own concern. Stirner's individual is really a bold and grandiose anticipation of the psychological content of the Marxian spirit of class struggle. His entire social critique, with its designation of the ideas of "duty," "sacred task" or even only "general matter" as manifestations of religious superstition on the part of spiritually immature persons, represents the significant beginning of a critique of a general social ideology.

STOCK BREEDING. The remote ancestors of present day farm animals were wild beasts subject to the prey of man; and as the animals migrated to fresh feeding grounds, man followed them closely. Eventually he realized that he could safeguard his own well being by herding them; this called for ingenuity in the provision of feed and shelter as well as protection from other animals. More uses gradually were discovered for animals and their products. Unconsciously man laid the crude beginnings of livestock improvement; the most useful animals were retained longest and hence were given a greater opportunity to reproduce their kind.

Interest and knowledge regarding animals increased slowly but steadily, and when Egypt reached its height special attention was being devoted to animal improvement. The Egyptians not only realized the advantages of superior ani-

mals but made some efforts to educate others in this respect. By this time also the arts of fattening animals and preserving meats had been advanced. Aristotle made numerous observations regarding the art and science of animal breeding. Most of his comments were erroneous, but the very fact that so prominent an individual found the problems a challenge attracted further attention.

The Romans made some progress in animal breeding. Sheep were improved and horse breeding received attention; even Julius Caesar devoted some thought to this work. The Arabs created the impression that they were past masters in the art and science of horse breeding, although they merely obtained a strain of fine horses from the Egyptians, who had received them from the Libyans; the Libyans earlier had inherited the horses as an indigenous breed. The Arab as a horse breeder was fortunate in that he lived under conditions in which only the best animals could survive; hence the rule of the survival of the fittest came to be the main factor in such advances as were made.

The dawn of the eighteenth century, however, found farm animals little improved. The sheep of Spain, which were famous for fine fleeces, yielded only about three or four pounds of wool. In England, the home of the mutton breeds, the sheep were ill shaped and were slow in reaching market weight. The swine of western Europe were rough and had fierce dispositions; more refined breeds, but deficient in many other respects, had been developed in China and in the Mediterranean area. Cattle, which had big rough frames, were triple purpose animals; they furnished power, milk and meat. A daily production of twenty-five quarts of milk was considered exceptional, and four or more years were required to bring a beef animal to market requirements.

Horses were the one class of animal on which serious effort had been expended in making them better suited to human needs. The varied specific demands of man had already called into existence and discarded several types of horses. During the Roman imperial period chariots were the order of the day. The best chariot horses were fast, hardy and of stocky conformation. Horseback riding replaced the chariot during the seventh century. Plate armor came into use about 1300 and necessitated heavier horses for war purposes; the invention of gunpowder, three centuries later, in turn made armor useless. Lighter footed horses were developed for

the cavalry and heavier ones for diligence use. In the nineteenth century the railroads replaced the stagecoach, and the diligence horse became the modern draft horse. The English thoroughbred dates from the early seventeenth century, British royalty from the time of James I having led in the development of this type to meet the requirements of the race course. Importations were made from the Orient and turf performance provided a rigid measure for selection.

The industrial revolution removed workers from rural and village life to urban centers and thus created a demand for more and better agricultural products. Robert Bakewell, who in 1760 assumed the management of his family estate in Leicestershire, England, was aware of the opportunities offered for superior animals and set out to improve sheep, cattle and horses in both economy of production and quality of product. He became the leader in stock breeding. It is likely that Bakewell was familiar with the improvement in light horses already accomplished by British royalty, for his two favorite maxims, "Luke begets like" and "Breed the best to the best," were principles which had long been practised.

Robert Bakewell's success was almost phenomenal; other Englishmen followed his example and his surplus stock was used to improve many flocks and herds. Chief among his disciples were the Colling brothers, who established the short-horn breed in northeastern England. The United Kingdom in fact became a virtual nursery for the development of breeds of livestock; and within this small area, only slightly larger than the state of Minnesota, there were created twenty-three important breeds of livestock as well as numerous minor breeds. Only a part of this improvement can, however, be attributed to Bakewell's leadership. The Tompkins and Galliers families, founders of the Hereford breed of cattle, had their work well under way even before Bakewell's time; and John Paterson, a tenant farmer of Lanarkshire, Scotland, laid the foundation for the Clydesdale breed of horses as early as 1715. Livestock improvement was not confined to the British Isles, for Percheron horses and Rambouillet sheep were being developed in France, Belgian horses in Belgium, Holstein-Friesian cattle in Holland and the Jersey and Guernsey dairy breeds on the Channel Islands. Other countries of continental Europe witnessed similar advances.

In the late eighteenth century and the nineteenth there was an intensification of effort along

these lines. The British assumed the leadership, partly because this period marked the rise in prosperity and power of the United Kingdom but also because the Britisher's temperament was admirably suited to this work. Furthermore the British Isles are well adapted to the development of animals; in England and Wales especially the climate is exceedingly mild, and most sections are favored with rich pastures and a long pasture season.

The industrial revolution was accompanied by a more progressive agriculture; roots and clovers were introduced into the cropping scheme and these provided more nutritious winter feeds. Pastures were improved through the intelligent and diligent application of fertilizers. Better feeding assisted the improvement of farm animals, for with inadequate feeding all animals, whether inherently good or poor, develop into inferior individuals; hence improved feeding brought out the essential differences between animals and thus made intelligent selection possible.

In the beginning the United States played an unimportant role in stock breeding. The turkey is America's only indigenous farm animal, but it was in Europe that it was domesticated and improved. The first horses and cattle were introduced by the early Spanish settlers; the horses escaped and their descendants were the American cayuse and mustang; from the Spanish cattle, on the other hand, were descended America's first ranch cattle, the longhorns. The early English and French colonists introduced their own native stock; but these, like the animals brought by the Spanish, arrived before the day of constructive livestock breeding.

Transportation was one of the major problems of early settlement; the hills of Virginia and the country radiating westward necessitated an easy riding but vigorous horse. The best horses of America and England were drawn upon, their descendants were selected and mated with the greatest care and the result was the American saddle horse, one of the world's most beautiful animals. Early Americans required sheep more for their fleece than for their mutton. Spain possessed the best woolled sheep, and from 1793 to 1850 many Spanish sheep were imported. From this stock the American merino was developed; the fleeces of these sheep were greatly improved; the annual clip per sheep was raised from four to about fourteen pounds, and a clip of fifty pounds has been recorded. Dating from about 1860 a more intensified type of

agriculture demanded that farmers devote more attention to the mutton qualities; hence the mutton breeds of England were imported. They have replaced the fine woolled merinos in most farming sections, but fine woolled types still predominate on the range.

The industrial development of America, as elsewhere, compelled farmers to keep more productive animals. Early in the nineteenth century improved shorthorn cattle were introduced from England. Many importations followed, and eventually other beef and dairy breeds were introduced. Hereford cattle remained rather localized in their native English territory until Americans found them well suited to range conditions. England's best Herefords were imported and improved greatly; today the American Hereford is outstanding.

Settlements west of the Allegheny Mountains opened up the rich corn belt, which supplied a new and more fattening feed for swine. Swine were imported from the old lands, but none of the strains as introduced fitted American conditions. English, Irish, Spanish, Russian, Portuguese, Asiatic and African swine were amalgamated to develop the American lard type hog, of which there were several breeds; but all had the common characteristic of being especially given to fat deposits. Frontier Americans were not fastidious in their appetites; they consumed much fat pork. In addition a market for lard was developed in Europe, especially in Germany. The German market collapsed with the World War; also since about 1910 Americans have been less willing to consume fat pork. As a result of these market changes, the American hog has recently been modified to approach the English bacon type.

Americans have drawn mostly upon Great Britain for their seed stock, but the strains and breeds which have appeared best to fit American conditions have been selected regardless of country of origin; for instance, the British draft horses, Clydesdale and shire, have found little favor in the United States. France furnished America with the Percheron and Belgium with the Belgian horses, both of which have been very popular in the United States. For dairy cattle the United States drew on Holland for the Holstein-Friesian type and on the Channel Islands for the Guernsey and Jersey breeds.

The livestock fair, or exposition, preceded modern livestock improvement; indeed fairs were social and business institutions as early as the Middle Ages. These fairs essentially were

markets with side shows. As farmers became more interested in their animals they began to compare them. There were arguments and wagers which called for settlement by some uninterested party, and from these crude beginnings the great livestock expositions developed. They have been an important factor in livestock improvement.

Record books and breed associations were established to protect and promote the interests of the respective breeds. Breed associations lay down the regulations as to which animals of the respective breeds are eligible for registration. Record books are used for recording important information, such as the animal's name, official number, date of birth and ancestry. For dairy breeds of cattle there are additional record books in which are recorded the milk and butter fat production of cows which meet certain requirements. The first record book for any breed was *An Introduction to a General Studbook*, for the English thoroughbred, published in 1791. George Coates, of Yorkshire, England, in 1822 published as a private venture the first volume of the *English Shorthorn Herdbook*, known as *Coates's Herdbook*. Subsequent publications followed, and in 1876 the Shorthorn Society assumed control of the work. The rules determining which animals are eligible vary with the breed associations, but the general requirement is that an animal's parents must be recorded in the same herdbook. The Royal Jersey Agricultural Society at the very outset established more stringent and constructive regulations regarding the registration of animals. Because it admitted only animals which possessed a certain standard of excellence, it succeeded in weeding out many undesirable specimens and assisted greatly in breed improvement.

The careful selection of breeding stock, especially as regards the morphology of the individual, has been one of the cardinal principles of livestock improvers. The more enlightened breeders, however, have considered ancestry and breeding performance. Nearly all breeds were established by the interbreeding of closely related individuals; that is, by inbreeding. In some instances wide crosses of types and strains were first made, and this was followed by inbreeding and careful selection. Inbreeding is not a popular present day practise. It is recognized as the quickest means of fixing type, but many breeders hold that the general decrease in size, vigor and fertility which frequently results outweighs the advantages. Line breeding is something of

a compromise; with this practise the breeder stays within a certain relationship but usually does not mate so closely as in inbreeding. Line breeding, when accompanied by rigid selection, has proved a very satisfactory method.

As a rule livestock breeders have concentrated upon improving morphology. While this has resulted in an improvement of the quality of meat and wool produced, it has not necessarily or as a rule led to economy of production. Dairy cattle breeders have improved the quantity and quality of milk production, but they too have given little attention to economy. In the future more attention must be devoted to this important aspect. The best animals of today are as good in form as it is practical to develop them; but there are too few good individuals. Good animals have not been purified genetically to such a degree that they produce only good offspring. It is still true moreover that not enough farmers and breeders appreciate either the advantages or the requisites of good animals. Further advances can be made only by continued line breeding accompanied by the most rigid selection and by the more thorough education of farmers.

STOCK EXCHANGE. A stock exchange is an organization whose members deal in admitted securities in accordance with established rules. Its primary function is to bring together,

through the medium of brokers, buyers and sellers of securities and thereby to enhance the marketability of stocks and bonds. Prior to the formation of such markets it was difficult to find a buyer or seller of a security. For this reason a number of dealers in securities as well as in commodities formed the habit of gathering at a certain place where they transacted their business. Thus in London they met at Jonathan's and Garraway's coffee houses; in New York under an old buttonwood tree in Wall Street. Originally both securities and merchandise were bought and sold on these exchanges, and even today on a smaller number of exchanges, particularly in Europe, both commodities and securities are dealt in. As the volume of the securities business grew and as the number of investors increased, it became necessary to improve the methods of trading; and gradually various by-laws and codes of practise were adopted. There followed the formal organization of stock exchanges and the establishment of definite places for trading in securities. Almost every country of importance has one or more well organized stock exchanges on which domestic and foreign securities are traded.

On the basis of the kind and character of securities bought and sold a distinction may be drawn between stock exchanges which are international in scope and those of a domestic or national character. The chief international stock exchanges are those of London, New York, Paris and Amsterdam, where securities of a large number of countries are bought and sold. The London Stock Exchange is perhaps the greatest international market for securities. The role of New York as an international capital market since the World War has also greatly enhanced the international importance of its Stock Exchange, but in contrast to that of London the former deals mainly in foreign bonds and only a comparatively few foreign stocks are listed. The growth of the New York Stock Exchange was accompanied by the decline of Paris and Berlin. While in recent years Paris has been able to regain to a considerable extent its international position, the Berlin Stock Exchange has become more and more national in character. Amsterdam acquired considerable prominence as an international financial center as a result of Holland's neutrality during the World War, and the Amsterdam Stock Exchange remains probably the most important international securities market on the continent of Europe.

The volume and variety of securities bought

and sold have increased in recent years to such an extent that one exchange alone is not able to take care of the entire business in the leading financial centers. Thus, for example, in New York there is alongside the New York Stock Exchange the New York Curb Exchange, whose rules are less stringent and even permit trading in unlisted securities. In New York the two exchanges are separately housed and operate as separate institutions, while in Paris the two exchanges, the Parquet and the Coulisse, are housed in the same building although they are two distinct organizations.

The relationship of the stock exchanges to the respective governments, their form of organization and mode of operation differ in many countries. In Great Britain the stock exchanges are private organizations managed by the members themselves. Thus the London Stock Exchange is an autonomous body free from governmental control. The site and buildings are owned by a private corporation, the stock of which may be held only by members of the exchange. Membership in the stock exchange is not limited to any definite number, but it has remained more or less constant at about 4000. Only British subjects are eligible for membership, and applications of candidates must be supported by at least three members. The members elect annually the Stock Exchange Committee consisting of 30 members, which has absolute control over admission of members and over all business transacted on the floor; it makes and enforces rules and regulations and decides disputes between members. The decisions of the committee are final. All members are elected for one year and application for reelection must be made to the committee each year. The committee has authority arbitrarily to refuse to elect applicants or to reelect members. Members of the London Stock Exchange may not advertise in any way or solicit business or send out circulars except to their own clientele.

In the United States the stock exchanges with minor exceptions were brought under government control by the Securities Exchange Act of 1934. The act provides that no transaction in securities in interstate commerce, except for certain public securities, may be executed by a broker or dealer or by an exchange unless it is registered as a national exchange with the Securities and Exchange Commission, a body composed of 5 members appointed by the president of the United States with the advice and consent of the Senate and charged with the

supervision and regulation of the stock exchanges. The leading stock exchange in the United States is the New York Stock Exchange; it is a voluntary association having a limited membership, which was increased in 1929 from 1100 to 1375. Only individuals can become members of the New York Stock Exchange and membership is obtainable only through the purchase of a seat from a member, but each candidate must be approved by the Committee on Admissions. The members elect the Governing Committee consisting of a president, treasurer and 40 members for a term of four years. Each year 10 governors retire and are replaced through election. The Governing Committee has complete control over all activities on the exchange. It elects officers and appoints its members to various committees which deal with the different phases of the work. Important committees are those on admissions, stock list, business conduct and arbitration.

The stock exchanges on the continent, particularly in France and Germany, are subjected to a rigid form of government control. Thus the members of the *Compagnie des Agents de Change de Paris* are public officials appointed by the president of France with the approval of the minister of finance or the minister of commerce and industry. The *agents de Change* are the only brokers entitled to deal on the Parquet, the official stock exchange of Paris. Their number is limited to 70 and only French citizens are eligible for membership. By reason of the restricted number and the monopolistic status of the official brokers the membership transferable under certain conditions possesses a value similar to that of the New York Stock Exchange. The members elect a committee called the *Chambre Syndicale* which makes all rules governing the conduct of business on the exchange. The regulations of the *Coulisse*, or curb market, are less rigid and trading facilities are not restricted to official brokers.

The German stock exchanges are under the supervision of their respective state governments. These appoint commissioners whose duty it is to watch the transactions on the floor, and who have the right to attend the meetings of the various committees of the exchanges. Governmental control is exercised through semi-official trade associations, such as the Chamber of Commerce in the case of the Berlin Stock Exchange. The federal stock exchange law of 1896 and the subsequent amendments stipulate who may not be admitted as members and leave

the adoption of rules governing the appointment of members to the Exchange Management Committee (Börsenvorstand). The latter is elected by and from the members of the exchange and the Chamber of Commerce. The Börsenvorstand issues administrative rules and regulations subject to approval of the Chamber of Commerce. Unlike the London, New York and Paris stock exchanges, the German exchanges admit incorporated banks to membership.

The rules and regulations governing the operations of members also differ greatly on the various stock exchanges. The members of the London Stock Exchange are divided into two classes, jobbers or dealers, and brokers. The broker usually acts as agent for his customers. The jobber, on the other hand, acts as principal and specializes in one "market" and in a limited number of securities. The broker may also execute orders on his own account, but he then has to disclose to his customer that he acts as principal and the transaction must be cleared through a jobber. The broker's commission is fixed by the rules of the Stock Exchange. Jobbers may deal among themselves and with brokers, but they are forbidden to deal with the public. The jobber quotes two prices, a buying and a selling price, and always stands ready to buy or sell the securities at these prices. The brokers and jobbers thus complement one another; but they may not become partners, and dealings between brokers and jobbers are carefully defined by the Stock Exchange Committee. In New York, on the other hand, the distinction between broker and jobber is not so clearly defined, and most members trade for their own account and act as agents for their clients. There is an important group of brokers, known as specialists, who make a market in one or several securities and who deal chiefly with other brokers. The Securities and Exchange Commission created in 1934 has the power to regulate the buying and selling of securities by brokers for their own account as well as the activities of the odd lot brokers and of the specialists. On the Berlin Stock Exchange and on the Parquet of the Paris Bourse the *Makler* and the *agents de Change* respectively act merely as brokers, buying and selling for account of others, having no direct dealings with the public.

The method of settling transactions between members of the various exchanges is far from uniform. On the New York Stock Exchange they are usually settled by delivery and payment

on the business day following the day of the transaction. Settlement may, however, take place on the day of the sale or may be postponed for several days. On the London Stock Exchange government securities are bought and sold on a daily settlement basis, but all other securities are traded "for the account," or on a term basis, unless otherwise stipulated. In Paris listed securities are divided into two groups, one of which may be bought and sold for cash settlement and the other on a term settlement basis. In Berlin only a limited number of securities are bought and sold for the end of the month settlement; the majority of the transactions are on a cash basis delivery and payment falling due two working days after the date of the deal.

The bulk of transactions on the London Exchange is settled twenty-four times per annum; twenty of these "accounts" cover a period of approximately two weeks each and the length of the remaining four is about three weeks each. The settlement dates are announced by the committee. The settlement lasts four days; transactions during the settlement period are applied to the new accounts. The first day is devoted to making up the accounts and arranging for carryovers to the next *contango*, or making up day. During the next two days, "name days" or "ticket days," tickets are handed over to the sellers by the buyers, who demand delivery of securities purchased. The tickets bear the names of the transferees of the securities and the names of the members who pay for them. The fourth day is "pay day," or settlement day, on which the brokers and jobbers exchange checks on town clearing banks for the differences resulting from the deals during the "account." The securities are delivered on pay day or within ten days thereafter. The system thus makes possible dealings within the settlement period without transfers of securities or cash.

Buying of securities for cash or immediate settlement may be either outright or on margin. Sales may be either of securities owned by the seller or short sales. Outright buying and selling of securities owned by the seller constitute what may be considered legitimate transactions. All other transactions may be regarded as speculative in character or as intended to facilitate speculation. Buying on margin, i.e. in part with funds borrowed through or from the broker, takes place when the buyer expects a rising market and is therefore willing to buy more securities than his own resources would permit at the moment. Borrowed funds enable buyers to

bid for more shares and the increased demand tends to cause a rise in the price of securities. Similarly short selling of securities takes place when the seller believes that security prices will go down and he wishes to profit by the drop. The additional selling by those who are not in possession of the securities further increases the volume of securities offered in the market, thereby tending to accelerate the decline of the security prices. Although it has been claimed that buying on margin and selling short widen the market and thereby make securities listed on the stock exchange more marketable, the element of speculation involved in such transactions cannot be denied. In the United States, where the buying of securities on margin has assumed wide proportions, the Securities and Exchange Act of 1934 authorizes the Federal Reserve Board to regulate this form of trading. While the law fixes a standard of margin requirement, the Federal Reserve Board is empowered to lower or raise the fixed margin percentage either for all or for specified securities or transactions.

A highly speculative type of stock exchange operation is option trading in its specialized forms of "puts," "calls" and "straddles." An option is the privilege given, for a consideration, to the buyer (holder) by the seller (maker), usually a brokerage house, to demand the fulfilment of a purchase or sale contract for a certain amount of a certain security at a stipulated price on any day within a specified time limit. When the option is a put, the maker of the option is obligated, for the consideration paid by the purchaser, to receive from the latter a stated number of units of the security at a specified price within the stipulated time at the option of the holder. The call is just the reverse of the put, as it obligates the maker to deliver the security at the wish of the buyer. The straddle is a combination of put and call, binding the maker to accept and to deliver the same number of units of a certain security at the same price within the same period of time at the option of the holder. The purchaser of the straddle may exercise both the put and the call contracts as well. The consideration for the straddle is usually at least double the price for cited puts or calls. Dealing in puts, calls and straddles as well as short selling of securities in the United States, in contravention of such rules and regulations as may be subscribed by the Securities and Exchange Commission, is prohibited.

The method of financing stock exchange

transactions differs in the various countries, depending primarily upon whether or not the bulk of the trading is done on a daily or on a term settlement basis. New York and Amsterdam are the principal markets where daily settlements prevail. In New York the purchase of securities on margin is usually financed through brokers' loans; that is, the broker borrows from a bank pledging securities as collateral. The loans may be either on call, that is, subject to cancellation at any time by the borrower or the lender, or on time, in which case the loans range from three to six months. In Holland a large proportion of the stock exchange transactions is financed through so-called *prolongatie* loans. These loans are made by individuals or corporations to brokers against stock exchange collateral usually for one month and are renewed automatically for another month if no notice of cancellation is given.

In countries where the term settlement exists stock exchange transactions are financed primarily through so-called *contango*, or carryover loans, which are carried from one settlement date to another or from the day of the transaction to settlement day. The rate of interest is usually fixed on the carryover day, and this rate prevails until the next settlement. The term settlement effects an economy in the amount and turnover of funds as contrasted with the daily settlement prevailing in the United States. Furthermore, since the exchange is in the market for funds only on certain days well known in advance, it is possible for the market to make proper preparations.

In Paris settlements on the Parquet take place twice a month and are financed by the official brokers with funds known as "report loans" received directly from individuals and firms. The rate of interest for the settlement period is fixed by the brokers in accordance with the demand and supply of funds. Whenever the supply is not sufficient, the brokers procure loans from the banks at a higher interest rate; and this rate for the marginal funds determines the "report rate" until the next settlement. The *Coulisse* transactions are settled monthly and are financed directly by the banks, which fix the rate of interest; this rate is substantially higher than that of the Parquet. The term settlement transactions on the Berlin Exchange are, like the Parquet settlements, financed by report loans. The settlements are made at the end of the month (*ultimo*), the specific days being announced semi-annually in advance.

The regulations adopted by the various com-

mittees of the stock exchanges deal not only with the code of practise but also with the listing requirements. Applications for listing on the New York Stock Exchange, the London Stock Exchange, the Parquet or the Berlin Stock Exchange are subject to very careful regulations, and a great deal of information is demanded of the representatives of the corporations or of the bankers who wish to have their securities admitted to trading. In addition in the United States, with the exception of certain public securities, the law stipulates the type of information that must be filed with the Stock Exchange and the Securities and Exchange Commission, while in Germany and France the listing of foreign securities requires the approval of the government. On the Coullisse in Paris the listing requirements are not so rigid, and many securities which do not meet the requirements of the Parquet are listed in this market.

The stock exchange is one of the most important financial institutions in every modern capitalistic society. Through it the securities of the government, public utilities and industrial establishments are distributed throughout the country or the world. It provides a market for these securities and thus makes possible the conversion of long term capital into liquid funds. Without these marketing facilities afforded by the stock exchanges the rate of interest on securities would be substantially higher, and furthermore the total amount absorbed by investors would of necessity be much smaller. The listing of a security on an exchange not only tends to make that security more marketable but by so doing enhances its collateral value. In almost every country and particularly in the United States a substantial amount of bank loans is secured by stock exchange collateral, and one of the principal reasons why banks are willing to make such loans is the fact that under ordinary conditions they can liquidate the loan by selling at virtually a moment's notice the securities pledged as collateral. The marketability created through the facilities of the stock exchanges has made possible the distribution of securities to every corner of the world and has aided the mobilization and transfer of idle funds to countries in need of capital. The stock exchanges have thus been a very important instrument in supplying the capital needed for the exploitation of the natural resources of undeveloped countries, for building of railroads and public utilities and for developing the industrial resources of the various nations.

At the same time the operations of the stock exchange undoubtedly accentuate the elements of instability in modern economy. The existence of a ready market for securities encourages the financing of business through the flotation of securities rather than through bank loans. A corporation which finances itself through the sale of securities, particularly stocks, assumes no obligation to repay within a specified period as in the case of financing through bank loans and is consequently more likely to indulge in ill considered expansion. As the volume of security issues increases, loans on securities increase; and this expansion of bank credit places additional purchasing power at the disposal of the country. Rising industrial activity generates a feeling of optimism, which is reflected in rising quotations on the stock exchanges; and these in turn enhance the value of securities as loan collateral and stimulate still further the expansion of loans. The expansion of credit, however, soon causes an increase in the rate of interest, and many small and medium scale enterprises which are unable to finance themselves through the sale of stocks become burdened with high interest charges on their bank loans—a factor which contributes to the turn of the business cycle. The moment, however, the cycle reaches its peak and business and security prices start to fall, the banks begin to demand additional margin or to call their loans. This gives further impetus to the downward movement of security prices, which in turn causes additional liquidation of loans, reduced purchasing power and further decline in business activity. Just as an increase in security loans stimulates business activity, a contraction of loans retards it. Thus the stock market through its facilities for speculation constitutes a vital element in the instability of business conditions.

The adverse effect of speculative booms on the exchanges has been recognized in a number of countries, and various efforts have been made to rectify this situation. In some countries, as, for example, in England, it has been realized for some time that the best way to curb excessive speculation is through the cooperation of the banks which furnish the credit and not through legislative action. In other countries, such as Germany, the Reichsbank has assumed the task of stemming excessive speculation. Thus in 1927 when speculation was high in Germany the Reichsbank forced the leading banks, members of the Stempelvereinigung, to reduce by 25 percent their stock exchange loans. This meas-

ure was sufficient to cause a substantial break in the security market and to check speculation.

The speculative boom in the United States during 1927-29 brought out forcefully the fact that a curb on speculation is necessary. One of the evils which developed during that period was the rapid growth of "loans for account of others"; namely, loans placed at the disposal of brokers by individuals or corporations through the intermediary of the banks. These loans were particularly dangerous in that they did not result in an increase of deposits and therefore did not necessitate an increase in the reserves which the member banks must maintain with the Federal Reserve Banks. Through the sharp increase in the volume of loans for account of others the ability of the reserve banks to control speculation was greatly curtailed. After the collapse of the stock market the clearing house banks of New York City realized the danger of this type of loan and by mutual agreement decided not to handle such transactions. The Banking Act of 1933 also recognizes the importance and the viciousness of loans for account of others and prohibits Federal Reserve member banks from acting as agents for non-banking firms or individuals in making such loans. The act also takes account of the fact that speculation can go out of bounds only if funds in ever increasing amounts are placed at the disposal of speculators. It consequently gave the Federal Reserve Board (by a vote of not less than six) the power to fix from time to time for each Federal Reserve district the percentage of individual bank capital and surplus which may be represented by loans secured by stock and bond collateral made by member banks within the district. Under the same law the Federal Reserve Board is empowered to direct any member bank to refrain from further increasing its loans secured by stock or bond collateral for any period up to one year. The Securities and Exchange Act of 1934, by fixing minimum margin requirements and by placing margin trading under the control of the Federal Reserve Board, further limits the amount of bank credit available for security transactions.

STOCKER, ADOLF (1835-1909), German religious leader and politician. After a short career as a Lutheran military chaplain Stocker in 1873 became cathedral and court preacher in Berlin. Under the influence of the Catholic social reform movement and English Christian Socialism he began to concern himself with the problems of the industrial proletariat and of modern urbanization. In 1878 Stöcker founded in Berlin the *Christlichsoziale Arbeiterpartei*, a strictly monarchist and paternalistic party, which was opposed to liberalism and to the Social Democrats but which favored social reform by the state, cooperatives and trade unions. A powerful orator, Stocker long had a large group of adherents. He made no headway among the working masses, but his anticapitalistic agitation brought him the support of petty traders and shopkeepers. This was in a large measure due to the fact that he was the first in Germany to combine his social and economic propaganda with antisemitism, a phase of his policy which brought him into repeated conflicts with Bismarck. In 1887 Stöcker as a member of the conservative faction of the Reichstag established contacts with Prince William, the future kaiser, which greatly displeased the chancellor. It appeared for some time

that the court preacher had acquired a powerful influence over the young monarch, especially over the latter's social policies. The relation soon cooled, however, and when the breach between Stöcker and the feudal elements of the conservative party widened the kaiser dropped the Christian Socialist politician entirely. After 1895 Stocker played no role in German politics, although he still retained a faithful following. He left a much deeper impress on the Evangelical Home Mission and influenced Lutheranism in the direction of a more practical social outlook. His political activity suffered as a result of the contradiction between his spiritual care of souls on the one hand and his contentious demagogy on the other. He thus became one of the most contradictory figures in German domestic politics, effective in arousing Christian conscience but altogether lacking in inner clarity and balance of personality.

STOCKS AND STOCK OWNERSHIP.

When an investment is made in a joint stock association or a corporation, the investor receives a "certificate of stock" for the number of units of ownership he has bought. In the United States the term stock commonly refers to shares of ownership in corporations or joint stock associations in distinction to such investment forms as bonds, which are usually instruments of debt. In Great Britain common usage defines the term to include all forms of tangible evidence of an investment, whether in a governmental loan or in the capital of a business enterprise. Although the practise of dividing an aggregate ownership or debt claim into numerous transferable fractional units for sale to many investors made its appearance in ancient Rome and in the public financing of mediaeval Italian cities, the history of its use as a business device properly begins with the formation of chartered trading companies in the latter part of the sixteenth and the seventeenth century. The joint stock device be-

came the dominant form of business investment with the appearance in the nineteenth century of the corporation issuing stock contracts, under which the liability of the holder was limited to the original investment.

Of the various conceptions of the nature of a stock contract two are fundamental. From the traditional point of view stocks represent shares of interest in the ownership of the corporation or joint stock association. The common stockholders are the ultimate owners, the corporate equivalent of partners and of proprietors. From another and perhaps more realistic point of view stocks and bonds are contracts between corporations and investors. These contracts are articles of financial commerce, sold by corporations to raise capital funds and bought by investors to secure an income or to acquire a position in the stock market in the hope of capturing a favorable speculative turn in values. From this point of view the capital structure of a corporation is a hierarchy of claims, expectations, legal rights, liabilities and de facto powers of action. Any property claims to corporation assets and income capable of legal definition or any combination of claims may become the subject matter of a contract between investors and the corporation. Common usage establishes certain gross classifications of investment contracts, calling some bonds and some stocks, within and between the general classes individual contracts vary greatly.

Just what a stock may mean to the investor is determined by the terms of the contract expressed in a certificate of stock. It depends also upon the terms of the charter expressed in the articles of incorporation and upon the provisions of the general statutes governing corporate organization and procedure. Lastly, it is conditioned by the actual exercise of power, whether legal or not, which corporate managements have arrogated to themselves. The managements of the large corporations, sometimes owning enough stock to be statistically classified as minority interests, often holding no appreciable amount of stock, act toward the investors and toward the corporation as if the corporation were their peculiar property. To the management the public holder of stock is an outsider who supplies the corporation with funds.

The terms of stock contracts commonly divide stock into two general classes, common and preferred. Common stock occupies the lowest rank in the hierarchy of claims against the earnings and property of the corporation, the common stockholders receiving dividends if and when

declared by the directors and only after all prior claims against earnings have been met. Offsetting this greater risk, some common stockholders may vote for the directors, have access to the corporation book of stock on all questions affecting corporation property as a whole, share proportionately in any new issue of stock and have full claim to the rising earnings of the corporation. Some common stock, however, is non-voting, participates only to a limited degree in the residual earnings—and sometimes to a lesser degree than a prior preference stock—and gives the holder no prior option to a proportionate subscription to new issues. Non-voting, limited participation common stock without preemption rights was popular with corporation managements in the United States during the 1920's and was apparently received without disfavor by investors.

Par value common stock has a formally stated money value presumably defining the worth of the assets received by the corporation in exchange for the stock. The aggregate par value therefore supposedly equals the net capitalization of the corporation after the sale of stock has been completed. In the United States, however, particularly in railroad finance and in the promotion of mergers and combinations, corporation managements were extremely liberal in their interpretation of the phrase value received and customarily issued stock with an aggregate par value several times any worth which might reasonably be imputed to the property or stock received in exchange. This overcapitalization, or stock watering, made the par value figure meaningless as a measure either of original capital or of changes in it. Under the laws of most of the European countries overcapitalization has been reduced to a minimum by stringent public regulation of the original issue of the stock, involving independent appraisal of any property or stock received in exchange and public disclosure of all financial data bearing upon the operations of the company.

In the United States many state governments permit corporations to issue unvalued shares, commonly known as no-par stock. The original issue price of such stock is variously determined, sometimes by the board of directors, sometimes by a majority vote of stockholders, sometimes subject to a general legal limitation, such as fair market value. Technically, no-par value stock eliminates overcapitalization, each share of stock being but an aliquot part of the whole and the whole being but an aggregate claim against the

assets and income of the corporation. It does not, however, protect present stockholders or those who have paid cash for their stock against dilution of their interest as a result of disproportionate payments of stock for property.

Preferred stock usually has some priorities over common stock with reference to dividends, assets or both. Preferred stock may be non-participating or participating; non-participating if the payment of the agreed return extinguishes the claim of the preferred stockholder, participating if there exists some arrangement by which the preferred stockholder shares with the holder of common stock a claim to new earnings. Preferred stock may be cumulative or non-cumulative: it is cumulative if unpaid dividends continue as a prior claim over common stock against future earnings of the corporation and non-cumulative if unpaid dividends in any year are permanently lost. Some preferred stock contracts, known as redeemable preferred stock, carry provisions giving the corporation an option to call in the stock on specified terms and conditions. Preferred stock contracts, called convertible preferred stock, give the holder the right to exchange the stock at his option into some other specified security. Some corporations have issued preferred stock for which a sinking fund is built up prior to payment of dividends to common stockholders until there is accumulated a specified sum believed sufficient to protect preferred stockholders against loss of dividends in bad years. Preferred stock may or may not have voting power. It may have voting power in general or only on specified questions. There may also be various classes of preferred stock which set up a hierarchy of prior claims.

An increasing proportion of the propertied wealth of capitalistic society exists in the form of investment claims against the income and assets of corporations. In the United States in 1922 corporate securities represented slightly more than 40 percent of the total national invested wealth and more than half of the income from property was distributed by corporations as interest and dividends. In 1927 corporate securities absorbed more than three fifths of all the income from property. The readjustment of values during the depression following 1929, the severe shrinkage of corporate financing and the marked expansion of public financing altered the percentage relationships between the various investment fields but in no way undermined the position of the corporation.

The greater part of corporate stocks and bonds

is owned by individuals. The remainder, no more than 25 percent of the total, is owned by institutions, including industrial and other corporations, banks, insurance companies, hospitals, schools and endowment funds. Presumably all individuals who buy stock expect in one way or another to gain in wealth thereby, but their behavior in managing their holdings is sufficiently varied to merit classification. Some owners trade in stocks on the basis of anticipated short run fluctuations of market values, buying the stock on as large a margin of borrowed funds as possible in the hope of capturing the proceeds of a favorable turn in stock prices. The dividends received from the stock are regarded merely as an offset to the cost of carrying the speculative account. In such cases ownership of any given stock is ordinarily of short duration, and the stock is usually registered in the name of some brokerage house which habitually sends the proxies to be voted by the management. Such ownership may be called speculative as distinct from investment ownership.

In contrast there is the type of individual who purchases stock outright and holds it for a relatively long period of time. Stock so held is usually registered in the name of the actual owner. The lethargy of this type of investment is not characterized by any single pattern of behavior on the part of the owner. In some cases inactive management of financial opportunities appears to be simply pecuniary ineptitude. In older economic communities, particularly where the accumulation of stock represents a family inheritance, there often exists a traditional sentimental attachment to a particular company, industry or locality, to which the more rational pecuniary judgment is subordinate. In other cases the purchase of stock represents an alternative use of savings in which the expectations of the investor rest primarily upon the earnings of the stock and the security of the investment. Although the pecuniary outcome of this type of investment depends more narrowly and directly than in the case of speculation upon the efficiency of the underlying industrial operations and upon the skill of the corporate management in turning the industrial process to a profitable account, the investors are in fact and in attitude dissociated from any effective control over management.

Concurrent with the tendency toward concentration of control there has been in the United States a wider dispersion of stock ownership in the hands of the general investing public.

The number of stockholders of record increased from an estimated total of slightly less than 4,500,000 in 1900 to probably more than 18,000,000 in 1928. The dispersion was greatest in the case of the large corporations: the stockholders of record for 31 representative large corporations increased from 250,000 to nearly 1,500,000, those of the American Telephone and Telegraph Company from 10,000 in 1901 to nearly 650,000 in 1931. The highest percentage increase occurred in the three-year period from 1917 to 1920, when the average annual rate of increase was 12 percent as compared with slightly more than 5 percent from 1900 to 1910 and again from 1920 to 1928. During the depression following 1929 the withdrawal of stocks from speculative accounts and their registration in the name of the owners increased the list of stockholders to a figure considerably greater than the 18,000,000 of 1928.

To what extent the lower income classes in the United States own stock can be estimated only within wide limits. A. A. Berle and Gardner Means in their study of corporations (*The Modern Corporation and Private Property*) suggest that by the end of the 1920's the number of individuals holding stock was probably between 4,000,000 and 6,000,000. From 10 to 15 percent of this number had annual incomes of over \$5000 and received approximately three fourths of the dividend and interest disbursements of corporations. Moreover the total number of stockholders represents at the minimum figure less than 10 percent and at the maximum figure less than 15 percent of the total of those gainfully employed. In spite therefore of the tendency toward wider public distribution of stock after the World War the greater proportion continued to be held within the higher income brackets. The growing though still very small holdings of the lower income classes have probably shrunk to insignificance since 1930 under conditions of widespread unemployment.

Although stock ownership has not seceded far down into the lower income brackets, there was during the war period a considerable displacement of stock ownership from the highest income levels to the class of the moderately well to do. In 1916 the 100,000 largest incomes, \$13,000 and over, received 78 percent of the total dividend disbursements reported on individual income tax returns; while in 1921 this group, then with incomes of \$20,000 or over, accounted for only 56 percent of the total disbursement of dividends. Various explanations are given for

this change. The most striking increase in stock ownership by the less wealthy occurred during the five years from 1916 to 1921. During this period the surtaxes on income were extremely high, so that investments in tax exempt bonds were a profitable alternative to common stock. The shift of the highest incomes to tax exempt bonds compelled corporations to seek other sources for their funds and explains in part the intensive campaigns which were then waged to sell stock to consumers and employees. Employee stock ownership was encouraged by management for the further reason that the latter believed it would constitute a good protection against trade union activity and would insure the loyalty of the workers to the company. Customer ownership was regarded by the public utilities as a good political defense against hostile regulatory legislation. It is estimated that 1,000,000 employees bought stock during the 1920's and that customer purchasing accounted for an equal number of small income stockholders. The habit of buying securities became more widely spread during the war as a result of the intensive drives to sell war bonds. During the boom period of the 1920's stock selling and advertising became a highly developed industry. New investment opportunities, such as investment trusts, were developed specifically to attract small individual capital.

There are various interpretations of the significance of this wider dispersion of stock ownership. It has been said to indicate a gradual democratization of ownership. But even before the depression almost 90 percent of the gainfully employed owned no stock. Moreover the stock certificate is little more than an uncertain claim upon that portion of the earnings of a corporation, if any, which the board of directors may see fit to distribute as dividends. Such ownership, wholly divorced from control, is of questionable value as a democratizing influence. Others have seen in the slight widening of stock ownership and the extension of speculative interests and habits during the 1920's the rise of a new middle class. This is a completely superficial interpretation. During a period of business expansion a considerable proportion of small savings are used for the purchase of stock and for speculation in the stock market, but the several million individuals who become owners of securities under such circumstances are a scattered aggregate of individuals rather than a social grouping with a well defined orientation of social, economic and political interest.

The relation of the owner of stocks, particularly of the small investor in the large corporation, to the management is that of a passive beneficiary of the latter's good will and conscience. He is largely helpless to protect his own interest. It is difficult and in some instances impossible for the stockholder to obtain a clear definition of his own position in the complicated hierarchy of claims, expectations, legal rights and liabilities which constitute the capital structure of a corporation. Nor do stockholders possess the means for effective criticism and appraisal of the management. The reports which managements render of their trust are largely uninformative to the general stockholder unacquainted with the art of financial analysis; the stockholders' meetings consist of voting proxies at the discretion of the management; boards of directors are either in fact self-perpetuating or are subject to new elections only at the behest of some controlling group of financiers. The general public investors are unrepresented in the government of the corporation and incapable of enforcing representation by their own initiative.

Under this regime of managerial freedom there developed in the United States during the recent period of business prosperity abuses of unusual magnitude. The numerous ingenious financial transactions of the 1920's were characterized by dilution of the interest of existing stockholders by special issues of new stock, secretive segregation and privileged diversion of earnings and manipulation of assets and interests in reorganizations and combinations. The enforcement of common law rules and of statutes designed to protect stockholders became increasingly lax, and only the most flagrant and obvious cases of fraud suffered prosecution. With the passage of the Securities Act of 1933 the legal protection of stockholders in the United States fell more closely into line with that of other highly developed capitalistic nations, such as Germany and Great Britain. Under this act investors will have some assurance that the prospectus, which must be issued publicly with the selling of the stocks, will be at least as truthful and complete as the fear of damage suits to which issuers of stock are made liable for a misstatement or omission of a relevant fact can make it. Stockholders' interests are also put in jeopardy by privileged manipulations of security values on the stock market. The Securities Exchange Act of 1934 attempts to prevent the recurrence of some of the worst abuses of the security markets by compelling periodic dis-

closures of detailed and relevant information of the operations of the corporation and of the speculative position of "insiders" in the stock of the corporations they control, and by subjecting the trading operations within the exchanges to public control. Whether these measures will induce any fundamental changes in the practices of corporation finance remains to be seen. The dubious outcome of reforms in the past and the history of successful efforts on the part of various business groups to soften the severity of public regulations suggest, if not skepticism, at least a delay of judgment as to the extent to which the struggle for power and fortune by financial groups will be directed into less exploitative patterns.

STOICISM. Zeno, the founder of stoicism, taught in a frescoed porch or colonnade at Athens, known as the Stoa. The school of philosophy which took its name from this fact arose about 300 B.C. in the early days of the Hellenistic world; and its historical background is to be sought in the conquests and policy of Alexander the Great. The way for the stoic doctrine of the equality of man and of the fraternity of all men in one great brotherhood was prepared when Alexander leveled the pale between Greeks and barbarians and pursued a policy of treating alike the Greeks, the Macedonians and the Persians, who were all included in his world empire. He is reported to have said that all men were sons of one Father: in the year before his death (324 B.C.), at the feast of reconciliation which was held at Opis following the mutiny of his Macedonian troops against the favor he had shown the Persians, he prayed for a union of hearts and a joint commonwealth of the two peoples.

But there is a still deeper preparation for stoicism than the conquests of Alexander. Early in the fourth century B.C. foreigners were beginning to enter the hitherto closed circle of Greek culture and Greek philosophy. If they were to find a level footing in the Greek world, with its exclusive city life and its sense of superiority, they had to preach a new philosophy of man and society. In place of what may be called "the closed culture-state" of the city type they had to proclaim the open world state, or cosmopolis, in which equal membership naturally belonged to every man who had the root of the matter in him. When there is a contact of races and civilizations, the impinging race or civilization which is seeking entry will always proclaim the larger whole and the higher unity in which the entrant can find an equal liberty with the ancient resident. The foreign entrant into the Greek world developed the social philosophy natural to the entering "gentle." The cynics had already followed this line before the stoics came. Antisthenes, their founder, was a Thracian; Diogenes, their great master, came from Sinope on the Black Sea. One of the sayings of the cynics expresses the negative side of their teaching: "Why should I be proud of belonging to the Soil of Attica, with the worms and slugs?" But Diogenes had also his positive side; and, according to tradition, he taught in his *Republic* that "the only right state is that of the world."

Like the cynics, the stoics were foreign entrants into the Greek world. Zeno, their founder, who came to teach in the Porch while Demetrius of Phalerum was governing Athens (317-307 B.C.), was a Hellenized Phoenician from Cyprus. Many of the stoic teachers in succeeding centuries were also foreigners. Chrysisippus, the systematizer of stoic doctrine, came, like Zeno, from Cyprus. Zeno the second and Antipater, both in their day masters of the stoic school, came from Tarsus, the city of St. Paul, on the mainland to the north of Cyprus. Posidonius, who reconciled stoicism to Platonism and was the teacher of Cicero and Caesar, came from Apamea, a city on the mainland to the east of Cyprus. Some of the later stoics came from even more distant regions: the home of one was Sidon, and that of another, the stoic Diogenes, who succeeded Zeno the second as the master of the school, was as far afield as Seleucia on the Tigris. The temper of these men can be guessed from some lines in a poem of Meleager, the father of the Greek Anthology and a Syrian from Gadara

who was educated in Tyre: "What is the wonder if I am a Syrian? There is one motherland, stranger, in which we all dwell, and that is the Cosmos: there is one Father of whom we are all begotten, and He is the void."

Foreigners, living in a Hellenistic—that is to say, a Greco-oriental—world, which used as its lingua franca the "common" Greek, the *koine* of the New Testament, the stoics built their philosophy accordingly. Its basis was a "theology," an account or explanation of God, which was also an explanation of man. In it may almost be detected some elements of that sun worship which was indigenous in Syria. God, who is also Reason or Nature, is essentially a fiery ether, which, as it is written in the *Book of Wisdom*, echoing the lore of stoicism, "passeth and goeth through all things by reason of . . . pureness." Pure and intact in God, this fiery ether deposits in every man a spark, a fragment, an *apospasma*, which is the guiding principle of his life. All men equally have thus within themselves something of the divine; all men equally should try to live by its common light; all men, if they do so, will be living according to the common law of nature (the *komos nomos*), which is, on a higher plane, the analogy of the "common" Greek. If any man makes the great endeavor, he will have his reward. To be a true man and to live conformably with nature is eventually to return, by the leading of the spark that is in man, to the fiery ether from which human essence was drawn.

There is a curious mixture of the spiritual and the material—God and a fiery ether—in this pantheistic philosophy. In the present context, however, stoic theology is less significant than the philosophy of human conduct and human society which was based upon it. The moral ideal of stoicism, which steeled the Romans of the empire and has its modern analogies in the temper of Puritanism and the ethics of Kant, is generally familiar. It is the ideal of the disciplined conscience, true to its vital spark, undisturbed though the heavens should fall, following a self-imposed road of duty by its own inward light. In itself this ideal is that of the solitary, who can walk a lonely way and cultivate the high virtues of an inward solitude. But stoicism had also from its first beginnings a social philosophy—a social philosophy which was connected not only with its theology but also with the provenance of its teachers and the social environment in which they taught.

The social philosophy of Zeno himself was more radical than that of his successors. He

lived as a metic in Athens and refused Athenian citizenship. He was un-Hellenic in the Hellenic world, "with an Asiatic darkness of Skin"; and the social philosophy he taught was un-Hellenic. Reason, he held, is the principle which builds society: by it man is a social being; and his society must be as wide as the reason on which it is based. The true state is therefore the cosmos: its law is the common law of nature or reason; and all rational beings are its citizens. "He taught," Plutarch records of Zeno, "that there should not be different City-States, each distinguished from the rest by its own peculiar system of justice: all men should be fellow-citizens; and there should be one life and order, as of a flock pasturing together, which feeds together by a common law." In much the same way he proclaimed that it is not the bonds of blood, but virtue and the similarity of moral interests that determine the membership of the true community. But in some of the details of his *Republic* he reveals himself as not content with preaching ascent to the natural in the sense of the universal, but as anxious rather to inculcate what may be called descent to the natural in the sense of the primitive. He would pare away the refinements and the luxuries of the Greek city and get down to the bare bones of essential life. The true city needs no temples and images, which are the works of men's hands and unworthy of the gods; it needs no courts of law; it needs no marriage or family life; it needs no gold or traditional system of education in arts and sciences. It will even treat men and women alike; and in it they will both wear the same dress.

Some of these statements, which have been handed down by report from Zeno's lost *Republic*, breathe a somewhat crude spirit of would be "natural" Arcadianism which summarily banishes churches and schools and law courts and marriage and money *et id genus omne*. These early crudities were later modified by Zeno himself and still more by his successors; but there always remained something of a revolutionary element in stoicism, which on the whole may be counted to the good. In the first place, if it did not obliterate, it sought to attenuate, the difference between races and the clash between colors and breeds. Eratosthenes, the librarian at Alexandria about 240 B.C., shows the change that has come since the days of earlier Greek thought when he refuses to agree with those who divide mankind into Greeks and barbarians and declares it better to divide men simply into the good and bad. This is a stoic tradition inherited

by St. Paul, for whom there is "neither Greek nor Jew, . . . Barbarian, Scythian, bond nor free." Secondly, as the final words of St. Paul suggest, stoicism, if it did not obliterate, refused to accentuate the division between the freeman and the slave. It treated slavery as an arbitrary human institution, recognizing that both slave and master might equally be among the elect, or *sapientes*; and faithful to the memory of Zeno, who had treated his slaves as himself, it actually helped, through its influence on the Roman lawyers and their ideas of natural law, to improve the actual lot of the slaves. Finally, stoicism as it affected the relations of races and classes affected also the relations of the sexes. Zeno's proposals that men and women should be indistinguishable and the institution of marriage should pass away were dropped. But the idea survived that women were the equals of men and should have an equal education and the same legal position; and on this basis later stoicism rose to a noble conception of marriage as the union of true minds in equal wedlock. This conception affected the Roman law view of marriage; and to stoic influence may be attributed the fine definition by the jurist Modestinus: *Nuptiae sunt consortium omnium vitae, divini et humani juris communicatio.*

The influence of stoicism has survived steadily for more than two thousand years. Four different phases of that influence may be mentioned. First, stoicism had a deep effect on the moral and legal genius of Rome. Its ethical ideal corresponded with the *gravitas* of the Roman temper; and just as the ideal of the gentleman descending from mediaeval chivalry has influenced the conduct of life in modern times, so the ideal of the *vir justus et praepositus tenax*, descending from the stoic philosophy, influenced the conduct of generations of Romans. But perhaps the profoundest effect of stoicism was that which it exercised on Roman jurisprudence. The stoic conception of the common law of nature became the Roman lawyers' conception of *jus naturale*; and the stoic principle of equality became a principle of this *jus*. The Roman lawyers thus came to hold that at the bar of natural law all human beings were equal; and this tenet affected, as has been said, both the institution of slavery and the position of women. An even deeper influence may be conjectured. In so far as the Roman Empire became an empire of common law, with a common citizenship, this development was perhaps due among other causes to the working of the stoic leaven.

The second phase of stoic influence may be

traced in the development of Christian thought. This influence first appeared in the teaching of St. Paul, but it made itself felt on an even larger scale in the Christian conception of natural law which has been expounded in the writings of Ernst Troeltsch. The conception had two forms, the absolute and the relative. Under absolute natural law—the law which would have continued to reign if it had not been for the fall—men were equal and enjoyed all things in common: there were no states or kings, no slaves, no private property. Under relative natural law—the law which the fall necessitated—government and slavery and private property all became necessary and natural things, *propter remedium peccatorum*; but even so they must still approximate as far as possible the old ideal. They must be institutions of human salvation and be used to serve the sovereign purpose of God as expressed in the relative natural law, which the God given reason of man could always discover and follow.

In the sixteenth century there arose and during the seventeenth and eighteenth centuries there flourished a new secular school of natural law, which based its precepts upon the unaided reason of man. Grotius and Pufendorf were the lights of this school in the seventeenth century, Wolff and Vattel in the eighteenth. This school set out to rationalize law, and in particular it proposed to rationalize and humanize international relations, seeking to bring them within the domain of the universal law of nature and attempting to make that law the obligatory law of international society. This was the foundation of what is called international law, and since it was regarded as a form of the law of nature and the law of nature goes back to the stoics, a third phase of influence of stoicism may be traced in the foundation of international law.

Finally, in the French Revolution there may be noted a great efflorescence of the principles of stoic thought. *Liberté, Egalité, Fraternité* were its watchwords, proclaimed as the universal inheritance of all mankind. The free man, equal to his fellows and united with them in a brotherhood of men: this was what Zeno had proclaimed, and this was what France proclaimed again in the Declaration of the Rights of Man and the edicts of fraternity. There were imperfections in the French proclamation of the old ideal. There are still imperfections in the modern world. But so far as efforts are still being made to establish human liberty and the natural rights of men; so far as man is seeking to realize

human equality; so far as he is attempting to achieve the brotherhood of men and an international society, so far as he is still walking in the old track blazed by the stoics.

STOLIPIN, PETR ARKADYEVICH (1862-1911), Russian statesman. Stolipin, a member of the landed nobility of western Russia, entered the state service in 1885. When in April, 1906, the council of ministers was reorganized in preparation for the opening of the First Duma, Stolipin, who as the governor of Saratov had vigorously combated agrarian revolutionism, was appointed minister of the interior. A few months later, when the dissolution of the radically oppositionist legislature was decided upon, he became also chairman of the cabinet. He invited the moderate liberals to participate, but since he refused to accept their program the membership of the cabinet remained bureaucratic. Although the revolutionary tide was obviously receding, he proposed "first pacification and then reforms" and adopted a policy of vigorous repression. By virtue of article 87 of the Fundamental Laws, permitting emergency legislation in the absence of the Duma, a decree was promulgated which directed the local authorities for a period of six months to refer "obvious" cases to field courts martial; these

courts, in which trial was secret and formal defense barred, were allowed to impose death sentences executed within twenty-four hours and not subject to appeal. This and other exceptional laws by which the jurisdiction of ordinary courts martial was extended to civilians were by the end of 1906 effective virtually throughout Russia, legalizing a reign of terror directed mainly against organized revolutionary groups, whose detection was facilitated by a network of political spies and agents provocateurs extended and perfected under Stolipin.

A subtler method of combating revolutionary tendencies was represented by the agrarian decree of 1906 and the law of 1910. These permitted every member of a peasant land commune to demand full title to his share of plowland or, in communes with infrequent repartitions, to the land he held at the time. This legislation, which in effect destroyed communal landownership, was meant to create a class of prosperous peasant proprietors as a bulwark against radicalism; actually, however, it merely injected the element of internal strife into the conflict between peasants and landlords.

Stolipin intended to preserve a semblance of constitutional legality. By careful preparation he hoped to elect a submissive majority to the Second Duma. When he failed, the franchise law was amended by decree, in crass violation of the Fundamental Laws, so as to limit the representation of peasants and working men and assure the preponderance of landlords and the upper bourgeoisie. The majority of the Third Duma was indeed friendly to the government, supporting its narrow class and nationalist policies in laws safeguarding the interest of the landowning nobility, furthering the disintegration of the commune for the benefit of the rich peasants, violating the autonomy of Finland and limiting the civil rights of Poles, Jews and other national minorities. On the whole Stolipin continued to rule by strong arm methods; eventually the moderate conservatives refused him their unconditional support, so that he allied himself more closely with the extreme right.

V. MIKOTIN

Consult: Struve, P., "Witte und Stolypin" in *Menschen die Geschichte machten*, ed. by P. R. Rohden and G. Ostrogorsky, 3 vols. (Vienna 1931) vol. III, p. 263-73; Miliukov, P. N., and others, *Histoire de Russie*, 3 vols. (Paris 1932-33) vol. III, ch. XXI; Pokrovsky, M. N., *Russkaya istoriya v samom szhatom ocherke*, 3 pts. (5th-10th ed. Moscow 1931), tr. by D. S. STONE, LUCY (1818-93), American feminist and abolitionist leader. Lucy Stone, who has been credited with the conversion of Susan B. Anthony to the feminist cause and, by Elizabeth Cady Stanton, with being the first person by whom "the heart of America was deeply stirred on the woman question," is ranked by the historians of the woman's movement as of equal importance with these two and with Lucretia Mott. Her contribution rested as much upon courageous acts of personal protest against convention as upon leadership of an organized movement. As a young girl she had innocently attempted to vote in church meeting only to be scornfully rejected. Over her father's protest she entered college, earning her way as teacher and as houseworker. She was a meteoric student at Oberlin College, the first coeducational institution, but closed her college career by refusing the honor of preparing an essay since tradition demanded that it be read by a man. After her graduation in 1847 she became renowned as an abolitionist lecturer, an activity to which she had been inspired by the pioneer efforts of the Grimké sisters and Abby Kelly Foster. Although women's rights had been stressed by many humanitarians, Lucy Stone was the first to make it the main theme of her discourses. Even before the first local women's rights convention in 1848 she issued a call for the first National Woman's Rights Convention, which was held in 1850. Upon her marriage in 1855 to Henry B. Blackwell, an antislavery agitator—brother of the pioneer women physicians, Elizabeth and Emily Blackwell, and a member of the family into which Antonette Brown, the first woman minister, also married—the newly wedded pair published a protest against the deprivation of women's rights which marriage entailed. Determined to keep her own name as a symbol of personal freedom, she evoked considerable agitation by registering merely as Lucy Stone in a Massachusetts school election. In 1858, while living in New Jersey, she permitted her goods to be sold for taxes as a protest against taxation without representation.

In all her activities she had the warm support of her husband and it was with his aid and later with that of her daughter that she edited the *Woman's Journal*, which she had founded in 1870 and which until 1917 served as the unofficial organ of the movement. In the atmosphere of highly charged humanitarianism which characterized the abolitionist and early feminist movements her engaging charm, simplicity and

fearlessness helped to dispel the hostility and ridicule which greeted her efforts as teacher, lecturer, organizer and editor to secure for women the freedom of intelligent human beings.

LORINE PRUETTE

Consult Blackwell, Alice Stone, *Lucy Stone, Pioneer of Woman's Rights* (Boston 1930)

STONE, MELVILLE ELIJAH (1848-1929), American journalist, one of the founders of the Associated Press. Stone was born in an Illinois village, the son of a Methodist preacher. He became a reporter and later an executive for various Chicago newspapers, served as a Washington correspondent and worked in New York City. In 1875 he organized a corporation to publish the *Chicago Daily News* as a one-cent newspaper. He gained financial experience by the organization in 1891 of the *Globe National Bank* in Chicago. It was not until 1893 that the Associated Press was incorporated in Chicago in its present dominant form, as a collector and distributor of domestic and international news. Stone was its general manager until 1921 and its counselor until his death.

The *Chicago Inter-Ocean*, expelled from the association for infraction of a by-law, brought suit, and the Supreme Court of Illinois declared in 1900 that the organization was a public utility, whose services should be available to all. To evade this interpretation the agency was reincorporated under a New York law for the formation of social clubs. It remained thereafter, although cooperative and seeking no profit, a closely guarded vested interest. The (New York) Sun News Service, suing it as a monopoly, failed to make its case.

In time the Associated Press came to have over 1200 members and served newspapers read by more than half the literate population of the United States. Until the second decade of the twentieth century its news was well organized and factual, uncolored in matters about which its members might disagree, dignified and exceptionally accurate considering the speed with which it worked, but reactionary and capitalistic in its selection and presentation. When the United States entered the World War its directors adopted a resolution, sponsored by Stone, that "the responsibility we have as citizens must overshadow any responsibility as news-gatherers," thus abdicating the association's primary function.

The competition of the younger United Press, a product of the Scripps-Howard chain,

which supplied a more lively and popular treatment of the news, forced the Associated Press to join with a motion picture concern to furnish pictures to its members, with "color stories" and quantities of trivia. Stone, who until his death determined the methods of the agency and helped it to establish legally a property right in news, reflected accurately the views of a commercialized constituency.

STONE, WARREN SANFORD (1860-1925), American labor leader and head of the Brotherhood of Locomotive Engineers. Dignified and aristocratic in appearance, Stone had the bearing typical of a president of a large business corporation, a factor which helped him to impress the railroad executives. He carried out what was essentially a business policy for his union. When he took charge of the Brotherhood in 1903, Stone initiated the concerted movement in collective bargaining with the managements. During the next decade he led the organization successfully through a number of such endeavors, and in 1916 he took a prominent part in the fight for the eight-hour day by all the trainmen's unions. He was likewise successful in dealing with the railroads during and after the World War. In the meantime Stone turned away from the narrow aspects of trade unionism. Following the war he became a strong advocate of government ownership and supported the Plumb Plan of railroad operation. Later he took a prominent part in the movement for independent political action which resulted in the candidacy of Senator La Follette for president. He was also willing to work and aid other organizations of labor in the railroad industry, an outstanding example being his assistance to the shopmen during the strike of 1922. Lastly, he plugged his union into cooperative banking, investment, real estate ownership and other capitalistic ventures, which he considered the means for realizing labor's financial power. Within a few years he had built up a large number of financial institutions with assets of more than \$150,000,000. Because of speculative overexpansion, a lack of knowledge in the field of business and certain other factors this financial structure fell to pieces shortly after Stone died,

as did most of the other labor banks, and necessitated large assessments upon the union's membership to compensate for the losses

STORCH, HEINRICH FRIEDRICH VON (1766-1835), Russian economist. Storch was born in Riga of German parents. After having studied at Jena and at Heidelberg he entered the Russian government service in 1789, at the same time continuing his interest in contemporary Russian economic problems. At the suggestion of J. G. Georgi, the famous geographer, he prepared a masterly historico-statistical description of the Russian Empire, an extensive work which earned him membership in the Russian Academy of Sciences. Storch gained still wider recognition by his *Cours d'économie politique*, his chief work on economic theory and an outgrowth of the lectures which as tutor he prepared for the sons of Alexander I. In his later years he devoted several papers to the problem of national income, in which he distinguished sharply between the concept of individual and that of national income.

Like all Russian economists of that time, Storch was essentially a follower of Adam Smith, but he differed from his master on a number of significant points. Without probing too deeply into the historical succession of economic facts he formulated a theory of stages of economic development not unlike that elaborated by List two decades later and believed that different economic principles apply to each historical stage. Following the line of reasoning which Smith had employed in disputing the validity of the physiocratic theory that all non-agricultural occupations are unproductive, Storch criticized Smith's treatment of professional classes as unproductive and emphasized the indispensable nature of immaterial services in promoting the prosperity of society. He did not subscribe to Smith's cost of production theory of value and stressed instead the importance of the subjective elements in value determination.

STORY, JOSEPH (1779-1845), American jurist. Story was born at Marblehead, Massachusetts, graduated at Harvard, studied law in the office of Chief Justice Sewall of Massachusetts and afterward under Samuel Putnam, later justice of the Supreme Court of Massachusetts, and became active in politics as a radical follower of Jefferson in a conservative Federalist community. He had been twice speaker of the house in the Massachusetts legislature and had sat one term in Congress when, at the age of thirty-two, he was appointed one of the justices of the Supreme Court of the United States. In 1829 he was elected Dane professor of law at Harvard; he sat in the Supreme Court and at circuit, as the justices of the Supreme Court then did, and taught in the Harvard Law School until his death.

As a judge Story ranks among the ten outstanding names in American judicial history and, along with Marshall and Kent, with the builders of American law. He came to the bench while American constitutional law was still formative and took part in most of the great decisions which established the leading principles of American public law. He sat at circuit during the War of 1812 in a circuit in which there was an exceptional amount of maritime litigation, and his decisions in admiralty and prize cases had much to do with making American law on those subjects and were in many cases of international importance. But his chief influence upon American law was as writer and teacher. After Kent, who went no further than an institutional book, Story was the pioneer among the great American law writers, publishing a long series of texts. These books, turned out in quick succession by a teacher who was at the same time sitting in the highest court of the land and also at circuit and doing his full share of the work in each capacity, had a decisive influence at a critical period in

American legal history. They summed up the English case law from the seventeenth to the early nineteenth century, worked it over on a philosophical basis and made it available for a new start in the commonwealths which were springing up in the westward expansion of the United States. Story's treatise on equity jurisprudence is still in everyday use, and that on the conflict of laws was epoch making for the subject. As a teacher Story sought to make lawyers rather than to expound the law dogmatically and thus pointed the way to American law teaching of today.

STOURM, RENÉ (1837-1917), French writer on public finance. Stourm's background was essentially conservative and traditionalist and his career served merely to strengthen these tendencies: he became inspector of finances in 1863 and administrator of indirect taxes in the Ministry of Finance in 1874, being recalled from this last post in 1879 because of his conservative political ties. He succeeded Léon Say as professor of public finance at the *École des Sciences Politiques* in 1885. In 1896 he was elected to membership in the *Académie des Sciences Morales et Politiques* (Institut de France), likewise to succeed Léon Say, and remained secretary of the academy from 1913 until his death.

Stourm adhered to a strictly fiscal concept of taxation and rejected all attempts to use taxes as a means of effecting social reform, such as redistribution of wealth. He opposed the principle of progression and favored proportional taxation. He was the author of several works, of which the best is *Le budget* (Paris 1889, 7th ed. 1913; tr. by T. Plazinski, New York 1917). The novelty of the subject, the clarity of the exposition and the elegance of the style won for this study great and universal acclaim; it is, however, outmoded at present. The *Systèmes généraux d'impôts* (Paris 1893, 3rd ed. 1912), which

has no scientific value, merely set forth ideas which had considerable currency in conservative circles in the early years of the twentieth century. Stourm's studies of financial history, such as *Les finances de l'ancien régime et de la Révolution* (2 vols., Paris 1885) and *Les finances du Consulat* (Paris 1902), which for a time constituted a valuable source of information, no longer meet the standards of precision set by modern historical science.

STOWE, HARRIET BEECHER (1811-96), American writer. In her first book, *The Mayflower* (New York 1843), Mrs. Stowe appears as a pioneer in the literary study of local or regional character, mainly of New England. On popular or folk levels this emphasis had long been apparent in plays, oral stories and journalistic sketches that portrayed the Yankee, the Negro or frontiersman, but it had been slow to reach literary levels. Whether Mrs Stowe was directly influenced by these pieces it is impossible to say; so many legends were attached to her name after the publication of *Uncle Tom's Cabin* that essential facts have been obscured. But an uncanny susceptibility to popular forces and popular feeling undoubtedly belonged to her and lay at the base of her power.

In *Uncle Tom's Cabin* (2 vols., Boston 1852) the Yankee and Negro characters were close to the portrayals of contemporary popular story telling and theatrical sketches, particularly those of early minstrelsy. In this connection it must be noted that the Negro in minstrelsy was by no means invariably comic. The alliances of the book are shown by the readiness with which it was transformed into drama that can only be called folk drama, although when she wrote it Mrs. Stowe was almost certainly unacquainted with the theater. She had seen slavery as a social and economic condition only once, favorably, during a brief visit to Kentucky. Her reasoning as to the issue was confused. Her main impetus seems to have been the force of intense feeling against the Fugitive Slave Act (1850) in the north, with which she came into contact briefly. To this she added a sweeping religious emotionalism, hers as a Beecher inheritance, that coincided with the prevailing religious emotion of the time. Hysterical and morbid as it is in many ways, *Uncle Tom's Cabin* achieved some-

thing of the epic scale by the wide unfolding of its theme, the union of many stories, the natural use of wide geographical areas. Quickly running through many editions, it has been called a prime mover in precipitating the Civil War. Its appeal has outlasted the slavery issue, for it is still read in many languages.

CONSTANCE ROURKE

Consult Stowe, Charles Edward, *Life of Harriet Beecher Stowe Compiled from Her Letters and Journals* (Boston 1889), Fields, Annie, *Life and Letters of Harriet Beecher Stowe* (Boston 1897); Rourke, Constance Mayfield, *Trumpets of Jubilee* (New York 1927) p. 87-148, Parrington, Vernon Louis, *Main Currents in American Thought*, 3 vols. STOWELL, FIRST BARON, WILLIAM SCOTT (1745-1836), English Admiralty judge. Stowell's younger brother, John, later Lord Eldon, likewise became famous as a judge, in the courts of chancery. William graduated from Corpus Christi College, Oxford, in 1764 and later became a tutor in ancient history at University College. In 1777 he commenced the study of the law, becoming a doctor of civil law in 1779. He first practised in the ecclesiastical courts, where his success was rapid. In 1798 he became Admiralty judge, holding that post until the infirmities of old age compelled his resignation in 1827. He had been raised to the peerage in 1821.

In the fields of prize law and of international law his reputation became and remained great. His decisions are marked by the breadth of their intelligence, and in them are implicit the ethics of a most scrupulous gentleman. It is difficult to realize in reading them that many were written during the highly impassioned era of the Napoleonic wars. Some important doctrines of international law owe either their most persuasive exposition or their origin to Stowell and almost all have borne well the test of time.

Thus Stowell boldly declared against wartime "paper" blockades, one of the greatest grievances of neutrals. He laid down the rule that blockades in order to be lawful must be effective, a rule explicitly recognized by the Declaration of Paris in 1856. He acknowledged, as modern statesmen have refused to do, the practical limitations of blockades. When it was sought to condemn goods in transit to an unblockaded port, which could be blockaded only with difficulty, because the goods could be conveniently transported by land to another port which was blockaded, he replied cogently

"Blame geography." He boldly upheld the independence and utmost good faith of prize courts in war time, insisting upon their character as true international rather than municipal courts. He considered all states as equal at law regardless of their territorial size. He denied the right to visit and search vessels of another nationality in time of peace and did much to clarify the law of contraband of war in holding that whether private property at sea was contraband was to be determined by its "probable destination," a rule not indefensible within the limitations declared by him but expanded to an unwarranted extent by American prize courts in the Civil War and extended beyond even those extreme limits by English prize courts in the World War.

FREDERIC ROCKWELL SANBORN

Consult Roscoe, Edward Stanley, *Lord Stowell, His Life and the Development of English Prize Law* (London 1916), and earlier literature there cited, and "The Influence of Lord Stowell on the Maritime Law of England" in *Law Magazine and Review*, 5th ser. vol. xxvii (1901-02) 210-18, Bentwich, Norman, "Lord Stowell" in *Great Jurists of the World*, ed. by J. Macdonell and E. Manson (London 1913) p. 517-31

STRACCA DI ANCONA, BENVENUTO (1509-78), Italian writer on commercial law. Stracca was born in Ancona of a respectable merchant family. He studied law at Bologna from 1533 to 1538. From 1539, when he returned to his native city, until his death he practised law and held numerous important public offices.

His first and most significant work in the field of commercial law, *De mercatura sive de mercatore* (Venice 1553, new ed. Amsterdam 1668-69), treats of commerce in general, the merchant class, mercantile contracts, maritime law, bankruptcy and mercantile practise. As in his other works the most noteworthy and original sections and those most systematically presented are the parts dealing with maritime law, especially with regard to liability and bankruptcy. *De proxenetis atque proxenetis* (Venice 1558) deals with the functions and responsibility of brokers. *De adiecto* (Venice 1569) discusses the conditions governing the transfer of claims to third parties. *De assicurationibus* (Venice 1569), which is not a systematic treatise, contains an introduction on the subject of insurance and a comment, under the title of a gloss, on the policy of Ancona with regard to insurance. These treatises are all contained in the Amsterdam edition of *De mercatura*.

Stracca's work is distinguished by the care

with which he studies the practical arguments which are disregarded by other jurists of his period and by the absence of the scholastic categories and formulae so much in vogue at the time. An admirer of the Roman law, he advocated the observance of the text of the *Corpus iuris*; but, like other jurists of the period, he was often compelled to give preference to local custom and statutes as representing a response to new needs. Previously commercial law had been studied only with regard to individual cases, as a part of civil and canon law. It was Stracca's truly distinctive merit to have been the first to present a systematic exposition of commercial law as a complex of norms separate from the other branches of the law and to have carried it out from both the practical and the legal aspect.

GUIDO BONOLIS

Consult Franchi, Luigi, *Benvenuto Stracca, giurconsulto anconitano del secolo XVI, note bio-bibliografiche* (Rome 1888), Alessandro, Jattes, "Lo Stracca giurconsulto" in *Rivista di diritto commerciale*, vol. vii (1909) pt. 1, p. 624-49, Goldschmidt, L., "Benvenuto Stracca Anconitanus und Petrus Santerna Lucitanus" in *Zeitschrift für das gesammte Handelsrecht*, vol. xxxviii (1891) 1-9.

STRACHEY, JOHN ST. LOE (1860-1927), English journalist. Strachey, who was one of the ablest English publicists of the late nineteenth and the early twentieth century, came of a Somersetshire landowning family which has made notable contributions to literature and public life. After graduating at Oxford, where he took a first in history, he joined the staff of the *Spectator*, then at the height of its influence under Richard Hutton and Meredith Townsend. He became in 1897 its proprietor and editor and made it the most prosperous and respected of the English weeklies, immune from the financial vicissitudes that harassed its rivals. In politics a Liberal Unionist, he allowed himself a considerable measure of independence in his support of the Conservative party; thus his paper became the most outspoken opponent of tariff reform, and for a long time the Unionist free traders, largely through Strachey, were able to hold off protection and colonial preference. Toward other trends of opinion he showed a tolerance and an active interest very unusual in political journalism. In the later years of his editorship he made a regular feature of articles in which the advanced radical viewpoint was stated by H. W. Massingham and others even farther to the left. He himself desired no far

reaching changes in the structure of society—he hated the thought of a socialist bureaucracy, for example—but he flung himself with great ardor and perseverance into the advocacy of minor reforms, especially in the field of local government, and in all that concerned the housing of the working class. His openmindedness and his talent for courteous discussion made the *Spectator* a forum valued by all educated readers rather than an organ of conservative opinion. Strachey also wrote for the *Saturday Review*, the *Observer*, the *Standard*, the *Daily News*, the *Manchester Guardian*, the *Academy*, the *Pall Mall Gazette*, the *Economist*, the *Cornhill Magazine*, the *Quarterly Review* and the *Edinburgh Review*. He was the editor of the *Cornhill Magazine* for the year or so immediately preceding his assumption of active control over the *Spectator*.

STRAUS, NATHAN (1848-1931), American philanthropist. Nathan Straus, one of three brothers of German-Jewish descent who made notable contributions to public affairs, philanthropy and mercantile development in the United States during the closing quarter of the nineteenth century and the early years of the twentieth, is best known for his work in the field of child health. Taking his cue from Dr. Abraham Jacobi, one of the prominent child specialists of his day, Straus decided that the greatest menace to the lives of children lay in impure milk. Most of the milk sold was subject to contamination and only pasteurization seemed to promise reasonable hope of combating it. Straus set himself the task of demonstrating the preventive virtues of pasteurization by opening in 1893 the first pasteurized milk station in New York City and observing the subsequent reduction of the infant mortality rate in the district served. He then initiated the organized movement for the pasteurization of milk and himself established and financed a large number of stations for the provision of pasteurized milk in urban areas accessible to the poorer population.

These stations were distributed among many cities in the United States, later in Europe and eventually in Palestine. Their dissemination was effected despite organized opposition induced by commercial interests. Straus' interest in child welfare continued and in 1909 he established at Lakewood, New Jersey, the first "preventorium," a term he himself coined, for the care of children exposed to tuberculosis. This also proved a fruitful idea and led to the development of similar institutions in other parts of the country.

In the latter period of his life Straus became actively interested in Zionism and was the first prominent American Jew of wealth to join the movement. In Palestine he was responsible for the establishment of milk stations, diet kitchens, workrooms for the unemployed and a health center for experiment and prevention as well as for remedial purposes.

STRAUSS, DAVID FRIEDRICH (1808-74), German theological and historical critic. Strauss was born in Ludwigsburg and studied at Tübingen and Berlin. At the age of twenty-seven he suddenly became famous as the author of a critical life of Jesus, *Das Leben Jesu, kritisch bearbeitet* (2 vols., Tübingen 1835-36; 4th ed. 1840; tr. by George Eliot, 3 vols., 2nd ed. London 1893). Discussing the Gospel narratives point by point this work argued that the decisive portions for theology of the canonical life of Jesus could be understood better as "myths" of the early Christian community than as historical facts, whether supernaturally or rationally interpreted. From 1835 to 1840 Strauss' book was a storm center of criticism. He lost his right to teach at Tübingen and was prevented by popular disapproval from occupying a professorship to which he had been appointed at Zurich.

In answering his critics in this period Strauss at first made some concessions, but eventually he reaffirmed the more radical implications of his position. He had come to his views by way of the exegesis of F. C. Baur at Tübingen, which had its philosophical background in the ideas of Schleiermacher and Hegel. In his *Die christliche Glaubenslehre* (2 vols., Tübingen 1840-41), however, he definitely rejected the view that the

truth of Christian dogma could be reestablished by speculative idealism. According to Strauss modern philosophy culminates in a humanistic pantheism, which can give new religious satisfaction but the content of which is not, as Hegel claimed, identical with Christianity. Not the unique man-God, Jesus, but the divinity of humanity in its consciousness of the universe is its central conception.

Strauss' misfortunes among the citizens of Zurich made him distrustful of democracy. He hoped for more from an aristocracy of culture, and in the politics of 1848 as Wurttemberg deputy he espoused a conservative liberalism. As opposed to social democracy he remained an individualist and a monarchist. He was strongly nationalist, however, and he accepted Prussian leadership, especially after the death of Frederick William IV, whose reactionary orthodoxy he had attacked. In 1866 and 1870 he wrote with chauvinistic ardor in defense of the Bismarckian wars and annexations.

During the reaction of the 1850's Strauss occupied himself with literary criticism and wrote several biographies of German protagonists of humanism, notably that of Ulrich von Hutten (3 vols., Leipzig 1858-60, new ed. 1 vol., 1914; tr. by J. Sturge, London 1874) In the next decade he returned to theological controversy. A rewriting of *Das Leben Jesu* as *Das Leben Jesu fur das deutsche Volk bearbeitet* (Leipzig 1864, 22nd ed. 1924; English translation, 2nd ed. London 1879) met with little success, but he drew fire once more with his last work, *Der alte und der neue Glaube* (Leipzig 1872, 16th ed. Bonn 1904; tr. by M. Blind, 3rd ed. London 1874), which presented a comprehensive contrast between the traditional Christian *Weltanschauung* and the modern sense of life. Strauss' "new faith" is a commitment to materialistic and evolutionary science (which conflicts not with idealism but only with dualism), to the national state, to public education and to classical modern art as represented especially by Goethe and Mozart. It is not a creative work, and Nietzsche's criticism of it as an epitome of bourgeois complacency was not altogether eccentric. Strauss' essential service was his forthright attack on the halfway, unclear position of liberal Christian theology and its philosophical apologists.

STRAW VOTE. A straw vote is an unofficial canvass of an electorate to determine the division of popular sentiment on public issues or on candidates for governmental office. Ordinarily the term implies the use of a sampling technique, but it may also designate an inclusive canvass, such as the precinct polls sometimes taken by the political parties in an effort to learn the preference of every voter.

The practical politician in the United States has long used the inclusive precinct poll to gather field data for the direction of his campaign. It plays an even more important part in English elections, where a canvass, a check canvass somewhat later in the campaign and even a counter canvass, ostensibly conducted by the opposing party, are sometimes employed. Ostrogorsky expressed the view that an English party organization which could not predict the outcome of an election to within 150 to 250 votes in a constituency of 10,000 to 12,000 was very inefficient. In the United States one state wide party canvass showed an error of 600 votes in a total of 10,000 cast, in estimating the winner's plurality. Because of the expense attached to the inclusive canvass, party appraisals of voting sentiment more often consist of partial canvasses and estimates made by precinct leaders. These estimates usually carry an element of honest bias and frequently fall wide of the mark.

Straw votes employing the principle of sampling have been conducted in the United States since the early 1900's, chiefly by newspapers and periodicals. Among the outstanding sponsors have been the *Chicago Journal* (later the *Daily Times*), the *Chicago Tribune*, the *Cincinnati Enquirer*, the *Columbus Dispatch*, the *Hearst newspapers*, the *New York Herald*, the *New York Daily News*, the *Salt Lake Tribune*, the *Scripps-Howard newspapers* and, among the magazines, the *Farm Journal*, the *Literary Digest* and the *Pathfinder*. The polls of the *Hearst newspapers*, the *New York Herald* and the *Literary Digest* have been national in scope. While

most polls have been concerned with candidates for public office, a few, notably some of those conducted by the *Literary Digest*, have dealt with such questions as the soldiers' bonus and prohibition. There are two reasons for the peculiar interest of newspapers and periodicals in straw polls: first, these canvasses provide a type of election news eagerly followed by the reading public and, secondly, a few publishers use them for circulation building purposes by attaching a subscription offer to each straw ballot distributed. The opinions are obtained either through ballots in the newspaper, direct personal interview or ballots mailed to a sample group of persons. Of these methods, the second would seem to be the most efficient. The extent to which straw samples reflect accurately the division of sentiment is affected by a number of factors. The sponsor may manipulate the returns for propagandist purposes. The ballot box may be stuffed by interested parties or by lazy canvassers. The ballots may be drawn disproportionately from certain classes or geographical areas. All groups or sections may be given equal opportunity to vote, but the people of one may be more willing to participate in the straw vote than those of another. The straw voter may not reveal his true preference. Finally, the sample may be too small. Differences between the results of the straw ballot and of the subsequent official election may result from any of the foregoing factors, and also from the fact that a person may change his preference after he has marked a straw ballot or may, because of disinclination or disfranchisement, fail to participate in the official election. Furthermore the count in the official election may be dishonest.

Comparison of straw and official pluralities in the past shows varying degrees of correspondence, the most common differences ranging from 6 to 12 votes for every 100 in the total cast. For the most part these differences are attributable to faulty sampling technique and they will probably decrease materially as sponsors become more skilled in managing such canvasses.

Political observers see both good and evil in straw votes. As a research tool the straw sample may throw significant light on voting behavior by revealing how voters shift from one party to another, how different classes in the electorate vote and to what degree popular sentiment changes in response to electioneering. The straw vote may also help to clarify the mind of the legislator or the executive as to the wishes of

his constituents. The practical politician, as he becomes aware of the possibilities of sampling, is coming more and more to employ this technique as a supplementary form of canvass. Again, a significant variation between the returns from a carefully conducted straw poll and those from the official election may suggest the desirability of an investigation of the honesty of the official count.

The principal evil charged against straw votes is that they lead people who have no well defined political convictions to align themselves with the winning side, thus giving the majority an unfair advantage over the minority. Further, it is held, disclosure of the apparent victor wrecks the morale of the minority workers, causes campaign contributors to withhold support from the supposedly lost cause, tempts local candidates of the minority party to betray the head of the ticket in order to improve their own position and swells the "stay-at-home" ranks by promoting the belief that the election is already decided. Inquiry among politicians shows that while some are impressed with the power of straw polls to attract voters to the winning side, the majority appear unconcerned, believing that such influence is small. The exhilarating or depressing effect of straw returns on party workers is undenied; but, it is argued, it is their business to know how their ticket fares with the voters. Far from deadening interest in voting, say straw poll sponsors, these canvasses stimulate interest and increase the turnout on election day.

In the absence of concrete evidence any view on this issue must remain largely a matter of personal opinion. It would seem, however, that whenever such polls become or are recognized as obnoxious, they can be rendered useless by the simple weapon of the boycott, provided the groups concerned possess sufficient organization to control the participation of their followers in straw votes.

Official in character but partaking in one respect of the nature of the straw vote is the advisory initiative and referendum utilized by some states in the United States. Under this device a particular proposition is submitted to the people in order to determine their attitude; the vote has no immediate statutory effect, nor is it binding on the legislature. Advisory ballots of this kind have sometimes been employed on questions outside the jurisdiction of the state government, such as national prohibition and the entrance of the United States into the League of Nations (as in Massachusetts in 1932), in

order that the action of the state's congressmen might be guided on these questions.

STREET RAILWAYS. See MUNICIPAL TRANSIT.

STRESEMANN, GUSTAV (1878-1929), German statesman. The history of the critical part of the first decade of the German Republic is identified with Stresemann's career; he was the instrument of the constructive continuity characterizing the years 1923 to 1929. As political leader in positions of the greatest responsibility, first as chancellor, then as foreign minister, serving for six years in all the cabinets of all the coalitions, he worked for the security of the German Republic and the restoration of German liberty as well as to achieve a permanent foundation for German foreign policy and the re-establishment of Germany in the European and international community. His courage, initiative and intuition are bound up with all the great decisions of the German Republic: the cessation of the struggle for the Ruhr in 1923, the acceptance of the Dawes plan in 1924, the security pact at Locarno and the Berlin agreement with Russia in 1926, the entry of Germany into the League of Nations in 1926, the signing of the Kellogg Pact in 1928, the Hague Conference over the Young plan in 1929.

The son of a small Berlin hotel keeper, who had been in sympathy with the Revolution of 1848, Stresemann studied history, especially that which dealt with the Revolution of 1848, the disaster of 1806 and the recovery of 1813; literature, in particular the German idealists and Goethe; and, finally, political science, which he first put to a practical test in German economic life as manager of industrial associations and of the German-American economic association. With this store of ideas and this economic experience, at the age of thirty he was elected to the Reichstag as delegate of the National Liberal

party, of which he became leader after the death of Bassermann in 1917 and which he converted into the German People's party after the disaster of 1919. During the first period of the new Germany until 1923 he remained in opposition to all policies which later, when he was given responsibility, he adopted and carried out. Indeed it may be said that his political genius was fertilized by responsibility.

It was Stresemann's ambition to effect the reorganization of Europe and the world on the basis of justice. He therefore supported the establishment of international jurisdiction and the relinquishment of armaments. This ideology he developed out of the *Realpolitik* of the new Germany; his entire position was consciously idealistic yet at the same time realistic. He had the courage to break off the struggle for the Ruhr despite frequent attempts on his life. He saw in the Locarno Pact the end of the political struggle over the Rhine. The bestowal of the Nobel peace prize on him and on Briand was a tribute to his constructive peace policy and his aim to rebuild Europe. When he died at the early age of fifty-one, the loss was felt more deeply than that of any other German statesman, not only in Germany but throughout the world.

STRIKES AND LOCKOUTS. A strike is a concerted suspension of work by a body of employees, usually for the purpose of adjusting an existing dispute over the terms of the labor contract. A lockout represents a similar situation initiated by the employer. Whereas all lockouts and most strikes, as thus defined, fall within the area of authority of the particular employing group, a small percentage of the total number of strikes deal with objectives not included therein, such as a sympathetic strike or a strike for political purposes. An interesting feature of all strikes is the assumption by the striker that he continues to be attached to the industry or place

of employment, although not at work. Despite the legal contradiction involved he thinks of the job as his own to be claimed again when the strike is settled. This point of view tends in part to explain the attitude of bitter hostility toward strike breakers.

In most countries the distinction between strikes and lockouts is avoided in statistical reports and the general term "industrial disputes" is used instead, although it is sometimes employed also to describe disputes which never reach the stage of strikes and lockouts. This is due in part to the difficulty of distinguishing in the course of the dispute upon which side the initiative for concerted suspension rests. In the United States in the periods 1881-1905 and 1916-21, when strikes and lockouts were recorded separately, lockouts represented 4 percent and 3 percent respectively of the total number of disputes recorded. The apparent insignificance of lockouts may be due to the fact that the employer can use other and more convenient weapons, such as discharge of particular individuals. Available statistics, however, show that the average number of persons involved in lockouts is larger than in strikes and that their severity in terms of duration is greater.

The strike or lockout as thus defined grows essentially out of the wage system under modern capitalism and is not comparable, despite certain similarities, with the revolts of servile or semi-servile laborers, self-employed peasants or guild craftsmen. It is, however, integrally related with all those conditions which have made for the rise of trade union organization, including the right of freedom of association and of collective bargaining. While there are reports of strikes taking place at a comparatively early period in the history of the factory system, they became of marked social consequence only after the rise of large scale industry. Carroll D. Wright, the first commissioner of labor of the United States, discovered records of only 1491 strikes and lockouts in this country before 1881, more than half of which occurred in 1880. The earliest governmental statistics of industrial disputes on which conclusions must rest as to the trend of strikes in modern industrial countries, their causes, their magnitude, duration and outcome, go back no further than 1878 (Italy) and most of them were inaugurated in the decade 1890-1900.

Although trade unionism has been held to be the prerequisite of any widespread or effective strike movement, many students have maintained that as trade unions gain in strength, the

tendency to strike diminishes, both because increasing bargaining power lessens its necessity and because responsible leadership and increasing centralization and control tend to check impulsive action. From the long run point of view this inference may be justified, but for various reasons it is difficult of proof. Most strikes do, as a matter of fact, arise in organized trades and industries. In the period 1916-32 in the United States 25,080 disputes took place with respect to which information regarding trade union connection is available. Of these 88 percent were definitely connected with unions and 10 percent were carried on without union organization. The remaining 2 percent included both union and non-union workers or those organized after the strike began. As trade unionism spreads to previously unorganized industries, it is often accompanied by strike waves. The great strike in the bituminous coal industry in 1897 and that in the anthracite field in 1902, the garment strikes of 1909-13 and the steel strike in 1919 are examples of the use of the strike for purposes of organization in the United States. Similar examples in England are the dockers' strike in 1889 and that of the miners in 1898.

In all countries more strikes and lockouts result from controversies over wages than from any other single cause. In the United States during the period 1881-1905 the wage question was a factor in 53 percent of all disputes and in the period 1916-32 in 55 percent. It reached its greatest importance in 1920 when wages were involved in 61.5 percent of the disputes, but even at the bottom of the curve in 1924 this cause appeared more frequently than any other and accounted wholly or in part for 45 percent of the disputes. In Great Britain it was the principal cause of 59 percent of the disputes from 1919 to 1930 inclusive. Only in Australia and New Zealand, where wage fixing laws have been in effect for many years, is the proportion of strikes due to this cause relatively low.

It is in these strikes for wages that the influence of prevailing economic conditions in determining whether the strike shall be for the purpose of effecting an advance or of preventing a retreat is most clearly shown. In the United States, in the period of rising prices and great industrial activity from 1916 to 1921, 95 percent of such strikes were conducted in order to effect an advance in nominal wages and about 5 percent were to prevent a decrease. In the depression year of 1921, 88 percent were against a

reduction and only 12 percent for an increase. From 1923 to 1929 the greater number of strikes—a 75 percent average each year—were for an increase, but in the period 1930-32 the order was reversed once more. In 1930, 66 percent of the disputes over wages were to prevent decreases, in 1931, 84 percent; and in 1932, 85 percent were for that purpose. Records in other countries indicate a similar sensitivity to economic change.

Union recognition alone or in connection with other causes accounted for 17 percent of the total number of strikes in the United States in the period 1916-32, thus ranking second in importance, whereas in more strongly unionized Great Britain trade unionism was given as the cause in only 7.5 percent of the disputes from 1919 to 1930.

Strikes which were concerned with the length of the working day or week figured in 13 percent of the cases in the United States between 1916 and 1932 and 10.4 percent between 1881 and 1905; but in Great Britain hour disputes accounted for only 4 percent of the strikes in the period between 1919 and 1930.

From this point on the causes of strikes are not so easily classified. Discharge of employees is listed in the United States as a factor in about 5 percent of the cases for 1916-32. This cause is not always identified as such in other countries. In Great Britain 19 percent of strikes occurring in the period 1919-30 are listed as those concerned with the employment of particular classes of persons. In the United States jurisdictional disputes, despite the greater frequency of their occurrence, account for only 1.1 percent of the strikes. Working arrangements, rules and discipline, causes not recorded in the United States, accounted in Great Britain for 8 percent of the cases in the period 1919-30.

Sympathetic strikes amounted to 2 percent of all labor disputes in the United States from 1916 to 1932 and to less than 1 percent from 1881 to 1905. Nor is the sympathetic strike of great significance in Great Britain. In the period 1911-30 such strikes ranged from less than 1 percent to 4 percent of all strikes and exceeded 5 percent of the strikers in three years only—1924, 1926 and 1928. In 1926, the year of the general strike, 1,595,000 persons, or 58 percent of all strikers, were involved in sympathetic strikes. In 1928, despite the law of 1927 forbidding sympathetic strikes, 25 percent of all persons on strike were in this category. In France also there were three years in the decade

1920-30 in which the proportion of workers participating in sympathetic strikes was very high, ranging from 31 percent in 1920 to 34 percent in 1922.

The procedure followed both in conducting a strike and in effecting a settlement tends to vary with circumstances. Influential factors include the nature, economic position and geographical location of the industry involved, the strength and effectiveness of the union, the general economic and social conditions prevailing, the economic and political philosophy of the participants, the legal restrictions and the type of industrial policing applying at the particular time and place and, to some extent, the attitude of the public. For these reasons a strike of coal miners in a remote mountain cañon, even though it may be part of a nation wide dispute, calls for a strategy differing from that involved in a walkout of garment workers in a congested city. Action which would be appropriate to a strike involving a single establishment under local and personal ownership would be inadequate in an industry corporately owned and controlled and covering a wide area. A strike of skilled building craftsmen not easily replaced presents problems different from those of an industrial union, made up in greater or lesser part of comparatively unskilled workers.

Another factor having an influence on strategy is the previous status of the union. In a shop which is unorganized or in which only a small proportion are union members and no recognition has been accorded the union, the strike is apt to be a spontaneous walkout without notice. Such a strike, while indicating a general condition of unrest, usually is the result of some sudden provocation, such as a quarrel with a foreman or some disciplinary action believed to be without justification. Spontaneous shop strikes, usually called "stoppages," may take place even in a well organized industry and in violation of a trade agreement. Where relations between the employer and the union as a whole are satisfactory, these interruptions are of short duration, since both employers and union leaders prefer to settle the controversy quickly lest the agreement itself be jeopardized.

When a strike is the culminating step in a campaign of organization it is considered good strategy to move suddenly and unexpectedly. If the strike involves large numbers distributed over a broad territory, such action is often impossible and there is actual although not official notice to the employers of the intention to strike

and of the date fixed. Thus in the campaign to organize the steel workers in 1919, the steel companies were aware of the vote taken in July authorizing a strike if necessary, not only because of their effective spy system but because of the newspaper publicity given to the decision. The actual strike did not take place until September 22, after the employers had refused to confer with the union leaders.

The circumstances are different when the strike is not for the redress of grievances in a previously unorganized shop or for the purpose of instituting collective bargaining, but is an attempt to renew on satisfactory terms a previously existing agreement. Trade agreements usually provide for conferences to consider the terms of renewal at some time preceding their termination. If negotiations are broken off, a membership vote of the union may empower its officers to call a strike. After such authority is voted, conferences often are renewed on a somewhat more realistic basis. If the conferees are still unable to agree, the strike date is announced.

Once the strike is under way the leaders are confronted with two major problems; they must maintain the enthusiasm and loyalty of the strikers and prevent others from taking their places. Attempts to promote morale include meetings addressed by popular leaders, publication of bulletins carrying news of an encouraging nature, social gatherings and other devices directed toward group solidarity. One of the most important elements in making possible the continuance of the strike is provision for meeting the immediate necessities of life, indeed strike benefits are the most universal form of trade union benefits. A union which enters a conflict with a well filled war chest is in a far stronger position than a group of unorganized workers in a spontaneous strike. A strike of considerable duration and involving large numbers may, however, tax the resources even of the strongest union. Consequently appeals are made to other labor organizations and sometimes to the general public as well. Contributions thus obtained are usually of lesser significance than funds already in the hands of the union or derived from non-striking members of the same organization by special taxes. In the United States the presence in large numbers of non-English speaking immigrants often requires the development of a special technique.

The principal method employed to prevent strike breaking is that of picketing by strikers or

their representatives at or near the entrance to the place of employment. Picketing has three chief purposes: first, to inform those unaware of the fact that a strike is in progress; second, to persuade the workers to join the strike; and, third, by moral suasion or, if necessary, by physical obstruction to prevent them from going to work. The extent to which these purposes, especially the last, may be accomplished varies according to the method of picketing employed and the presence or absence of legal difficulties.

It is obvious that violence in the form of physical assault or destruction of property may easily arise in the course of a strike, particularly if it be prolonged or if bitter feeling is engendered. In the long run, responsibility for violence in strikes is fairly evenly divided between employers and strikers. It is usually difficult to find out which party is responsible for the initial step, but available evidence indicates that both sides at times make definite plans for physical resistance or attack.

It is in the settlement of strikes rather than in their direction that the social and political philosophy of the labor organization is apt to manifest itself. Unions proclaiming a radical or revolutionary philosophy are not especially addicted to violence in strikes, since the weapon of violence is reserved for definitely revolutionary purposes. There is no strike method known to the organizations of a left wing tendency that is not employed by the conservative unions as well. But a revolutionary union, while endeavoring to secure improved conditions for its members, utilizes the labor conflict for the additional purpose of attacking the institution of capitalism. Consequently in the settlement of a strike it avoids so far as possible all compromising truces such as are involved in arbitration or time agreements, preferring to retain its freedom to renew the attack whenever circumstances warrant.

A strike settlement may be achieved by default, by direct negotiation of the parties or by the intervention either of individuals or of governmental agencies. The first implies failure of the strike and its unconditional abandonment without any concessions or agreement by the employer, the strikers making individual application for reemployment on the employer's terms. A negotiated settlement indicates some degree of success, ranging from the most limited sort of concession to the granting of all the strikers' demands. Intervention may take the form of mediation, whereby the contestants are

brought together for direct negotiation or assisted in reaching a formula for agreement; or of arbitration, as when the dispute is referred to a third party for settlement. The latter may be voluntary, following an agreement, or compulsory and enforced by the state.

Three types of governmental contribution to the settlement of industrial disputes are to be observed, one or another of which or a combination is to be found in each of the more important industrial countries of the world. In the first, machinery is provided for encouraging voluntary conciliation and arbitration of disputes. This is the characteristic method of the English speaking countries generally, with the exception of Australia and until 1932 New Zealand, which in that year abandoned compulsory arbitration after nearly forty years' experience. Other countries in this group are France and Sweden.

In the second group of countries, mostly those of continental Europe, voluntary action with respect to conciliation is combined with varying degrees of compulsion. An interesting feature of the Belgian law is a provision that if an employer refuses conciliation, his striking employees are entitled to unemployment insurance benefits, while strikers who similarly refuse are barred from the receipt of unemployment benefits for one year.

The maximum of governmental control appears in the third group. Compulsory arbitration of practically all disputes with consequent prohibition of strikes and lockouts is the logical outgrowth of the governmental systems of Italy, Germany and Soviet Russia. Compulsory arbitration of a somewhat milder order is in effect in Australia. Denmark passed a law in January, 1933, prohibiting all strikes or lockouts for one year. Another aspect of the relation of governments to industrial disputes appears in the administration of public employment exchanges. Where the exchange is requested by the employer to supply new workers to replace striking or locked out employees, the general practise is to inform the applicant of the existence of a dispute and to leave the decision to him.

In the absence of specific prohibitions the legal right to strike exists in most countries where compulsory arbitration is not in effect. Some countries forbid strikes by public officials, by workers in public utilities and strikes endangering the safety of the state. Great Britain since 1927 has forbidden sympathetic strikes and those having political objectives. All countries forbid strikes of seamen at sea. In the

United States the legality of strikes depends largely upon the decision of courts in injunction cases.

Strike results are recorded under three classifications: those won by the employers, those won by strikers and those compromised. A compromise may range from the most limited concession to what amounts to victory. Until the period immediately after the World War the general trend in all countries was toward a larger proportion of strikers' victories; these fluctuated, however, with periods of depression and prosperity, and there was a marked decline in the last decade. In the United States, in the period 1916-32, of all strikes on which information was available as to outcome 37 percent resulted favorably to the employer, 34 percent to the strikers and 29 percent were compromised. For the period 1881-1905 the corresponding percentages were 37, 48 and 15. For Great Britain for 1919-29 inclusive they were 36, 22 and 42. It must be noted, however, that these figures give no indication of the actual number of workers in each group. Thus in the unfavorable year of 1932 in Great Britain, despite the decline in the number of disputes and the larger proportion of defensive strikes, the figures showed that the 22.6 percent of the disputes won by workers affected only 6.9 percent of the total number of strikers, that the 43.2 percent won by the employers covered 47.9 percent of the strikers and that the compromised disputes, accounting for 34.2 percent of the total, involved 45.2 percent of the strikers.

As stated above, most of the leading industrial countries attempt to compile and publish from time to time statistical data with respect to industrial disputes. The reports vary in completeness, but the information usually includes at least the number of disputes, number of workers involved and number of days lost. In general they indicate that the period immediately following the World War was one of exceptional unrest. In most countries the years 1919 and 1920 were exceptional with respect to the number and severity of strikes. In the United States over 4,000,000 persons were involved in 2665 disputes in 1919. In 1930, 653 disputes were recorded, with 158,000 persons affected. This was the lowest point reached after 1919, and during this period the decline was almost continuous. In 1931, 894 strikes and 279,000 strikers were reported and in 1932 there were 808 disputes involving 243,000 workers. The Canadian reports indicate a trend not unlike that

of the United States. Labor disputes in Great Britain have been relatively more frequent and extensive than in the United States and Canada, but here too the index of severity in general declined in the period 1919 to 1930. In the main a similar trend is to be observed in other countries. Japan alone presents an almost opposite tendency, with strikes increasing both in number and severity after 1920. This is due apparently to the comparatively recent rise of class consciousness and of trade unionism in Japan. The apparent decline in the severity of strikes in other countries is due in part to the abnormal activity in 1919 to 1921. The decline after this period is in the main no greater and is in some cases less than the rise from the decade preceding the war. However, considering the increase both in population and in trade union membership, there seems to have been a real decline in strike activity after 1921. Reasons for this vary according to conditions prevailing in each country. In Europe generally the tendency to set up legal restrictions of one sort or another, calculated to discourage or forbid strike activity, has doubtless had its effect. In England the reaction against the general strike of 1926 together with the drain on resources that that effort entailed had an obvious effect on strike activity in the years immediately following.

In the United States, where the lessening of strike activity since the war has been most noteworthy, the outstanding causes appear to be the rise in real wages, the development of a new and more effective technique of opposition to trade unionism and the decline of trade unionism both in numbers and in aggressiveness, partly as a result of the hothouse growth during the war period.

There was a considerable increase in strike activity in 1933, which was due in large part to the legal protection thrown around organization and collective bargaining by the National Industrial Recovery Act, which took effect in June. In July to October inclusive there were more than twice as many disputes as in the corresponding months of 1932 and more than seven times as many persons affected. There were 1248 disputes in the first ten months of 1933 involving 741,870 persons. This was a larger number of disputes than in any full year since 1925 and a larger number of persons affected than in any year since 1923.

Strike statistics need to be analyzed with great care, however, to avoid misinterpretation. Questions arise as to adequacy and comparability

even within a given country. Moreover, in order to get a complete picture of the strike problem it is necessary to consider not alone number of strikes but also number of persons affected, trade union membership and the size of the wage earning population. In only a few studies has there been any attempt to make the necessary correlations. Temporary or unusual factors also, if not allowed for, may lead to unjustified inferences. Thus in the United States in the period 1881 to 1905 there were 36,757 strikes involving 6,728,048 persons, an average of 1470 strikes and 269,122 strikers a year. In the 17-year period covered in the second series, 1916-32, 31,889 strikes were reported with a total of 16,188,885 strikers, or an average of 1875 strikes and 928,758 strikers a year. The average number of strikes is thus 27 percent higher and the average number of strikers 254 percent higher than in the earlier period. But the major proportion of this increase is to be accounted for by the unusual strike activity in the years 1916-22 inclusive, when the average number of strikers was 1,771,760 per year, and especially in the years 1919 and 1920, when the number and severity of strikes reached an unusual peak in other countries as well.

Account must be taken too of the preponderance in every country of three or four industries in the figures of strikes and lockouts and their increasingly large coverage as conflicts shifted from local to nation wide scope. In the United States coal mining, clothing manufacture, building and textiles were responsible for nearly 75 percent of the disputes between 1926 and 1932. The construction industry, characterized by local strikes, is first in the number of strikes but third in the number of strikers. In Great Britain in years when the number of disputes reached high peaks, mining and the cotton spinning industry have accounted for a large proportion. In 1926, although there were fewer strikes in mines and quarries than in any other year of that decade, the number of persons involved was more than twice as great as in any other year. In the period between 1910 and 1924 in Great Britain, although 48 percent of the disputes involved 100 persons or fewer, and 41 percent 1000 persons or fewer, the disputes affecting 5000 or more workers accounted for 71 percent of all strikers and 83 percent of the time lost.

The question has frequently been raised whether, even in strikes that are "won," possible gains are not outweighed by the wage loss alone.

From the point of view of the community as a whole the question must take into account not only the loss of wages but employers' loss of profits and the loss to society through direct or indirect interference with its activities. Any attempt to estimate these losses in money terms must result in failure. The most intangible item is of course the indirect cost to business generally; but the direct loss to the employer involved in the strike is almost equally difficult to compute, since profits are influenced by many factors, of which the labor conflict is but one. Nor can the losses to strikers be gauged satisfactorily, since it is by no means certain that the wage loss can be reckoned by multiplying the average wage by the number of man days lost. Most industries are somewhat seasonal and the time lost in a strike is frequently made up by work during what would otherwise be the dull season. The average duration of strikes in the United States in the greatest strike year, 1919, was 34 days, it was 51 days in 1921, the highest in the current series of records, and only 16 in 1931 and 1932. For the period 1916-32 the average yearly duration of strikes was 26 days; for the period 1881-1905 it was 25 4 days.

Equally inconclusive are judgments as to the social cost involved in settlement of disputes by strikes. On one side of the balance sheet may be included the heritage of bitterness between employers and workers and between strikers and strike breakers, the loss of morale which sometimes accompanies a prolonged strike and the rupturing of domestic and community ties through the migration of workers who are unable to see it through. Against these items must be weighed, in each individual case, the social cost of acquiescence.

Whatever the facts may be, the great mass of legislation in every industrial country designed to promote the peaceful settlement of disputes or to penalize strikes is evidence of a belief that the cost of such strife is too great. Much of this legislation, when wisely administered, has been helpful. It has not, however, brought an end to industrial conflict. Strikes continue even in countries of compulsory arbitration or where strikes have been declared illegal.

The explanation for the tenacity with which the workers cling to the strike lies in the double purpose for which it is employed. Its first purpose is to secure protection in the enjoyment of recognized rights, and such progress as society as a whole tends to sanction. The second purpose is to a degree revolutionary in

character. This is clearly evident in the strikes designed to move the government to any sort of action. It is a substitution of the organized workers for society as a whole in the field of political power. But even in the strikes where the aims appear to lie solely in the industrial field and within the recognized area of the trade agreement there is usually, whether clearly understood or not by the strikers themselves, something more. It is a challenge by a weaker group to the ruling forces in society. The strike is not solely a demand for protection in the enjoyment of privileges or rights already sanctioned; it is in part a move in the direction of new rights. The labor movement seeks not alone the interpretation and application of existing law but the positive achievement of new law. This is what makes compulsory arbitration in the long run a vain weapon against strikes. The labor struggle from the dawn of recorded history has been a movement both for protection and for status. In a society in which there is economic inequality it is this inequality which makes the strike inevitable.

STROJNOWSKI, HIERONIM (1752-1815), Polish physiocrat. Strojnowski was educated at the convent of the Piarists and later, as a member of that order, taught for three years at the famous Collegium Nobilium. In 1780 he was appointed professor of natural law and economics at the Academy of Vilna. Subsequently he became rector of this institution and contributed greatly to its development as the cultural center of the Polish frontier. In 1785 he published his chief work, *Nauka prawca przyrodzonego . . .* (The theory of natural law, Vilna 1785, 3rd ed. 1805), which won him wide recognition. In 1787, while traveling abroad, he came into contact with Beccaria, Moschati and Fabbroni and was elected to membership in the Academy of Science of Florence and of Rome.

Strojnowski was one of the leading Polish physiocrats. The principles of physiocracy found wide acceptance in Poland because of the traditional close intellectual contact between France and Poland and also because of the high position accorded to agriculture in the physiocratic system. While Strojnowski followed the broad outlines of physiocratic theory, he understood how to adapt its principles to the economic and social conditions of his country; his physiocratic system was a theory in defense of the oppressed classes, aiming in particular at the emancipation of the peasantry, the single largest class in Poland. He advocated the complete exemption from taxation of the "craftsmen, traders and others" whose earnings were just sufficient to maintain their customary standard of living and, along with other physiocrats, sponsored the introduction for the first time of a tax on the landed

gentry; this was the contribution of the tenth *grosz*, a tax which approximated the ideal of Quesnay. In his plea for complete freedom in internal and international trade he went beyond the theory of the physiocrats and approached closely that of Adam Smith. Strojnowski's views in general exerted a profound influence on the Polish statesmen of the Four Years Parliament, particularly on Staszic and Kołłątaj, the leading protagonists of the constitution of May 3, 1791.

STROSSMAYER, JOSIP JURAJ (1815-1905), Croatian nationalist. Strossmayer studied at the University of Pest and entered the Catholic church, where he rose rapidly by virtue of his unusual ability. In 1847 he was appointed director of the Augustinian, an important theological seminary in Vienna, and two years later he became bishop of Djakovo.

Strossmayer is one of the outstanding figures in the history of South Slav thought. He was the first great exponent of the Yugoslav ideal, the spiritual heir of the Illyrianism of Gaj, which had so greatly impressed him in his student days. The Serbs, Croats, Slovenes and Bulgars he regarded as branches of one great family which should be united. He did not, however, envisage a South Slav union as an immediate possibility and accordingly he contemplated not the dissolution of the Austro-Hungarian Empire but rather its transformation into a federal state in which the South Slavs should constitute one unit. A tireless propagandist, Strossmayer devoted himself to assisting the South Slav peoples, especially the Croats, and to promoting unity among them. His spirit dominated the nationalist party; the article of 1861 which established the independence of Croatia within its historical boundaries, with the understanding that its constitutional relationship to Hungary would be regulated, was his achievement. Believing that the basis of nationalism for the Slavs must be a knowledge of their cultural heritage,

Strossmayer persistently stimulated and encouraged research in this field. Through his efforts the Yugoslav Academy of Sciences and Arts, which tended to be "the literary half-way house of the whole race," was established in 1866 at Zagreb, and the University of Zagreb was founded in 1874. Strossmayer also reorganized the secondary school system in Dalmatia and Croatia. A liberal in church doctrine, he attempted to reconcile the Orthodox and Roman Catholic churches in the hope of removing one of the obstacles to South Slav unity.

Although during the 1860's Strossmayer was active in politics, he was not fitted for political intrigue. Essentially an enthusiast inspiring others with his own ideals, he exerted a profound influence upon several generations of Slavs, especially the Croatians.

STRUGGLE FOR EXISTENCE. *See* EVOLUTION; SELF-PRESERVATION.

STRUVE, GEORG ADAM (1619-92), German jurist. Struve was professor at the University of Jena and also a Saxon privy counselor. In his university days he became acquainted with Heinrich Hahn and Hermann Conring; the latter as one of the leaders of the revival of German law introduced him to German legal antiquities. Although his scientific and practical activity was coincident with that of both Conring and Carpzov, Struve may justly be ranked with them by reason of the important role he played in the development of the science of German private law. His *Jurisprudentia romano-germanica forensis* (Jena 1670; new ed. by J. G. Schaumburg and L. Mencke, Frankfurt 1771) remained until the beginning of the nineteenth century the most celebrated and influential general legal textbook. It held this eminence because it treated not only the Justinian law but also the German common law, *usus modernus pandectarum*, which was adapted to German legal requirements and in addition explained Germanic legal concepts. In view of the fact that the artificial Ramistic method was still in vogue, Struve's clear,

systematic and empirical method, which indeed he was the first to introduce into jurisprudence, was the more remarkable. Called "the little Struve," to distinguish it from the author's *Syntagma juris civilis universi* (2 vols., Jena 1658-63), which later appeared as *Syntagma jurisprudentiae secundum ordinem pandectarum concinnatum* (2 vols., Jena 1687; new ed., 3 vols., Nuremberg 1738), the work was often annotated and translated. It appeared also in a German version, *Jurisprudenz oder Verfassung der landublichen Rechte* (Merseburg 1689; 4th ed. by H. E. Florcke, Frankfurt 1718), which closely resembles the Latin original.

In his metaphysical conception Struve regarded the law as derived from God, who has implanted in all men *recta ratio*, the source of *jus naturale*. The law of the state, however, is determined by the *majestas* of the contemporary sovereign. Thus it is necessary to return to empiricism, to pure positive law, which for Struve is compounded of *jus scriptum* and *jus non scriptum*, or *consuetudo*. He then applies this doctrine to the legal situation in Germany, classifying its law into local and common law. The latter is divided into *jus caesareum* (imperial recesses and ordinances), received Justinian law, *jus pontificum* and *mores sive consuetudines in imperio universaliter*. This division of German law became classic.

STUBBS, WILLIAM (1825-1901), British historian. Stubbs was born in Yorkshire and studied at Christ Church, Oxford, where under the influence of the Tractarian movement he became a high churchman. He was ordained in 1850 and served as country clergyman until 1866. His routine duties and proximity to London, along with his prodigious industry, led him to publish many learned articles, to compile his *Regstrum sacrum anglicanum* (Oxford 1858, 2nd ed. 1897) and to build the foundations of his massive scholarship. In 1864 he edited his first volume in the Rolls Series of mediaeval chronicles, lately established by the government, and soon became the most eminent and productive of the scholars who contributed to that series.

In 1866 he was appointed regius professor of history at Oxford. He planned to create there a school of historical research but, like many others, was unable to withstand the influence

that put history so largely in the hands of the tutors and directed its study toward the passing of examinations. This, however, gave him more leisure to continue the production of his long series of editions of mediaeval chroniclers, to contribute to the *Dictionary of Christian Biography* and the *Dictionary of Christian Antiquities* and to publish the three volumes of his *Constitutional History of England* (London 1874-78, 5th ed. 1891-96). He edited in all nineteen volumes in the Rolls Series with learned introductions, which have since been separately published as *Historical Introductions to the Rolls Series* (ed. by A. Hassall, London 1902). The *Constitutional History*, more scholarly than any other constitutional history of any other country, has so imposed itself on all later writing on that subject that students have found it difficult to emancipate themselves from its influence, even when a new approach to the subject has evidently been called for. Nevertheless, his conception of the English limited monarchy as the normal form of government, his belief in early Teutonic self-government and his stress on Parliament as a legislative body have had to yield to later criticism. In other respects writers have rather extended than corrected his work.

When in 1884 Stubbs was made bishop of Chester, his work as a historian was virtually ended. He threw himself with devotion into his work as bishop and took high church ground in the controversies of the time on questions of ecclesiastical government.

Stubbs' principal achievements were to put at the disposal of scholars a vast mass of previously obscure material, to set an example of unflinching industry, thoroughness and self-effacement in historical scholarship and to write the first comprehensive work on English constitutional history.

STUCKENBERG, JOHN HENRY WILBURN (1835-1903), German American sociologist. Stuckenberg, who was born in Hanover, came to the United States in childhood. After graduating from Wittenberg College, Ohio, he returned to Germany, where he studied theology in the universities of Halle, Göttingen, Berlin and Tübingen. He then served for several years as a Lutheran pastor in Iowa and Pennsylvania. Before joining the Wittenberg faculty, of which he was a member between 1873 and 1880, he had with W. L. Gage translated parts of Hagenbach's *Vorlesungen über Wesen und Geschichte der Reformation as German Rationalism* (Edinburgh 1865) and had written the *History of the Augsburg Confession* (Philadelphia 1868). In 1880 after the appearance of the first edition of his *Christian Sociology* (New York 1880) he went to Berlin for further study and research and there served as pastor of the English speaking congregation, later the American Church. He became intimately associated with and was greatly influenced by Adolf Stocker, the founder of the Berlin Inner Mission work and leader of the Christian Socialists in the German Reichstag. Stuckenberg came to be regarded as a leader among American intellectuals and students in Berlin and was one of the strongest cultural links between Germany and the United States, sharing that distinction with Andrew D. White and Bayard Taylor. It was during this period that he wrote his *Life of Immanuel Kant* (London 1882), *The Final Science* (New York 1885), *Introduction to the Study of Philosophy* (New York 1888) and *The Age and the Church* (Hartford 1893). Upon his return to the United States in 1894 he settled in Cambridge. It was in this second period of residence in the United States that he wrote *Tendencies in German Thought* (Hartford 1896), *The Social Problem* (York, Pa. 1897), *Introduction to the Study of Sociology* (New York 1898) and *Sociology, the Science of Human Society* (2 vols., New York 1903). In sociology he was an idealist and intellectualist, stressing the evolution of sociological concepts and social forms. He was the first in the United States to formulate a Christian sociology.

SUÁREZ, FRANCISCO (1548-1617), Spanish theologian and legal philosopher. Suárez entered the Society of Jesus in his seventeenth year and after completing his studies in philosophy and theology taught these subjects in various Spanish and Italian universities. From 1597 to 1616 he was a professor at Coimbra, Portugal. The outstanding philosopher of the sixteenth century Spanish school of law, Suárez exerted a profound influence upon scholastic thought and upon the philosophy of politics and law, especially international law.

His *Tractatus de legibus ac Deo legislatore* (1612) is a detailed treatise on law, the systems of law and their interrelationships. Starting with the Platonic categories of law—divine, celestial, natural and human—Suárez discards the second as either superfluous or erroneous. The divine, he holds, is the equivalent of what the theologian calls eternal law, in so far as it exists in God Himself, and temporal law, in so far as it is proposed immediately by God, although outside of Him. The other two categories in Plato's division Suárez calls natural and positive law respectively. He defines natural law as "that which dwells within the human mind for the purpose of distinguishing the upright from the base." This is so not because execution of this law is natural or arises from necessity but because it is a property of nature which God Himself imposes. In a certain sense therefore natural law may be called divine. Human positive law is defined by Suárez as "a precept, common, just and stable, and sufficiently promulgated," supplementing the general principles of natural and divine law. In this connection he discusses many very interesting problems, whether the law is intended to improve subjects; what persons are obligated by it; what kinds of change are possible; and the question of the unwritten law called custom.

Most significant, however, are his chapters on international law, which mark Suárez as one of the founders of that science. Here he establishes for the first time a clear distinction between natural law and the law of nations. The latter he designates as positive law based upon custom, although it may be derived in large part from natural reason. International law moreover, unlike natural law, is not immutable. Suárez also discusses the necessity of an association of sovereign states and of a body of law to regulate it, basing the need for such an association upon the moral and political unity which exists among all peoples. His further contributions to international law are contained in *Opus de triplici*

virtute theologica (1621); the section on charity includes a disputation on war which is an excellent summation of the prevailing ideas of the Spanish school and which gives evidence of the deeply moral point of view pervading all of Suárez' writings.

His political doctrines are to be found in *Defensio fidei catholicae . . . adversus anglicanae sectae errores* (1613), a reply to the theory of the divine right of kings as propounded by James I of England. Suárez maintains that government depends upon the consent of the governed; that political sovereignty, or the supreme civil power, is granted immediately by God to men associated together in a state, or perfect political community. Accordingly this power does not reside in one person or in the special association of the many but in the entire people or body of the community. It may be conferred upon a single prince or monarch through the voluntary consent of the people or by the voluntary election of the king, to whom the community transfers its power. Once a stable and perpetual transfer has been made, there is no need for a new election or further consent. In the case of peoples involuntarily subjected to kings through wars, whether just or unjust, title to the exercise of the royal power arises only by prescription. Suárez condemns as false the opinion that a tyrant may be killed by any subject, holding that authority to punish is not the attribute of the private individual. The entire commonwealth, by a public and common council of the cities and leaders, may, however, depose a tyrannical ruler; but this must be "done prudently without greater detriment to the people."

Suárez also attained fame as a theologian. His *Disputationes metaphysicae* (2 vols., 1597) was the last great study in scholastic philosophy. The spirit which Suárez introduced into his speculations helped to prepare the way for neo-scholasticism.

SUAREZ, KARL GOTTLIEB (1746-98), German jurist. Suarez, or Svarez as he called himself, was not, as might be supposed from his name, of Spanish ancestry. His family name, originally Schwartz, was changed by his father, a councilor and advocate. Born in Schweidnitz in Lower Silesia, Suarez passed his youth in the tragic atmosphere of the wars of Frederick the Great. He then studied in Frankfort on the Oder and began his juristic career in Breslau, where he was instrumental in establishing a Schleswig credit institution and in the reform of university and *Gymnasium* education. In the year 1780 he was called to Berlin by Chancellor von Carmer. Here he was entrusted with the task of preparing a general legal code. He thus had the opportunity to embody in legislative form the great ideals of the law of nature and the Enlightenment, such as freedom of religion and conscience, the separation of powers and the independence of the judiciary. Suarez was further honored with the responsibility of schooling the crown prince in the legal and political sciences. His pupil, who was twenty-two years old and very impressionable, readily absorbed the ideal view of life and juristic doctrine of his teacher, who fulfilled his duties with disinterestedness and deep earnestness. It was due to Suarez' teaching that the later King Frederick William III was so well versed in the new governmental forms. Indeed the entire so-called Stein-Hardenberg legislation was but the embodiment of the ideas of Suarez.

The Prussian general code contained civil law, criminal law and an unusually large amount of public law. It regulated education as well as the law of the various estates; as the law of the merchant class it comprises the whole of commercial law. The language of the code is simple, but since it is also caustically explicit it is rather voluminous. Published in 1791, it was suspended in 1792 because of its rule relating to "prerogative judgments"; that is, decisions of the monarch in matters in which the ordinary courts were competent. When the code was finally proclaimed in 1794 under the title *Allgemeines Landrecht für die preussischen Staaten*, the prerogative provision and many others were omitted. The unified law of the Prussian monarchy proved to have very beneficial results and became the model for later German legislations, as, for example, in Austria. As a result of this reception it was adopted in the other German states and in several Swiss cantons. Suarez' work remained

fundamentally unaltered for over a century until it was abrogated by the German Civil Code.

SUBMARINE WARFARE. *See* WARFARE.

SUBSIDIES. In its broadest application the term subsidy refers to a great variety of grants, loans and allowances, including financial assistance by one authority to another within the state (*see* GRANTS-IN-AID) and by one state to another (*see* LOANS, INTERGOVERNMENTAL). It also comprises governmental financial assistance which is based on a specific sum per unit of an article produced, imported or exported (*see* BOUNTIES). In its narrower meaning, however, as used in this discussion the term is confined to financial or other aid given, without equivalent recompense, by governments, government agencies or government owned corporations to promote or preserve private enterprise in industry, trade, commerce and agriculture. Subsidies always involve an actual outlay in cash or in kind (usually land) by governments or government agencies or assistance, benefits or promises which might lead to government expenditure. They thus effect a shift in the national income, since in the last analysis the government must use for special purposes and for the benefit of a small part of the community funds which have been derived from general taxation. Since subsidies are always calculated to increase the profitability of the enterprise beyond its extent in an entirely unaided free market, they change the competitive position of different parties in either the domestic or the foreign market. Tariffs, which in many countries are still the most frequent form of government interference with the competitive situation in markets for the benefit of individual interests, are not subsidies, since no governmental expenditure is involved. Financial help by governments for educational institutions can be considered a subsidy only in cases where they are carried on as private enterprises and on a competitive basis with others. Governmental grants for the purpose of lowering the price of food, fuel and other necessities for certain classes of the population are not subsidies, since they are not intended to help individual businesses or to increase their profit.

A strict classification of the forms in which subsidies are granted is very difficult. The distinction between "direct" and "indirect" subsidies, depending on whether an actual governmental outlay of money is involved, proves in practise to be hardly feasible and without much significance. Cases in which a certain amount of money is actually paid to the enterprises in question are perhaps rarer than formerly, but they still occur frequently. In modern times governments often use methods which disguise the real purpose but which, sooner or later, lead to government expenditure. Loans are granted where credit from private sources would not be obtainable and with the tacit understanding that the money may not be repaid. Sometimes loans are given or procured by the state on much more favorable terms as to repayment or amortization than would otherwise be obtainable. Interest rates may be lowered, either by actual additional payment by the state to the bank granting the credit or by the state's serving as guarantor to the lending bank. In other cases in which the reliability of domestic or, more frequently, foreign customers is uncertain governments make possible sales to them by guaranteeing payments; sometimes these subsidies are on an insurance basis. Not infrequently governments pay prices above those ruling in the market, thus allowing the party concerned to make an additional profit at the expense of the general public. More recently governments have subsidized industries by making contributions to their wage bills or by assuming or canceling some of the cost of social insurance which these industries have to carry. Tax exemptions constitute another common form of subsidy. Although in such cases governments are actually not spending money, such exemptions, from the viewpoint of economics and public finance, have the same significance as the other forms of subsidies. The same is true when governments grant exemptions from import duties; this is sometimes done for importation of machinery or material intended to be used for the establishment or development of home industry. Frequently subsidies take the form of government contributions to freight cost and to ocean and air mail service. Contributions to freight, however, especially preferential railway or shipping rates, are very often bounties. Also in many cases in which certain premiums are granted by governments bounties are usually involved but not subsidies.

New methods of subsidizing private businesses have been invented particularly during

the depression following 1929. In connection with programs of public works subsidies have been given in forms which were not previously employed and to an unprecedented extent. An outstanding example is the Reconstruction Finance Corporation in the United States, which made loans in large sums and in many cases where private credit would have been entirely unobtainable and where bankruptcy or collapse would have been unavoidable. The system organized in Germany to make cash grants to private businesses out of money derived from arbitrage transactions with German foreign bonds or from deferred interest payments on such bonds did not involve subsidies in the strict sense, since no government expenditure was entailed. This whole scheme, however, could not have been evolved and carried through without governmental help and supervision. Subsidies vary widely as to their duration; some are given only once, some are given intermittently, regularly for a certain period or permanently.

Economic history offers numerous instances of governmental help accorded to individual interests in using public funds. Very often it would be difficult to determine exactly whether a grant made would fall within the limits of a subsidy or of a bounty or of a similar governmental allowance. Subsidies were a frequent requisite of economic policy under mercantilism and were still used well into the eighteenth century. With the rising influence of Adam Smith, the slow growth of democratic governments and the more liberal era in economic policy the use of subsidies slowed down, although governments in most countries never altogether ceased helping individual interests. But except for all forms of transportation subsidies in the strict sense of the term were more seldom used in that period, not the least because discussions in parliaments, chiefly on the budget, made outright subsidies undesirable. During and after the World War, however, subsidies were revived in almost all countries, and they are now a very considerable element in economic policy.

The motives for subsidies always have been manifold, although not seldom concealed. Subsidies are advocated and granted for economic, military, or "national," and social purposes, in many cases for numerous combinations of these. Those supported on economic grounds include: financial aid given to undeveloped industries and sometimes referred to as "educational" subsidies; subsidies to forestall an emergency; and

those which are calculated to preserve an industry. Subsidies with educational purposes have always been known. Widely used to encourage production, they played a large role in almost all countries in developing the shipping industry and the railway system, as exemplified in the land donations to railroad companies by the government of the United States and of Canada, and they are now very frequent in the development of aviation. Subsidies calculated to meet a special emergency multiplied particularly after the war in some of the belligerent countries. The outstanding instances in that period were the subsidy to the coal industry and the trade facilities act in Great Britain. Furthermore subsidies to meet a special situation have often been adopted since the onset of the depression in 1929. These have been given in various forms, either to prevent further aggravation of the depression, especially to key industries, to mortgage institutions, banks, railways and the like, or to stimulate business through programs of work creation, tax exemption, wage assistance and so on. When countries aim at self-sufficiency, they nearly always resort to "protecting," or assisting, particular industries by tariffs or by subsidies, which are initially supposed to be only a temporary, educational help but which very often become a permanent institution. In practise such subsidies may be very similar to governmental aid in support of industries or trades which, because of new developments at home or abroad, could not survive in entirely free competitive markets.

Subsidies for military, or national, purposes are much more frequent than is commonly supposed. They are frequently concealed in a more or less ingenious way and are preferably given to armament, chemical and steel industries. Sometimes they are identical with subsidies which are granted to increase or secure self-sufficiency in special fields, particularly in agriculture. Subsidies for means of transportation are moreover often justified on military grounds.

Subsidies in connection with large housing programs, slum clearing and the like are sought for purposes of social betterment. Such subsidies were extensively employed after the war, especially in Europe. The so-called productive unemployment aid, through which unemployment benefits are turned over to employers as an allowance for their cost of production, is a subsidy for which social motives are advanced.

The economic, political and social ramifications of subsidies are manifold and complex.

Generalizations in this connection are unwarranted, for the special circumstances in each individual case and the concrete facts must be studied before a definite judgment is possible. The decision as to the advisability of subsidies should always be based on an examination designed to determine whether the results which may be achieved will justify the costs involved: the burden upon the budget, the partial upsetting of the functions of free markets, the artificial maintenance of profitability in private businesses, the shift in national income with all its far reaching consequences, the diversion of capital into "unnatural" channels and last but not least the effects on the international division of labor. These effects might interfere considerably with economic relations with foreign countries and with international trade treaties and might lead to similar actions abroad. The costs incurred may be justified chiefly in cases where it is clear that a temporary emergency is involved and where subsidies probably prevent much larger losses involved in the closing down of particular industries and in the deterioration of large amounts of fixed capital. Moreover in cases where help is needed for "education" for a relatively short time a subsidy may be found advisable. All other instances call for the utmost prudence. In circumstances in which government assistance is either advisable or for political reasons unavoidable subsidies should be preferred to tariffs, since the effects of the former on the economic system and the price structure are often much less harmful than those of tariffs. Finally, political implications are far from negligible. Corruption is sometimes tied up with the subsidizing of private businesses at government expense, and therefore the greatest possible extent of publicity and the avoidance of all secret measures are essential.

SUBURBS A suburb is one of a cluster of communities immediately surrounding the central city. Whereas the ancient city was confined within walls, the modern city, thanks to civil order and transit facilities, can spread in all directions over a series of concentric zones of diminishing urban character until it merges with the open country. The metropolitan district typically includes also a rural fringe of intensified agricultural production catering to city markets, an unpopulated area for water supply, extensive recreational areas and possibly forest preserves. Complementary to the expansion of cities is their still wider attraction, which tends to concentrate an ever larger proportion of the total population in their tributary areas and to divide the whole nation into a collection of metropolitan regions.

The expansion and gradual thinning out of any city take place upon a particular terrain, which usually presents natural barriers to even development. Expansion first follows natural gateways, actual growth consequently proceeds by a series of radial thrusts along these lines of least resistance, so that intensified urban development is carried much further in some directions than in others.

The urban core is a limited area occupied by many people. The most conspicuous characteristic of the suburban zone is that fewer people occupy much more land. Equally distinctive, however, is the fact that all the suburbs combined decentralize only a fraction of the city's total functions and thus remain fragmentary and dependent communities. They have fewer major institutions than independent towns of equal size, because the city performs part of their community functions and because they lack dependent hinterlands. Suburbs can exist only by virtue of a set of continuously active connections with the city. Dependence and intensity of intercommunication, subject to modification because of unequal radial expansion, are generally proportionate to the distance of the suburb from the

central city. Suburbs which existed as independent communities before being caught up into the metropolitan nexus sometimes continue to show exceptional characteristics.

Because the dependence of all suburbs on the central city is only partial and because of the prior organization of their territory into minor political units, their political separation from the city tends to continue except as proximity and the development of intensive urban character make strongly for annexation. Sociologically speaking, however, political status is no final criterion of a suburb, which should include all areas, whether located within or without city boundaries, that reflect the basic suburban characteristics.

Suburbs differ in type because those elements of city life which have most easily become decentralized under natural urban development do not all move to the same place. The residential suburb represents the decentralization of consumption, the industrial suburb the decentralization of production. Heavy industries and space-consuming transit facilities, such as railway freight yards and airports, naturally seek suburban location where land is cheap. They in turn attract other types of industry, thus creating distinctively industrial communities. In other cases industry remains centralized, while the homes and recreational pursuits of its workers are decentralized.

Suburbs thus tend to go to extremes. The typical industrial suburb is more exclusively given over to industry than the central city; frequently it has a greater proportion of foreign born population and, although it is less congested, it may accentuate all the evils of slum housing and social disorganization. Residential suburbs, on the contrary, often do not reflect any trace of the basic economic activities of the city. They show a larger proportion of married people and frequently also of elderly people. Because the wealthiest suburbs are preeminently servant employing communities, they often attract a higher percentage of Negro population.

There are numerous varieties of still more specialized and distinctive suburbs, such as those which develop about a single institution: a school or a university, an asylum, a prison, a military establishment or a county seat. Suburban pleasure resorts are characteristic of every metropolis.

It is not commonly recognized how large a proportion of outlying communities is characterized by decentralization of both production

and consumption. Since they share the city's natural advantages, such as access to its harbor and transportation terminals, and exchange economic services with parts of the same hinterland, these communities may acquire the proportions and major characteristics of a large city and are more properly designated as satellite cities. But within metropolitan districts there are also numerous smaller communities which lack suburban selectivity; they are urban fragments, detached but little modified. Most of the types of suburbs which have been mentioned exist at different economic levels.

Finally, since the hitherto unplanned expansion of cities subjects every suburban venture to the risk of failing to attract a sufficient number of people, multitudes of suburbs must be classed as economic failures, marked by closed factories and abortive real estate developments overgrown with weeds.

The rapid growth of cities ranks among the most conspicuous of modern social tendencies. But suburbs grow still faster. For the eighty-five metropolitan districts listed in the United States census of 1930, the suburbs showed an increase in population of 39.2 percent during the preceding decade, more than twice that of both non-suburban cities and central cities of similar size. This was an acceleration of the tendency of the decade 1910-20. The most rapid growth was in suburbs of 2500-5000 population and in those surrounding the larger cities. The population of London's "outer ring" in 1901 was less than one third that of Greater London, but gained upon that of the "registration" city until in 1931 it constituted 46 percent of the total.

In the rapidity of its development the recent suburban movement reflects the intensity of the struggle for space in the city, where the limits of profitable vertical expansion have already been passed. In the United States the rate of suburban growth has been generally proportionate to the congestion of the central city. This escape from congestion has been made possible physically, technically and in part economically by spectacular improvements in means of transportation (see MUNICIPAL TRANSIT).

The costliness in time and money of movement to and from the city, the economy of the multifamily type of urban dwelling and the greater availability for the poor of low rental housing in the extensive deteriorated areas of cities put the advantages of suburban life beyond the economic reach of the majority. Choice of

residence as between city and suburb is virtually limited to the most highly paid types of labor and to the upper middle classes. In exchange for a more spacious and healthful environment and possible home ownership these select populations must bear not only the higher individual cost of these improved conditions but also a heavier rate of taxation, especially for education and public improvements.

As suburbs age and their housing becomes somewhat obsolete, it becomes increasingly difficult for them to meet the costs of maintaining their suburban character. They must compete with other suburbs and with new "country club" areas designed by real estate exploiters to attract the more prosperous. Most frequently the older suburbs have escaped economic difficulties by absorbing the urban overflow and adopting urban types of housing and ways of living. In the unplanned expansion of cities one generation has surrendered what the previous generation achieved, so that some authorities have doubted whether the suburban movement as a whole is succeeding in securing suburban advantages for a larger fraction of the people than in the past. A succession in occupancy, generally by populations of lower living standards, tends to characterize the suburbs as it does the older city areas.

Institutional case studies have revealed the profound sociological consequences of this recurrent conquest of suburbs by the city. Psychological analysis of suburban characteristics, on the other hand, has been concentrated for the most part on the residential suburb. Interpreters of urban life have been particularly disturbed over the withdrawal of large numbers of the more competent and successful members of the urban community from responsibility and participation in the life of the central city in which they make their living. This withdrawal has been blamed for the notoriously bad government of cities. The sociological consequences of such segregation are not less significant for the suburb itself. Even the most strictly residential suburbs are extremely heterogeneous. Scarcely more than half of the total population is made up of commuting residents and their families. The remainder consists of tradesmen and servants, often of alien nationality or race. The residential suburb movement is often superimposed upon an old and outmoded community life. For these reasons it involves sharp problems of social integration, among which that of the cleavage between the commuting and non-commuting elements is predominant.

The most distinguishing characteristic of the commuting population is the shuttling of its interest between city and suburb. The disintegrating effects upon personality of the heterogeneity, anonymity and mobility characteristic of urban life are indeed partly counteracted by the definite neighborly ties of the smaller and more coherent community. On the urban side of his experience, however, the suburbanite is subject to all the demoralization which city life brings, while on the suburban side he is greatly handicapped by divided loyalties. And it may well be that this duality of experience introduces an even more serious schism than ordinary urban life involves. For the commuter devotes his creative activity to the city, returning to the suburb when he is fatigued and in need of rest. The suburb is consistently portrayed in fiction as petty, frivolous and lacking in virility.

The development of urban life in great metropolitan communities has increasingly challenged social intelligence in its efforts to understand and control the total complex phenomenon. With respect to suburbs social planning has two chief aims first, to free the masses of population from urban congestion; second, to control the process so that decentralization shall not merely submerge areas which have already acquired suburban character. The ultimate ideal is to accelerate decentralization and to assure a future distribution of prospective population so as to secure to all outlying metropolitan areas permanent spaciousness of living conditions and easy access to recreational and forested areas. On the technical side planning has shown the physical possibility of such arrangement for all predictable increase of population as well as the economic conditions under which it may be realized.

The most conspicuous results of earlier suburban planning were a few relatively small model garden cities generally created by particular industries for the housing of their workers. Larger scale planning, with an entire metropolitan district as the unit, now tends to advocate the development about a central city of a series of self-contained communities maintaining suburban spaciousness but at the same time decentralizing all elements of a city's life in balanced proportion. This would greatly reduce the uneconomic transportation of workers and goods, add to the cultural and aesthetic independence of the suburb and afford the suburbanite the possibility of an integrated life in a community large enough to command unified

loyalties. It would also make suburban life economically available to a much larger proportion of the people.

Local government remains one of the most decentralized of suburban activities, and despite the consolidation of a few counties with cities no political agency corresponding to the metropolitan whole has yet been developed. The need for such an agency is evidenced by the rapid formation of special districts performing single necessary functions. Centralized control adequate to bring order into the desirable decentralizing of functions remains a vital problem.

Meanwhile the most potent factor of metropolitan control is the unifying prestige of the city. Decentralization is likely to throw into still higher relief the unassailable residuum of its central functions. These will include the control of economic credit and the final administration of productive and distributive functions; but they will also be cultural and aesthetic.

SUBVENTION. See GRANTS-IN-AID.

SUCCESSION, LAWS OF. The idea of succession to property, whether by will of the owner or upon his death without formal declaration of his wishes, scarcely exists in primitive forms of social structure. In tribal or clan organizations the goods of the deceased may be destroyed, burned or buried with him or, possibly because of some religious sanction, they may be abandoned to strangers. Even an agrarian economy, involving settlement of the social group in a more or less fixed territory, does not always give rise to the institution of succession. For the greater portion of the period during which man has tilled the earth, some sort of communal system of possession and use has doubtless predominated. In such a system the death of a member of the group merely requires a repartition by the chief or council of the clan. Modern India and Slavic peoples in the more remote areas of the Balkans still preserve the institution of the joint family, while evidences of its former existence are found in Greek and Celtic law. Sir Henry Maine has said, with some exaggeration, that all laws of inheritance are the débris of the varying forms which the family has assumed. The existence of some sort of concept of individual property and the abandonment of the joint family organization afford the substratum upon which customs and laws of succession are erected.

The development of succession, as exhibited in the history of European law, began with the relaxation of the clan and the enlargement of the powers of the paterfamilias. This is certainly the case with the law of Rome, where the paternal power (*patria potestas*) amounted to a sort of sovereignty within the state. There is little evidence in Roman institutions of a joint family system excluding succession. Already in the earliest period the *patria potestas* had largely usurped the place of the gens, or clan, and ancestral property, far from reverting to the community, was subject to control at death by the paterfamilias. Intestate succession occurred where there existed neither a will nor persons under the paternal power of the paterfamilias on the day of his death, the so-called *heredes sui*. Only if the latter was lacking did the law of intestate succession take effect in favor of the agnates, relatives of the deceased who traced descent from a common male ancestor. The gens, the artificial family presumed to be descendants of a remote and usually mythical common ancestor, took by a sort of escheat, if there were no agnatic kin. Intestate succession

occupied a minor role in Roman law, for the paterfamilias might disregard the *heredes sui* and the agnates in the exercise of his power of testation.

The early outstanding features of the Roman will were the absolute liberty of testation and the idea of universal succession. The appointment of a *heres*, very different from the English heir, was all important. The *heres* succeeded not only to the property of the deceased but also to his debts. He was regarded as continuing the legal personality of the deceased and was liable for the performance of the latter's religious duties as well as for his debts. So absolute was the power of the Roman testator that in the earlier law he might disinherit his own sons and appoint his slave *heres*.

The oldest form of Roman will was the comital will, *testamentum in comitiis calatis*. The testator orally appointed the *heres* and the legislative assembly approved the selection, meeting for this purpose on two days in each year. The will *per aes et libram*, adopting the ceremonies of mancipation, akin to the formal acts employed in sales and manumissions of slaves, supplanted the comital will at an early date. The original irrevocable character of this disposition was later modified, and the praetors gradually relaxed the formalities required for the institution of the *heres*. The result was that a written instrument subscribed, sealed and witnessed by the testator and seven witnesses became in the days of the empire the usual form, the so-called praetorian will. For a time even an unwitnessed will, wholly in the handwriting of the testator, was sufficient. Justinian, however, followed Theodosius in forbidding the holographic will, except where made by a parent in favor of his children. Oral wills, declared before seven witnesses, were recognized under the name of nuncupative wills. Soldiers' wills were permitted to be enforced, with almost no formalities. The work of the praetors, the emperors and the jurists succeeded in evolving out of the formal materials of the early law instruments that were flexible expressions of intent.

The almost boundless power of disposition by will, as it existed in the earlier law, became subject to many limitations in the classical and postclassical periods of Rome's legal history. The principle of express disinheritance was developed. A form of contest of wills, the *querela inofficiosi testamenti*, was created, allowing various statutory heirs to upset a will on the ground that the testator's disregard of his natural ties

could be explained only by his insanity. A peculiarity of this procedure was that it might result merely in the partial cancellation of the will. The legislation of Augustus and later emperors restricted the capacity of unmarried and childless persons to receive benefits under wills and limited the amounts of legacies; by other laws a portion of a testator's estate was withdrawn from his power of alienation and devoted to his family. Justinian's legislation increased the amount of the children's portion (*portio legitima*) to as much as one half of the estate in certain cases. The children might, however, be disinherited for certain enumerated causes.

The Roman law of intestate succession underwent changes as profound as those which remodeled the will. The early system which traced descent only through males deriving from a common ancestor, the so-called agnatic system, was supplanted by one which, without wholly rejecting the agnatic principle, found a place for cognates, or blood relatives, counted through males and females alike. Finally in 543 and 547 A. D. respectively Justinian laid the basis of the western law of succession by the famous 118th and 127th Novels. Blood relationship without distinction of sex took the place of agnatic relationship. Another legislative change of great significance introduced into the law of succession by Justinian was the so-called benefit of inventory (*beneficium inventarii*). This virtually changed the character of the *heres*. By taking advantage of this benefit he escaped the personal liability for debts which he otherwise assumed upon acceptance of the inheritance, and became liable only to the extent of the property received from the deceased. In other words, his position approached that of the modern executor more closely than that of a universal successor to the moral and legal personality of his ancestor.

The Germanic law of succession varies widely from the Roman. Tacitus observed a striking difference in the fact that the Germans rested their law of inheritance mainly upon intestate rather than testamentary succession. There was also no conception of universal succession as in the case of the *heres*. The laws of succession in regard to chattels developed independently of those relating to land; likewise inherited lands were treated differently from lands acquired by purchase. Special rules of succession were established in different regions. The Germanic law reckoned kinship by regarding the persons concerned as generations, descendants of parents, of grandparents and so on. A man's own de-

scendants constituted what was called the first parentelic group; the descendants of his parents (other than himself) constituted the second parentelic group; the descendants of his grandparents not included in the first and second groups were the third parentelic group. The kin of the first group were more nearly related to a person than his kin of the second group, and those of the second more closely than those of the third. Ultimately this system of recognizing kinship found its way into the canon law, and it has been basic in the English law of descent. The question whether this scheme of descent antedates feudalism or is the outcome of feudalism is still unsettled.

The succession laws of mediaeval Europe were the result of a multitude of influences. The Roman system never quite died out, and the canon law continued much of its content. The Germanic tribal customs were imposed upon the lands held or conquered, and the different rules of descent under the laws of the Salic and Ripuarian Franks have even affected royal successions, as when Queen Victoria's sex prevented her succession to the throne of Hanover under the Salic law.

English law, because of the establishment of a powerful central government by the royal power, with its regular system of national courts, early developed a system of succession that was fairly uniform throughout the realm when compared with the variant forms found in continental Europe. It has been stated, for example, that prior to 1789 there were 547 customs governing descents of land in France. Even in England, while succession to freehold lands has been governed for centuries by general rules of law, rules of descent varying in important particulars have prevailed almost down to the present day with respect to the descent of lands held by other forms of tenure. The prevailing doctrine of the common law, under which a decedent's lands descended to his oldest son, oldest male descendants or oldest male collaterals of his blood, left room for the existence of the system of gavelkind, under which all the sons shared equally, and for that of borough English, whereby the youngest rather than the oldest succeeded upon intestacy of his father.

Intestacies have been as rare in modern England as they were in Rome. But until 1540 there was in English law no general provision for the disposition of real property by will. The feudal law did not readily recognize the power of a tenant freely to alienate land by conveyance in

his lifetime, much less by postmortem disposition. Although the English law by the end of the thirteenth century had removed the fetters from conveyances *inter vivos*, a devise of land remained impossible because the lawyers held that no seisin, or possession, could be delivered by the dead man and that land could be transferred only by corporal delivery. The law was evaded, however, by resort to the device of the trust (see TRUST AND TRUSTEES). When the Statute of Uses in 1536 destroyed this sort of trust, Parliament enacted the Statute of Wills, which permitted the testator to devise all his lands held by socage tenure and two thirds of those held by knight service. The English will of lands under the act of 1540, however, operated only with regard to lands owned at the date of execution of the will; those acquired subsequently passed to the heir; this rule was not altered until 1837.

The Wills Act of 1540 was defective in its guaranties against fraud and forgery. It did not demand the signature of the testator or attesting witnesses. The testator was merely given "full and free liberty" to devise lands "by his last will and testament in writing, or otherwise by any act or acts executed in his life time." Some of the defects were overcome by the Statute of Frauds in 1677, which required signature by the testator and witnesses in the case of wills disposing of lands. In 1837 a new Wills Act established further precautions against fraud and simplified and unified testamentary law in many respects. The act of 1677 furnished a model for the legislation of the American colonies and still controls the form of wills in many of the states of the United States. In most, however, the act of 1837 has been adopted with slight changes.

The English law of succession to personal property has moved along different lines from those directing successions to land. A compromise between the mediaeval kings and the church left wills and successions involving personal property to the laws and customs of the ecclesiastical courts and those involving the descent of land to the kings' courts, which gradually gathered into their jurisdiction what remained of the powers of the feudal courts. Although the ecclesiastical courts suffered in influence and power by Henry VIII's breach with Rome and although the chancellor's equitable jurisdiction cut into their monopoly of administration of the personal effects of decedents, they continued to exercise a large jurisdiction in respect to wills and successions involving per-

sonal property until the latter half of the nineteenth century. Their law was of course influenced by the canon law, which in turn had been deeply affected by the development of the law of imperial Rome.

The earliest English law of intestacy is obscure, but the evidence indicates a prevailing tendency to forfeit the personal property to the feudal lord. The ecclesiastical authorities had secured the right to administer personality by the thirteenth century, however, and the next of kin administered the intestate's goods under a delegation from the ordinary. After payment of debts one third of the residue of the personality was given to the wife, one third to the children and one third, called the "dead's part," was expended for pious uses. If there were no children the dead's part was one half. Even before the Norman Conquest intestacy was regarded as something accidental; the church encouraged the drawing of a will as a duty.

The portion of a testator's goods which might be disposed of by will was at first limited to one third; but this limitation was abandoned by degrees, and the law of the ecclesiastical courts came finally to recognize the privilege of the testator to dispose of his goods at his death to strangers, if he desired to do so. However, the customs of such important places as the province of York, the principality of Wales and the city of London continued to enforce restraints upon testators in favor of their families, until after the beginning of the eighteenth century. But by 1715, when the custom of London was amended by act of Parliament, the power of the owner of goods and chattels to exercise a privilege after his death to the prejudice of his wife and children had been established as the law of England. Even the conservative Blackstone lamented the harshness of the English law, but the pull toward the despotic authority of the property owner in areas where English influence operates has been so strong that the principle of liberty of testation has by legislation supplanted the legitim in South Africa. On the other hand, there has recently been discussion in Parliament in favor of the introduction of the legitim in English law.

The English law of intestate succession as to personality was codified in a seventeenth century statute, in part modifying and in part restating existing laws and customs. The so-called Statute of Distributions continued to govern until the Administration of Estates Act, 1925, which became effective on January 1, 1926. The latter statute not only set up an entirely new system of

intestate succession for realty as well as for personal property, which for the first time was made the same with respect to both species of property, but abolished intestate succession beyond the issue of deceased brothers and sisters, giving the property in the absence of near relatives to the crown with directions that it might make provision for actual dependents, whether kindred or not. This legislation illustrates pointedly the influence of modern social ideals both in its narrowed limitation of the degrees of succession and in its attempt to effect justice in the case of dependents. The same legislation brought England into line with modern states by abolishing primogeniture, the preference in descent of males over females, the distinction between the whole blood and the half blood (not entirely obliterated, however), differences in rights of succession depending upon whether property was ancestral or acquired by purchase.

The maintenance of such vestiges of ancient Germanic tradition once tempted a French jurist to characterize English law in the nineteenth century as a veritable museum of antiquities. But despite the modernization of the law of intestacy effected by the legislation of 1925 English law still, to quote Sir Henry Maine, exhibits "the greatest latitude ever given in the history of the world to the volition or caprice of the individual." The law of wills must, however, be considered in connection with other legal provisions which affect the use of the will as a device to effect the wishes of the testator. Among these is the well known rule against perpetuities (*q v*); the law of restraints upon accumulations of interest and income; the law of entailed estates (*see* ENTAIL), which although they could be barred and conveyed *inter vivos* were not subject to disposition by will; the statutes of mortmain; and limitations upon charitable bequests. Above all, the establishment of family and marriage settlements and the application of the law of trusts and powers to such conveyances have long made the law of wills a secondary law of postmortem disposition.

The English law of wills and inheritance naturally suffered some change in the process of transportation to the American colonies, especially those of New England. Primogeniture seems never to have existed in Massachusetts, although the oldest son received a double portion. The preference of the oldest son to the exclusion of the other children existed, however, in New York and the southern colonies, but it broke down during the period of the American

Revolution. Rhode Island was the last state to abolish it in 1798. Distinctions between males and females in regard to succession have been wiped out, and the same is true with respect to the variations between the succession to real and to personal property, although as late as 1927 seven states still retained differences in this regard. However, the essential features of the English law of wills, including the sovereign power of the testator arbitrarily to direct the destiny of his property for many years after his death, remain unchanged. The legitime exists only in Louisiana. Generally testamentary dispositions are simpler than in England, family settlements and conveyances to trustees, with postmortem directions, are less frequent and intestacy is the rule rather than the exception. A recent study of decedents' estates in New York City shows that only one third of the adults who died there in 1929 left estates and that only one eighth of that number died testate. Recently, however, family settlements and wills have been more widely employed, and the tendencies which were operative among a people engaged predominantly in agriculture are beginning to have less force in a commercial and industrial society. There are of course differences among the states as to particular rules and even as to the construction of rules expressed in statutes identical in form. This is illustrated by the difference in interpretation of acts giving children born before the making of a will an intestate share, "unless it appears that such omission was intentional." Parol evidence is admitted in some states to show the intentional omission, while in others such evidence is rejected, although the statute is precisely the same in the different states. Some states permit holographic wills, that is, wills written by decedents without witnesses, but most states refuse them effect; some allow nuncupative wills without the limitations prescribed by the English Statute of Frauds, in one state a testator must declare formally in the presence of witnesses that an instrument is his will, while in a neighboring jurisdiction such declaration is not required; in some a will must be merely "signed," while in others it must be "subscribed," or signed at the end. There is frequently confusion and occasionally injustice because of the variance in state laws in these and other matters of detail concerning both form and substance. Such difficulties have been somewhat diminished by the application of conflict of laws rules relating to succession.

Modern tendencies indicate a disposition on

the part of legislatures to develop the protection of the surviving spouse against disinheritance. The ancient law of dower and curtesy gave interests to the wife and the husband respectively out of the lands of the other. Recently, however, doubtless as a result of the feminist movement, such states as New York, Massachusetts, Connecticut and Pennsylvania have substituted a share in the estate of a deceased husband or wife in place of the ancient claims. Thus in Pennsylvania the surviving spouse may claim the privilege of her intestate share as against the deceased spouse's will. If the survivor accepts a provision made in the will, a warver follows. The statutory right is more extensive than common law dower or curtesy, which amounted at most to a life estate in freehold lands of the decedent. The interest given is absolute and exists in lands and personalty; it may under some statutes entitle the survivor to the entire estate, where there are no children or close relatives of the deceased. In the eight states in which the community property system exists the testamentary power of the spouses is limited with respect to property acquired by labor during the marriage to one half of such property.

Curiously, however, the claims of infants against the estates of fathers have not yet won the same legislative protection. A New Zealand statute of 1908 provides that if a testator fails to make adequate provision for either the surviving spouse or the children, a court may at its discretion order that suitable provision be made for such persons from the decedent's estate. But when Lord Astor introduced a similar bill in the House of Lords, Lord Haldane argued that it was better to trust people's sense of justice than to have the state attempt to compel them by legislation. The privilege of disinheriting the wife and children in general continues to exist in most American states, although laws making temporary allowances and admitting rights of occupation of a home during the period of administration are common. Courts continue to say that a person has the right to make an unjust will, an unreasonable will or even a cruel will. The verdicts of juries which attempt to correct the effect of such wills are frequently set aside by courts but sometimes succeed by indirection in effecting what the conscience of the community regards as a more just division of property. In some respects the English Statute of Wills was modified during the seventeenth and eighteenth centuries by judicial construction. The courts, quoting Cicero and the Digest, read into the

language of the statutes a presumption that a will was revoked where a testator married after its execution and died leaving issue by the marriage. The doctrine of presumed intention might have continued to be used by the courts to correct wills offending the social conscience, but Parliament in the Victorian Wills Act of 1837 expressly forbade the extension of the doctrine of implied or presumed revocation.

Outside the Anglo-American region of law there exists no such absolute power of disposal by will to the detriment of the family. The French Civil Code limits the testator's power by mathematical rule. He may bequeath only one half of his property if he leaves one child, one third if he leaves two children, one fourth if he leaves three—the disposable fraction having for its denominator one more than the number of children. The surviving spouse is otherwise provided for: under the community property system she takes one half of such property where there are children. The *légitime*, so-called, is regarded as a strict right of property, not merely a claim or debt against those succeeding under the will. The rights of children can be affected only by certain acts of immorality, crime and undutiful conduct, which entitle the father to disinherit them; or settlements, entered into before marriage with the mother, may alter the rights of spouses or children. Obviously the system presents a democratic ideal of life, with the protection of the family unit as one of its central purposes. Although choice of various systems of family law is possible under the French law, the vast majority of French people prefer to live under the regime of community of goods and the system of forced successions. The will is infrequent, as might be expected where so slight a power is left to the testator to bequeath his property.

The German Civil Code is not quite so strict. The compulsory portion (*Pflichtteil*) is regarded as a personal claim against the successors, not a direct property interest in the succession, and the amount of the compulsory portion is less than under French law. Collateral heirs are not guaranteed any portion of the decedent's property under either the French or the German system, although parents and grandparents are protected from disinheritance within the group. The Swiss Code of 1912 carries the protection of the reserve to brothers and sisters of the deceased. In view of the close relation between England and Scotland it is worthy of note that the legitim has a place in the law of Scotland.

The law of Soviet Russia promulgated in 1927 permitted successions, intestate and testamentary where the net value, after deduction of debts, did not exceed in value ten thousand gold rubles. Succession was limited to children and descendants, to the surviving spouse and to persons unable to work who were completely dependent on the deceased. Equal division of the property was to be made among the designated persons, and necessary household goods of the deceased but not articles of luxury were included in the property distributed. The privilege of testation, however, was permitted within this field. The decedent, by a will signed and presented to a notary for insertion in the register of acts, might leave the disposable property to others than his wife and children. In 1927 a decree introduced the community of acquets, resembling the French system of marital property. In 1928 a decree incorporated the principle of the compulsory portion into its law of wills, and the descendants of a decedent were declared to be entitled to three fourths of the share they would receive in case of intestacy.

Clearly the law of succession has small importance in the economic and legal life of Soviet Russia; it is probably true also that its importance in the life of other nations is diminishing with the increasing activities of the state and with changing theories as to the distribution of wealth. It is not likely that the mere abolition of the will even in England and the United States would effect profound changes in the actual situation regarding transmission of property on the death of the owner. The solicitor in England and the trust company in the United States are able to suggest to testators means of controlling wealth superior in convenience to the last will and testament. The common resort to life insurance in modern society is another factor which diminishes the sum total of property passing by will or succession, since the insurers pay death benefits on the basis of contracts whose consideration has passed from the insured. The growth of inheritance taxes has stimulated the effort of wealthy property owners to avoid wills and to seek escape from such burdens by gifts in their lifetime, settlements and other devices.

SUCCESSION, POLITICAL. The problem of political succession is to secure the orderly accession of successive individuals to a given political office. Whenever a society, unwilling to rely solely on the inculcable emergence of informal leadership, crystallizes a significant proportion of its political activities into a formalized institutional structure, the existing social order becomes dependent on the uninterrupted performance by successive individuals of the of-

ficial functions which have been thus established. Since this is particularly true of the highest magistracies of the state, political writers have generally used the method of succession to such offices as a criterion for the classification of the various forms of government, carefully distinguishing, for example, between hereditary and elective monarchy. This extreme emphasis on an apparently minor matter is wholly justifiable, for the adequacy of its method of dealing with the question of political succession is one of the principal factors determining the stability of any given form of government.

The moment of succession is one of the crucial danger points of political life. Unusual opportunities for lawless action accompany the confusions of an interregnum and the comparative weakness of new and inexperienced rulers. Such moments are particularly rich in causes for disension, placing a severe strain upon the loyalty even of the most ardent supporters of the existing constitutional structure. Since personalities profoundly affect the course of government and of international relations, vital interests are frequently involved in the choice of a particular individual for the exercise of authority over an appreciable period of time. Consequently passions may be raised to a fever heat at the precise moment when the established order is least capable of effective resistance. The result is that such periods have frequently been characterized by bitter conflicts occasionally developing into full fledged wars, of which the Spanish, Polish and Austrian wars of succession are outstanding examples. History bears eloquent witness to the unusual vulnerability of social order in these times of transition.

It is therefore extremely desirable to devise methods which will insure prompt succession under conditions of unimpeachable legitimacy. In order that this end may be attained determinate laws of succession covering all probable contingencies must be established and a determinate arbiter created for their authoritative interpretation. This need is so evident that quite primitive societies often evolve formalized rules of this character, insuring the uninterrupted exercise of authority by means of definite rules of elective or hereditary succession to political office. If political institutions are to be preserved from decay, however, it is not enough to obtain secure and prompt succession; it is necessary also that the ability of those chosen for office should be adequate to the performance of their prescribed functions. Unfortunately these

two prerequisites of political stability often prove mutually inconsistent, and it becomes necessary to sacrifice some elements of one or the other. In the relative weight placed upon each of these factors is to be found one of the characteristic features serving to distinguish the several forms of government.

Hereditary monarchy goes farthest in its willingness to sacrifice personal ability to the interests of a secure and prompt succession. With all due allowance for the persistence of inherited or acquired aptitudes in a single family, it is obvious that no consistently high level of ability can be maintained under so arbitrary a system. Compensation for this defect is found, however, in the resulting simplification of the problem of succession. In constitutional monarchies of course the conflict between prompt succession and personal aptitude is of relatively minor significance. Here the monarch's role is such that no unusual ability is required, while the hereditary character of the succession remains an important factor making for stability in government. In monarchies, then, through the mechanical operation of the law of inheritance an unbroken series of heads of the state is provided. Where there is no elective feature the difficulties of an interregnum are wholly avoided, and the phrase "The king is dead, Long live the king," reflects the automatic security of succession under a fully developed monarchical system. Controversies may arise nevertheless even in connection with the relatively simple law of hereditary succession. Special problems are created by the necessity of establishing a regency during the minority or incapacity of the monarch. Moreover when more than one member of the reigning family is eligible for the succession and the new sovereign is elected by the vote of a particular group, factional interests frequently give rise to conflicts. Furthermore there is a danger of royal pretenders, which can be avoided only through the agency of a dynastic council or some other recognized organ of government capable of giving an authoritative interpretation to the law of succession in cases of disputed legitimacy. But the questions of law and fact involved in determining the course of hereditary succession are usually of comparatively minor complexity. Short of the extinction of the royal family, most contingencies can be dealt with in terms of an adequate law of inheritance.

Republics, on the other hand, betray a distinct tendency to exalt talent at the expense of

security. Election, an institution characteristic of all republican governments, including even hereditary oligarchies, surpasses inheritance as a means of providing able rulers; but the inevitable complexity of the electoral mechanism impairs the security of succession. If the selection of a successor is postponed until the office is actually vacant, the slowness of the electoral process creates a troublesome interregnum. It is largely because they moderate the dangers implicit in such a situation by assuming control during cabinet crises that constitutional monarchs retain an appreciable utility under the modern parliamentary system. Such interregna are not of course unavoidable. The maintenance of an unbroken line of succession to the American presidency, for example, is made possible by the fact that the new president is elected before the retirement of his predecessor, while the vice presidency provides against the contingency of premature vacancies. But the problem of disputed legitimacy is peculiarly acute in all republics because of the relative complexity of their institutions. The Hayes-Tilden election controversy in the United States illustrates not only the extraordinary intricacy of the questions of law and fact which may be involved in such cases but also the extreme danger to the security of succession which accompanies the failure to provide for their authoritative solution. The complexity of the republican mechanism involves so many possible points of conflict that loyalty to the constitutional rules of succession is put to an unusually severe test. Venice stands out as a conclusive proof of the possibility of an enduringly stable republic. But the extreme difficulty of maintaining the requisite level of constitutional morality is indicated by the frequency with which the law of succession has broken down in South America under the impact of election controversies and of coups d'état.

Although republics go farther than monarchies in sacrificing security of succession in the interests of personal ability, they are much less extreme than an unconstititutional despotism, which offers very broad scope for the exercise of individual ability but provides no solution whatsoever for the problem of political succession. When the rise of the individual to political office is freed from all constitutional restrictions, powerful personalities naturally enjoy unusual opportunities for advancement. Thus a particularly high level of personal ability is to be found among the tyrants of ancient Greece, the

dictators of Latin America and other usurpers. In times of stress society frequently turns to able despots for the solution of its problems. But rulers who have won their position without regard for existing rules of succession usually find it difficult to reestablish the principles of constitutional legitimacy in the selection of those who are to succeed them. Remaining without secure rules of succession therefore an unauthorized despotism depends wholly on the incalculable hazards of conspiracy and rebellion to determine the sequence of rulers. Deprived as it is of the resources of constitutional legitimacy, such a despotism is the least stable form of government.

It is in connection with contemporary European dictatorships, which threaten to attain efficiency at the cost of despotic insecurity, that the problem of succession is of the greatest interest at the present time. Existing principles of succession remain unaffected of course in so far as the power of dictators, without supplanting the formal constitutional structure, rests on an informal position of personal leadership. Even in Fascist Italy, for example, the monarchy remains as the possible guarantor of a stable political succession. If it appears, however, that all traditional constitutional forms have been effectually destroyed by the dictatorial regime, despotic insecurity can be avoided only by the introduction of new principles of succession. Although usurping monarchs of the past have ordinarily failed to effect this result, it is possible that highly organized party dictatorships may prove more successful in this respect than those absolutisms which were more uniquely dependent on the genius of a single individual. Endowed with corporate unity through a conviction of their exclusive fitness for rule, communist or fascist élites may well evolve stable oligarchical institutions. Although no final conclusions can be reached at so early a date, it is perhaps significant that Soviet Russia has developed a complex institutional structure which has survived the death of Lenin and which continues to exist concurrently with the almost wholly unofficial power of Stalin. But if these possibilities of solid constitutional development fail to materialize and the problem of succession remains unsolved, modern dictatorship will be indistinguishable from the various despotisms of the past. Despite its temporary effectiveness it will fail to form the basis of an enduring social order.

SUEZ CANAL. Egypt, the gateway to the East, was for centuries a natural highway of commerce. Although it was virtually abandoned after the discovery of the Cape route, there was in France considerable agitation for its revival. Many writers suggested that the two seas be connected by a canal, as had been undertaken by the ancients, and this was one of the aims of Napoleon's expedition in 1798. During the first half of the nineteenth century the project of constructing a canal was taken up successively by the Saint-Simoniens, Prince Metternich and the Société d'Études du Canal de Suez, an international financial group organized in Paris; but they all met with the opposition of the Egyptian viceroy, Mehemet Ali. England became interested in a shorter route to India for mails and passengers and considered the possibilities of improving land communications across Egypt. In 1847 Lord Palmerston instructed the English consul general at Cairo to oppose any attempt to construct a canal but to work for a railway from Alexandria to Suez. Fearing that the railway would lead to English control of Egypt, France supported the canal. Mehemet Ali rejected both the rival projects; in 1849, however, he was succeeded by Abbas Pasha, who, under

English influence, granted (July, 1851) the concession for a line from Alexandria to Cairo. Despite French protests this was completed in 1854 and four years later was extended to Suez.

While the railway facilitated transit across Egypt, it did not satisfy the needs of merchants and shippers. With the expansion of commerce and industry there had developed an increasing demand for a shorter route to the East. By the middle of the century the proposal of a canal connecting the two seas had gained considerable prominence and many advocates, among them Ferdinand de Lesseps, whose diplomatic training, knowledge of Egypt, courage and will power admirably qualified him to be its projector. Few saw more clearly the possibilities of a canal for eastern trade or had a better understanding of the difficulties confronting its realization. Upon learning that his old friend Sa'ïd Pasha had succeeded Abbas as viceroy, de Lesseps wrote to congratulate him and received an invitation to visit Egypt. On November 7, 1854, he reached Alexandria and on November 30 obtained the concession for the canal. The concession (a second was granted in January, 1856) declared that before beginning work de Lesseps must secure the sultan's sanction. This requirement proved to be exceedingly difficult since it shifted negotiations to Constantinople, where English influence was supreme. Having already shown unmistakable hostility, England now bent every effort to prevent the sultan from approving the concession. Secure in India, commanding the Cape route, which it regarded as adequate for British commerce, and enjoying an enviable position in eastern trade, England felt that a canal would threaten its supremacy. Since de Lesseps was a Frenchman, England persisted in maintaining that the canal was a French scheme, although the French government had adopted an attitude of benevolent neutrality toward it. For twelve years, employing almost every pretext, English statesmen opposed the sanction. They held that the canal was physically impossible of construction except at a cost which would make it commercially unprofitable; that it would lead to French control of Egypt and threaten the integrity of the Ottoman Empire; that de Lesseps was a rogue and a swindler.

Against this stubborn opposition de Lesseps fought relentlessly, even carrying his campaign to England, where he tried to arouse public opinion against the government. In November, 1858, he organized his company and marketed the shares (400,000), over half of which were

sold in France; and on April 25, 1859, he started work on the canal near Port Said without the sanction. Finding it impossible, however, to fight British influence single handed, he appealed to his government for support. France, joined by Austria and Russia, demanded the sanction by the sultan, fearing to displease England, held back. A crisis was reached in July, 1863, when the Porte threatened to interrupt the work by force unless the company returned certain lands to Egypt and reduced the number of native laborers. These questions were submitted for arbitration to Napoleon III, who announced his award on July 6, 1864. Forced labor on the canal was to be abolished and the lands returned to the Egyptian government, which in turn was ordered to pay the company an indemnity of 84,000,000 francs. After further delays occasioned by British opposition and accompanied by insistent demands from France the sultan on March 19, 1866, officially recognized the concession. With the removal of political difficulties the work proceeded rapidly and the canal was completed in August, 1869, and formally inaugurated on November 17. The channel was over ninety miles long. It proceeded from the Mediterranean through a narrow region to Lake Menzaleh, traversed this shallow lake, continued its course through a stretch of land to Lake Ballah, five miles in length, again cut through flat country to Lake Timsah, four miles in length, and then crossed a plateau to the Bitter Lakes, which cover a distance of twenty miles. From these lakes there is a short stretch to Suez, the terminal on the Red Sea. Lakes accounted for more than one third of the total distance.

No sooner was the new highway opened than England became aware of its importance for British trade with India. More than half the vessels employing the canal carried the British flag; and as there were many complaints against the arrogance of the company officials and the high toll charges, it was only natural that England should desire a voice in the canal's management. Imperial considerations moreover demanded that it should control every approach to its eastern empire. Late in 1875 rumors reached London that the khedive, Ismā'il Pasha, in urgent need of funds, was negotiating with certain French banks for the sale or mortgage of his canal shares. Determined that the canal should not become entirely French, Disraeli seized the opportunity and on November 25 purchased for the British government 176,602 shares for the

sum of £3,976,580, which he borrowed from his friend Baron Rothschild. This spectacular transaction aroused tremendous enthusiasm in England, where it was thought that the canal must now be under British control. The expectation was somewhat premature, for although England held nearly half the shares, it received merely ten votes in the general assembly of shareholders and was permitted to name only three out of the twenty-four directors. By the purchase the canal was changed from Franco-Egyptian to Franco-British ownership. A few years later a nationalist uprising occurred in Egypt which threatened the security of the new highway. Failing to secure aid from France or the other European powers, England intervened alone and on September 13, 1882, defeated the nationalists at Tel el Kebir. British troops remained and Egypt was converted into a veiled protectorate, while France, having refused to cooperate, lost its position in that country; indeed the French continued hostile to English policy until 1904.

The dangers to which the canal had been exposed revealed the need for some sort of international understanding for its protection. Although the subject had been discussed for years, no official action was taken until January 3, 1883, when England addressed a circular note to the powers urging a general agreement to respect the free navigation of this important waterway. There was no immediate response, but two years later upon the suggestion of the French government a conference met at Paris. Unable to reach a settlement because of the differences in the French and British viewpoints, the conference dissolved after drawing up a draft treaty, to which Sir Julian Pauncefote added a general reservation that the treaty did not limit England's freedom of action so long as that country was in occupation of Egypt. Following an exchange of views France and England agreed to a convention which was signed by representatives of the powers at Constantinople on October 29, 1888. This provided that the canal was to be open to all vessels in time of war as well as in time of peace; that the entrances to the canal were not to be blockaded; that no permanent fortifications were to be erected on the canal; and that in case of danger the Egyptian government was to take measures for the canal's protection. If it lacked the means, it was to call upon the Turkish government for assistance. As a result of the British reservation the convention was held in abeyance until the Anglo-French agreement of 1904; but this did not alter the

actual situation, for the protection of the canal as well as its control remained with England.

Strategically the canal was of great importance to England. As the shortest and most convenient route to India it was regarded as vital to the preservation of the empire, and the government was determined to keep it open at all costs. Any threat to its safety, such as the French ambitions in the Nile basin, the Russian attempts to open the Straits and the German Berlin-to-Bagdad Railway, aroused immediate fears. The World War proved, however, that the canal was not absolutely vital to the British Empire and that its effectiveness depended to a large extent upon conditions in other parts of the oriental highway. This was made clear by the German submarine campaign in the Mediterranean, which forced the diversion of much of the far eastern traffic to the Cape route. There remained also the possibility that in another conflict the canal might be demolished by aerial attacks. The establishment of Egyptian independence raised a new problem for England. In its declaration of February 28, 1922, abolishing the protectorate set up in December, 1914, England reserved to itself the right to protect the canal. Not satisfied with this half measure, Egyptians demanded that British troops should be withdrawn and that the protection of the canal should be left to Egypt or to the League of Nations. England refused to concede these demands and the problem remained unsettled.

In shortening the voyage from Europe to India by from four to five thousand miles the Suez route opened a new era in world commerce. With the substitution of steam for sail and the widening and deepening of the canal it came to be employed more and more regularly. During the first two years the results were disappointing, but beginning in 1872 the traffic showed a fairly steady increase, which continued to 1914; there was a sharp decline during the war but after 1918 another period of rapid growth set in, which lasted until 1929. The net tonnage passing through the canal was only 435,911 in 1870, 761,467 in 1871 and 1,439,169 in 1872; but by 1912 it had reached 20,275,120 net tons, the highest in the pre-war period. From 1919 to 1929 there was a 100 percent increase, while tonnage for 1929 (33,466,014) was 65 percent greater than in 1912. The proportion of British traffic to the total has varied from 60 to 80 percent, most of it representing Indian trade. In 1913 England was first with 60 percent of the tonnage, being followed by Germany with 16.7

percent, Holland with 6.4 percent and France with 4.7 percent. The Cape route in the post-war period continued to be used for much of the eastern shipping, especially in the outbound voyage to Australia and New Zealand. It is interesting to note that the opening of the Panama Canal did not seriously affect the amount of traffic passing through the Suez Canal. From the viewpoint of distance the only areas for whose trade competition between the two routes was possible were northeastern Asia, eastern Australia, New Zealand and the west coasts of North and South America.

Financially the canal more than justified the expectations of its projector. The total cost of construction was 432,807,882 francs, of which 200,000,000 francs were raised through the sale of the shares and the remainder from a bond issue and from sums advanced by the Egyptian government. During the first four years after the opening of the canal the company experienced considerable financial difficulty and actually initiated negotiations for the sale of the waterway. By 1875, however, the situation was much improved and losses began to give way to profits. In round numbers the receipts were 5,000,000 francs in 1870, 9,000,000 francs in 1871 and 16,000,000 francs in 1872; by 1914 receipts totaled 117,000,000 francs. The war brought a decline in revenues but the post-war period saw an immediate recovery, so that receipts reached nearly 204,000,000 francs in 1927. With the growth of business the value of the shares increased. A total of 400,000 shares had been placed on sale in November, 1858, at 500 francs each with interest at 5 percent. After dropping to the low figure of 208 francs in 1871 the shares began to climb gradually, passing par in 1875 and attaining the high mark of 6107 francs in 1912. In 1924 the number of shares was doubled, although the capitalization of the company remained unchanged.

SUFFRAGE is defined as voting in support of some opinion or measure or some candidate for office, and derivatively as the right or privilege of participating in elections. The term is substantially synonymous with franchise when used in connection with political activity. The suffrage and related questions acquire importance only in governments which are to some extent democratic; the problem does not arise in pure monarchies or oligarchies. The suffrage is generally associated only with popular elections in which a large or at least a considerable element of the community takes part. This element of the community which exercises the suffrage is properly spoken of as the electorate; it is often very incorrectly identified with the people as a whole, as in the statement "the people have decided the question at the polls."

The history of the suffrage is connected with five different basic conceptions, or theories, of its nature, most of them not explicitly stated but inherent in the current practise. These are: first, the theory, effective among primitive peoples and in the city-states of antiquity and of the Renaissance, that the suffrage is an attribute or function of citizenship; second, the later feudal theory that the suffrage is a vested privilege, an incident of a particular status, usually connected with the possession of land; third, the theory of the early constitutional regime that the suffrage is an abstract right founded in natural law, a consequence of the social compact and an incident of popular sovereignty; fourth, the theory of modern political science that voting is a function of government, that the voter in casting his ballot performs a public office and that the electorate, like the legislature or the courts, is an organ of government; and, fifth, the ethical theory, which is strongly urged at the present time by certain writers, that the suffrage is an important, indeed an essential means for the development of individual character, a condition necessary for the realization of the worth of human personality.

The basic social bond among primitive people is kinship or some extension of kinship. The

concept of citizenship emerges from the family, the clan and the tribe. Participation in the political as in the social, the religious, the artistic and the economic life of the state is viewed originally as a prerogative of citizenship. In the early history of both Greeks and Romans certain families (eupatridae or patricians) monopolized civic rights, and there was a long period of internal struggle before a broader basis of citizenship could be secured. In Athens the reforms of Solon early in the sixth century B. C. swept away all distinctions of birth but recognized four classes of citizens on the basis of property. It took more than a century for class lines to be obliterated and for a complete equality of citizenship to be achieved. The suffrage in the Greek popular assembly was always viewed as an adjunct or attribute of citizenship and no differentiation was made between citizens. Aristotle discusses the question as to whether artisans and tradesmen should be admitted to citizenship; that is, to membership in the state. But no question was raised as to the right of all citizens to the suffrage. The same underlying conception obtained among the Romans. Civic participation in government occurred through the several assemblies, or *comitia*. Originally only the patricians were considered citizens; they alone at first had voting rights in the *comitia curiata*. With the establishment of the *comitia centuriata* and the *comitia tributa* the plebians, as a result of a series of measures, obtained the rights of citizenship. The right of suffrage (*ius suffragii*) was thus extended to the lower class along with the right of marriage (*ius conubii*), the right of trade (*ius commercii*), the right of holding office (*ius honorum*) and the right of suing in the courts (*ius legis actionis*). Roman citizenship was extended to the Latin peoples when they were brought under the control of Rome and eventually to various other communities. The citizenship thus granted was restricted in various ways, and for a time some of these communities were denied the suffrage, their inhabitants being *cives sine suffragio*. In the first century B. C., however, this distinction completely disappeared. In the Greek cities and in Rome the suffrage was limited to adult males. The admission of the youth to the full rights of citizenship was an event which was usually marked with distinctive ceremonies. The same concept of the suffrage underlay the political institutions of the Germanic peoples of the early Middle Ages. Participation in the folk-moot was a consequence of membership in the tribe. Dif-

ferences in rank and social status involved no political inequality. In the national assemblies of the German peoples important questions, such as peace and war, were decided by the body of armed men, the citizenship, by the shaking of spears or the clash of arms. The suffrage in the self-governing cities of Renaissance Italy was likewise dependent on citizenship, often narrow and exclusive, frequently hereditary in certain families. Only those who were citizens possessed the right to vote, but all citizens enjoyed this right equally.

In the socially stratified society of the later Middle Ages the suffrage was an adjunct or attribute of some special status. The right to elect representatives to the House of Commons in England, to the Estates General in France and to similar assemblies in other European countries rested upon the same kind of legal basis as the right of the nobles to be summoned in person to the House of Lords or the Assembly of Notables. The suffrage was a privilege attached to a particular status, such as that of taxpayer, freeman, burgess, pot-walloper or "forty-shilling" freeholder. It was generally although not always connected with the possession of land and was thus tenurial or patrimonial in character. Sometimes women who possessed the status had the right to vote, just as noblewomen frequently had the right to be represented by proxies in the estates of the nobility. Chief Justice Holt, in the case of *Ashby v. White* (1703), stated the accepted legal doctrine as follows: "The election of knights belongs to freeholders of the counties, and it is an original right vested in and inseparable from the freehold, and can no more be severed from their freehold, than the freehold itself can be taken away. . . . As for citizens and burgesses, they depend on the same right as the knights of shires, and differ only as to the tenure, but the right and manner of their election is on the same foundation." The suffrage in the American colonies and indeed in the states until well into the nineteenth century reflects the predominance of this vested right theory. This conception of the nature of the suffrage persisted in England until the electoral reform of 1918. The several reform bills in England in the nineteenth century simply provided new and additional statuses under which the right to vote could be exercised. Thus "ten-pound" copyholders, householders, "twelve-pound" occupiers, "fifty-pound" leaseholders and other special classes were given the ballot.

This theory was historically the basis for all

property and taxpaying qualifications for the suffrage, some of which still persist even in the United States. It was responsible also for the systems of plural and weighted voting. Until the reform of 1918 in Great Britain a man might vote in a number of parliamentary constituencies in which he possessed a qualifying status. This theory was also responsible for various systems of weighted or plural voting on the continent, such as the three-class system in Prussia and the Belgian system of plural voting, both of which obtained before the World War.

The theory that the suffrage is a natural right of man may be traced back to the Middle Ages or even to antiquity, but it became effective only with the revolutions of the seventeenth and eighteenth centuries and is closely related to the principle of popular sovereignty. It was a cardinal doctrine of the Levellers in England during the Commonwealth and underlay the Agreement of the People which they proposed as a written constitution. It was urged as an essential basis of government by most of the leaders of the French Revolution. Condorcet declared: "We would have a constitution, the principles of which are solely founded on the natural rights of man previous to social institutions. . . . One of these rights we consider to be that of voting for common interests, either personally or by freely elected representatives." He urged that women be accorded the same rights as men, including the suffrage. The Declaration of the Rights of Man and of the Citizen declared: "The law is the expression of the *voionté générale*. All the citizens have the right of concurring personally or by their representatives in its formation" (art. vi). Paine contrasted this principle with the practise in England, where the basis of representation consists in royal patents and embodies a grant or boon. The electoral law of 1789 did not, however, give full application to the natural right theory of voting. The suffrage was limited to citizens who paid a certain amount of direct taxes. But in the electoral law of 1792 the abstract right to vote was fully accepted in theory; and with the establishment of the Convention the right to vote was recognized as universal and was extended even to certain classes of foreigners domiciled in France. Limitations were actually maintained with respect to age, sex, mental competence and the like. Montesquieu had said earlier that "All the inhabitants. . . ought to have a right of voting at the election of a representative, except such as are in so mean a situation as to be deemed to

have no will of their own" (*Esprit des lois*, bk. xi, sect. 6). Women, minors and imbeciles were considered deficient in this respect. In the United States the doctrine of man's natural right to vote has been urged effectively since pre-revolutionary times. Samuel Adams held that "the establishment of the legislative power is one of the rights which no man can either relinquish or take away from others. The Declaration of Independence, in basing government upon the consent of the governed and in maintaining that it is the right of the people to alter or abolish tyrannical governments and institute new governments, implies a theory of an abstract right to vote. A resolution adopted in Ipswich, Massachusetts, in 1778 declared more specifically that "All the members of the State are qualified to make the election, unless they have not sufficient discretion, or are so situated as to have no wills of their own." The early state bills of rights frequently contained expressions of the theory of a natural right to vote, but generally they were modified and confused by suggestions of the vested privilege theory.

The theory of the suffrage generally accepted by contemporary political scientists is that voting is a function of government. The voter does not exercise a natural right when he casts his ballot, but performs a public governmental office. The electorate is not identical with the people, the sovereign authority in the state and the ultimate source of law; it is an organ of government, established, organized and determined by the law, which can moreover limit, expand or totally abolish it. The problem of who shall vote becomes, under this theory, one of mere political expediency, similar to the problem of the composition and organization of the legislature or the courts. Ritchie clearly expressed this viewpoint in the statement: "The suffrage, by all thoughtful persons at least, is regarded as a means to the working of the Constitution; and the right of voting is obviously a right created by the law . . . , and cannot intelligibly be represented as a right prior to and independent of law. . . . On whom the suffrage should be conferred is a matter not to be settled *a priori*, but by reference to the particular circumstances of the country" (*Natural Rights*, 3rd ed. London 1916, p. 255). Restrictive proposals such as educational and taxpaying qualifications are usually justified today on the ground that they would make the electorate a more efficient organ of government. This functional theory of the suffrage is the basis for proposals for proportional

representation, the representation of economic interests and the short ballot. It would seem also to be the basis for age and residence requirements and for the exclusion from the suffrage of criminals, paupers and the insane.

A fifth theory of the suffrage postulates the equal moral worth of all men and insists upon the value of the vote as an instrument for its realization. Civil rights are the conditions which the political experience of a community has discovered to be essential to the achievement of the good life, they constitute the minimum of opportunity necessary to give effect to the inherent moral worth of the human personality. It is urged, however, that the possession of civil rights alone is not sufficient. "Political equality," says MacCunn, "follows from the same ultimate ideas that justify equality before the Law. . . . The right to vote can alone open to its possessor that sphere of public activity, which cannot be closed on him who is fit for it without contracting his life and stunting his development" (*Ethics of Citizenship*, Glasgow 1894). "The ballot indeed," says Dole, "is only a piece of machinery. It is a method for the expression of men's manhood. Its use is not itself a natural right. The natural right is that a man shall express himself in some valid form touching the interests which affect him" (*The Spirit of Democracy*, New York 1906). Laski in his *Grammar of Politics* (New Haven 1925) likewise insists that "Every adult citizen has the right to indicate what persons he desires should undertake the task of government." "No test," he says, "has been devised which enables us to limit the franchise in such fashion as to equate civic virtue with its possession." This right is, however, not an abstract right of nature but an essential condition of freedom, and "the permanent essence of freedom is that the personality of each individual should be so unhampered in its development, whether by authority or by custom, that it can make for itself a satisfactory harmonisation of its impulses." There is no doubt that this ethical theory of the suffrage has contributed to the extension of the suffrage in recent times. Woman suffrage was urged as a natural right and as functionally desirable. But it was justified also on the ground of its value in affording an opportunity for the moral self-realization of half the adult population. The adoption of the Fifteenth Amendment to the Constitution of the United States was hailed in some quarters as a means of ennobling and enriching the lives of the recently emancipated Negroes of the south.

The five theories concerning the suffrage are all mingled in the thought of the present time. No single consistent basic concept has gained general acceptance. Tangled and confused, this conglomerate of ideas offers no satisfactory explanation of the existing institutional arrangements or any adequate criterion by which proposed innovations may be judged. The clarification of the underlying theory of the suffrage is one of the important obligations of contemporary political science.

SUGAR. For many centuries sugar was a costly luxury, but today it is a necessary of general consumption. It is indispensable in the nourishment of the human body, and it is an important food-stuff for many animals and plants. In the United States about three quarters of the sugar output is consumed directly. Another quarter is used, as either raw or refined sugar, as a basic raw material in the manufacture of confectionery, candy and chocolate or as a more or less important admixture in ice cream, condensed milk, canned goods, beverages and other products. The importance and growing use of sugar are evident in the per capita consumption in the United States, which rose from 71.7 pounds in 1900 to 103.5 pounds in 1931, nearly five times as much as in 1850. Although sugar may be produced from many plants, the only important industrial sources are sugar cane and sugar beets, particularly the former, although a small amount is produced also from the sap of maple and palm trees.

Among all primitive and most ancient peoples the sugar necessary for the body was derived from fruits, vegetables or cereals containing sugar or starch. The production of sugar and syrup was known in India perhaps a few centuries before the Christian era, and certainly by 400 A. D. For sweetening purposes the Teutons, Greeks and Romans used honey almost exclusively. From India the growing of sugar cane and its use in the making of sugar spread to China, Ceylon and Java, to Persia in the sixth century and to Spain in the eighth. In the course of their conquests from the seventh to the ninth centuries the Arabians introduced the growing of cane and the making of sugar into Cyprus, Egypt, north Africa, Spain and Sicily. The Egyptians so perfected the refining process that their white sugar enjoyed the highest reputation in the Middle Ages. Northwestern Europe was acquainted with the use of sugar by the crusaders, who themselves promoted its production in Syria, Palestine and Cyprus. The trade in sugar was dominated by Venice and Genoa, and it was a particularly important factor in Venetian commercial supremacy. At this time, however, sugar was essentially a luxury, although it was also used for medicinal purposes.

While Venice imported sugar from Syria and Egypt as early as 996, the refining of sugar was

not practised in Europe until the fifteenth century. Refining was a Venetian monopoly for one hundred years or more and then spread to England, Germany and Holland. In the seventeenth century the refining of sugar was practised on a considerable scale in France, where it was encouraged by the government.

The cultivation of sugar cane was promoted in all the tropical colonies of the European nations after the discovery of America. Cane planting, which was first introduced in Haiti, was originally a failure but subsequently succeeded on a large scale. It spread to Cuba in 1511, Mexico in 1522, Porto Rico in the following year, Jamaica in 1527 and Peru and Brazil at about the same time. The Turkish conquests, by virtually destroying the cultivation of sugar cane, favored the industry in the New World; the large colonial supply completed the ruin of the sugar industry in Syria, Cyprus and Egypt and also eventually eliminated the competition of Spanish and Portuguese possessions in Africa. From the beginning Negro slaves supplied the labor force of the sugar plantations.

Severe restrictions were imposed upon the colonial sugar industry by the mother countries. In the French, Spanish, British and Portuguese colonies there was usually a prohibition against sugar refining in the colony itself and against exporting raw sugar to any country other than the motherland, from which moreover all machinery and implements had to be imported. The result of these restrictions may be seen indirectly in the fact that when they were lifted in Cuba the exports of sugar rose from 2000 tons in 1753 to 13,940 tons in 1790. The European powers, in accord with their general colonial policy, desired to retain a monopoly of sugar refining, with the colonies supplying raw materials and buying manufactured goods. Political disturbances also interfered with the growth of the sugar industry. When the Portuguese expelled 20,000 Dutch from Brazil in 1655, the cultivation of sugar cane was practically wiped out; many of the Dutch planters went to Haiti. The uprising of the Negroes in Haiti in 1791 forced many planters to flee; for many years the island lost all significance as a sugar producer, while the Cuban industry flourished.

By the end of the eighteenth century the world was dependent mainly upon American sugar, although a considerable supply came from Java and Ceylon. During this period also new varieties of cane with a higher yield were bred, and the plant was made more tolerant of or com-

pletely immune to diseases, frost and insects. The most striking success in this respect, however, has been achieved only in recent years.

During the seventeenth and eighteenth centuries there was a considerable intercolonial trade in sugar, much of which was smuggling. Some large fortunes were made by New England merchants who imported sugar from Cuba and used it to make molasses and rum largely for export. In 1751 the Jesuits introduced the cultivation of sugar cane into Louisiana, which became the principal North American producer of raw sugar. The first refinery in the colonies was opened in New York City in 1730—"A Refining House for Refining all sorts of Sugar and Sugar-Candy." By the time of the revolution there were substantial sugar production and trade.

Sugar consumption was stimulated both by price reduction and by the growing use of coffee, tea and cocoa. This encouraged the development of refining in Europe and national struggles to control the lucrative business. Colbert in 1684 introduced differential duties on raw and refined sugar to protect the French refining industry. His efforts resulted in ousting English and Dutch refined sugar from the French market and in increasing exports of refined sugar. Colbert's policy, which involved a subsidy in the form of a drawback on raw sugar import duties, marked the commencement of the bounty system, which gained great importance in Europe in the nineteenth century.

Sugar cane, a tropical and subtropical plant, was virtually the sole source of raw sugar until the development of the beet sugar industry at the beginning of the nineteenth century. Although the juices of certain roots had been used as sweetening, it was not until 1747 that a German chemist, Andreas Marggraf, observed that beets contain "genuine perfect sugar identical with that in the sugar cane." A pupil of Marggraf, Franz Karl Achard, experimented with the cultivation of beets rich in sugar and containing a juice of higher purity. He devised machinery for the extraction of beet sugar, obtained the first lot of raw sugar in 1799 and in 1802 erected a factory. The rise in sugar prices following upon the destruction of commercial cultivation in Santo Domingo and Napoleon's proclamation of the Continental System in 1806 stimulated the development of the beet sugar industry. Napoleon himself encouraged the cultivation of sugar beets in France and the countries under his control. As soon as colonial sugar was obtainable, the new industry declined everywhere

except in France; but it revived again in other countries, and by the middle of the nineteenth century sugar beet cultivation was firmly established in Germany, Austria, Russia, Belgium, Sweden and Holland. Beets can be grown on farms with other crops, they are an important factor in crop rotation and parts of the beets serve as valuable fodder. Only in exceptional cases, as in Java, is cane planting adaptable to crop rotation. Because it provided a source of revenue, beet sugar production enjoyed government encouragement and protection, including bounties. These brought about undesirable conditions in the world sugar market, since for various reasons the bounty system could not be introduced in the colonies. The beet sugar industry itself suffered as bounties became increasingly more generous, and only those factories derived full benefit which received the bounty at the highest rate. Moreover the profit from the bounty was in part lost, because some countries levied counter duties on bounty fed sugar, the first to do so being the United States in 1890. The system eventually proved more or less of a drawback for all parties concerned, and it was finally abolished by a convention signed at Brussels on March 5, 1902.

While the beet industry, owing to the bounty system, was able to increase its output up to 50 percent of the world's sugar production, the cane industry regained part of the lost ground after the adoption of the Brussels convention. The beet sugar industry, however, was far from ruined by the abolition of export bounties, as had been prophesied by antagonists of the convention: in 1913-14 it supplied 45 percent of the world's sugar (Table 1).

TABLE I
WORLD PRODUCTION OF RAW SUGAR, 1900-14
(In 1000 metric tons)

| YEAR | CANE SUGAR | BEET SUGAR |
|---------|------------|------------|
| 1900-01 | 6,485 | 6,019 |
| 1901-02 | 6,835 | 6,909 |
| 1902-03 | 6,808 | 5,702 |
| 1903-04 | 6,773 | 5,988 |
| 1904-05 | 7,467 | 4,926* |
| 1905-06 | 7,336 | 7,281 |
| 1906-07 | 8,031 | 7,199 |
| 1907-08 | 7,670 | 7,037 |
| 1908-09 | 8,251 | 6,939 |
| 1909-10 | 9,018 | 6,627* |
| 1910-11 | 9,120 | 8,616 |
| 1911-12 | 9,709 | 6,909* |
| 1912-13 | 10,099 | 8,947 |
| 1913-14 | 11,094 | 9,015 |

* Small output due to crop failure in the greater part of Europe.

Meanwhile the refining industry had made great progress, particularly in the United States. In 1830 there were 38 American refineries. The scale of production increased and by 1845 there were several refining mills, each of which cost over \$300,000 to erect and equip, with a daily capacity of 10 to 15 tons. Technical progress was rapid, including new and more efficient methods of extraction, evaporating and drying. By 1850 American mills were able to produce more than half of the total sugar consumed. The number of refineries grew to 50 in 1870, but ten years later they had been reduced to 27 by a process of concentration which set in at the time, and which resulted in the formation of the Sugar Refineries Company in 1887, merging several other concerns. The sugar trust, of which Henry O. Havemeyer was the guiding spirit, waged ruthless war upon its competitors and strengthened its control. In 1891, after the dissolution of the trust, the American Sugar Refining Company became its successor and dominated the industry for years, owning 10 of the 17 existing refineries but producing a much larger share of the total output. The government investigated the company's affairs under the pressure of public opinion, which resented the company's large profits. At the same time costs of production were lowered considerably. Expansion of sugar refining was stimulated by the results of the Spanish American War. Hawaii was already a colony of the United States, producing 204,834 tons of sugar in 1898. Cuba's sugar industry was more firmly attached to American capital and American interests, while the annexation of Porto Rico and the Philippines provided another great source of raw sugar supply. Sugar imported into the United States from these colonial possessions was either given a preferential tariff or admitted free of duty.

The efforts of the refining interests to secure free imports of raw sugar met the opposition of the cultivators of beet sugar. This industry was growing slowly but steadily; by 1879 there were a dozen or more beet sugar factories. The McKinley tariff of 1890 granted a bounty of 2 cents per pound on home produced sugar, but this was repealed four years later. A definite policy of protection of domestic sugar was established by the Dingley tariff of 1897, which resulted in a rise in output of domestic sugar from 37,536 tons in 1896 to 214,825 tons in 1903. This development was facilitated by production in American factories of the necessary machinery and implements for the cultivation of beets and

manufacture of sugar. In 1913, when there were 71 beet sugar factories, Congress passed the Underwood-Simmons tariff bill, which reduced the duty on sugar 25 percent, granted duty free admission to Philippine sugar and provided that all sugar should be placed on the free list on May 1, 1916. The free clause, however, was repealed. This repeal and the high sugar prices prevailing during the World War gave a new impetus to the beet sugar industry.

The war completely changed the world's sugar situation. It was a disaster for the European beet sugar industry; many factories, particularly in France, Belgium and Russian Poland, were paralyzed. Production declined also in Germany and Austria and even in the neutral nations, because of the demand for labor by the war industries. The cane sugar industry, far from the scene of war, greatly increased its output (Table II), both absolutely and relatively. This was particularly true in Cuba, which augmented its output 33 percent. In the United States and in most European nations, both belligerent and neutral, the limited sugar available and the high prices led to state control.

When the war came to an end in 1918, the economic situation in central Europe became

still worse for a while; but after 1919-20 there was a steady increase in beet sugar production. Despite this recovery the cane sugar countries kept on producing a constantly larger output, particularly in Cuba, where production in 1924-25 was 97 percent higher than in 1913-14. In May, 1920, the price of sugar reached the peak of 22.5 cents per pound. Then the crash came, and in December, 1920, the price had fallen to 3 6 cents. Cuba realized that its overproduction menaced the world market and its own interests, and in 1926 a crop restriction law was enacted. It was not Cuba alone which suffered. All the sugar exporting countries were harassed by the fall in prices, the shrinking of the world market and the accumulation of surplus stocks (Table III). Despite an increase in consumption up to the close of 1929 output regularly exceeded consumption, as the exporting countries increased production and capacity while formerly importing countries expanded home production, often encouraged by government aid, such as the British subsidy act of 1925. Thus both the importing and exporting countries increased their sugar output (Table IV), with disastrous results. Overproduction was intensified by greater productivity; for example, the cane yield per acre in

Cuba, whose whole economic life is practically dependent upon the sugar crop, realized in its desperation that if it alone were to adopt restrictive measures there would be sacrifices but no lasting success. Negotiations were therefore opened by the Cuban government, through Colonel J. M. Tarafa, with the large exporting countries for united action to restrict output and exports. The project was frustrated by the opposition of the Java industry, by the hesitant attitude of the European producers and by the abandonment of the Cuban restriction policy in 1928. It was soon realized in Cuba, however, that unrestricted production was even worse than restriction. Another attempt at governmental control was embodied in the presidential decree of July 26, 1929, which set up a unified

selling agency. But the depression which set in after 1929 made it impossible for the plan to succeed. Cuba suffered not only from low prices but also from the decline in its exports to the United States, where because of tariff preference colonial and domestic sugars acquired an increased share in the market (Table II). The unified selling agency was dissolved in April, 1930. As a result prices fell to a new low of 1.04 cents a pound. Another attempt at international action led to adoption of the Chadbourne plan in 1931, by which Cuba, Java, Germany, Czechoslovakia, Poland, Hungary and Belgium agreed upon export quotas. The plan provided that accumulated surplus stocks were to be disposed of during the five years covered by the agreement and that no surplus stocks should exist upon its expiration on September 1, 1935. Subsequently two other producing countries, Peru and Yugoslavia, signed the agreement, and a number of other states which were not exporters but suffered from surplus stocks adopted the principles of the Chadbourne plan without joining the agreement. The restrictive measures of the agreement are to be carried out with governmental assistance. This development is another indication of the spread of state intervention in industry. Fifteen nations, out of which nine are members of the International Sugar Agreement, are at present bound by a restriction plan.

The sugar crisis aggravated the conditions of workers engaged in the production of cane and beet sugar. Unemployment increased and wages fell to extremely low levels particularly in Cuba. Seasonal workers coming from foreign countries are frequent in both cane and beet production—Filipinos in Hawaii, Mexicans in the United States, Haitians and West Indians in Cuba and Belgians or Slavs in France. However, increasing unemployment has brought about some antagonism against foreign hands. In times of depression some aversion to foreign interests arises from the fact that sugar growing in several countries is largely controlled by foreign capital. In 1924 not less than two thirds of the \$950,000,000 invested in Cuban sugar production was controlled by Americans, and this proportion has not changed materially since then. In some countries unions of sugar workers exist and collective agreements are made with manufacturers and, more rarely, with the agricultural producers.

Part of the cane and beets manufactured into sugar is grown by the sugar factories. In Java

almost all the cane is planted by the factories themselves; this, however, is unusual. By far the larger part of the cane and beet supply is delivered by more or less independent planters. In the beet industry the independent planter is typical, while in some cane growing countries the *colono* system of cultivation prevails. In some countries, for example, Germany and the Netherlands, most of the factories are owned by the planters; the shareholders of these factories are usually obliged to deliver annually a certain quantity of beets per share to the factory.

In 1929 there were 21 cane sugar refineries in the United States, with an output of \$507,389,000. They employed 13,912 workers, who received wages amounting to \$20,044,000. The value of the output of beet sugar factories in that year was \$108,553,000; they employed 7496 workers and paid \$10,021,000 in wages. The productivity of labor has been increasing steadily in recent years, refining is a highly mechanized process, and many workers have been displaced. The American Sugar Refining Company, with assets in 1933 of \$123,358,169, still dominates the industry, in that year it owned 5 refineries on the Atlantic coast and in Louisiana and 2 cane sugar factories in Cuba. The cane sugar refineries are suffering from the competition of the domestic beet sugar industry and from the expansion of sugar refining in the American insular possessions, in Cuba and in the Dominican Republic; existing capacity is more than double the actual requirements. Refiners are energetically demanding special tariff protection for their product. A sugar quota law was enacted in 1934. Moreover as many of the refiners control raw sugar factories in Cuba, they are the natural allies of the Cubans in the demand for an increase in the tariff preference. The American Sugar refiners are organized in the Sugar Institute, which in recent years has carried on an advertising campaign to stimulate sugar consumption.

In normal times the consumption of sugar has increased steadily, and there is no evidence that the saturation point has been reached in any country. It is quite possible that the industry may experience renewed expansion with improvement in world economic conditions.

SUGGESTION. See CROWD; MOB.

SUICIDE. Group patterns, standards of life, conceptions about death and religious convictions, all of which vary from place to place, determine the attitude with which suicide is regarded. Some peoples endorse and recommend it under specified circumstances; others oppose it resolutely and uncompromisingly. Among primitive groups there is no uniformity of judgment. In some tribes it is practically unknown;

in others it is a rare and reprehensible act; in still others it is relatively common; and sometimes it may be the only fitting answer to a trifling insult. The determining factor whether in primitive or sophisticated societies is the emphasis that is placed upon individuality. Where there is no striving for leadership and no desire to attain personal recognition and prestige, suicide is infrequent. But where the pressure exerted by the group is weak, personal ambition keen and rivalry between individuals intense, suicide is found.

In the Orient certain forms of suicide have always been considered praiseworthy. Brahman and Buddhist doctrines with their denial of the flesh approve the idea that the body is a dwelling place to be abandoned at the will of its owner. Institutionalized forms of suicide such as suttee, the sacrifice of wives upon the death of their husbands, and *hara-kiri*, a deliberate ceremonial act, reflect great credit upon the willing victims. The suicides of defeated generals, dethroned rulers and statesmen protesting against political policies are regarded as honorable; personal insult, insolvency, dishonor or a slight offered to the memory of an ancestor are also adequate reasons for self-destruction. In direct contrast to the other religions of the East, Islam severely condemns suicide. While neither the Old Testament nor the New Testament specifically prohibits suicide, the Koran stigmatizes it as a much graver crime than homicide. The teachings of Judaism have emphasized the sacredness of life, and throughout Jewish history until recently suicide has been extremely rare. The Talmud condemned it as sinful and did not permit the customary mourning rites for the suicide, whose body was denied funeral honors and was buried apart with criminals and outcasts.

Since the time of St. Augustine, who denounced suicide as a sin under all circumstances, Christianity has regarded it as murder. The arguments against suicide are deeply rooted in such Christian doctrines as the sacredness of life, the duty of submission to God's will, the positive value of suffering and the impossibility of expiating a sin committed at the moment of death. The teachings of the Catholic church were legalized in Europe and suicide became a crime as well as a sin. The first civil laws against suicide in England, which date from about the eleventh century, provided that the offender's property be confiscated and the body denied Christian burial or interment in consecrated ground. The corpse was treated with indignity

and was mutilated, dragged through the streets and hung on the public gallows. In England up to 1823 it was legal to bury a suicide at cross-roads with a stake through his body; when this was prohibited burial was allowed only at night, without religious rites; these restrictions were removed in 1882. A provision concerning the confiscation of the property of a suicide in a law passed during the reign of Henry III remained in force until 1870, when all forfeitures for felony were abolished; but suicide is still classed as a crime in England. In other countries of Europe also ignominious burial and confiscation of property were regular punishments of suicide until the nineteenth century. In America, since the ratification of the constitution, the completed act of suicide has never been punished by confiscation of the estate or ignominious burial and therefore is not considered criminal. Attempted suicide, however, has been regarded as felonious in some jurisdictions and is still treated as a crime in four states. Some state statutes likewise consider aiding and abetting suicide a crime and prosecute a person who advises another to kill himself.

Popular opinion regarding the sinfulness of suicide had been changing before stringent punishments had been annulled. In some quarters opinion was veering around to the viewpoint of the Greeks and Romans, who had contended for the right of a man to take his own life. During the seventeenth and eighteenth centuries Donne and Hume in England, Montaigne, Montesquieu, Voltaire and Rousseau in France and Beccaria in Italy protested against the rigorous condemnation of suicide by church and state and argued that suicide was not necessarily a heinous offense, and their views are now widely held.

The variety of traditions, religious practices and social attitudes of different countries of the world is reflected in the suicide rates. In the United States about 22,000 persons kill themselves each year. Under present conditions of mortality 10 males and 3 females, out of every 1000 persons born, will eventually take their own lives. For each suicide there are countless unsuccessful attempts which are never recorded. The official statistics are underestimates, for the families often conceal the fact that death was self-inflicted and many suicides are recorded as accidents. On the other hand, some few homicides are registered as suicides. The United States occupies a middle position in suicide frequency, along with Belgium, Sweden, New

Zealand and Australia; England and Wales, Scotland, Canada and Italy rate somewhat lower; France and Denmark somewhat higher. Extremely high suicide mortality is recorded for Japan, Germany, Austria, Hungary, Czechoslovakia and Switzerland, and very low rates are found in the Irish Free State, Northern Ireland and Spain (Table I).

Mortality records of the last three decades do not warrant a conclusion that suicide is definitely increasing or decreasing. In 1900 the rate was 11.5 per 100,000 persons in the expanding registration area of the United States; it reached 17.8 in 1908, then fell and remained fairly stationary around 16 per 100,000 in the period before the World War. From 1917, when the United States entered the war, it declined steadily, until it fell to a low point of 10.2 in 1920. Since then the general trend has been upward with a definite increase since 1925, until the rate stood in 1932 at 17.5 per 100,000 population. When the pre-war period between 1910 and 1914 is compared with the period between 1926 and 1930, one finds a decline in the United States, Sweden, France, Denmark and Spain but definite increases in England and Wales, Scotland, Germany, Italy, Belgium and Holland.

Negroes do not commit suicide nearly so frequently as do whites; in 1930 their suicide rate in the United States was 5.1, compared with

15.6 among the total population. Age and sex are also important factors in determining suicide frequency. Contrary to prevailing opinion, suicides increase consistently with advancing years. Children and adolescents rarely kill themselves, but at the older ages of life the rate is very high; more than half of all suicides occur among persons forty-five years of age and over, although they constitute only a little over a fifth of the total population. For all age periods combined over three times as many men as women kill themselves each year. The age distribution of suicide in the two sexes differs: the rates for men and women are about equal between ten and twenty, and then the male rate rises sharply and steadily; while the female rate rises gradually up to the age of thirty, after which there is but a slight rise until old age. Consequently in the last age period there are almost seven times as many men as women suicides per unit of population (Table II).

Suicide is more common in cities than in rural areas in the United States and in a number of European countries, in 1929 the urban rate in the United States was 58 percent higher than the rural. In general the larger the city, the higher is its suicide rate. The explanation probably lies in the greater stability of the country family, its lower divorce rate and larger number of children and in the more unified interests, traditions and beliefs of a farming community. The best proof

TABLE I
DEATH RATES PER 100,000 FROM SUICIDE IN PRINCIPAL COUNTRIES OF THE WORLD, 1912-1930

| COUNTRY | 1930 | 1928 | 1926 | 1924 | 1920 | 1916 | 1912 |

of the effect of urban life on suicide mortality is found in the high rates of southern cities in the United States, although southern states have extremely low rates. Very high rates are found on the Pacific coast.

There have been many erroneous generalizations as to the effect of the weather on the suicide rate. In the United States suicide rates are highest in the spring; the rate rises from January through April, reaching a peak in May. Beginning with June through the summer, autumn and early winter suicides decrease, until the lowest point is reached in December.

The existing data on the relationship between economic status and suicide are scanty; but a few scattered European and American studies seem to show that suicide predominates at both ends of the social and financial scale. The rates are highest among the wealthy; but among the laboring classes, skilled and unskilled, suicide is most frequent among those nearest the poverty line. An abrupt loss of wealth and position is a destructive psychological experience and is provocative of self-destruction. Thus it follows that suicide rates, especially among males, tend to rise in times of business depression and to fall

when prosperity comes. An exception to this general rule is that the suicide rate rose steadily from 1925 on, even during years when business was flourishing. The recent upward trend in suicide was probably accelerated by the economic crisis, but it is not the result of economic stringency alone. There is no simple causal relationship between the two; suicide is a highly complex reaction to many interlocking factors.

Although economic stress and group attitudes influence the amount of suicide and cultural patterns act as inhibiting or encouraging forces, the personal factors which lead men to self-destruction are important underlying factors. Suicide is a reaction to problems that apparently cannot be solved in any other way; it is the final response which a human being makes to inner emotional distress. The motives behind it are as varied as the number of people who seek this method of escape. Hardships of various kinds, like unemployment, poverty, hunger and other deprivations; ill health, mental abnormality, physical pain and deformity, often induce thoughts of suicide. The loss of honor, position, freedom or love as well as failure with its accompanying feeling of inadequacy, disgrace, sex

difficulties and tangled personal relationships make death seem necessary as an escape. But ordinarily no one of these alone would drive a person to suicide unless he were already harassed by a serious emotional conflict. Usually external events merely intensify latent disturbances and provide the immediate provocation in any given case.

To understand suicide therefore one must uncover the basic causes of psychic conflict. The usual explanations given in suicide notes cannot be accepted, because they are rationalizations covering up powerful buried impulses. Abnormal grief at the loss of a loved one, jealousy, marital difficulties, infidelity, desertion, family discord, pride, remorse and shame are but symptoms of difficulty in personal adjustment. Far more fundamental forces are fear and anxiety, feelings of inferiority, hatred, aggressiveness, revenge, guilt and the other mental disorders that prevent people from attaining emotional maturity. Psychoanalysts, who have given the most satisfactory explanation of how these emotions drive individuals to despair and suicide, have shown that the way to prevent them from ending in self-destruction is to build up each personality through self-discipline so that it can adapt itself readily to life's demands. The individual who is able to accept the exigencies of fortune with equanimity will not find it necessary to choose suicide as the only solution of seemingly insurmountable difficulties.

SULEIMAN I (The Magnificent) (1494-1566), Ottoman sultan. Suleiman I succeeded his father, Selim I, in 1520 and inherited from him a most efficient military organization. His task was to keep the army employed, to exclude powerful enemies and to enlarge the boundaries of his dominion. Ten times during his reign he led the complete army into Europe and three times into Asia. His victorious fleets sailed as far as Morocco and India and he annexed Hungary, Tunis, Algeria, Tripoli, the Yemen and Mesopotamia. In 1536 he agreed with France upon rights of extraterritoriality for the French in Turkey and thereby inaugurated the modern system of Turkish capitulations.

The greatest achievement of Suleiman's outstanding rule was the perfection of the governmental organization, so that in spite of feeble leadership, internal decay and the growth of powerful enemies the Ottoman Empire was able to endure substantially unchanged for three centuries. It is impossible to discriminate precisely between what he found and what he added. Under Suleiman virtually the entire structure of the Ottoman power at its height depended upon two administrative institutions, the "Ottoman ruling institution" and the "Moslem institution in the Ottoman Empire." The former attended chiefly to the tasks of war and administration and was composed of about eighty thousand persons, almost exclusively Christian by birth and slave by status. They were recruited from captives and purchases in the market, supplemented by the regular *devshirmeh*, or levy, by which ten or twelve thousand boys were recruited every four years, chiefly from the Greek, Albanian and Slavonic Christians of southeastern Europe. About one tenth

of the recruits were trained for administrative tasks, the others for the army; the more intelligent became generals, admirals, governors and ministers of state. The chief administrative official under the sultan was the grand vizier, who with a dozen high officials constituted the divan, or supreme administrative council.

The members of the "Moslem institution," concerned with law and education, were almost exclusively Moslem born and were educated in Islamic law, the more capable becoming professors in the legal-theological schools, cadis, or judges, and muftis, or legal counselors. Suleiman reorganized this educational system, particularly by establishing schools of university grade, and he regulated the hierarchy of judges and counselors. Promotions and demotions in the two great institutions may be said to have been his principal task.

The Turks call Suleiman *El Kanuni*, or "the legislator." He is credited with several codes, or *Kanunnames*, relating to Egypt, to police and markets, to the subject Christians and to the feudal system. Most of these laws appear to have been simplifications of practise and readjustments demanded in a prosperous and growing community. Like his great predecessors, Suleiman was a poet, a patron of literary and holy men and a founder of many famous buildings.

SULLY, DUC DE, MAXIMILIEN DE BÉTHUNE (1560-1641), French statesman. Sully was born in Rosny and from his youth was one of the most intimate companions of the future Henry IV, who enlisted him in the service first of the government of Navarre and then of France. He was secretary of state, chief inspector of roads, superintendent of finances, governor of Poitou, duke and peer of France and fulfilled the functions of a prime minister until the king's death. In 1611 he was dismissed and retired from active politics except to give support to his Protestant co-religionists.

Sully was an agrarian in the fullest sense of the term. He believed that cattle breeding and agriculture constituted the only true wealth of France. He therefore encouraged land clearing, undertook irrigation projects and constructed roads and canals. He pursued this passion for agriculture to such an extent that he even vainly opposed the attempts of Laffemas to establish silk manufacturing as well as all other measures favorable to industry.

His principal work was concerned with financial administration. He reconstructed an administration which had been dislocated by thirty years of civil war. He established a rigorous control, which made it possible for him to save a portion of the royal receipts; he set up an account of the general and particular revenues and expenditures, centralized as far as possible the collection of tariff duties and consolidated one portion of the debt and refunded another. The economy realized in the reduction of the public debt and in the correction of abuses served to provide for the protection of the national frontiers and to furnish the army with an effective artillery. As a servant of the crown Sully contributed to the consolidation of the royal power. With somewhat different ideas he was engaged in the same task as that pursued later by Richelieu, Mazarin and Colbert. His political and economic ideas as well as the record of his ministry are revealed in his *Mémoires des sages et royales oeconomies d'État de Henry le Grand* (4 vols., Amsterdam and Paris 1638-62; reprinted in Collection . . . des mémoires relatifs à l'histoire de France, 2nd ser., vols. i-ix, Paris 1820-21; tr. by C. Lennox, new ed. London 1856). This history of his ministry is not beyond criticism, for it is poorly written and abounds in unreliable documents. Sully falsely attributed to Henry IV the Grand Design whereby Europe was to be organized on a federal basis with a supreme court of arbitration and a council presided over by France. This project did not exist outside Sully's imagination, but he did not hesitate to falsify documents to this end just as he had no scruples about enriching himself in the service of the state.

SUMMARY JUDGMENT, as its name implies, is a judgment summarily rendered in a civil action without the lengthy formalities of the ordinary lawsuit. It represents a special form of procedure developed in England and the British colonies and adopted in some of the American states by statute or rule of court.

Although it is generally advocated in the United States as one of the most important of modern procedural reforms, the procedure is not a new legal development or one unique in Anglo-American law. It has in fact a long history in continental procedure. In the early Romano-canonical practise the popes had been accustomed to enjoin the judges whom they appointed to dispatch the simpler, smaller and more pressing cases without the formalities of the ordinary procedure, and in the year 1306 Pope Clement v issued his famous statute *Saepe contingit* establishing a simple procedure for such cases, which were initiated orally and subject to direct control of the judge, who was given authority to reject dilatory exceptions. This *Clementina saepe* was of great importance in its influence on later law, provisions for summary and simple procedure existed in mediaeval law and are still applied in modern continental European countries, including Germany, Austria, France and Italy.

A summary procedure was developed also in South Carolina and Kentucky and in several other states as a result of emigration from Kentucky, but these ventures did not survive the adoption of modern procedural codes. An early motion procedure in Virginia, copied in West Virginia, did, however, survive and has recently been expanded.

The essence of summary procedure as developed on the continent of Europe has been a simple, mainly oral, practise controlled by the judge, with the entire case being quickly heard and disposed of. This was, however, at variance with the whole spirit of English common law pleading, which was devoted to the objective of obtaining by successive formal steps of the parties an issue affirmed by one side and denied by the other. While this objective may not originally have been due to the institution of trial by jury, yet the latter gave it its great force and all pervading importance. Since the jury was not to be confused by complicated issues, it was necessary to have a system of successive

steps of pleading whereby the parties themselves by assertion, admission, counterassertion and denial stripped away the non-essentials or undisputed points. Any procedure which dispensed with this orderly progression was therefore foreign to the common law. It is noteworthy, however, that the original development of equity procedure, with its informal appeal to the chancellor, was in the summary form ordained by the *Clementina saepe*. But equity in time became as rigid a system as the common law. A summary procedure seems to be one of the ways in which a court system that has solidified through long observance of administrative rules is again brought back to efficient action.

The modern summary judgment was introduced in England in 1855 in actions upon bills of exchange and promissory notes, and in 1873 it was greatly extended to include actions for the recovery of debts or liquidated demands and those between landlord and tenant for the recovery of land. It then spread to the English colonies, Ontario developing a practise outstanding in its extent and simplicity. The English rule was adopted in the District of Columbia in 1873, in New Jersey in 1912, in Michigan in 1915, in a much more limited form in New York in 1921 (since twice extended) and thereafter also with modifications or extensions in Connecticut, Massachusetts, Rhode Island and (effective 1934) Illinois. A few other states, such as Virginia and Pennsylvania, have a somewhat analogous practise, while yet a few others provide for summary procedure against certain persons, such as public officials and co-sureties for any amounts due.

Following the English model the tendency has been to limit the procedure to actions on claims generally of a liquidated nature, although the Connecticut and amended New York rules follow the Ontario model in adding various other types of action dealing with real and personal property. Under the practise after the action is instituted the plaintiff moves at once for judgment, supporting his motion by affidavit showing the facts and asserting that there is no defense (in Ontario the plaintiff need not file an affidavit). Thereupon unless the defendant by counteraffidavit shows explicitly that there is a real defense and thus a question to be decided by trial, judgment is entered summarily in favor of the plaintiff. Under the earlier provisions it has been held that questions of law cannot be tested by the motion nor can judgment be entered

summarily for a defendant who shows that he has a complete defense. More recent provisions expressly make the procedure available in these cases.

In England the procedure has been so effective that four out of five judgments rendered are on motion for summary judgment. In the United States there has been considerable hesitancy on the part of judges in granting the motion, since they fear to deprive a party of his right to trial upon a defense asserted by him. In New York a determined attack was directed against the practise on the ground that it was unconstitutional, in that it deprived a defendant of his constitutional right to a trial by jury. But the courts have uniformly sustained the practise on the theory that a defense shown to be false may be stricken as sham, thus leaving the action in a situation where essentially a default judgment may be entered. The procedure is now being used more frequently in New York City, where it has been estimated that the time of three trial court judges is saved. With the trial calendars in arrears, at times as much as for two years in jury cases, there is special need of the practise in order that justice be not delayed so long as to be in reality denied. The safeguards for a defendant who has a real defense seem adequate.

Since the summary procedure forces the opposing party to disclose at once any defense he may have, it partakes somewhat of the old equity procedure of "discovery," which has been now generally authorized by statutes. The discovery procedure is, however, generally hedged about by two serious limitations: first, that discovery is had not by oral questioning of the opponent but only through formal and inflexible written interrogatories; second, that it may be had only of matter supporting the movant's own case and not of matter supporting the opponent's case. The limitations seem to be due in part to the sporting theory of justice, whereby a party may conceal his case until he discloses it by surprise attack. A reason usually assigned, however, is the increased disposition to perjury if the case which must be overthrown is known in advance. On the other hand, there is increasing recognition of the fact that perjury is not prevented by any purely mechanical means and that justice is aided by the greater knowledge of the parties and the court concerning the dispute. As urged by students of the subject, discovery seems therefore a proper adjunct of the summary judgment. Moreover in addition

to expediting litigation in the many formal situations where, as judicial statistics show, the overwhelming majority of cases results in judgments for the claimants, both are advances toward what is perhaps the next most important step in civil procedure reform—the development of some device more or less automatic in operation to sort the cases so as to send them to those parts of the court which can most properly dispose of them.

SUMNER, CHARLES (1811-74), American statesman. Sumner played a central part in American politics from his entrance into the United States Senate from Massachusetts in 1851 until his death. The questions in which he participated most actively were concerned with slavery, the Civil War, reconstruction and foreign relations. In the field of domestic affairs he became notable for the decided stand which he took against the Fugitive Slave Law of 1850, the Kansas-Nebraska Act of 1854, secession and efforts to compromise in 1860-61 with the Confederate states. After the southern states left the Union he developed his theory of reconstruction, which was based on the idea that the states in seceding had become *jefos-de-se*. Therefore he held that in fact they had resumed the status of territories and that their readmission into the Union was subject to determination by the legislative department of the govern-

ment. As conditions precedent to readmission they should grant equal civil, political and social rights to the Negroes. This stand brought him into opposition to President Lincoln's reconstruction policy and into bitter conflict with President Johnson. Ultimately Sumner had his way, and perhaps he more than any other man was responsible for the course of reconstruction in the South.

During the Civil War Sumner, as chairman of the Senate Foreign Relations Committee and by means of a voluminous correspondence with many powerful friends in England, threw his influence on the side of maintaining peace with that country. After the war, however, he insisted that England, by recognizing southern belligerency and by failure to maintain a strict neutrality, had been responsible for doubling the duration of the conflict and hence was morally, and by inference legally, liable to the United States for the sum of about \$2,000,000,000. This attitude dismayed and angered the English authorities to such an extent that it is altogether probable that the *Alabama* claims could not have been peacefully adjusted had not Sumner been removed by his party associates from the chairmanship of the Foreign Relations Committee, incidentally not so much because of his bating of the English as because of his bitter attack on President Grant's attempt to bring about the annexation of Santo Domingo. After this humiliation Sumner's influence declined rapidly and his support of Horace Greeley, the Liberal Republican and Democratic candidate in the presidential election of 1872, caused the severance of his connection with the Republican party, in whose councils he had figured so largely since its organization.

SUMNER, WILLIAM GRAHAM (1840-1910), American economist and sociologist. Sumner graduated from Yale College in 1863 and then studied at Geneva, Göttingen and Oxford. After a tutorship at Yale in 1866 he was ordained as an Episcopal clergyman and served in that capacity in New York and in Morris-town, New Jersey. In 1872 he returned as

professor of political and social science to Yale, where as a compelling teacher and a dynamic publicist he exercised very wide influence.

Sumner was an unequivocal exponent of the doctrines of economic individualism in their most extreme form. He condemned socialism and trade unionism, social legislation including child labor laws and legislation for the eight-hour day, and governmental efforts to control monopoly, such as the Interstate Commerce law, on the ground that such measures interfered with the natural laws of supply and demand. Through public addresses and widely circulated tracts he became one of the most prominent leaders of the agitation for free trade and sound money. The slogan of "the forgotten man," which gained wide currency through its use by Franklin D. Roosevelt during the presidential campaign of 1932, was originally coined by Sumner, in the course of his vigorous polemics in favor of *laissez faire*, to characterize the individuals who bore the costs of the protective tariff, of governmental social services and of the increased wages secured through trade union activity. His was a stark, drastic, social Darwinian philosophy unrelieved by any concession to humanitarian sentiments, which he ridiculed. Defending what he designated as the sacredness of private property in its industrial uses, he criticized plutocracy as manifested in the use of political power by capital; he declared it, however, to be an inevitable result of the baneful extension of control by the state over industry, and he opposed any attempt to curb it by legislation. The Spanish American War he regarded as a blunder in statecraft and he attacked the imperialism involved in the subjection of Cuba. In his many controversies he used none of the arts of the diplomat but was blunt, uncompromising and overtly partisan.

After 1890, following an illness, Sumner withdrew from active political agitation and devoted himself largely to sociology, which he preferred to designate the science of society. Under the influence of Spencer's *Principles of Sociology* and Lippert's *Kulturgeschichte der Menschheit* he compiled from library sources the vast collection of anthropological data on the origin and evolution of social institutions which formed the content of his *Folkways* (Boston 1907) and which was used by him and his disciple and successor, A. G. Keller, as the basis of their *The Science of Society* (4 vols., New Haven 1927-28). *Folkways* ranks as one of the most influential works in American sociology. Although it is not

a systematic treatise, it added to the vocabulary of sociology such terms as folkways, mores, in-group and out-group and ethnocentrism and furnished valuable descriptive materials. The book, however, applied no original method; Sumner was scornful of emphasis on methodology and in particular denied the applicability of the statistical method to the subject matter of the social sciences. *Folkways* likewise formulated no original concept but merely elaborated the theme, familiar since Montaigne, of the variability of custom in time and space, the lack of rationality in human sanctions and the exaggerated value placed by members of each social group on the merit of its own behavior. Its chief contribution was in its analysis of the mores as a superorganic system of relations, conventions and institutional arrangements, sanctioned as conducive to societal welfare, which were by origin chance products of a long series of minute trial and error adjustments to physical, social and supernatural environments, dictated by needs and motivated by hunger, sex passion, vanity and fear. Believing that the mores functioned through individuals without coordination by any formal authority, Sumner found his theories of the origin and nature of social institutions consistent with his advocacy of *laissez faire*.

SUMPTUARY LEGISLATION is the term applied to ordinances which regulate the private expenditures of individuals. A representative ex-

pression of paternalism in government, they are based sometimes upon economic but more often upon social and moral considerations. They are enacted generally when customs and conditions of life are changing and are intended to correct departures from more ancient ways. Directed against the outward manifestations of economic transition, sumptuary laws are always difficult to enforce, for the extravagances which they attempt to curb are reflections of fundamental transformations in social life rather than causative factors themselves.

Laws regulating expenditure appear at an early date in the written history of European countries. Among the laws of Solon, who reformed the constitution of Athens about 594 B.C., one provided that a bride, in addition to the dowry given to her husband, could not take with her personal ornaments beyond three robes and certain minor articles of furniture. Funerals were to avoid excessive display, and prices were fixed for the animals used in public ceremonies. In Rome the increase of wealth which followed the conquests endangered the equalitarian social system; the sumptuary legislation of the republic was an attempt to force a return to the early simplicity of the Romans and to prevent the embarrassment of the poorer citizens by the extravagances of the wealthy. The laws of the empire were induced by the nobility, who saw in the enormous wealth of the capitalists a threat to their own influence. According to the Oppian law of 215 B.C., in force for some twenty years, a woman could not possess more than a half ounce of gold or a dress made of different colored materials and was forbidden to ride in a carriage within a mile of a city or town unless she were en route to a public sacrifice. Down to the time of Augustus Caesar the rules were concerned for the most part with entertainments and expenditure for food. Tiberius, Nero and their successors attempted to check the increase of luxury in dress, ornaments and food but with apparently little or no effect.

During the later Middle Ages and early modern times sumptuary legislation reached its most extensive development. Governments which regulated minutely the economic life and the status of their citizens naturally considered it within their province to control expenditure and consumption, whether in order to encourage savings, domestic industry and class distinction or to prevent the moral decline which high living was sure to induce. Sumptuary legislation appears very early in mediaeval times but is es-

pecially prominent in records dating from the thirteenth century until the close of the eighteenth, a period during which the feudal and guild systems declined and capitalism developed. Many of the laws were accordingly directed toward the maintenance of fast disappearing class differences in dress and manner of living. Other ordinances, forbidding the wearing of foreign apparel, were due as much to the inspiration of mercantilist theory as to a horror of strange fashions and extravagances. Legislation of this sort was to be found in all the principal countries of western Europe, although there was wide variation as to origin, content and methods of enforcement. The lawmaking power was sometimes national, as in France and England, or local, particularly where central authority was less effective, as in the cities along the Rhine and in Switzerland. In France under the *ancien regime* the ordinances extended from 1294 under Philip the Fair to the close of the reign of Louis XIV, nearly one third of them being issued by the latter monarch. In both English and French laws there were many similarities, including prohibition of various precious stones, velvets and silks for certain classes and limitation of expenditure for clothing according to rank, income or both. The English laws have a stronger economic tinge, as shown in prohibitions of foreign goods or occasionally in a direct command to wear English fabrics, such as woolen caps, or to use woolen shrouds for burial. In England sumptuary legislation was of much shorter duration than in France, extending from Edward III to James I, under whom it was finally repealed in 1604. Although subsequent regulations in England forbade the use of certain foreign materials, their function was obviously protective only in an economic sense and they were by no means intended as a prohibition of extravagant spending.

In addition to the decrees of emperors and diets sumptuary laws were passed by city councils in central Europe and Italy. These vary in detail but all conform to prevalent conceptions of political duty. They were designed explicitly to restrain extravagance, which was considered not only displeasing to God but economically ruinous to individuals, to encourage patriotism by requiring the wearing of the national costume and to maintain class distinctions by regulating the cost and material of clothing for each class.

The powers enjoyed by city governments explain the important position of sumptuary rules in their legislation. In independent towns like

Basel, Berne or Zurich the city council had the powers of the ruler of a sovereign state; the regulation of funerals, christenings, wedding gifts, banquets, prices of clothing and similar matters is part of a conception, frequently expressed in preambles to the laws, of the patriarchal right and duty to oversee all activities of the citizens. Much interesting light is shed on social habits by the itemized regulation of private expenditure for dress: many precious stones were forbidden; and there were restrictions upon the use of velvets, satins and silks and gold thread. City councils even went so far as to prescribe the length of certain garments, the number of flounces, width of lace, length of shoe points or height of bonnets. Arguments in support of the law were often found in external events. The sins of the people had brought on hard times, misery and disaster. The earthquakes of the early sixteenth century served as a warning text for more than fifty years, and the belief in an interfering Providence was incorporated into the acts of city councils. Up to the end of the eighteenth century sumptuary ordinances were frequently reenacted; for the Reformation had no effect on details but merely provided a stronger religious motive. Modifications indicate changes in fashions: some articles were no longer forbidden, while others were newly proscribed.

In England the administration of sumptuary laws was in the hands of sheriffs, justices of the peace, mayors and aldermen, so that there was wide dispersion of responsibility. The records are so scarce that only the preambles to the laws and the complaints in literary publications serve to indicate that they were indifferently obeyed. In Switzerland before the Reformation execution was entrusted to the ecclesiastical courts which had jurisdiction over marriage laws. Later sumptuary laws were enforced in the cities by a small tribunal, a *Reformationskammer* or a *consistoire*, whose membership was chiefly secular and which continued in operation down to the French Revolution. Penalties were entirely monetary. In Basel, Berne and Zurich the courts consisted of eight to thirteen persons drawn from the highest officials and the ranks of respected citizens. Their duties covered not only costume and festive expenditure but also profanity, absence from church, Sabbath observance, dancing and various other matters. Records of these courts are incomplete, but in the archives of Basel a docket of its Chamber of Reform covers the years from 1674 to 1796 and in

Zurich there are records for the eighteenth century. A statistical study of these records presents a picture which fits any country where sumptuary laws were enacted. Periods of high activity alternate with times of little or no action. The growth of wealth made it practically impossible to enforce such laws. Statutes repeat their stiff rules to the end; but sumptuary prosecutions gradually fade out, until the rare sittings of the courts are wholly taken up with other matters. The eighteenth century with its doctrines of individual liberty and its leanings toward economic freedom finally sealed the doom of sumptuary law. Class distinctions persist in life, but they are evidently sustained by other social forces.

In New England such laws had appeared at an early date and displayed the same spirit as those of Europe, made more emphatic, however, by the Puritan sentiment, which regarded ornament as a sin as well as an extravagance. These statutes, however, form but a small part of the so-called blue laws, for the colonists devoted more effort to the eradication of profanity, desecration of the Sabbath and heresy. In Massachusetts the enactment of sumptuary laws extended from about 1634 to 1676, and at that time in spite of repeated efforts at enforcement the courts were already beset with widespread disobedience. The laws did not embody such detailed regulation of dress as did those in Europe, but they expressed a similar desire to maintain distinctions between an upper and a lower class.

Sumptuary laws are sometimes compared with modern tariffs and excise duties on luxuries; but the motives of the latter are revenue and the protection of industry, not the prevention of extravagance. They are effective in restricting the use of expensive merchandise by the less affluent classes, as in the case of automobiles and gasoline in various European countries, but their desirability has become a fiscal rather than a social question. Laws restraining and forbidding the use of liquor and tobacco have more kinship with sumptuary legislation, for they are based upon the same principle, the protection of individual and public welfare and morality.

SUN YAT SEN (1866-1925), Chinese nationalist and political theorist. Sun Yat Sen was born near Macao, south China, and was educated in village schools and in Hawaii. He became a Christian and attended the medical schools at Canton and Hongkong from 1885 to 1892. After a brief period of medical practise he identified himself with the revolutionary movement against the Manchu dynasty and despite tremendous obstacles carried on revolutionary propaganda among Chinese students and merchants overseas and inspired the organization which succeeded in establishing a republic in 1911. He was the founder and recognized leader of the Kuomintang (*q.v.*), or Nationalist party, which after the revolution of 1926-27 set up the Nationalist government at Nanking.

Sun traveled widely as both a political refugee and an agitator, and he studied political and economic conditions in western countries and the literature concerning them. As early as 1900 he began to formulate his political and social doctrines, fully expounded in his published writings of later years, in which he endeavored to combine what he believed best in western and in Chinese social thought and experience. He possessed considerable insight into his country's condition and problems and knew the temper of his people, but he was not a deep or thorough scholar and his literary work is marred by not a few inconsistencies, unverified statements and general abstractions for mere effect.

In 1918, in his *Chien kuo fang lueh* (A program of national reconstruction), Sun called for three types of reconstruction—psychological, social and material. The psychological involved a reversal of the old Chinese philosophy that

"knowledge is easy but action is difficult." Sun felt, on the contrary, that exact scientific knowledge is most difficult to attain and that it must precede effective and progressive action. Material reconstruction meant the modernization of China through new systems of communication and development of the nation's rich resources. His famous "Three Principles"—nationalism, democracy and livelihood—were interpreted at length in lectures delivered at Canton in 1924 (*San mün chu* 1). The book was widely circulated and had a profound effect. China must secure national unity and an equal place in the family of nations, and this was to be achieved both by a revival of its old racial and national spirit and by a frank recognition of the serious dangers which China faced within and without. While an ardent advocate of political and social democracy, Sun repudiated the theory of natural equality: the republic should find suitable place for men according to their varying endowments. Liberty had been the watchword of western revolutions but China should struggle for national rather than for individual freedom. To avoid the weaknesses of western democracy Sun proposed a new kind of balance between popular sovereignty and the "government of experts" whereby the people should be given the suffrage, initiative, referendum and recall while the government should exercise the legislative, judicial and executive powers familiar in the West and in addition two other functions modeled upon historic institutions in China—a civil service branch for selection of officials and an independent censoring or impeaching branch.

Sun's doctrine of the "people's livelihood" was a moderate form of socialism. He emphatically opposed class war and rejected Marx' materialistic conception of history for what he called, following Maurice William, the "social interpretation." Capital and labor must seek harmonious cooperation. The state must see that all people are provided with food, clothing, shelter and adequate means of communication; to this end there should be regulation of private capital through various types of social legislation. Sun spoke of a communism of the future but objected to Russian communism as ill suited to China's needs. A phrase from the Confucian classics, "All under heaven will work for the common good," became Sun's favorite description of the ideal state and a popular slogan of the revolution which began in 1926. In his *Chien kuo ta kang* he describes the three stages on China's road from revolution to complete de-

mocracy: a military stage, during which the country is to be unified; then a period of political tutelage; and, finally, a constitutional era. In his "will," or final message to the Chinese people, dictated upon his deathbed, he reviewed his forty years of struggle and urged his compatriots to work for the realization of his dreams.

Sun attracted to himself and to the revolutionary cause an extraordinary number of able and devoted followers, firing their imaginations with his visions of the new China and compelling loyalty and self-sacrifice by his own patriotic ardor, perseverance and integrity of character. But he was more of a political prophet than a practical statesman and administrator, never seeming fully to appreciate the difficulty of realizing his vast ideas. He set the patterns of political ideology which largely control public opinion and state education in China today and laid important foundations for the new social and economic structure which is slowly emerging. He was the most influential single figure in China's awakening and transition to a modern state; his prestige has grown steadily since his death and his tomb at Nanking has become a national shrine.

SUNDBÄRG, AXEL GUSTAV (1857-1914), Swedish statistician. Sundbärg studied at the University of Uppsala, where he developed an

interest in statistics. In 1880 he joined the permanent staff of the Central Bureau of Statistics of Sweden. While the scope of his studies covered a wide field of statistical inquiry, his main interest centered in demography. Sundbårg was influenced particularly by the work of Eilert Sundt, whose law of the flow and ebb of births he elaborated. Among other works Sundbårg investigated early Swedish demographical material dating back to 1749 and by the use of ingenious methods of calculation succeeded in correcting and supplementing the old population tables. He published the essential results of his researches in *Statistisk tidskrift* and also in his *Bevölkerungsstatistik Schwedens 1750-1900* (Stockholm 1907), which he prepared on the occasion of the Fourteenth International Congress of Hygiene and Demography in Berlin in 1907. Sundbårg took an active interest in international statistics and from the year 1895 published a survey of international statistics at first in *Statistisk tidskrift* and later in the form of a separate publication, *Aperçus statistiques internationaux* (2 vols., Stockholm 1906-08). At the behest of the Swedish government he prepared for the international exhibition at Paris in 1900 *La Suède* (Stockholm 1900), a statistical manual of the country and population of Sweden; this was followed by a Swedish edition in 1901 and in 1904 by an English edition (2nd ed., 2 vols., 1914).

In 1910 Sundbårg resigned from the Central Bureau of Statistics to occupy the new chair of statistics at the University of Uppsala. He was entrusted by the government with the study of emigration, a problem of great significance in the economic life of Sweden. His work not only yielded a wealth of economic and population statistics but contained a brilliant although much disputed description of the national character of the Swedish people.

E. AROENIUS

Other important works: *Bidrag till utvandringsfrågan, från befolkningsstatistisk synpunkt* (Contribution to the emigration question from the standpoint of population statistics), Uppsala University, Årsskrift, 1884, no. 4, and 1885, no. 3, 2 vols. (Uppsala 1885-86); *Utvandringsstatistik* (Emigration statistics), and *Det svenska folklynnet* (The Swedish character), Sweden, Statistiska Central Brydån, Emigrationsutredningen, nos. 4 and 16 (Stockholm 1910-11); *Sveriges jordbruk, vid 1000-årets början* (Swedish agriculture at the beginning of the twentieth century), in collaboration with W. Flach and H. Juhlin-Dannfelt (Göteborg 1909).

SUNDT, EILERT LUND (1817-75), Norwegian sociologist, statistician and social reformer. After studying theology, Sundt became interested in Norwegian gypsy and vagrant types, and in 1847 began to study them from the ethnological, linguistic and sociological points of view. In 1850 he published the results of his investigations in a valuable book, *Beretning om fante- eller landstrygerfolket i Norge. Bidrag til kundskab om de laveste samfundsførholde* (Report on the gypsies or vagabonds in Norway. Contribution to a study of the lowest social class, Christiania 1850, 2nd ed. 1852), which led the government to appoint him to study the increase of pauperism in Norway as well as social conditions in general. From 1850 to 1868 he wandered through the country investigating the life of the poorer classes.

Besides a new series, *Beretninger om fante-folket* (4 vols., Christiania 1859-65) he published a number of works, chiefly concerning the population in the suburbs of Christiania and the health, mortality, hygienic conditions, marital customs and moral habits of the poorer Norwegians. His later books, one of the most important of which is *Om husfliden i Norge* (Domestic industry in Norway, Christiania 1867), deal especially with what he called Norwegian industries, such as house and shipbuilding, fishing, clothing and home crafts. In these studies Sundt did pioneer work in social statistics and in many phases of population statistics for Norway. His writings, although popular in style, were based upon sound scientific research. One of the best known is *Om giftermål i Norge* (Marriage in Norway, Christiania 1855).

Sundt's originally pessimistic reaction to the poverty and degrading conditions with which he came in contact gradually gave way to a more optimistic view. He came to believe that the growth of immorality had its basis in the increasing pauperism of the people but held that this might be counteracted by education and self-help. The Kristiania Arbeidersamfund (Workers' Corporation), which he founded in 1864 and of which he was president until 1870, organized lectures, a library, sick benefits and other activities and provided great impetus to the establishment of similar societies in other cities. Sundt was also a founder of the Norwegian Society for the Advancement of Popular Education and from 1857 to 1866 was the editor of its review, *Folkevennen* (The people's friend).

SUPILO, FRANO (1870-1917), Croatian politician and publicist. Supilo began his journalistic and political activities at an early age. In 1900 he became the editor of the *Novi list* (New Journal), a nationalist organ published in Fiume, which advocated the political, propagandistic and organizational methods of Mazzini and the Italian socialist movement. Within a short time the journal had become a nationalist nucleus, one of the most important political periodicals in Croatia. Through it Supilo spread his doctrines over Dalmatia, Croatia and Bosnia, giving a new orientation to Croatian nationalism by his thesis that the Serbs and Croats were one people. He strove for a union of the Slovenes, Croats and Serbs on a democratic basis and for the complete emancipation of the Austrian South Slavs. Croatian clericalism he attacked as the enemy of emancipation and the prop of spiritual enslavement. In democratic Serbia he saw a Yugoslav Piedmont, which would serve as the political and moral center of nationalist policy.

Supilo, together with Trumbić, took a leading part in drawing up the Fiume Resolution (1905) by which a Serb-Croat coalition was initiated; Croatian politics was thus given a new direction, which led ultimately to the Yugoslav state. In 1906 he was elected to the Croatian and Hungarian assembly, where he was one of the leading exponents of the new coalition, uniting also with the Magyars against Vienna. Subsequently he opposed the Magyar plans for hegemony in the administrative and political field.

During the World War Supilo, an important figure in the Yugoslav Committee, visited all the allied countries, carrying on propaganda for an independent Yugoslavia. In this task his unusually extensive connections with authoritative political personalities were invaluable. He was the first to uncover the secret understanding with Italy whereby the latter in the London Pact (1915) received important assurances that it would obtain a dominant influence in Dalmatian territory in return for entering the World War; Supilo campaigned against this scheme among the English and Russian diplomats. In

1916 he resigned from the committee because of differences with regard to plans for the internal structure of Yugoslavia. But in 1917 he supported the Corfu Declaration, which stated that the Serbs, Croats and Slovenes were one people who on the basis of self-determination wished to unite in an independent national state.

SUPINO, CAMILLO (1860-1931), Italian economist. Although he had no formal university training, Supino early acquired a considerable reputation as an economist and in 1887 he was appointed professor of economics at the Istituto Tecnico at Genoa; later he occupied chairs at the universities of Messina, Siena and Pavia. Supino's scientific interest comprised economic theory, monetary and banking problems and economics of transportation. His works on economic theory are fragmentary in nature. Of greater importance are his contributions in the field of money and banking, which include *La storia della circolazione bancaria in Italia* (Turin 1895, 2nd ed. Milan 1929), presenting a complete history of monetary circulation in Italy from 1861 to 1928, *Il saggio dello sconto* (Turin 1892) and *Il mercato monetario internazionale* (Milan 1910), in which he sought to prove that the markets for short and long term credit are not closely related and that consequently the rate of discount and the rate of interest are determined and fluctuate independently of one another—a very debatable thesis, at least in the rigid form presented by the author. In *Le crisi economiche* (Milan 1907) he offered what may be considered the best discussion of the seismology of the business cycle. Supino's most important work, however, is *La navigazione dal punto di vista economico* (Rome 1890, 3rd ed. Milan 1913), a comprehensive and systematic treatment of the economics of navigation; this is comparable to Sax' standard treatise on transportation and includes a discussion of naval construction, cost of transportation, agreement between shipping lines and of the various forms of naval protectionism. While he was generally opposed to government interference, Supino

recognized the efficacy of certain forms of subsidies to navigation. His later works include "Salario e profitto nell'economia corporativa" (*Annali di scienze politiche*, vol. III, 1930, p. 247-75), in which he displayed thorough familiarity with the theoretical problems involved in the Italian socio-economic experiment; and "Il capitale immaginario" (published posthumously in Università di Pavia, Facoltà di Giurisprudenza, *Studi nelle scienze giuridiche e sociali*, vol. xvii, 1932, p. 1-85). He regarded as imaginary capital the additional value which capital goods acquire as a result either of an increase in their productivity or of a decrease in the rate of capitalization.

SUPIŃSKI, JOZEF (1804-93), Polish sociologist and economist. Supiński studied under Fryderyk Skarbek at the University of Warsaw. Upon the collapse of the Polish insurrection of 1831 he migrated to France but in 1844 returned to Lwów, where he divided his time between the task of earning a livelihood as a minor official and pursuit of his studies in the social sciences. Because of weakening eyesight he was early compelled to retire; thenceforth he devoted himself entirely to the completion and publication of his numerous works.

Supiński's most important works are *Mysł ogólna fizjologii powszechnej* (General thought of universal physiology), a treatise on general sociology written about 1850 and published in Lwów in 1860, and the uncompleted *Szkola polska gospodarstwa społecznego* (The Polish school of social economy, 2 vols., Lwów 1862-65). Both works attracted wide attention and contemporary critics frequently compared Supiński with Bastiat and Carey. In the realm of sociology Supiński stressed the essential unity of all social disciplines and the need for an integrated science of man. Among the numerous specific problems he discussed the nature of man, the role of habit in individual behavior, the position of the individual in group life, the nature of social change, the process of social disintegration and integration and the concept of social progress. In the field of economics he

attempted to lay the foundation of a Polish school of economic theory which in opposition to the classical school was national in approach and scope and organic in its conception of society; it assigned a greater role in the production of wealth to immaterial factors, such as accumulated knowledge and skill. Supiński rejected the Ricardian doctrine of rent but accepted the Malthusian theory of population.

SUPPLY Although in such phrases as "demand and supply economics" or "the law of demand and supply" the two terms appear to be correlative, the meaning of the term is not strictly parallel or symmetrical with that of demand. While demand is commonly used to designate a functional relation between the price of a commodity and its rate of flow out of the market into use, supply means the rate of flow itself of the product into the market. Thus demand is synonymous with demand function, and the quantity demanded under given conditions must be separately specified; but supply is the quantity supplied—generally in a unit of time, hence rate of supply—and the supply function or curve must be explicitly designated. The crucial fact preventing symmetry in the usage of the two terms is that in the natural view of demand price determines quantity taken, but only under restricted conditions (perfect competition and increasing cost) and never in a parallel sense can the quantity supplied be treated as determined by price. Moreover the analysis of short run and long run relations is quite different in the two cases.

Notoriously it is this matter of varying lag of effects behind their theoretical causes which is the main source of difficulty in economic analysis generally; this is peculiarly true of the problem of supply. Demand and supply analysis has two aspects, appealing to two problem interests. On the one hand, it attempts to explain prices and other economic magnitudes "scientifically" in terms of impersonal market forces; on the other, it deals with the general problem of social economic policy, the question whether, in what

degree and under what circumstances the automatic working of market forces leads to the efficient and equitable use of economic resources in satisfying the wants of the people. Obviously this whole problem is on the practical side essentially one of the supply of means of want satisfaction. In both the practical and the theoretical connection it is necessary to take careful account of the fact that different forces working under different conditions produce movement at various rates toward positions of stability or equilibrium more or less permanent. The underlying axiom of the analysis is that in the long run the supply, or the amount produced, of any good or service must be equal to the consumption, along with the closely related principle that all resources tend to be employed at maximum yield. But production and consumption may or may not be equal in a short period of time, and the tendency toward full employment of resources at the highest efficiency operates slowly at best.

In a society where the maintenance of wealth forms a part of the physical sequence between productive activity and the enjoyment of its fruits and where both the wealth used in production and the active human beings themselves are more or less specialized in ways which it requires time to change, there is a considerable and highly variable lag between a change in consumers' demand and the ultimate adjustment of production to the new demand conditions. Moreover many productive activities, notably those of agriculture and outdoor construction, are periodic and are affected with a considerable degree of uncertainty; similarly consumption is both more or less periodic and subject to unpredictable changes. For all these reasons there can be no exact correspondence over very short periods between production and consumption. There is always a buffer in the twofold shape of stocks of consumption goods and surplus capacity of productive equipment.

Variations in the supply of any single consumption good or service are in fact connected with changes in the production and consumption of most other goods and in the use and remuneration of a considerable part of the productive resources of society. If supply is to be treated apart from the general equilibrium of an economic system, the problem must be limited and simplified by abstraction from related changes, so far as this is possible. Growth in wealth must be ignored; and effects of other "historical" movements, such as increase of

population and new inventions, are also to be eliminated. It is usual to take the case of a single commodity and, assuming consumers' incomes fixed, to consider only the effects of changes in their preferences for this commodity in comparison with others. The first effect of a shift in consumer preference is a change in the price of the commodity, upon which as cause the changes in supply follow in turn. The problem of supply is thus defined as one of the relation under "given conditions" between output and price for the individual commodity. This is the partial equilibrium method of Marshall and his followers of the neoclassical school, the only method practicable without the use of simultaneous equations and more complicated mathematical devices as a medium for exposition.

In the long run the supply of a particular commodity is the rate of its production on the assumption that all productive resources are employed in the most profitable manner. Under perfect competition this means that the marginal productivity of any productive resource is equalized in all alternatives of use, the resource being apportioned among the alternatives in such a way as to achieve this result. To the producer this means equality between the selling price per unit and the necessary elements in the money cost of producing any unit, i.e. the payments for resources which must be made to prevent their going into some other use where they would have a greater yield. These costs are distinguished from rents, which are price determined, and from pure profit, which does not exist under competition. Under monopolistic production, however, output is reduced below the competitive level, resources yield more than in competing uses and price is above cost per unit. In fact the monopolist's aim is to maximize the difference between total selling price and total cost for his output as a whole; that is, marginal cost—the increment of total cost due to producing the final unit—is made equal to the marginal revenue similarly defined. Most producers in fact possess more or less monopoly power; they are in a position to vary price and output within some range, whereas a producer under perfect competition can only produce more or less at a price over which he has no influence. In technical language, the elasticity of demand for the output of the latter is infinite, regardless of the character of the demand in the industry as a whole—a condition which requires that every producer in the industry operate at a point on his cost curve at which cost is constant.

A tolerably realistic treatment of the response of supply to a price change under effective competition must distinguish a number of elements in the process of adjustment. In the very short run—if the price change is or is believed to be a temporary fluctuation—there will be little or no change in production, but the supply in the sense of sales of the commodity and its flow into consumption will respond through a drawing down or piling up of the accumulated stocks in the hands of dealers all along the line from retailers back to producers. The role of professional speculators may be decisive in this connection, and in theory all holding of stocks must be viewed as a speculative provision for fluctuations in demand. All this applies only to a product which can be stored; in the case of a service or a consumption good which cannot be stored essentially the same effect is achieved through surplus productive capacity in the industry. If the change in demand is expected to be of longer duration, the price change will be transmitted back to producers and will appear in a rise or fall of business profits—which are a part of cost, not pure profit—away from the normal level. The next step is a tendency to expand or contract production.

Again in the process of changing production a number of elements must be distinguished, which it is well to consider roughly in the time order in which they will presumably come into action. To begin with, the intensity or speed at which resources used in an industry at a given time are worked may be changed within certain limits. And since the specialization of resources to the uses in which they are severally employed at any moment differs in degree, changes in demand, the expected duration of which is still longer than in the previous case, will be met by a movement of resources (or at least of the productive capacity of resources) of the highest mobility into or out of the particular industry. This involves using the more mobile resources in varying proportions in combination with those less mobile or more specialized. The resources transferred into or out of an industry will in the main come from or go into other industrial uses, but this is not necessarily true of all of them; production may be expanded by drawing upon resources not previously held by business enterprises or upon those which have been really idle even though formally devoted to some industrial use. The latter must be distinguished from resources deliberately held idle in speculative anticipation of fluctuations in demand: the pay-

ment for resources not demanded for making other salable products is a rent and not a supply conditioning and price determining cost. Strictly speaking, the use of resources at an increased activity rate—the case mentioned above—may itself represent a transfer of capacity from non-pecuniary use and absorption of idle capacity held speculatively or resulting from previous miscalculation of demand. In this connection there appear certain differences between the behavior of laborers and of material instruments, but most of them are differences in degree and not major differences in kind; the “irksomeness” of labor reflects competing uses of time and strength to which other instruments are also subject. There are moreover innumerable differences between types of labor and types of other agencies and still other distinctions depending on contractual relations of the productive agency and the enterprise in which it is employed.

A fourth set of changes operating over still longer periods in adapting supply (flow of product) to a change in demand (demand conditions) involves such factors as reconditioning or remodeling of equipment and retraining of laborers without loss of identity. These phenomena also admit of indefinite variation in degree and merge into the fifth and last mode of adaptation, which is the outright retirement of individual laborers or items of equipment and replacement by individuals or items of another type differently specialized. It is in connection with this mode of shifting productive capacity that a categorical difference between laborers and other productive instrumentalities is first encountered. The difference, however, is institutional rather than natural; it is due to the fact that since the human individual is legally free, laborers (in the inclusive sense) are not produced and retired under economic conditions, on the basis of capital accounting in terms of gain and loss. The transfer of the productive capacity through replacement of one item of material equipment by another of a different type can generally be accomplished without loss if and only if the occasion of change is correctly anticipated a long time in advance. It is a limitation on all economic theory as applied to long period changes that the conception of economic behavior implies accurate foreknowledge on the part of the behaving subject of all consequences, however remote, knowledge of which would influence his acts.

While changes in supply adapting it to a change in demand have been listed in a rough

order of the time within which they work out their effects, it is not possible to take these processes of adaptation separately as bases for relatively short or long period supply curves. Regarding this time relation two general statements can be made. The first is that the more permanent and more extensive a change in demand is expected to be by those who make the adaptive responses, the greater will be the predominance of the modes of adaptation given later in the order of treatment, thus in the event of a change expected to be permanent all the changes considered will begin at once and go on concurrently. A realistic supply curve must be drawn independently in both directions, increase and decrease, from a point representing an initial condition; and the two parts will not usually be continuous. The second statement possible is that the longer the period allowed for adjustment, the greater will be the elasticity of supply. This concept, analogous to that of elasticity of demand, is to be defined quantitatively as the amount of productive adjustment which will result from a given price change. Concretely it is the ratio between the relative price change and the relative change in the output of the commodity, computed for changes of negligible magnitude. The symbolic expression for the elasticity of supply is $E = \frac{dx}{dy} \cdot \frac{y}{x}$, where x is product quantity (rate of production, or supply) and y its price per unit. In view of the character of production in the large it may be said that there is practically no limit to the elasticity of supply, if adequate time is allowed for readjustment and the change is anticipated far enough in advance. Infinite elasticity of supply means constant cost. An approximation to this condition for slow changes—very slightly increasing cost—probably holds typically in industry as a whole; that is, the occurrence of productive factors specialized to particular uses and not ultimately replaceable by others differently specialized, coupled with diminishing returns in their combination with mobile factors in increasing proportions, is not a phenomenon common enough and of sufficient magnitude to play an important role.

Under perfectly constant cost in the long run a price change due to a demand change will be temporary, although it will nearly always be present during productive readjustment, for output can rarely be increased quickly without increasing cost. Actually, however, cost usually tends to increase somewhat even in the

long run, if other things remain equal; that is, if there are no changes in technical conditions and if competitive production normally obtains. For there is some specialization in resources which economic adjustment can never remove, particularly in the human factor, and in some cases natural resources are a significant limitation. A tendency to decreasing cost can result only from economies of organization which more than offset the increase in cost involved in all the phases of productive change discovered by analysis; such economies moreover must be unobtainable by expansion of an individual firm or their result would be a tendency to monopoly.

In view of these long run conditions the notion of a supply curve representing output as a function of price must be regarded as unreal. Under monopoly supply is obviously not dependent upon price as an independent variable. Under competition with constant cost at any price above the cost point an indefinitely large output would be produced and at any lower price none at all. With decreasing cost any fixed price would lead to either infinite or zero production. Under constant or decreasing cost competitive production equilibrium must be represented as equality between price and cost, each dependent on output, not as equality between supply and quantity demanded viewed as functions of price.

* Thus far supply has been treated as the continuous flow of a product from production or out of accumulated stocks into the market. This is the problem which is of general interest in the study of economic organization. A special problem of supply and of demand and supply equilibrium arises in a market isolated in space and time, as in the case of a local daily market for perishable produce or of a market for a crop which is not imported or carried over when a year is taken as the unit. In application to such markets the notion of a variable supply based on reservation prices, which is often employed, has little justification. For the owners of supply have generally produced it for sale and have little possibility of making use of the product themselves if it really cannot be held over for more favorable conditions in the same market or transported to another market locality. In so far as isolation is effective, the supply is typically an approximately fixed amount rather than a function of price, and the equilibrium price is the highest price at which demanders will take this supply out of the market. If isolation is imperfect, holding over or removal to another center is

likely to be a specialized function of speculative dealers rather than of producers themselves. Such dealers will figure in the perishable produce market on the side of demand rather than of supply when and where there seems to be an excess of the product, becoming a source of supply when conditions are reversed. The phenomenon comes then under the head of short period variations in flow of commodities to market discussed above. In the market for agricultural staples the demand of producers for their own produce is again generally inconsequential. Wheat or cotton growers, for example, have reservation prices only on their output chiefly because they really speculate to the same effect as specialists in that field. In general the short run theory of supply, in the sense of variations independent of changes in production, is merely the theory of speculation; but it is never more than a relatively small thing in comparison with the speculation to which production itself is necessarily subject.

FRANK H. KNIGHT

See DEMAND, COST; PRODUCTION, DIMINISHING RETURNS, INCREASING RETURNS, MONOPOLY, VALUE AND PRICE, PRICES, section on THE PRICE SYSTEM.

SUPREME COURT, UNITED STATES. The legislative history of the United States Senate began with a bill to implement article III of the federal constitution, providing for the establishment of "one Supreme Court" and "such inferior courts as the Congress may from time to time ordain and establish." The scheme for a federal judicial establishment, of which the chief architect was Oliver Ellsworth, himself a future chief justice, became law on September 24, 1789. There were many contenders for the chief justiceship and the five associates for which the first Judiciary Act provided, and not until February 1, 1790, was the day set for the organization of the court. Even then a majority of the court were not able to reach New York and the first formal session of the court could not be held until the following day. From then on for a period fast approaching a century and a half the Supreme Court has maintained unbroken its very special relation to the constitutional scheme of American society, although during the first three years practically no business came before the court. The Supreme Court mediates between citizen and government; it marks the boundaries between state and national authority. This tribunal is the ultimate organ—short of direct popular action—for adjusting

the relationship of the individual to the separate states, of the individual to the United States, of the forty-eight states to one another, of the states to the union and of the three departments of government to one another.

A tribunal having such stupendous powers inevitably stimulates romantic interpretation. Men of learning on both sides of the Atlantic have characterized the Supreme Court as the great political invention of the framers of the constitution and have appraised it as their most successful contrivance. The most successful it is, but the claim of originality must be denied. Certainly neither the presidency nor the Congress has better withstood the fluctuating winds of popular opinion than the Supreme Court. Despite intermittent popular movements against it the court is more securely lodged in the confidence of the people than the other two branches of the government. But the establishment of the court was not a fruit of the creative intelligence of the federal Constitutional Convention. It was a continuation of means for adjustment which the colonies first and then the thirteen sovereign states and finally the Confederation had evolved. The various controversies, most of them regarding boundaries between different colonies, had to be settled, and partly they were settled by the Privy Council. After independence these controversies did not cease. To them were later added difficulties between the states and the Confederation. At first the Continental Congress tried to adjust these conflicts, but eventually it became necessary to set up a technical judicial tribunal, the Court of Appeal. Not merely the recognition of the need for a body to compose the difference between the states *inter se* and between the states and a central government but the practical response to that need evolved by the predecessor of the United States dictated the necessity and furnished the materials for the Supreme Court which the constitution outlined and the First Congress established. At least one litigation that began during the Confederation before its Court of Appeal had its final stage before the Supreme Court. In effect the Supreme Court constituted not the invention of a new institution but the perpetuation and perfection of an old one.

Indeed some mechanism for adjusting conflicts between the center and the constituent units is indispensable to a federalism. Such adjustments might be left to the federal legislature, as in part and ineffectively they were under the

Confederation. But where the powers in a federalism between the center and the circumference are distributed by a legal document, certainly in any political society where the ideas of public law derive from the common law, it is natural that conflict regarding this distribution of power should become legal issues to be resolved by a judicial and not a political tribunal. Canada, Australia and the proposed dominion of India represent three different forms of federalism. The distribution of governmental authority as between center and circumference is different in all three. In all three a court with functions similar to our own Supreme Court is part of the scheme not in imitation of the American Supreme Court but as an inevitable mechanism of a federal state. To be sure the scope of authority of this adjusting mechanism may vary and is itself defined either explicitly or by the implications imported into constitutions in the document distributing governmental powers in a federalism. That the Supreme Court should have been given all the powers it has is of course not a matter of natural law. But if any federalism is to endure, it must provide for some checkrein on the constituent units, and the history of the American colonies and states made it inevitable that that checkrein should be a court and not Congress. "I do not think," wrote Justice Holmes, "the United States would come to an end if we 'lost our power to declare an Act of Congress void. I do think the Union would be imperilled if we could not make that declaration as to the laws of the several States. For one in my place sees how often a local policy prevails with those who are not trained to national views and how often action is taken that embodies what the Commerce Clause was meant to end."

But judicial adjustments in the English speaking world operate within traditional limitations. By confining the power of the Supreme Court to the disposition of "cases" and "controversies" the constitution in effect imposed on a tribunal having ultimate power over legislative and executive acts the historic restrictions governing adjudications in common law courts. Most of the problems of modern society, whether of industry, agriculture or finance, of racial interactions or the eternal conflict between liberty and authority, become in the United States sooner or later legal problems for ultimate solution by the Supreme Court. They come before the court, however, not directly as matters of politics or policy or in the form of principles and abstractions. The court can only deal

with concrete litigation. Its judgment upon a constitutional issue can be invoked only when inextricably entangled with a living and ripe lawsuit. In lawyer's language the court merely enforces a legal right. The rationale of the Supreme Court's function has been admirably expressed by one of the leaders of the American bar: "But august as are the functions of the court, surely they do not go one step beyond the administration of justice to individual litigants. . . Shall we say that when an American stands before the court demanding rights given him by the supreme law of the land, the court shall be deaf to his appeal? Shall wrongs visited upon him by the illegal excesses of Congresses or legislatures be less open to redress than those which he may suffer from courts, or sheriffs, or military tyrants or civilian enemies? If this be so, if in any such case the ears of the court are to be closed against him, it is not the power of the court that has been reduced but the dearly-bought right of the citizen that is taken away" (John W. Davis in his address as president of the American Bar Association, 1924).

How subtle and unfamiliar this traditional view of American constitutional law is to even the most eminent English lawyers appears from the comment made by an English lord chancellor, Lord Birkenhead, upon the distinction taken by Davis: "Your President is one for whom intellectually I have a great admiration. . . His masterly address today carried me entirely with him. But surely one refinement was a little subtle. He said that the Supreme Court had not the right *in abstracto* to construe your fundamental constitutional document; but only in relation to the issues presented by an individual litigation. But is this in ultimate analysis a very serious derogation? When an issue challenged by an individual raises the question whether a law is constitutional or not, the decision of the Supreme Court decides this question for all time; and if the decision is against the legislature, the attempted law is stripped of its attempted authority."

In thus passing on issues only when presented in concrete cases the Supreme Court is true to the empiric process of Anglo-American law. But the attitude of pragmatism which evolved the scope and methods of English judicature and subsequently its American versions was powerfully reinforced by considerations of statecraft in defining the sphere of authority for a tribunal of ultimate constitutional adjustments. For in

the case of the Supreme Court of the United States questions of jurisdiction are inevitably questions of power as between the several states and the nation or between the court and the executive and Congress. Every decision of constitutionality is the assertion of some constitutional barrier. However much a judgment of the House of Lords may offend opinion, the Parliament can promptly change the law so declared. But a decision of constitutionality by the Supreme Court either blocks some attempted exercise of power or releases the cumbersome procedure of changes of fundamental law. Therefore the Supreme Court, and very early, evolved canons of judicial self-restraint. Thus it would avoid decisions on constitutionality not merely by observing common law conventions. The court very early in its history refused to give merely advisory opinions [Hayburn's case, 2 U.S. 409 (1792); *Muskat v. United States*, 219 U.S. 346 (1910)]. Partly this was an assertion of its independence, a refusal of the role of subordination either to legislature or executive. The court withholds utterance unless a controversy is so molded as to give the court the last word. Partly also this is a manifestation of the psychology underlying the development of English law, which has special pertinence to the unfolding of American constitutional law. To refuse to give advisory opinions, to refuse to speak at large or indeed until litigation compels, is to rely more on the impact of reality than on abstract unfolding. In the workings of a constitution designed for a dynamic society this means a preference for "a judgment from experience as against a judgment from speculation" [Tanner v. Little, 240 U.S. 369 (1915)]. To pass on legislation *in abstracto* or still worse in advance of enactment would too often be an exercise in sterile dialectic and as a practical matter would close the door to new experience. But the court has improved upon the common law tradition and evolved rules of judicial administration especially designed to postpone constitutional adjudications and therefore constitutional conflicts until they are judicially unavoidable. The court will avoid decision on grounds of constitutionality if a case may go off on some other ground, as, for instance, statutory construction. So far has this doctrine been carried that at times the court will give an interpretation to a statute much more restrictive than its text or the intention of Congress apparently indicated. Again, in order to avoid the projection of a conflict between state and national authority the court, in reviewing state

court decisions, is alert to find that the state court merely enforced some state law which the Supreme Court is bound to respect and thereby to deny the existence of a federal controversy.

The court has thus evolved elaborate and often technical doctrines for postponing if not avoiding constitutional adjudication. In one famous controversy, involving a conflict between Congress and the president, the Supreme Court was able until recently to avoid decision of a question that arose in the First Congress. Such a system inevitably introduces accidental factors in decision making. So much depends on how a question is raised and when it is raised. For the composition of the court decisively affects its decisions in the application of constitutional provisions and doctrines which by their vagueness not only permit but invite conflicting constitutional views on the part of the justices. But time is the decisive element in all phases of government, as in war. The cost of uncertainty in result due to changes in the personnel of the court, through postponing constitutional adjudication until such a decision is unavoidable, is more easily absorbed than would be the mischief of premature judicial intervention in the multitudinous political conflicts arising in a vast federal society like the United States. Political harmony would not be furthered and the court's prestige within its proper sphere would be inevitably impaired. And so it is as important for the court not to decide when a constitutional issue is not appropriately and unavoidably before it as it is to decide when its duty leaves no choice.

Some claims of unconstitutionality, however much they may be wrapped in the form of a conventional litigation, the court will never adjudicate. Such issues are deemed beyond the province of a court and are compendiously characterized as political questions. Thus although according to the constitution "The United States shall guarantee to every state in this union a republican form of government," the Supreme Court cannot be called upon to decide whether a particular state government is "republican." This and like questions are not suited for settlement by the training and technique and the body of judicial experience which guide a court. What such questions are and what they are not do not lend themselves to enumeration. In these, as in other matters, the wisdom of the court defines its boundaries.

To be sure judicial doctrine is one thing, practise another. The pressure of so-called great

ases is sometimes too much for judicial self-restraint, and the Supreme Court from time to time in its history has forgotten its own doctrines when they should have been most remembered. On the whole the court has had to weather few popular storms. Even these few could have been avoided by a more careful regard for its own canons of judicial administration. The avoidable political conflicts which the Supreme Court has aroused by transgressing its own technical doctrines of jurisdiction demonstrate the large considerations of policy in which those doctrines are founded.

In the same soil of policy is rooted the canon of constitutional construction to which the Supreme Court throughout its history has avowed scrupulous adherence. The court will avoid if possible passing on constitutionality; but if the issues cannot be burked, if it must face its responsibility as the arbiter between contending political forces, it will indulge every presumption of validity on behalf of challenged powers. This is not merely the wisdom of caution but the insight of statesmanship. For the cases involving conflicts between the states and the nation or between Congress and the executive that touch the sensitive public nerves usually turn on such ambiguous language or such vague restrictions of the constitution as to afford a spacious area of choice on the part of the primary political agencies of government. And the Supreme Court, being a court even in these matters affecting closely the nation's political life, has enunciated again and again the doctrine that the court cannot enforce its notions of expediency or wisdom but may interpose its veto only when there is no reasonable doubt about constitutional transgressions. Here too the Supreme Court has sinned against its own rules. Especially in construing such vague generalities as "due process" and "equal protection of the laws" it has overlooked their significance and failed to observe that they express "moods and not commands." Cases like *Lochner v. New York* [198 U.S. 45 (1904)] and *Adkins v. Children's Hospital* [261 U.S. 525 (1922)] illustrate what Chief Justice Hughes has characterized as "self-inflicted wounds," because the deep resentment they aroused was due essentially to the court's departure from its own postulates for deciding constitutional issues.

A rhythm, even though not reducible to law, is manifest in the history of Supreme Court adjudication. Manifold and largely undiscovered factors determine general tendencies of the

court, much too simplified by phrases like "the centralization" of Marshall or "the states' rights" of Taney. Thus there are periods when the court seems to forget its doctrine against declarations of unconstitutionality so long as there is room for reasonable doubt. Thus the liberality of the Waite period was followed by the dominance of the strict views of Justice Field, in turn yielding to the reaction which made the Holmes outlook prevail. After the World War, during the decade when William H. Taft was chief justice, the court again veered toward a narrow conception of the constitution, although Taft himself, especially in a classic dissent, admonished against this tendency. Between 1920 and 1930 the Supreme Court invalidated more state legislation than during the fifty years preceding. Merely as a matter of statistics this is an impressive mortality rate, and it is no answer to point to the far larger number of laws which went through the court unscathed. All laws are not of the same importance, and a single decision may decide the fate of a great body of legislation. Moreover the discouragement of legislative effort through an adverse decision and a general weakening of the sense of legislative responsibility are influences not measurable by statistics. The trend has been reversed since Charles E. Hughes became chief justice, and the court is apparently in one of its alternating swings.

Other factors than personnel explain much of the court's history. Thus on a long view what the court does and how depends much on the amount and the nature of its litigation. And these largely turn on the sources of its business. Few suits begin in the Supreme Court. Only the United States or a state or a diplomat can become an original suitor. All other litigants reach the Supreme Court by way of appeal from some other court. While boundary controversies or other contests between states (as, for instance, the litigation arising out of Chicago's attempted use of the waters of the Great Lakes) involve sharp conflicts and invoke one of the most important functions of the Supreme Court, they are relatively few in number. The chief work of the Supreme Court is furnished by appellate business, and that business comes from the highest courts of the forty-eight states as well as from inferior federal courts. The last fact is of profound importance in the history of the court. Unlike its analogues in Canada, Australia and the proposed all India federation, the Supreme Court is the head of a hierarchy of federal

courts. Waiving negligible exceptions, the Supreme Court of Canada and the High Court of Australia have before them only constitutional and federal questions coming for review respectively from decisions of the provincial and state courts. Similarly in cases coming to the Supreme Court from the state courts only questions involving the federal constitution or controlling federal legislation arise. But through the federal courts there reaches the Supreme Court a stream of litigation having nothing to do with the federal constitution and federal legislation but involving the myriad problems that arise under the common law and under state law and state constitutions.

The constitution empowered the establishment of inferior federal courts not merely for the enforcement of federal law but also to provide tribunals of impartiality to which non-resident suitors may resort. Congress acted upon this authority, established a nation wide system of federal courts and not only entrusted them with the enforcement of federal laws but also conferred upon them the so-called diversity jurisdiction; that is, cases between citizens of different states. Thus instead of setting the Supreme Court apart as a court for adjustments of legal conflicts within the federal system, such as is the position of the corresponding tribunals of the British Empire, the first Judiciary Act and its successors also gave the Supreme Court a vast budget of common law business. Indeed down to 1875 the Supreme Court was concerned much more with common law than with issues of federal public law. In that year the power of the lower courts over federal matters was widened and consequently a stronger federal content was given to the cases coming before the Supreme Court. This enlargement of jurisdiction of the lower courts and the increase generally of litigation because of the country's expansion in size, population and enterprise produced an amount of business which was beyond the physical powers of the court. It took from three to four years for a case to reach argument after an appeal was perfected. Such delays plainly were denials of justice.

Nor could the court give itself up completely to grappling with its appellate docket. The federal judicial system as originally established was patterned on the English judiciary in including the system of circuit riding. Circuit courts were established, but no circuit judges were created. The members of the Supreme Court were also made circuit justices with nisi

prius duties in their respective circuits. In plain English, they had to sit as judges in the lower courts and later as a collective body hear appeals from their judgments on circuit. As the court's appellate work steadily mounted, the justices had either to neglect their circuit work, especially in view of the difficulties of travel in early days, or their Supreme Court work. In fact the administration of justice suffered both in the Supreme Court and on the circuits. Only partly was the pressure eased by the creation in 1869 of circuit judges in collaboration with circuit justices for circuit work. The obvious remedy was to relieve the judges of the duty of circuit riding. This was urged as early as 1790 by Edmund Randolph, Washington's attorney general, in reporting to the House of Representatives on the workings of the new federal judicial system. But circuit riding was an obstinate institution. Tradition and provincial attachments no less than the desire to promote national sentiment through the peregrinations of the Supreme Court justices maintained the circuit riding system until 1891. Since then it has fallen into desuetude.

Indeed all efforts to enable the Supreme Court adequately to discharge its essential function floundered on the circuit court system. Instead of the obvious remedy various mechanical devices for keeping abreast of the Supreme Court docket were urged. With a too frequent misconception as to the nature of the judicial business and the conditions for its wise disposition, it was assumed that more business calls for more judges. The first Judiciary Act provided for a Supreme Court of six members, which was increased to seven in 1807 and to nine in 1837. Subject to short fluctuations from a tribunal of ten to one of seven between the years 1863 to 1869, this has remained the size of the court. There is no magic in the number nine, but there are limits to effective judicial action. Deliberation by the court is the very foundation of sound adjudication, as is also a lively sense of responsibility by every member of the court for its collective judgment. Experience is conclusive that to enlarge the size of the Supreme Court would be self-defeating. When this recurring proposal for increasing the number of justices was once more made by the American Bar Association in 1922, Chief Justice Taft authoritatively rejected it.

Variants of the proposal to increase the membership of the court for dealing with the increase of its business after the Civil War were

recurrently urged. Thus a larger membership of the court was proposed, ranging from fifteen to twenty-four, so as to permit shifts in the sittings of the court or work by standing divisions. England and France were cited as examples of such schemes of judicial organization, and their experience has been drawn upon by some of the states of the United States. But either of these devices would be fatal for the special functions of the Supreme Court. A contemporaneously shifting personnel would disastrously accentuate the personal factor in constitutional adjudications, and divisional courts within the Supreme Court would require a mechanism for adjusting conflicts among the divisions. Happily these devices never attained enactment. But their persistent advocacy delayed the only efficacious remedy. Not till 1891 did Congress pass the requisite legislation. Instead of increasing the size of the court, it decreased its business.

This was accomplished by establishing intermediate courts of appeal for each of the nine circuits (in 1929 increased to ten). These were given final authority over a large field of appeals which theretofore had gone to the Supreme Court, leaving the latter court discretionary power to resolve conflicts among the intermediate courts or, when an important national interest otherwise required finality of determination, by the Supreme Court itself. By thus giving to the Supreme Court obligatory appellate jurisdiction over a restricted type of litigation and for the rest letting the Supreme Court decide whether to review, the Congress enabled the court to keep abreast of its docket. It did more. It introduced a principle of procedure capable of progressive application, which saved the court for the discharge of duties peculiarly its own in maintaining the constitutional system. When after the Spanish American War and the World War the vast expansion in economic enterprise and the resulting governmental regulation of business again produced a volume of judicial business beyond the court's powers, Congress in 1925 came to the court's rescue at its own request, by still further withdrawing the types of cases which can be taken to the Supreme Court as a matter of right and extending the area of litigation in which an appeal can be had in the Supreme Court only by its leave. At present in about nine cases a year leave is asked of the court for review, and in only about one case in six is the leave granted.

The Supreme Court has thus ceased to be a common law court. The stuff of its business is

what on the continent is formally known as public law and not the ordinary legal questions involved in the multitudinous lawsuits of *Doe v. Roe* of other courts. The construction of important federal legislation and of the constitution is now the staple business of the Supreme Court.

Constitutional interpretation is most frequently invoked by the broad and undefined clauses of the constitution. Their scope of application is relatively unrestricted and the room for play of individual judgment as to policy correspondingly broad. A few simple terms like "liberty" and "property," phrases like "regulate Commerce . . . among the several States" and "without due process of law" are invoked in judgment upon the engulfing mass of economic, social and industrial facts. Phrases like "due process of law," as Judge Hough reminded us, are of "convenient vagueness." Their content is derived from without, not revealed within the constitution. The power of states to enact legislation restricting an owner's use of natural resources, providing a living wage for women workers, limiting the rents chargeable by landlords, fixing standard weights for bread, prohibiting the use of shoddy in comfortables, prescribing building zones, requiring the sterilization of mental defectives, fixing the price of milk and other commodities—these powers hinge on the court's reading of the due process clause. The Stockyards Act, the Grain Futures Act, the West Virginia Natural Gas Act, the recepture clause of the Transportation Act, the First Child Labor Law, all involved interpretation of the commerce clause; but the fate of these laws depended on adequate information before the court on the economic and industrial data which underlay this legislation, and judgment on these facts by the court. Again, the Steel Trust case [*United States v. United States Steel Corp.*, 251 U.S. 417 (1919)], the Shoe Machinery case [*United States v. United Shoe Machinery Co.*, 247 U.S. 32 (1917)], the Duplex case [*Duplex Printing Press Co. v. Deering*, 254 U.S. 443 (1920)], the Bedford Cut Stone case [*Bedford Cut Stone Co. v. Journeyman Stone Cutters' Ass'n.*, 47 Sup. Ct. Rep. 522 (1926)], all involved interpretation of the antitrust acts. But the interpretation of this legislation was decided by the facts of industrial life as seen by the court. The conflicting opinions of the justices in the recent series of cases involving the activities of trade associations are not due to any differences in their reading of the Sherman law *in vacuo*. The differences are attributable to the economic

data which they deemed relevant to judgment and the use which they made of them. What constitutes a "spur track," when public convenience justifies a railroad extension or abandonment, under what conditions one railroad must permit use of its facilities by a rival, how far the requirement of a state for the abolition of grade crossings depends on approval by the Interstate Commerce Commission—these and like questions cannot be answered by the most alert reading of the Transportation Act. Their solution implies a wide knowledge of railroad economics, of railroad practices and the history of transportation as well as a political philosophy concerning the respective roles of national control and state authority.

These are tremendous and delicate problems. But the words of the constitution on which their solution is based are so unrestricted by their intrinsic meaning or by their history or by tradition or by prior decisions that they leave the individual justice free, if indeed they do not compel him, to gather meaning not from reading the constitution but from reading life. It is most revealing that members of the court are frequently admonished by their associates not to read their economic and social views into the neutral language of the constitution. But the process of constitutional interpretation compels the translation of policy into judgment, and the controlling conceptions of the justices are their "idealized political picture" of the existing social order. Only the conscious recognition of the nature of this exercise of the judicial process will protect policy from being narrowly construed as the reflex of discredited assumptions or the abstract formulation of unconscious bias.

Thus the most important manifestations of our political and economic life may ultimately come for judgment before the Supreme Court, and the influence of the court permeates even beyond its technical jurisdiction. That a tribunal exercising such power and beyond the reach of popular control should from time to time arouse popular resentment is far less surprising than the infrequency of such hostility and the perdurance of the institution. No political party has been consistent in its support or its hostility to the court. Every American political party at some time has sheltered itself behind the Supreme Court and at others has found in the court's decisions obstructions to its purposes. This is a reflection of the fact that the court throughout its history has not been the organ of any party or registered merely party differences. Clashes

of views, and very serious ones, there have been on the court almost from the beginning, but these judicial differences have cut deeper than any differences as to old party allegiances; they involve differences of fundamental outlook regarding the constitution and the judge's role in construing it.

Whenever Supreme Court decisions have especially offended some deep popular sentiment, movements have become rife to curb the court's power. In Marshall's days such efforts were invoked by decisions promoting centralization and subordinating the states. In recent times invalidation of social legislation, both state and national, has aroused popular disfavor. In the earlier period we find proposals for repealing the famous section 25 of the Judiciary Act of 1789, whereby the Supreme Court had power to review decisions of state courts denying some federal right. A brake upon a finding of unconstitutionality was also proposed by requiring the concurrence of seven justices and not a mere majority. The latter safeguard was revived by Senator La Follette in 1924, while in an earlier stage of the Progressive movement, in 1912, Theodore Roosevelt proposed a recall by popular referendum of decisions nullifying state but not congressional legislation. But no proposal for curtailment of the Supreme Court's power over legislation has ever been adopted. The wise exercise of this power, it has shrewdly been discerned, cannot be assured by any mechanical device. The only reliance rests in the quality of the judges and the temper and training of the bar, for no graver responsibilities have ever confronted a judicial tribunal, no more searching equipment was ever required of judges. The spirit and culture and insight which should be the possessions of a justice of the Supreme Court have been stated by Judge Learned Hand: "I venture to believe that it is as important to a judge called upon to pass on a question of constitutional law, to have at least a bowing acquaintance with Acton and Maitland, with Thucydides, Gibbon and Carlyle, with Homer, Dante, Shakespeare and Milton, with Machiavelli, Montaigne and Rabelais, with Plato, Bacon, Hume and Kant, as with the books which have been specifically written on the subject. For in such matters everything turns upon the spirit in which he approaches the questions before him. The words he must construe are empty vessels into which he can pour nearly anything he will. Men do not gather figs from thistles, nor supple institutions from judges

whose outlook is limited by parish or class. They must be aware that there are before them more than verbal problems; more than final solutions cast in generalizations of universal applicability. They must be aware of the changing social tensions in every society which make it an organism; which demand new schemata of adaptation; which will disrupt it, if rigidly confined."

All told, seventy-five judges have thus far (1934) sat on the Supreme Court. A goodly number of them have been men of intellectual distinction. But hardly a half dozen are towering figures: Marshall, the creative statesman; Story, a scholar of vast learning; Taney, who adapted the constitution to the emerging forces of modern economic society; Holmes, the philosopher become king; Brandeis, the master of fact as the basis of social insight. Confidence in the competence of the court has not been won by the presence of a rare man of genius. The explanation lies rather in the capacity of the court to dispose adequately of the tasks committed to it. The effective conditions for insuring the quality of judicial output of the Supreme Court have in the long run been maintained. Human limitations have been respected. While in response to the country's phenomenal increase in population and wealth and the resulting extension of governmental activities duties have been placed upon Congress, the executive departments, various federal administrative agencies and the lower federal courts which disregarded their strength and capacity, the duties of the Supreme Court have on the whole been kept within the capacities of nine judges who are not supermen.

The Supreme Court's internal procedure moreover has been an important factor in the achievement of its high standards of judicial administration. In its disposition of cases, in the rules and practises which determine argument, deliberation and opinion writing, the Supreme Court operates under the following conditions, indispensable to a seasoned, collective judicial judgment: (1) Encouragement of oral argument; discouragement of oratory. The Socratic method is applied; questioning, in which the whole court freely engage, clarifies the minds of the justices as to the issues and guides the course of argument through real difficulties. (2) Consideration of every matter, be it an important case or merely a minor motion, by every justice before conference and action at fixed, frequent and long conferences of the court. This assures responsible deliberation and decision by the whole

court. (3) Assignment by the chief justice of cases for opinion writing to the different justices after discussion and vote at conference. Flexible use is thus made of the talents and energies of the justices, and the writer of the opinion enters upon the task not only with knowledge of the conclusions of his associates but with the benefit of their suggestions made at conference. (4) Distribution of draft opinions in print, for consideration by the individual justices in advance of the conference, followed by their discussion at subsequent conferences. Ample time is thus furnished for care in formulation of the result, for recirculation of revised opinions if necessary and for writing dissents. This practise makes for team play and encourages individual inquiry instead of subservient unanimity. (5) Discouragement of rehearings. Thoroughness in the process of adjudication excludes the debilitating habit of some state courts of being too prodigal with rehearing. (6) To these specific procedural habits must be added the traditions of the court, the public scrutiny which it enjoys and the long tenure of the justices. The inspiration that comes from a great past is reinforced by sensitiveness to healthy criticism. Continuity and experience in adjudication are secured through length of service as distinguished from the method of selection of judges.

These factors probably play a larger part in the effective work of the Supreme Court than elevation of station, high responsibility and the greater ability of the justices, drawn as they are from the whole country, as compared with state court judges.

SURETYSHIP AND GUARANTY. Suretyship involves the assumption of liability for the obligation of another. Historians, however, identify suretyship with situations which are quite outside modern connotations of the term. Thus they hold that family and clan members and other social groups have been made to assume, as by suretyship, collective responsibility for the offenses and wrongs of one another. Duties of policing and of apprehending wrongdoers and bringing them to trial have been imposed by embryonic political organizations upon their several members. A city and its governor are said to have been made responsible as sureties by the Code of Hammurabi for the failure to capture a brigand. The English system of frankpledge, which obtained from the twelfth to the fourteenth century, is supposed to have represented the highest development of this state promotion of small groups into suretyship; the general plan was known to Germanic nations earlier and its prototype existed in Anglo-Saxon customs.

Another ancient type of suretyship is more consistent with modern notions of pledge. The surety, pledged as if he were *res*, was delivered over as a hostage to the custody of the claimant and to imprisonment and servitude if not death, upon default of the principal. This surety-hostageship, which antedated any substantial development of credit transactions, served in the several legal systems primarily to strengthen a weak and undeveloped legal machinery by assuring appearance of the defendant, at first in criminal causes and later in civil proceedings. As such a mechanism of mediaeval procedure the hostage became bound "body for body" for the person accused. Only in later periods was the punishment of the hostage separated from that of the principal offender; and not until pecuniary liability became recognized as a fit substitute for punishment in person was the role of the surety-hostage ameliorated.

In the later developments of hostageship in private causes ancient laws indicate certain distinguishing characteristics of the suretyship liability. The surety taken as a hostage alone became responsible to the claimant. The principal was discharged as to the creditor, and vague indeed was the right and remedy of this surety to

be reimbursed by the principal. This surety may have been comforted, however, with the realization that his obligation was personal; that is, it was extinguished upon his death and did not pass to his heirs. If it be questioned why anyone, however friendly to the principal, should offer himself in his hostageship, it may be answered that it was not an entirely voluntary matter: it was the principal's family, dependents, vassals or others in obligation who became his substitute.

There were many types of suretyship in the history of the Roman law. Such forms as *praes*, *vas* and *receptum* as well as *constitutum* and *mandatum* were of limited or specialized application. The more general early forms were the *sponsio* and its somewhat later contemporary, the *fidepromissio*, which had its origin at the time of suretyship by way of hostageship. Both the *sponsio* and the *fidepromissio* were accomplished by *stipulatio*, the formal verbal contract of Roman law which was formed by questions and answers. Neither contract could be used to guarantee any other than a verbal contract, and the *sponsio* at least was confined to *crimes*. The obligations of these sureties did not survive against their heirs.

The suretyship category of the mature Roman law was the highly flexible *fidejussio*, which, like the *sponsio* and *fidepromissio*, was consummated by the *stipulatio*. It is recognized, however, as the maturity of Roman law is approached, that, largely because of Greek influence, the formality of the *stipulatio* was usually that of a written memorandum; the significance of the verbalism of questions and answers had waned. The *fidejussio* was available for the guaranty of undertakings generally—*re, verbis, litteris* or *consensu*. Heirs of the *fidejussor* were obligated as in other transactions.

Legislation accorded beneficial privileges to Roman sureties. The very early legislation was confined to *sponsio* or *fidepromissio*, but both these forms had become obsolete under the empire and the imperial legislation dealt with *fidejussio*. As a result the contract was converted into a purely accessory obligation. While it is true that each surety became liable for the entire debt, Hadrian is credited with having provided the *beneficium divisionis*, by which such a surety could, upon being sued for the whole debt, require proportional division of the debt among the sureties who were solvent at the time of the action. Again, these sureties were accorded the right of *beneficium cedendarum actionum*,

Supreme Court, United States — Suretyship and Guaranty 483

whereby a surety, as against his co-sureties and the principal, was entitled, after issue joined, upon offering full payment to him of the debt, to receive an assignment of the claim of the creditor and any securities of the debtor or other sureties. Thereafter Justman ordained the *beneficium ordinis vel excussionis*, whereby these sureties acquired power to require the creditor to sue the debtor before proceeding against them or any one of them, provided only, if the debtor were beyond the jurisdiction, that the court fix a time after which the surety must, if the debtor continued absent, perform the obligation. Of course if the *fidejussio* were drawn so that the surety promised to pay "whatever the creditor cannot recover from the debtor" (*fidejussio indemnitatis*), suit against the debtor would be a prerequisite to enforcement of the surety's undertaking according to the condition. The *Lex cornelia* limiting the extent to which a person could become surety in a single year for one man to one creditor was extended to the *fidejussor*, and right of reimbursement against the principal was accorded by the *actio mandati*.

It was a fundamental principle of Germanic law that the surety was jointly liable with the principal; recourse to the surety was primary not secondary. But this principle was abrogated by the reception, and suretyship contracts of the modern civil law have closely followed the Roman *fidejussio*. Corresponding to it are the *cautionnement* of modern French law, the *Bürgschaft* and *Garantie* (*Gewährvertrag*) in Germany and the *garanzia*, including the *fidejussione*, in Italy.

The *beneficium divisionis* of Roman law is preserved to sureties in the codes of France and Italy but not of Germany. As in Roman law, the right may be stipulated away; indeed its renunciation may be implied from the form of the transaction, as where a surety becomes a co-promissor with the principal debtor. The general principle of *beneficium ordinis vel excussionis* also is recognized in civil law codes, although in Germany, by express provision of the Commercial Code, it does not apply to commercial transactions. It may be renounced, however, and waiver is usually implied where the surety signs as a co-promissor with the principal; and, unless the right is claimed promptly after suit is instituted by the creditor, it is waived. The surety must also designate to the creditor the assets of the debtor and "advance enough money." to quote the French Civil Code, "to have the property seized and realized" (art. 2023); more-

over "the creditor is liable toward the surety to the extent of the particular property for the insolvency of the principal debtor which has occurred in consequence of his failure to institute proceedings" (art. 2024). *Beneficium cedendarum actionum* is generally accorded in modern civil codes, as is also the right of reimbursement.

Early English law apparently did not prescribe any particular formalities for suretyship contracts or restrict the undertakings to which they could be adapted. With the advent of the action of debt, however, the specialty became popular; for it was considered, at least from the time of Edward III, that ordinarily the principal rather than the surety received the *quid pro quo* and that therefore the action of debt would not lie against a surety unless a seal had been affixed to his bargain. The occasion for this formalism ceased when *assumpsit* was held to lie against a surety, but there followed the Statute of Frauds (sect. 4) requiring a writing in case of a "special promise" to answer for the debt, default or miscarriage of another person. Judicial manipulation of the statute, however, especially in the United States, has excluded several classes of promises of frequent recurrence from the category of special promise; for example, in cases in which the surety is sufficiently "benefited" by the promise.

Equivalents of the beneficial rights of the surety in the modern civil law are recognized in common law jurisdictions. Unless specifically stipulated away they arise in the absence of express contract. The right of reimbursement, or indemnity, in Anglo-American law is traceable to the writ *de plegiis acquietandis* recorded in the ancient register of writs. But apparently this writ was not available to a surety who, without more, became bound jointly or jointly and severally with the principal, for the writ did not lie "without express naming of surety or fideiusor in the writing." Glanvill reports, however, that the action of debt was vouchsafed a surety to recover from the principal and that in equity indemnity was early accorded even in the absence of agreement therefor; early in the eighteenth century moreover a surety could recover from the principal in *assumpsit*. Sureties of the king's debtors were less favorably considered; provision in Magna Carta, however, gave them the right of reimbursement, but this is still denied to sureties by way of bail in criminal causes, for to give them the right "would relieve them from the motives to exert themselves in securing the appearance of the principal."

Closely connected with the surety's right to reimbursement are his rights of subrogation and exoneration. As soon as a surety has satisfied the creditor, he becomes entitled by virtue of the right of subrogation to the benefit of all the securities or advantages which the creditor received from the principal. The remedy of exoneration has always remained exclusively equitable. After maturity of the principal obligation a surety may procure a decree against the principal and sureties requiring the principal to pay the creditor, so that the surety will never be required to pay, and requiring the sureties to pay their proper share in anticipation of the principal's non-payment. The creditor is joined as a formal party defendant to receive payment, but the creditor may pursue the principal and surety regardless of the pendency of these proceedings.

A surety's claim of contribution against a co-surety was once denied by the common law courts of England. By the seventeenth century, however, and probably before, the claim was accorded in equity. Subsequently at law a surety, having paid more than his part of the debt, was also allowed to recover from a co-surety on the count of money paid to his use, the sum resulting from division of the debt paid by the total number of co-sureties. In equity, however, the debt was divided by the number of solvent sureties and contribution allowed accordingly. This distinction still obtains in some jurisdictions in the United States where law and equity are separately administered.

No such general rights as those of *beneficium divisionis* or *beneficium ordinis vel excussionis* are recognized in common law jurisdictions. The former is contrary to the common law theory of joint and several liability in contract. The latter is recognized in effect, however, in nearly half of the states of the United States, where there obtains either by judicial decision or by provision of statute the so-called rule of *Pain v. Packard* [13 Johns (N.Y.), 174 (1816)], which allows sureties of certain classes to compel the creditor first to sue the principal under penalty of discharge as to themselves. There are also statutes in some states which provide that where judgment has been obtained against both principal and surety execution shall first exhaust the assets of the principal. Similarly in some states where property of a surety is hypothecated with the property of the principal, the surety is entitled, either by statute or by judicial decision, to have the property of the latter first applied to the discharge of the obligation.

While common law courts were more tardy and strict than courts of equity in according sureties rights against their principal and as among themselves, they are supposed early to have ameliorated a surety's position toward the creditor by the doctrine *strictissimi juris*. A surety is said to be a "favorite of the law." In other words, the law courts are supposed to have allowed a surety frequently to escape responsibility to the creditor by strictly construing the contract and attendant circumstances in favor of the surety. Any such generalization, however, is mostly doctrine fabricated upon generalizations of court opinions in restricted classes of cases. It is applied most frequently perhaps when the words used by the parties, especially by the surety, assume ambiguity in view of intervening events but frequently also when after consummation of the contract of the principal parties and of the surety the former, without authority from the surety, enter into a bargain which tends toward changes or variations of performance under the original contract.

In modern English law the term guaranty has largely superseded suretyship, although little consequence is attached to the variation of nomenclature. Generalizations are made in American legal literature, however, upon the basis of a distinction between suretyship and guaranty, which is often also recognized in statutory provisions. With respect to rights of reimbursement, subrogation, exoneration and contribution the distinction is scarcely mentioned. It is voiced chiefly in causes involving the responsibilities of sureties and guarantors to the creditor. It may be conceded broadly that there are many differences in American law between the surety and the guarantor and between the contract of the surety and the contract of the guarantor. As it is usually stated, the responsibility of a surety is supposed to be direct and primary while that of a guarantor is held to be secondary and collateral, expressly conditioned upon the principal's failure to perform. There is, however, little satisfaction in this generalization, because the contract of the surety and of the guarantor may be varied to such an extent that a surety's contract may be held to be one of guaranty and a guarantor's contract one of suretyship.

The liabilities are determined by the form and terms of the particular transaction. Thus if the obligor has transferred property to the creditor by way of mortgage or pledge, in other words, if he is a real rather than a personal surety, his

liability may be limited to the value of the pledged or mortgaged property. Very rarely is the term real guaranty used in such a case. In the personal surety category of transactions the liability of the obligor again will depend upon the form of the security. Thus if a negotiable instrument is given, his liability will depend upon whether he signs as maker, co-maker or endorser and upon whether his signature is qualified by the addition of some such expression as "I guarantee collection of the within note." Furthermore his liability may depend upon whether he has become accommodation drawer or endorser of a bill of exchange with or without conditions. Particularly when the purpose of the contract is to secure not simply the payment of money but the performance of an obligation, such as a building contract or a bail bond, will the liabilities of the obligor be conditioned by the terms of the particular bargain.

To be sure, in the case of the more simple credit transactions the courts have arrived at a certain routine of construction. The law of negotiable instruments contains specific rules which bear upon the conditions of liability when such instruments are involved. The creditor is better protected if he secures the signature of the obligor as an accommodation maker rather than endorser, for in the latter case presentment and notice of dishonor must expressly be waived. As far as words of qualification with reference to the guaranteed note are concerned, the creditor is better protected by a guaranty of payment than by a guaranty of collection, for in the former case he need not first sue the debtor. In the case of other contracts a promise of "full and faithful performance" is likely to be assimilated to the guaranty of payment of a promissory note. Nevertheless, the distinction between guaranty of payment and guaranty of collection should not be overemphasized, for construction proceeds on the basis of the transaction as a whole.

To the layman the word surety is probably much less familiar, notwithstanding Scriptural references, than the word guarantor. The latter term—or at least the term guaranty—has been considerably popularized in sales promotion, while any distinction between the contract of the surety and that of the guarantor is generally unfamiliar. It is probable that the layman will report his undertakings in such cases to the effect that he signed, or "went on," the debtor's note or that he went bondsman for the principal. Whether or not a generic word should be coined to embrace all of these variable bargains is

merely a matter of taste. Perhaps the term accommodation contracts would serve the purpose.

With increasing frequency in modern times suretyship has come to be undertaken not by relatives or friends but by business corporations organized for this purpose. Surety companies engage in selling bonds wherein they undertake to pay money for the defalcation of public and private officers and employees, administrators, executors, guardians, trustees and other fiduciaries; bonds relating to criminal prosecutions and private litigation including bail bonds, appeal bonds, attachment and replevin bonds; bonds to assure faithful performance of contracts on both public and private undertakings; and bonds for the faithful performance of public and private licenses, permits and payment of imposts and taxes. Indeed a modern surety company may carry an inventory in excess of five hundred such contracts (bonds), which it is ready to sell at a price (the premium) Promotion of these companies originated with fidelity underwriting and dates back in England to the early part of the eighteenth century. The organization there of the Guaranty Society of London in 1840 should, however, be credited with the beginnings of the modern business of surety companies. It remained for promotion in the United States to extend the scope of operations beyond fidelity bonds.

As a result of this development courts and legal writers have come to compare "the modern, compensated surety," "the corporate surety," with other sureties and have attempted to generalize the effect upon the law of suretyship. There have been many arguments for and against the proposition that these surety companies are insurers and that, as such, their obligations are more stringent and their defenses more restricted than are those of an individual surety-guarantor. To the extent that many of these surety bonds are sold for a premium, which is determined on the basis of a law of averages experienced on the particular risk assumed, and in view of the fact that these contracts, generally very elaborate in detail, are written by the company, aspects of an insurance policy are apparent. But, on the other hand, insurance is a broad term in commercial and legal usage. It is difficult to catch significant functional similarities between a bond of a surety company which has been given for the value of property in lieu of surrendering it in a replevin action and an insurance policy sold to an automobile owner to protect him from liability claims for personal in-

juries. This is not an argument against treating the two contracts similarly on some given legal issue. Their functional distinctions do, however, tend to encourage doubt if there is not substantial oversimplification in identifying these transactions which are functionally so different. It may be conceded that the courts in discussing contracts of surety companies have promiscuously described them as contracts of insurance and have generalized to the effect that they are different from individual surety-guaranty contracts. Most of this language, however, appears in cases where there are, in view of intervening events, ambiguities as to the language of the contract. It may be admitted that there is a distinct tendency in cases of this kind to resolve such questions against the company, since it wrote the contract. Pro tanto the doctrine *strictissimi juris* seems to be disregarded. There may be noted also, however, the recurring observation of judges that this formula of adverse construction is after all not without the limitation that even a surety company is not to be held to a contract which it did not make and that the contract of such a company, like that of other sureties and guarantors, must not be extended beyond its fair and reasonable meaning. Moreover in the case of statutory bonds—bonds whose terms and conditions are prescribed by statute—there is little reason for stricter construction against the surety company than against other sureties; the purposes of the statute demand primary consideration in all cases. It may be remarked further that the plausibility of this practise of strict construction against surety companies is at least not enhanced when it is observed that as yet there is no such current practise of construction against banks respecting a large variety of suretyship-guaranty contracts, including so-called bank, or commercial, letters of credit, which are sold by them for a price. Of course the rights of reimbursement, exoneration and contribution are in general accorded to the corporate surety as they are to the individual surety-guarantor.

The generalizations as to the effect of the advent of the surety company upon the law of suretyship suffer from the same vice as those upon the distinctions between suretyship and guaranty. Surety companies have not begun to function in much of the field of commercial credit, except as they operate with some finance companies, and individual surety-guaranty contracts rather than those of these companies still service the greater part of the field of borrowing

and lending and buying and selling on deferred payment.

SUSSMILCH, JOHANN PETER (1707-67), German statistician. Sussmilch studied law, medicine and theology at the universities of Halle and Jena and for many years served as pastor in Berlin. He ranks among the greatest figures in the history of statistics. Although he was greatly indebted to the works of Graunt, Petty, King and other contemporary statisticians, he surpassed them in the completeness of his material, the high objectives which he set himself and the systematic nature of his work. His main work, *Die göttliche Ordnung in den Veränderungen des menschlichen Geschlechts, aus der Geburt, dem Tode und der Fortpflanzung desselben erwiesen* (Berlin 1741; 6th ed. by C. J. Baumann, 1798), is replete with interesting and original demographical investigations, placing particular emphasis on frequency rates of births, marriages and deaths. Sussmilch ascertained the variations in mortality rates with respect to sex, age, place of residence (urban or rural) and season and constructed a mortality table which, despite its methodological shortcomings, was used by German insurance companies until the middle of the nineteenth century. He also studied the problem of the increase of population and attempted to compute world population figures.

It is his conception of "the divine order," evidenced by the regularity and order underlying all demographic phenomena, which makes his work especially noteworthy. According to Sussmilch such phenomena are subject to definite, universally valid rules; the number of births, for example, has a certain fixed relation to the number of persons living as well as to the total dead; in any given period there is a slight preponderance of births over deaths; more boys are born than girls, but as a result of the higher mortality rate of boys there is maintained between the two sexes at the marriageable age a balance which forms the basis of monogamy; every age has its set total of deaths and pays a certain toll

to the general order; the various diseases, stillbirths, twin births and accidental deaths likewise have a definite relation to the entire trend. All these laws combine to effect not simply the perpetuation of the human species but its gradual increase up to a point where the means of subsistence permit no further growth. Sussmilch was the first in Germany to point out the law of large numbers, which is basic to statistical inquiry; he observed the fact that in measuring mass phenomena the general validity and independence from accidental variations of the numerical results obtained increase as the number of cases under observation is increased.

Sussmilch expressed himself also on certain problems of current economic policy. True to the mercantilist notions of his day, he stressed the desirability of a maximum achievable population and pointed to peasant emancipation, internal colonization, cheap food supplies and equitable taxes as the factors favoring a speedy growth of population. For the same reason he welcomed the development of new industries and manufactures, although he cautioned against any overestimation of these. Should the marriage rate decline, the sovereign must intervene to restore the divine order, the basis of a rational population policy.

SUTTNER, BARONESS BERTHA VON (1843-1914), Austrian pacifist. The daughter of Field Marshall Count Franz von Kinsky, Baroness von Suttner was given the advantages of a liberal education and extensive travel. Later financial reverses obliged her to earn her own living, and she obtained a position as governess in the home of a wealthy Viennese family whose son, Baron Artur Gundaccar von Suttner, she eventually married. Her numerous writings attracted little attention until she published *Die Waffen nieder!* (2 vols., Stuttgart 1889; tr. by T. Holmes, 1 vol., 2nd ed. London 1894), a novel picturing the horror and futility of war

The enormous popularity of this book, which went through more than thirty editions and was translated into many languages, together with her numerous addresses, pamphlets and treatises on arbitration and disarmament served to make Baroness von Suttner an effective force in the peace movement of the late nineteenth and the early twentieth century. She founded the Austrian Peace Society, serving as its first president, attended international peace congresses in Rome, Berne, Antwerp, The Hague and elsewhere and lectured both in Europe and in America. From 1892 to 1899 she edited a monthly magazine, *Waffen nieder!*, organ of the international peace bureau at Berne. In 1905 she was awarded the Nobel Peace Prize, the establishment of which she is said to have prompted through her friendship with the Swedish inventor.

Although Baroness von Suttner supported pacifism chiefly on ethical and humanitarian grounds, her enthusiasm and her indefatigable efforts enabled her followers, notably Alfred Fried, to impart a sociological, economic and legal foundation to the movement.

SVERDRUP, JOHAN (1816-92), Norwegian statesman. Sverdrup, who had studied and practised law, was carried into politics by the great nationalist and democratic movement of 1848. As a member of the Storting from 1851 to 1884 and as prime minister from 1884 to 1889, he strove consistently for the establishment of parliamentary government and other democratic reforms as well as for the social and political advancement of the farmers. A follower of the political philosophy of Francis Lieber, he succeeded in uniting farmers and bourgeois liberals into the first party in the Norwegian parliament which was based on strict political principles and organization. He made the introduction of trial by jury a program common to these groups, led the farmers in their fight against the king's organization of the army along Prussian lines and finally organized a united party in 1869 when he succeeded in carrying an amendment to the constitution providing annual

instead of triennial sessions of the Storting. Under his leadership, the new party, the Left (*Venstre*), already representing the majority of the Storting, had as its chief objective the transformation of the government into an organ of the popular will through participation of the cabinet members in the parliamentary deliberations. This effort, which came to involve the absolute veto right of the king, divided the whole nation into two camps and culminated in the impeachment of the conservative government in 1884. In that year Sverdrup was called to the premiership, a step which definitely established the principle of parliamentary control in Norway. The outstanding reforms of Sverdrup's ministry were the adoption of trial by jury, the democratic reorganization of the army, the improvement of popular education, the extension of the franchise and the initiation of labor legislation.

SWAINSON, WILLIAM (1800-83), British lawyer. Swainson studied at the Inner Temple in London, where he was undoubtedly influenced by the ideas of Austin and Bentham. He served as attorney general for New Zealand from its formation into a separate colony in 1841 until the establishment of a complete parliamentary system and of responsible government in 1856. In 1854 he was chosen as first speaker of the legislative council and from 1856 to 1868 was a member of the new legislative council.

As attorney general Swainson drafted the early laws of the colony. The legislation for which he was responsible set a new standard: it was remarkable for its logical arrangement and directness, departing boldly from English precedent when lucidity and the needs of a new community so required. The law relating to the transfer of real property and the simplified court and procedural systems are notable examples. Swainson played a prominent part also in framing a constitution for the members of the church who were cut off from the establishment in England; it recovered the ancient ideal of territorial

autonomy with world wide intercommunion and provided a system of internal government.

In the political sphere Swainson's career may be open to more criticism. After representative government had been granted, he advised the acting governor against conceding the principle of ministerial responsibility without further instructions from England. He championed the rights of the natives, regarding the Treaty of Waitangi (1840) as a solemn obligation and envisaging the continued progress of the Maori under Christian influence, which should culminate in equality with the British settlers. Accordingly he came into conflict with the colonists, whose aim was to build a British community and who were impatient of restrictions on the acquisition of land. He questioned the jurisdiction of the crown over certain native chiefs not parties to the Treaty of Waitangi and received a severe rebuke from the Colonial Office, despite the fact that legally his position had many points in its favor. Swainson was the author of *New Zealand and Its Colonization* (London 1859) and *New Zealand and the War* (London 1862).

SWIFT, JONATHAN (1667-1745), British man of letters. Swift ranks among the great satirists of all literature; but since he was primarily a pamphleteer, his art, even when most universal, is integrally related to the political preoccupations of his day. Born of the faded gentry, penniless and yet consumed by ambition, he chose the church as a career and party pamphleteering as the shortest road toward ecclesiastical preferment. He served a literary apprenticeship as secretary to Sir William Temple and through him became embroiled in the current controversy over the respective merits of the ancient and modern writers; from his brief sortie into this field emerged *The Battle Fought between the . . . Books* (1704), the most brilliant of the products of the controversy, which already revealed Swift's Tory leanings. An unsuccessful mission to London in behalf of the established church in Ireland taught him the difficulties of political intrigue in what was perhaps the most

corrupt period of English politics and gave him moreover a taste for it. He started as a moderate Whig, and wrote his *Dissensions between the Nobles and the Commons in Athens and Rome* (1701) for the Whigs. But his discontent with the treatment they accorded him ("Rot 'em for ungrateful dogs; I will make them repent their usage") and especially his sense for church statesmanship, his preference for order and authority and his dislike for the new merchant class finally threw him in with the Tories. He played an important role in bolstering the Harley ministry (1710-14), being most effective as the editor of the official party newspaper, the *Examiner*, which was the spearhead of Tory opinion. He ranks therefore, with Addison and Defoe, as one of the founders of English journalism. He was quite conscious of the possibilities for power that journalism offered in a parliamentary system increasingly dependent on the opinion of the electorate. His writings reached the wits of London and the aristocracy and especially the plain people in the country parishes; but, unlike Defoe, he scorned to appeal to the growing class of merchants, shopkeepers, clerks and apprentices. He relished his part in the councils of the great, and in return he served them powerfully in his articles and pamphlets. The most important of these politically, *The Conduct of the Allies* (1712), was an attack on the military and diplomatic logic of British participation in the War of the Spanish Succession, and it made European history. Despite his repeated pleas for preferment and his obvious panting for a bishopric Swift had finally to be content with a deanship in Ireland. The tragic frustration of his ambition must be laid to his irresponsible pen, which in *A Tale of a Tub* (1704) had treated religion somewhat cavalierly; and in a succession of poems and pamphlets he had lashed out so furiously at persons in high place as to make him powerful enemies. But it is to this same irresponsibility that Swift's political pamphlets owe their greatness. The best of them, to be sure, such as *The Sentiments of a Church of England Man* (1711) and the *Letter . . . concerning the Sacramental Test* (1709) are measured and cogent expositions of his political and ecclesiastical theory. Swift was shrewd enough to see that the Tories and the High Churchmen had to abandon their divine right theories and rest their claims upon the strength of traditional institutions; he sought to adapt the Tory position to the *fait accompli* of the Revolution of 1688 and went so far as to claim for the

Church of England as against the dissenters the important part in that revolution. He is thus, with Bolingbroke, a crucial figure in the readjustment of Tory thought. But there is a desperate strength in his polemics. He had attached himself to the Tory party in its brief interval of power before its final decay. It was part of his ironic destiny to spend his fine gifts upon a losing cause and in defense of a dying class. Like the great Latin satirists he was defending an old order against the encroachments of a callow bourgeoisie and a rising money power.

Swift in Ireland, banished as he felt from a life of action, looked back with nostalgia upon his brief years of power, brooded over his grievances, journeyed through the countryside and was further embittered by the poverty and degradation of the life of the Irish masses. When the English crown sold the Irish coinage monopoly in a manner flagrant even for an age of political jobbery, Swift's accumulated resentment flared up in the *Draper Letters* (1725), whose importance lies not so much in their somewhat questionable monetary doctrine and value theory as in their ringing challenge to British imperialism and in the basis they laid for the later agitation for Irish independence. In *A Modest Proposal* (1729) he reached the most relentless *reductio ad absurdum* of English policy, in his suggestion that the Irish economic problem could best be met if Irish children were sold as tender meat. But the climax at once of his social thought and his writing art was reached only in *Gulliver's Travels* (2 vols., 1726). Using the contemporary literary form of the imaginary voyage, he achieved thereby an anthropological attitude which enabled him to gain an inhuman perspective in measuring human character and social organization. Toward this end he sought heroically to master a wide range of devices—increasing the size of man (Brobdingnag), decreasing it (Lilliput), making him live forever (Struldbrug), making him all intellect (Laputa), making him all bestiality (Yahoo). Into the early voyages Swift poured his entire experience with English government, so that the satire is chiefly political. But at the time he wrote the later voyages he was more concerned with Irish social conditions: the satire broadens in scope, reaching to the institutions behind politics and the essential human character underlying both. He launches a frontal attack upon the entire apparatus of civilization—upon war, capitalism, property, trade, kingship, the court, education and imperialism. He had in the second voyage

described men as "the most pernicious race of little odious vermin that Nature ever suffered to crawl upon the face of the earth"; in the fourth, which has been quite generally repulsive to critics, he goes beyond invective into symbolism, and by setting off the Yahoos against the Houyhnhnms he portrays at once the most degrading traits in human nature and the possibilities for a rational ordering of social life. It is a mistake to regard his doctrine as all cold hate. His corrosive mind ate away the Augustan complacencies of the England of his day. Living in an age of expansion, at the crest of the commercial revolution and the beginning of the industrial, he saw clearly that man's increasing power was being crystallized in stupid institutions, vested in a grasping new class, entrusted to an animal who, in Swift's own words, was not by nature *rationalis* but only *rations capax*.

SWINTON, JOHN (1830-1901), American journalist and social reformer. Apprenticed to a printer at the age of twelve, Swinton by his own efforts acquired a broad education in literature, science and philosophy. In 1849 he went to New York, and while working as a printer he studied medicine and then law and finally entered journalism. An ardent abolitionist, he joined John

Brown's raid at Osawatimie, Kansas, in 1857. Upon his return to New York he worked under Greeley and later joined the staff of the New York *Times*, of which he was managing editor during the Civil War. In 1870 he went over to Dana's *Sun*, serving as chief editorial writer from 1875. After the panic of 1873 the labor movement became Swinton's dominant interest. He witnessed the Tompkins Square riot in 1874, and his bitter denunciation of police brutality and his espousal of the labor cause led to his nomination for mayor of New York on the Socialist Labor party ticket. In 1880 he went to Europe and met Marx. When he left the *Sun* in 1883 he put his life savings of \$40,000 into *John Swinton's Paper*. This weekly was the best labor paper in the country's history. Although he was a socialist and a proponent of such measures as progressive income tax and public ownership of railroads, telegraphs and mines, he never tried to impose any particular ideology on the labor movement but served as its champion. The paper was discontinued in 1887 after Swinton's capital had been exhausted. He lost his eyesight in 1889 but continued his work as journalist, teacher and writer until his death.

SYBEL, HEINRICH VON (1817-95), German historian. Sybel was born in Dusseldorf of a bourgeois, Protestant liberal family. He studied under Ranke and taught at the universities of Bonn, Marburg and Munich. Although he was a pupil of Ranke, he soon abandoned the strictly scientific and objectively dispassionate methods of his master and became one of the leading representatives of the Prussian school of historians. He rejected the ideal of "neutrality" for the historian, who, he urged, should teach his readers national ideals in religion and politics. He was an ardent advocate of Prussian hegemony in German unification but was just as strongly opposed to absolutism, feudalism, romanticism and ultramontanism as to democratic radicalism and socialism.

Sybel's first large work, *Geschichte des ersten Kreuzzugs* (Dusseldorf 1841, 2nd ed. 1881), dispelled many notions through its keen critical use of sources; and his much disputed *Entstehung des deutschen Königthums* (Frankfort 1844, 2nd ed. 1881) denied the indigenous origins of the kingdom and emphasized Roman influences. During the Revolution of 1848 Sybel was a

delegate of the University of Marburg to the Hessian assembly of estates, where he assumed a position "completely removed from democratic enthusiasm or cosmopolitan speculation." After the disintegration of the movement of 1848 he returned to his study. A pamphlet designed to trace the origins of the socialistic tendencies in the French Revolution served as the starting point for his *Geschichte der Revolutionszeit von 1789-1800* (5 vols., Dusseldorf and Stuttgart 1853-79; vol. i 4th ed 1877, vol. ii 3rd ed 1866, vol. iii 2nd ed. 1861), which was based on thorough study of the archives at Paris and which established Sybel's European reputation. He was a forerunner of Albert Sorel in that he brought the revolutionary movement into the setting of general European history and stressed the Russian and Polish questions. He looked upon the revolution not merely as a struggle on constitutional questions but rather as a tremendous social transformation. Nevertheless, he still retained the viewpoint of the typical German bourgeois, who, overcome by fear and revulsion, was unable genuinely to understand this powerful movement and to grasp the historical and social significance of the revolutionary principles. In this respect Burke's influence upon Sybel is as apparent as Sybel's upon Taine.

In 1856 Sybel was called to Munich by King Maximilian II. Here he created the history seminar at the university. With Ranke he organized the Historical Commission of the Bavarian Academy of Sciences, and he took an active part in its publications. In 1859 he established the *Historische Zeitschrift*, which became one of the leading historical journals of the world.

A lecture at Munich gave rise to his controversy with Julius Ficker concerning the significance of the German imperial policy during the Middle Ages. Sybel contributed to this discussion the important point that the *renovatio imperii* of Otto I in 962 gave to the German Empire that universal character which up to 1806 had hindered the development of a national state similar to that of England or France. Sybel's conceptions were influenced by the tendencies and aspirations of his own time. His belief in the "German mission" of Prussia and his idea of a "narrower German confederation" under the lead of Prussia and with the exclusion of Austria are clearly expressed in the preface to his *Die deutsche Nation und das Kaiserreich* (Dusseldorf 1862).

In 1861 Sybel was called to the University of Bonn and the following year was elected to the

Prussian diet, where he served several terms. As a moderate liberal he was for a short time in sharp opposition to the military policy of Bismarck and Roon, but he later changed his attitude. In 1875 he was appointed head director of the Prussian state archives at Berlin. He reorganized the archives and initiated the extensive series of *Publikationen aus den preussischen Staatsarchiven*. As a member of the Academy of Sciences he was a frequent contributor to its publications on Prussian history, and with Sichel he prepared the *Kaiserurkunden in Abbildungen* (11 pts., Berlin 1880-91). He served also as director of the historical institute at Rome which he had founded with Sichel. His last great work, *Die Begründung des deutschen Reiches unter Wilhelm I* (7 vols., Munich 1889-94, vols. i-v 4th ed. 1892; tr. by M. L. Perrin, Gamaliel Bradford and H. S. White, New York 1890-98), is essentially a history of Bismarck's policy of German unification up to the declaration of war in 1870; here Sybel attempted to present the harsher aspects of Bismarck's policy in a more sympathetic manner.

SYLVIS, WILLIAM H. (1828-69), American labor leader. A molder by trade, Sylvis became secretary of the Philadelphia union shortly after his participation in a strike in 1857. He led the movement for a national molders' union which was organized in 1859 and became its national treasurer in 1860. As its national president and organizer from 1863 on he made the organization, which had virtually disintegrated during the Civil War, into the most powerful trade union organization of the period. Envisaging the need for a national center for all workers he was one of the promoters of the first American labor federation, the National Labor Union, of which he became president in 1868, and was the first labor lobbyist at Washington. Although an able trade union executive, Sylvis viewed trade

unionism as a mere palliative useful so long as the wage system endured but incapable of solving the wage earners' basic problem. He pinned his faith at first on producers' cooperation, independent political action and "greenbackism" as methods of fighting monopoly. The first trade unionist to realize the importance of international ties, he later developed a friendly interest in Marx' International Working Men's Association and dispatched A. C. Cameron as delegate to its congress in 1869. His sudden death in that year deprived the American labor movement as well as his own union of its first great leader.

SYMBOLISM. The term symbolism covers a great variety of apparently dissimilar modes of behavior. In its original sense it was restricted to objects or marks intended to recall or to direct special attention to some person, object, idea, event or projected activity associated only vaguely or not at all with the symbol in any natural sense. By gradual extensions of meaning the terms symbol and symbolism have come to include not merely such trivial objects and marks as black balls, to indicate a negative attitude in voting, and stars and daggers, to remind the reader that supplementary information is to be found at the bottom of the page, but also more elaborate objects and devices, such as flags and signal lights, which are not ordinarily regarded as important in themselves but which point to ideas and actions of great consequence to society. Such complex systems of reference as speech, writing and mathematical notation should also be included under the term symbolism, for the sounds and marks used therein obviously have no meaning in themselves and can have significance only for those who know how to interpret them in terms of that to which they refer. A certain kind of poetry is called symbolic or symbolistic because its apparent content is only a suggestion for wider meanings. In personal relations too there is much behavior that may be called symbolic, as when a ceremonious bow is directed not so much to an actual person as to a status which that person happens to fill. The psychoanalysts have come to apply

the term symbolic to almost any emotionally charged pattern of behavior which has the function of unconscious fulfilment of a repressed tendency, as when a person assumes a raised voice of protest to a perfectly indifferent stranger who unconsciously recalls his father and awakens the repressed attitude of hostility toward the father.

Amid the wide variety of senses in which the word is used there seem to emerge two constant characteristics. One of these is that the symbol is always a substitute for some more closely intermediating type of behavior, whence it follows that all symbolism implies meanings which cannot be derived directly from the contexts of experience. The second characteristic of the symbol is that it expresses a condensation of energy, its actual significance being out of all proportion to the apparent triviality of meaning suggested by its mere form. This can be seen at once when the mildly decorative function of a few scratches on paper is compared with the alarming significance of apparently equally random scratches which are interpreted by a particular society as meaning "murder" or "God." This disconcerting transcendence of form comes out equally well in the contrast between the involuntary blink of the eye and the crudely similar wink which means "He does not know what an ass he is, but you and I do."

It seems useful to distinguish two main types of symbolism. The first of these, which may be called referential symbolism, embraces such forms as oral speech, writing, the telegraph code, national flags, flag signaling and other organizations of symbols which are agreed upon as economical devices for purposes of reference. The second type of symbolism is equally economical and may be termed condensation symbolism, for it is a highly condensed form of substitutive behavior for direct expression, allowing for the ready release of emotional tension in conscious or unconscious form. Telegraphic ticking is virtually a pure example of referential symbolism; the apparently meaningless washing ritual of an obsessive neurotic, as interpreted by the psychoanalysts, would be a pure example of condensation symbolism. In actual behavior both types are generally blended. Thus specific forms of writing, conventionalized spelling, peculiar pronunciations and verbal slogans, while ostensibly referential, easily take on the character of emotionalized rituals and become highly important to both individual and society as substitutive forms of emotional expression. Were

writing merely referential symbolism, spelling reforms would not be so difficult to bring about.

Symbols of the referential type undoubtedly developed later as a class than condensation symbols. It is likely that most referential symbolisms go back to unconsciously evolved symbolisms saturated with emotional quality, which gradually took on a purely referential character as the linked emotion dropped out of the behavior in question. Thus shaking the fist at an imaginary enemy becomes a dissociated and finally a referential symbol for anger when no enemy, real or imaginary, is actually intended. When this emotional denudation takes place, the symbol becomes a comment, as it were, on anger itself and a preparation for something like language. What is ordinarily called language may have had its ultimate root in just such dissociated and emotionally denuded cries, which originally released emotional tension. Once referential symbolism had been established as a by-product of behavior, more conscious symbols of reference could be evolved by the copying in abbreviated or simplified form of the thing referred to, as in the case of pictographic writing. On still more sophisticated levels referential symbolism may be attained by mere social agreement, as when a numbered check is arbitrarily assigned to a man's hat. The less primary and associational the symbolism, the more dissociated from its original context, and the less emotionalized it becomes, the more it takes on the character of true reference. A further condition for the rich development of referential symbolism must not be overlooked—the increased complexity and homogeneity of the symbolic material. This is strikingly the case in language, in which all meanings are consistently expressed by formal patterns arising out of the apparently arbitrary sequences of unitary sounds. When the material of a symbolic system becomes sufficiently varied and yet homogeneous in kind, the symbolism becomes more and more richly patterned, creative and meaningful in its own terms, and referents tend to be supplied by a retrospective act of rationalization. Hence it results that such complex systems of meaning as a sentence form or a musical form mean so much more than they can ever be said to refer to. In highly evolved systems of reference the relation between symbol and referent becomes increasingly variable or inclusive.

In condensation symbolism also richness of meaning grows with increased dissociation. The chief developmental difference, however, be-

tween this type of symbolism and referential symbolism is that while the latter grows with formal elaboration in the conscious, the former strikes deeper and deeper roots in the unconscious and diffuses its emotional quality to types of behavior or situations apparently far removed from the original meaning of the symbol. Both types of symbols therefore begin with situations in which a sign is dissociated from its context. The conscious elaboration of form makes of such dissociation a system of reference, while the unconscious spread of emotional quality makes of it a condensation symbol. Where, as in the case of a national flag or a beautiful poem, a symbolic expression which is apparently one of mere reference is associated with repressed emotional material of great importance to the ego, the two theoretically distinct types of symbolic behavior merge into one. One then deals with symbols of peculiar potency and even danger, for unconscious meanings, full of emotional power, become rationalized as mere references.

It is customary to say that society is peculiarly subject to the influence of symbols in such emotionally charged fields as religion and politics. Flags and slogans are the type examples in the field of politics, crosses and ceremonial regalia in the field of religion. But all culture is in fact heavily charged with symbolism, as is all personal behavior. Even comparatively simple forms of behavior are far less directly functional than they seem to be, but include in their motivation unconscious and even unacknowledged impulses, for which the behavior must be looked upon as a symbol. Many, perhaps most reasons are little more than *ex post facto* rationalizations of behavior controlled by unconscious necessity. Even an elaborate, well documented scientific theory may from this standpoint be little more than a symbol of the unknown necessities of the ego. Scientists fight for their theories not because they believe them to be true but because they wish them to be so.

It will be useful to give examples of some of the less obvious symbolisms in socialized behavior. Etiquette has at least two layers of symbolism. On a relatively obvious plane of symbolism etiquette provides the members of society with a set of rules which, in condensed and thoroughly conventionalized form, express society's concern for its members and their relation to one another. There is another level of etiquette symbolism, however, which takes little or no account of such specific meanings but interprets etiquette as a whole as a powerful

symbolism of status. From this standpoint to know the rules of etiquette is important, not because the feelings of friends and strangers are becomingly observed but because the manipulator of the rule proves that he is a member of an exclusive group. By reason of the richly developed meanings which inhere in etiquette, both positive and negative, a sensitive person can actually express a more bitter hostility through the frigid observance of etiquette than by flouting it on an obvious wave of hostility. Etiquette, then, is an unusually elaborate symbolic play in which individuals in their actual relationships are the players and society is the bogus referee.

Education is also a thoroughly symbolic field of behavior. Much of its rationale cannot be tested as to direction or value. No one knows or can discover just how much Latin, French, mathematics or history is good for any particular person to acquire. The tests of the attainment of such knowledge are themselves little more than symbolic gestures. For the social psychologist education, whatever else it may be or do, stands out as a peculiarly massive and well articulated set of symbols which express the needs of the individual in society and which help him to orient himself in his relations to his fellow men. That an individual possesses the bachelor's degree may or may not prove that he knows, or once knew, something about Roman history and trigonometry. The important thing about his degree is that it helps him to secure a position which is socially or economically more desirable than some other position which can be obtained without the aid of this degree. Society has misgivings about the function of specific items in the educational process and has to make symbolic atonement by inventing such notions as the cultivation of the mind.

It is important to observe that symbolic meanings can often be recognized clearly for the first time when the symbolic value, generally unconscious or conscious only in a marginal sense, drops out of a socialized pattern of behavior and the supposed function, which up to that time had been believed to be more than enough to explain it and keep it going, loses its significance and is seen to be little more than a paltry rationalization. Chairmanship of a committee, for instance, has symbolic value only in a society in which two things are believed: that administrative functions somehow stamp a person as superior to those who are being directed; and that the ideal society is a democratic one and that

those who are naturally more able than others somehow automatically get into positions of administrative advantage. Should people come to feel that administrative functions are little more than symbolic automatisms, the chairmanship of a committee would be recognized as little more than a petrified symbol and the particular value that is now felt to inhere in it would tend to disappear.

An important field for investigation is that of personal symbolisms in the use of cultural patterns. Personal symbolisms are often the more valuable as they are hidden from consciousness and serve as the springs of effective behavior. Interest in a particular science may be an elaborately sublimated symbol of an unconscious emotional attachment to what a man who is significant in one's personal development is believed to be linked up with, such as the destruction of religion or the discovery of God, these grandiose preferences in turn serving as symbols of repressed hate or love. Much charitable endeavor is animated by an unconscious desire to peer into lives that one is glad to be unable to share. Society itself, perfecting its rigid mechanisms of charitable activity, cannot in every case or even in the vast majority of cases subject the charitable act to a pragmatic critique but must rest content for the most part with charity organization as its symbolic gesture toward alleviating suffering. Thus individual and society, in a never ending interplay of symbolic gestures, build up the pyramided structure called civilization. In this structure very few bricks touch the ground.

SYMONDS, JOHN ADDINGTON (1840-93), English man of letters and historian. Symonds was born in Bristol, the son of John Addington Symonds, a prominent physician and literary figure. He was educated at Harrow and at Balliol College, Oxford, where he came under the strong influence of Benjamin Jowett and where he developed a deep interest in the classics and the literature of the Renaissance. Of frail health from his youth, he later developed consumptive tendencies which made it necessary for him to dwell for a period in Italy and Switzerland. He returned to London and started to study law but soon abandoned it for literature. In 1877 illness again forced him to leave England, he settled at Davos-Platz, Switzerland, where he remained for the rest of his life.

Symonds was primarily a literary critic. He contributed to numerous reviews and wrote lives of Shelley and Sir Philip Sidney and also of Walt Whitman, having been attracted to the American poet by his democratic sympathies. His most lasting works, however, were those on the Italian Renaissance. Preceded by a detailed study of Dante and supplemented by a magnificent biography of Michael Angelo, his *Renaissance in Italy* (7 vols., London 1875-86; 2nd-3rd ed. 1897-98) helped more than any other English work to fashion the now conventional view of the Renaissance. It was to the English speaking world what Burckhardt's work was to the continent. Symonds' most original contributions are to be found in the volumes on literature and the fine arts, but in general he was greatly under the influence of Michelet and Burckhardt. He pictured the Renaissance as the inauguration of the great age of freedom: of the individual, of thought, of religion and politics and of youth. The Renaissance meant for him the discovery of the world and the discovery of man. As opposed to the mediaevalism of Ruskin he glorified the Renaissance as "the first transcendent springtide of the modern world!" and the liberation of mankind from everything sickly, effete and despairing. More broadly he looked upon the Renaissance as a movement which aimed at equal social, political and cultural advantages for all. Thus he

definitely linked the Protestant Reformation to the Renaissance and even considered the French Revolution as a phase of the same historical process. Many of his ideas have since been revised by the results of later investigations, but because of the charm of his presentation and his luminous insight into men and works of art his books are still the most widely read English works on the period.

SYMPATHETIC STRIKE. See STRIKES AND LOCKOUTS.

SYNDICALISM derives from the French word for trade unionism. In its English connotation, however, it corresponds to that particular form of French trade unionism known as revolutionary syndicalism (*syndicalisme révolutionnaire*) in contrast to reformist syndicalism (*syndicalisme réformiste*). Revolutionary syndicalism as developed in France and carried over with some modifications to other countries combines the doctrines of trade unionism with certain socialist ideas in such a way as to form an autonomous set of ideas, which have played a distinctive and influential part in the intellectual and social history of the last half century. It accepts the Marxian premise that in modern society the wage earners, the proletariat, are pitted against the owners of property, the bourgeoisie, in a class struggle which must end in a social revolution and in the establishment of a collectivist society. It differs from other schools of socialism, however, in its conception of the technique of revolution and the form of the ideal collectivist society. Its distinctive features are the special and predominant role which it ascribes in the revolutionary struggle to the labor union and the emphasis which it places upon the struggle against the state. The trade union is viewed not only as the chief instrument for improving the condition of the worker under capitalism but as the primary means of achieving the revolution through the general strike (*g.v.*) and as the cell of the future society. In attacking the state the syndicalists share with other socialists anti-patriotic and antimilitarist sentiments, but in addition they oppose parliamentary democracy

and the use of any political weapons in the class struggle. Both in its conception of a future stateless society and in its attack upon the existing state syndicalism has taken over so much of anarchist ideology and has been supported to such an extent by anarchist traditions and forces that the movement is sometimes termed anarcho-syndicalism.

Syndicalism emphasizes the inherent social and revolutionary possibilities of the everyday functions of the trade union and builds its strategy and tactics on that basis. According to the syndicalists the trade unions by participating in the struggle for higher wages, shorter hours and better working conditions can and do intensify the worker's class consciousness, develop in him a will to power, drill him in the manoeuvres of class warfare and prepare him for the final task of social revolution. But if the trade unions are to perform these functions effectively, they must organize on an industrial basis and must use their weapons, such as the strike, sabotage, the label and the boycott, in a spirit of militancy against the system of private property and against the state. It is this aspect of the economic and social struggle, its direct action (*g.v.*) against employers, the army and the state in general, which gives it a revolutionary significance. Through a series of such acts the workers are being trained for the supreme act of the class struggle, the general strike, which will mark the death knell of the present industrial system and inaugurate the new social order.

Syndicalism pictures the future society as a free and flexible federation of autonomous productive and distributive associations based on collective ownership and carrying on their functions in accordance with the needs of the community. It thus shares the collectivist concept of property, the communist principle of distribution according to needs and the anarchist idea of statelessness. More concretely, the syndicalists visualize a society in which each industry is collectively managed by the workers, both manual and mental, engaged in producing its particular goods or services. All of these *syndicats*, functioning harmoniously and without external compulsion, would form a general national federation. The latter would differ essentially from the familiar concept of the state. The state today represents a political and coercive force based in democratic countries on the representation of geographical units supposedly homogeneous in interests. Under syndicalism the *syndicats* and workers' cooperatives would

merely express the functional interests of the workers and would combine to carry on statistical and administrative services necessary for the smooth operation of the system as a whole.

The origins of syndicalism are rooted partly in the peculiar characteristics of the French labor movement, partly in the general conditions of the socialist movements of the last century. The first anticipations of syndicalist ideas may be found in the discussions and resolutions of the First International between 1868 and 1872 and especially in those of its Bakuninist sections between 1872 and 1876. In its definite historic form, however, syndicalism was elaborated between 1895 and 1904 by the leaders and spokesmen of the *Confédération Générale du Travail* (*q. v.*), the French counterpart of the American Federation of Labor, and by a group of intellectuals who, in close contact with the C.G.T., were revising their socialist thinking. Syndicalism thus came into being as a result of two movements, one an attempt to reorient the trade unions and the other a phase of the general tendency toward a revision of Marxism which produced Eduard Bernstein in Germany, Georges Sorel in France, the guild socialists (*see GUILD SOCIALISM*) in Great Britain and the Industrial Workers of the World (*q. v.*) in the United States.

The two movements were carried on in France at the same time by two different although closely connected groups. The men who undertook to reshape the character of trade unionism, Pelloutier, Pouget, Griffuelhes, Delesalle, Niel and Yvetot, either came from the working class or were engaged in trade union activities as officials and executives and took an active part in building up the French trade union movement. This group did not indulge in much speculative theorizing. Its members were chiefly concerned with the ways and means of realizing syndicalist ideals, with the forms and methods of direct action and with the relations of the syndicalists to other social revolutionary elements. A second group, the "intellectual" wing, among whom Georges Sorel, Hubert Lagardelle and Édouard Berth were most prominent, came from outside the trade union movement. Sorel, the outstanding writer of this group and regarded as the syndicalist philosopher par excellence, elaborated most of the philosophical and sociological ideas of the school. The key to his thinking is his attempt to work out a synthesis between the proletarianism of Marx, the anti-political associationism of Proudhon and the voluntarism of Bergson. Starting with the

Marxian concept of the historic and creative function of class struggle Sorel argues that the class struggle will end in the downfall of capitalism only if, as and when working men have acquired a will to power and a vision of their spiritual capacity to hasten the birth of a new order out of the old. The historic need of mass violence lies in the assumption that it trans the will to power of the working class and accentuates class consciousness. This also explains the necessity of the idea of a general strike, which stirs the imagination and concentrates the energies of the working class for the coming of the day of revolution. The general strike is thus the social myth of the workers, the vision which is to maintain their fighting morale and their sense of historic mission, similar to the myths of other historic social movements, such as, for example, early Christianity.

Syndicalism has been explained as a peculiarly French or at most Latin phenomenon, traceable to the special racial and national characteristics of the Latin peoples. Undoubtedly some of the features of syndicalism as evolved between 1895 and 1904 may be attributed to the special conditions of the French labor and socialist movements. The slow rate of development of French industrialism during the nineteenth century hindered the growth of large, powerful trade unions, and the traditional individualistic inclinations of the French workers had the same effect. The social institutions of France which provided against insecurity made the benefit features of trade unions less attractive to the workers and the obligation to pay dues more irksome. On the other hand, the French trade unionists were influenced by the revolutionary tradition of France, by the continuous quarrels between socialist and anarchist groups and by their antagonism to intellectuals who used the labor movement as a means to a political career. Another element was the opposition in certain French circles to the centralized powers of the French state and to the French bureaucracy. Thus the French labor unions, generally poor financially, were unstable in membership, defective in the provision of strike, sickness and unemployment benefits and, torn by internal political dissensions, a fertile ground for the doctrines of direct action, anti-*étatisme*, anti-politicalism and anti-intellectualism. These factors and the Blanquist tradition in France explain the readiness of the élite of the French working class to think in terms of a social revolution rather than of immediate betterment and

to build up a doctrine which posited this élite as the historic vanguard of a great social transformation.

Between 1906 and 1910 syndicalism grew rapidly in France. It took on more definite form also in Italy and Spain, as a result in part of close intellectual contacts but also because of similarities in economic condition, political history and social and cultural traditions. In Germany the *Lokalisten*, organized in the Freie Vereinigung Deutscher Gewerkschaften, which had been formed in 1897, advocated federative industrial organization similar to that of the syndicalists. Between 1910 and 1914 syndicalism began to acquire importance in other countries and to assume the character of a world movement. In England the Industrial Syndicalist Education League was formed in 1910, and from 1912 on the guild socialist movement reflected increasingly the influence of industrial unionism and syndicalism. In the United States the I. W. W., which had been organized in 1905 principally on the basis of revolutionary industrial unionism and had by 1908 assumed a definitely syndicalist aspect, appeared dramatically on the industrial scene with the Lawrence textile strike of 1912. In Italy in the same year the syndicalists under Labriola separated from the socialist controlled Confederazione Generale del Lavoro and set up a committee for direct action, which in 1914 became the Unione Sindacale Italiana. An international syndicalist conference was held in London in 1912. The wave of unrest and mass strikes which swept the western world between 1911 and 1913, stimulated by discontent among semiskilled and unskilled workers, was in part inspired and led by men who had been influenced by anarcho-syndicalist ideas and in part a spontaneous manifestation of tendencies which served to strengthen the syndicalist movement. In the years immediately preceding the World War syndicalism was in the ascendant and seemed to many to hold out the promise of a new and socially revitalized labor movement.

The World War cut this development short. Some leading syndicalists were jailed by their governments, others turned patriots. In the United States a series of criminal syndicalism (*q.v.*) laws, initiated by the Idaho law of 1917 and followed by those of other states until 1920, was aimed definitely at the disconcerting tactics of the I.W.W.

During the great post-war upheaval of 1919-20 syndicalism experienced a revival. In France a great strike was called in 1920. In the same

year a similar strike was called in Spain by the Confederación Nacional de Trabajo, which had outstripped the slowly growing socialist Unión General de Trabajadores. The *Lokalisten* in Germany, reorganized as the Freie Arbeiter-Union Deutschlands, increased their membership to about 100,000 as a result of the dissatisfaction of the workers with the policy of the free trade unions in supporting the war and in entering into long term collective agreements. In Italy the syndicalists and other revolutionary groups openly advocated and actually attempted the seizure of industrial plants.

Since the early 1920's syndicalism has steadily waned, a decline which is attributable to many factors. Perhaps the most important between 1921 and 1929 was the growing influence of communism and of the Third International. The latter and its satellite, the Red International of Labor Unions, made inroads into the syndicalist unions and for a while won over some of the most influential syndicalist leaders—Rosmer, Monmousseau and Monatte in France, Tom Mann in England, Nin in Spain and William D. Haywood in America. The glamour of the Soviet workers' republic and the absorption of some of the syndicalist ideas by the communists combined to draw the left wing elements in the labor movement away from the syndicalists and to rally them around the Comintern. A second factor was the profound change wrought by the war in the status of organized labor in France and other countries. In France, the principal home of syndicalism, the C.G.T., after the failure of the 1920 strike, became more and more interested in immediate social reforms and in peaceful penetration into the economic and political structure of the state. The leaders of the C.G.T. reinterpreted syndicalism in this evolutionary sense and cleansed it of its pre-war "revolutionary romanticism." They also embarked upon a policy of cooperation with the French government and the League of Nations and became active in the direction and work of the International Labor Office. The small and scattered elements in the C.G.T. which tried to remain true to the revolutionary syndicalist tradition and which refused to accept the communist theory and practise of proletarian dictatorship broke away and formed an organization of their own, the Confédération Générale du Travail Syndicaliste Révolutionnaire (C.G.T.S.R.), in opposition both to the C.G.T. and to the communist Confédération Générale du Travail Unitaire (C.G.T.U.). The tendency of

the C.G.T. toward reformism cannot be explained entirely by a change of heart on the part of its leaders; in the main it must be considered a reflection of the change in social life in the post-war era, which gave many of the French unions a new interest in purely trade union objectives. At the present time the C.G.T. can no longer be regarded as a revolutionary syndicalist organization.

✓ In other countries the syndicalist labor elements were destroyed as a result either of dictatorial oppression, as in the case of Fascist Italy, or of unfavorable political and economic conditions, as in the case of the I.W.W. in the United States. In Spain the C.N.T. was crushed by governmental opposition and repression, particularly under the Rivera dictatorship, but the revolution of 1931 gave it a new impulse. In a very short time its membership grew to a figure estimated at more than 1,000,000, and it has become the leading and most prominent anarcho-syndicalist movement in the world. The C.N.T. is divided, however, over the question of the desirability of using governmental force and establishing a dictatorship of the proletariat for a brief period after the successful revolution to prepare the way for the ideal society. An attempt at a syndicalist revolution in December, 1933, proved abortive. Syndicalism is also an active element in the labor movement of some of the Latin American countries.

Those syndicalist unions which survived were affiliated until recently with the International Working Men's Association, founded in Berlin in 1922. Between 1923 and 1932 most of the theoretical work of the movement was carried on by German, Swedish and Dutch labor men, the chief spokesmen being Rudolph Rocker, Fritz Kater and A. Souchy, all of Germany and secretaries of the I.W.M.A. After the National Socialist revolution of 1933 the I.W.M.A. was transferred from Berlin first to Holland and then to Madrid. It is impossible to obtain accurate information as to the membership of the various unions affiliated with the I.W.M.A.; at the outside in all likelihood its members in 1933 totaled no more than 1,100,000, the overwhelming majority of whom were members of the Spanish C.N.T. The I.W.M.A. has restated the tenets of syndicalism in a series of ten propositions which may be taken as the present platform of the syndicalist movement. In the main they reaffirm the principles presented above.

The outlook for syndicalism in the near future is not promising. Its temper and tactics are out

of harmony with the growing trends toward nationalism, increased state action and emphasis on immediate economic security. It stands between the upper and nether millstones of fascism and communism and is likely to be crushed between the two.

Nevertheless, syndicalism remains and is likely to continue in some measure as an intellectual influence in all labor and social movements. It has made its contribution to most varieties of current social philosophy. The communist labor movements have taken over most of the syndicalist analysis of the relation of labor reform to revolution. The left wing trade union groups have inherited from the syndicalists the faith in trade union organization and in militant action. Syndicalism has contributed to modern social thought the concept of pluralistic authority in society and the idea of functional economic organization. Thus syndicalists have the doubtful pleasure of being told that both fascism and communism are the heirs of the really valuable and permanent elements of syndicalist doctrine.

SYRKIN, NACHMAN (1868-1924), Jewish journalist and one of the founders of socialist Zionism. Syrkin was affected in early youth by Jewish national and socialist ideals, out of which he eventually fashioned a constructive synthesis. Even before graduating from the *Gymnasium* in Minsk he became active in Zionist circles, and on enrolling in 1887 as a student at the University of Berlin he joined Russian revolutionary groups, among whom he eloquently opposed assimilationist ideas. Two years after the publication of Herzl's *Judenstaat* Syrkin issued in German *Die Judenfrage und der sozialistische Judenstaat* (Berne 1898), in which, after offering a socio-psychological analysis of antisemitism and explaining the causes which must induce the Jewish masses to transfer their allegiance from liberalism to socialism, he maintained that a Zionist Jewish state is possible only on a socialist basis. This pamphlet was followed by *Vozzvanie k evreiskoi molodexi* (An appeal to Jewish youth, London 1901), which became in effect the official manifesto of the newly organized Zionist-Socialist party. Between 1901 and 1908 Syrkin was busily engaged in editing periodicals, notably *Hamon* in Yiddish and *Hashahar* in Hebrew, and in carrying on propaganda in Switzerland, England, France, Russia and the

United States. In 1897 he participated as a Zionist-Socialist in the first Zionist Congress. He criticized Zionist activities from a socialist angle, however, and in 1905 withdrew from the Zionist organization because of its rejection of Uganda as a possible territory for Jewish mass colonization. After the Young Turk revolution he rejoined the Zionist movement by entering in 1909 the Jewish Socialist Labor party (*Poale Zion*).

In 1907 Syrkin settled in the United States, where he edited the *Folk*, the *Yiddisher Kämpfer* and the *Zeit* and contributed numerous articles, feuilletons and editorials to the *Tog* and other Yiddish publications. As a leader of the American *Poale Zion* he was instrumental in convening the American Jewish Congress, and he represented the American Jewry in negotiations at Paris and Versailles for the protection of Jewish national rights. In 1920 he participated as a member of a *Poale Zion* commission appointed to investigate economic, political and cultural conditions in Palestine and to present a program which might lead to the establishment of a Jewish socialist commonwealth. The project which he helped to elaborate has served as a basis for present day activities of the Palestinian Jewish working men.

Syrkin, unlike Boruchov, did not believe that Jewish migration must of necessity tend toward a semi-agrarian country like Palestine. Jewish settlement in Palestine is not so much the result of ineluctable economic laws as of an inner psychologic and historic urge for an autonomous Jewish life, which is unrealizable elsewhere. Zionism is therefore an ethical and cultural as well as a social and economic revolution in Jewish life. Moreover it is a movement of universal import. For the creating of a new culture in Hebrew speech and the generating of potent spiritual forces essential to the transformation of a petty bourgeois people into a productive nation of workers will enable the Jews to offer a valuable contribution of their own to a revitalized world civilization free of classes. Syrkin's semi-mystic faith in the inherent ability of the Jewish masses radically to alter their status and his lofty estimate of the ethical significance of the socialist way of living gave his writings a prophetic tone.

HAYIM FINEMAN

Important works: *Gehlbene zionistisch-socialistische scharften*, ed. by Isaac Zar, Joel Entn, Dr. Jehudah Kaufman and Mosheh Freilichov, 2 vols. (New York 1925-26).

SZABÓ, ERVIN (1877-1918), Hungarian socialist writer and sociologist. Szabó despite the handicaps of Jewish origin, youthful poverty and almost constant ill health played an outstanding role in the intellectual and labor movement of Hungary. An admirer of Nietzsche, Proudhon, Lavrov and Kropotkin, he became a Marxist under the influence of Russian exiles in Vienna. His first important work was the introduction into Hungary of the collected works of Marx and Engels (*Marx és Engels válogatott művei*, 2 vols., Budapest 1905-09). From 1911 he was director of the Municipal Library of Budapest, which he made the most efficient in the country. As vice president of the Sociological Society, one of the editors of its organ, *Huszadik század* (Twentieth century, Budapest 1901-19), a teacher in the "Free School of Social Sciences" and a significant contributor to sociological and economic thought, he was able to influence the progressive intellectuals toward an understanding and alliance with the labor movement, in which he participated actively. In socialism he represented an antirevisionist tendency with strong syndicalist leanings; he deplored middle class predominance in the party and emphasized the necessity of reaching the agrarian masses. He became an almost mythically heroic figure for Hungarian workers and a leader of their more independent elements, and after his death some of the chief actors in the short lived Soviet Republic were drawn from among his students and adherents. In his most important work, *Társadalmi és párttharcok az 1848-49 magyar forradalomban* (Vienna 1921, with biographical preface by O. Jászi), he tried to interpret the Hungarian revolution in terms of historical materialism. Although he was one of the few foreign socialists whom the Communist Academy early elected to membership, his broad intellectual and aesthetic tolerance and his increasing emphasis on the ethical foundation of political action would seem to cast doubt upon the assertion that he subscribed to Bolshevism.

SZCZEPANOWSKI, ANTONI PRUS STANISŁAW (1846-1900), Polish industrialist and political leader. Szczepanowski, the son of an engineer and railroad builder, studied chemistry and geology at the technical school of Vienna. After a brief stay in Paris he went to London in 1867. Here after some years he secured a post at the India Office, where he collaborated in various projects pertaining to the economic development of India and prepared several reports issued by that office. Inspired by the Italian political renaissance which, he held, had been made possible by the preparatory work of economic development achieved by Cavour in Savoy and Piedmont, Szczepanowski decided to return to Poland and initiate a similar development among his countrymen. He settled in Galicia, a Polish province incorporated into the Austro-Hungarian Empire. A study of the natural resources and economic conditions of Galicia convinced him that the general economic backwardness of the people was due primarily to the deliberate policy of the Vienna government, which under the pressure of the financial interests of Austrian industrialists supported by the Galician feudal landlords blocked the industrial development of Galicia and thereby assured a steady low priced supply of raw materials to the manufacturing industries in the western provinces of Austria. Szczepanowski initiated an elaborate campaign of economic development; he appealed to the patriotic sentiment of the men who had fought for the political freedom of Poland in the uprising of 1863, and of those who sympathized with them, to join in the struggle for economic independence as the essential prerequisite to ultimate political independence. He himself began to develop the oil fields on the slope of the Carpathian Mountains. He encouraged Canadian technicians to come to Galicia and introduce modern methods of drilling; he introduced liquid fuel for heating steam boilers and built in Peczenizyn the first modern oil refinery on the European continent.

Szczepanowski entered the political arena by becoming a member of the provincial diet in Lwów and of the parliament in Vienna. In the Reichsrat he played an important role and prepared the report which was instrumental in the introduction of the gold standard in Austria. Although his success in Vienna gave promise of a brilliant political career, he abandoned the Reichsrat and returned to Galicia in 1896 to continue his work of economic reconstruction. In his later years he was not only the recognized

leader of the oil industry but he served also as president of the cooperative societies and as one of the founders of the Towarzystwo Szkoły Ludowej, a highly influential society for popular education. He was also editor of the monthly *Ekonomista polski* and of *Słowo polskie* (The Polish word), a widely read nationalist daily. Szczepanowski's economic and political activities aroused the antagonism of the political and financial interests in Vienna, which finally succeeded in forcing him into bankruptcy; but they could not destroy his life work, the industrial development of a hitherto backward country.

SZÉCHENYI, COUNT ISTVAN (1791-1860), Hungarian statesman. A member of the aristocracy and an active participant in the Napoleonic wars, Széchenyi as early as 1813 predicted the dissolution of the Austrian Empire. With Kossuth, who called him "the greatest of the Magyars," he was the outstanding exponent of liberal Magyar nationalism, although he was considered more conservative than Kossuth because of his insistence that the initial step must be economic and cultural reconstruction rather than immediate political independence. Széchenyi's denunciation of the feudal and antiquated institutions of Hungary, expressed in three epoch making works, *Hitel* (Pest 1830; new ed. by A. Gyulai, Budapest 1901), *Világ* (Pest 1831) and *Stádium* (Leipzig 1833), and his practical activities, which included outstanding contributions to the development of transportation and industry, showed the influence of his careful study of liberal political and economic institutions in the countries which he had visited during his earlier travels. A founder of the Hungarian Academy of Sciences, in a speech before that body in 1842 he denounced the spirit of intolerant Magyarization and chauvinism. Believing that Kossuth's increasing influence would plunge the country into ruin, Széchenyi attacked him. In 1845 he accepted the presidency of the transportation section under the absolutistic administration; this course lost him

the popularity he had won. Although early in 1848 he feared the collapse of the revolution, he nevertheless entered the first constitutional cabinet. Beset by doubts and disturbed by the inevitable conflict between Vienna and the Assembly, he suffered a nervous breakdown and in September was removed to the Döbling asylum for the insane at Vienna. Here he remained even after his recovery so that he might escape retaliation by the government and in 1857 published an anonymous pamphlet attacking the absolutistic system of Bach. The subsequent seizure of his manuscripts and the threat of expulsion from Döbling led to a second collapse and finally to his suicide.

Budapest 1934), Lónay, M., *Gróf Széchenyi István és határozott iratai* (Budapest 1875), tr. into German by A. Dux as *Graf Stephan Széchenyi und seine hinterlassenen Schriften* (Budapest 1875), Ácsády, I., *A magyar birodalom története* (History of the Hungarian nation), 2 vols. (Budapest 1903-04).

TABU may be defined as a negative sanction, a prohibition whose infringement results in an automatic penalty without human or supernatural mediation. The word was introduced into English from Polynesia, and special Polynesian usages have colored the interpretation of the institution. If the term is to be employed effectively in comparative discussions, it must be stripped of these accidents of interpretation and be restricted to describe prohibitions against participation in any situation of such inherent danger that the very act of participation will recoil upon the violator of the tabu. The description of a novice or a sacred king as tabu is too loose; it should be said that certain acts are tabu to them, because their committing such acts has been culturally defined as producing a dangerous situation. For example, an adolescent girl on the northwest coast of America may drink water, but she must drink it through a drinking tube; if her lips come directly in contact with water, this contact will result auto-

matically in disaster. Historically great emphasis has been laid, especially by Marett, upon tabu as the negative side of mana, or impersonal undifferentiated supernatural power. This is a misleading association which cannot be supported by the data from different cultures, unless the definition is reversed and all situations involving tabu are regarded as ipso facto involving mana. There is no justification in the facts for regarding tabu as a religious phenomenon, although many religious systems have relied generously upon the use of this kind of prohibition. Tabu is more accurately defined by its lack of any external sanction, religious or temporal. A tabu takes its meaning from the definition of any experience or of those who participate in it as inherently dangerous. This situation may be childbirth, handling the dead, retreat for a vision, being the eldest born or blowing a sacred flute. It is not more difficult to explain the fact that there is a great similarity, throughout the primitive and civilized world, in the situations which have been defined as dangerous than it is to explain the nonchalance with which many other peoples regard these same situations.

The Polynesian idea *tapu*, or *kapu*, contains the following elements: any prohibition enforced automatically, that is, the punishment followed inevitably without external mediation; or the edicts of chiefs or priests, which are supported either by the superior mana of these individuals or by the temporal or spiritual forces which they have under their control; prohibitions against theft or trespass for which the sanctions are specific magical formulae; religious prohibitions which are referred in native theology to the decree of some deity or spirit, and prohibitions which carry no penalties beyond the anxiety and embarrassment arising from a breach of strongly entrenched custom. The fact that in Polynesian languages these various kinds of prohibition are distinguished linguistically was not known to students of comparative institutions until after the term had been used in each and all of these divergent senses.

Furthermore among the true tabu prohibitions, those whose breach is followed by automatic punishment, there are in Polynesia two main classes: tabus associated with the inherent sanctity of gods, chiefs and priests and tabus associated with the inherent uncleanness of certain occurrences, such as menstruation, childbirth, bloodshed and death. Both conditions, that of sanctity and that of uncleanness, have a dynamic and dangerous quality; an individual disregard-

ing the tabu becomes himself infected, a carrier of the danger, and subject to whatever illness, loss of powers or form of death is believed to proceed from the infraction. Because the Polynesians subsume under one heading tabus of sanctity and tabus of uncleanness, the term tabu has been defined as applying to prohibitions against contact with situations which are regarded as *sacer*, situations toward which the attitude is one of mixed awe, reverence, fear and dread. While such tabus occur in some primitive societies, as among the Omaha Indians and certain Australian tribes, the distinctive aspect of Polynesian tabu is that the two attitudes, toward the sacred and toward the unclean, have been carefully differentiated and a further tabu situation has been elaborated on the basis of the inherent danger of any contact between the most sacred and the most unclean. This further elaboration finds institutional expression in rituals like that of the New Zealand Maori ceremony in which a canoe, constructed under most sacred conditions by men, must be made free or common to women. A woman of high rank, sacred because of her rank, non-sacred because of her sex, is used as a mediator between the incompatible poles of dangerousness and by stepping into the canoe can without endangering herself make it safe for women who have no sacred rank to protect them. A Marquesan can commit suicide by deliberately bringing the sacred and the profane into too close contact, by calling one half of a coconut a vulva and the other the head of a god. While the tabu situations may have the undifferentiated character described by the word *sacer* or may arouse an ambivalent attitude, this is not an invariable aspect of tabu.

While essentially negative, tabus may become the basis of cultural structure when they are of such a character that they must necessarily be infringed in the course of everyday living. This is true of the ceremonial which is built up around the daily life and contacts of a sacred king. If the period of childbearing is marked off by tabu, a ceremony of release from that period is a common development, as in the Admiralty Islands. If no tree in a whole forest may be cut without infringing a tabu, a ceremony like that of the Maori for freeing the tree is almost a social necessity.

Even within one culture area there may be great variation in the proportionate dependence of the society upon tabus or upon other forms of sanction. In Polynesia there is great contrast be-

tween the Maori attitude according to which a common man would die if he discovered that he had accidentally eaten the sacred food of a chief, and the Hawaiian attitude whereby the tabus had so lost emotional content that they had to be enforced by policing and capital punishment. In the Marquesas a chief himself was endangered if a commoner violated his tabu, but he had to avenge himself and so protect himself from such violations by a personal stock of black magic. Samoan society has so little confidence in the observance of even such rudimentary tabus as those relating to food during pregnancy that a secondary tabu is relied upon, the one against the inherent dangerousness of an expectant mother's ever being alone; thus under cover of the enforced gregariousness the woman's food is supervised.

Because contagion is so frequently a part of the tabu situation, it is often included in the definition. The contagious nature of an infringed tabu has been particularly institutionalized among the Eskimo, who see the broken tabu as a dark cloud which gathers around the culprit and is communicated to everyone with whom he comes into contact. But many cultures limit the penalty of a broken tabu to the individual violator. This distinction becomes clearer when it is recognized that in some cultures an individual is regarded as an actor in his own tabu situation, as when a king endangers himself by treating his own sacredness carelessly or an adolescent girl risks her future health by refusing to observe the special tabus of puberty. Other cultures do not associate the individual and his peculiar condition, and he then may become dangerous to others only. More often there is a combination of these two attitudes; thus a menstruating Arapesh woman who has borne no children cannot eat food which she has cooked herself for fear of endangering her reproductive powers, but she must also stay out of the village lest she harm the power and strength of mature men.

Tabus against participation in any situation may have very wide extension, such as a prohibition against eating food from a site where a chief's house once stood, against eating from a pot in which food has been cooked by people who have been responsible for the death of a relative or against using a word or a syllable which is a part of the name of an avoidance relative or a dead person.

Wundt has discussed tabu as a method of social control inherent in a very early stage of religious development. It seems more accurate to

say that some societies use tabu as a major way of controlling social behavior, while others have relied upon external social sanctions or differently motivated habit structures; that some societies have elaborated tabus associated with the inherent danger of occasions, such as periods in the life cycle of the individual or planting and harvest or hunting and warfare; that other societies have selected either by birth or status certain persons to carry a burden of special sanctity or defilement which they and others must respect under fear of automatic penalty. The difference is one of the degree of social reliance upon this particular type of control, not one of the complexity or sophistication of the particular culture. Even such a widespread tabu as the incest tabu cannot always be properly so classified, for wherever an external social penalty is required to maintain it, some of the essential force inherent in genuine tabu is lost.

Although tabu attitudes may be said to be those parts of an individual's cultural training which are enforced by a deep seated fear, nevertheless a religious system like the Polynesian, when it is built upon an elaboration of the tabu situation, may dignify the individual personality by placing him in a position of power and choice which is granted by few religious systems. The world has been charted, its places of danger are known; an intelligent following of the chart permits the individual to walk through life petitioning no deity and administering his own death if he infringes upon the order of the universe.

The term tabu may be used in modern society to cover those aspects of behavior which are rooted in the individual personality to such a degree that they are so automatic and emotionally charged that the personality suffers inevitably from their infringement. Food tabus inculcated in early childhood, such as a dread of eating horse or dog meat, and the elaborate individual system of tabus built up by neurotics suffering from a compulsive neurosis both come under this head. They are self-enforced, independent of all outer agencies, and the punishment is believed to flow automatically from the breach. Every society depends to some extent upon building into the growing personality a system of tabus enforced by fear. But just as psychological research reveals great differences in individual capacity to absorb social prohibitions into the personality, so both primitive and modern societies differ in the degree to which

they entrust the preservation of culture forms to tabus or find it necessary to externalize prohibitions in the form of socially enforced laws.

TACITUS, PUBLIUS CORNELIUS (c. 55-c. 120), Roman historian. Knowledge of important details of Tacitus' life is conjectural, and partly in consequence of this fact, partly as a result of patriotic and political preconceptions which subsequent generations have brought to their analyses, the motives and trustworthiness of his writings have given rise to endless controversy. Probably he was of knightly origin and later introduced into the senatorial rank; he served as praetor in 88, consul in 97 and proconsul in Asia c. 112-16. In his first essay, the *Dialogue on Oratory* (c. 81), it is suggested that moral decay and more settled conditions are responsible for the decline of the art under the empire. During Domitian's reign (81-96) he was silent; but the emperor's terrorism directed against the aristocracy, which affected Tacitus' own family, became the most important influence upon his historical writing. In 97 or 98 appeared his pious memorial of his father-in-law, Julius Agricola. Although it serves also as an apologetic for the prudent conduct of the latter during the tyranny, the short account is concerned largely with the hero's governorship of Britain. In 98 he brought out his brief treatise on Germany and its inhabitants, which touches upon almost every phase of life. While his main

approach was probably that of the historian, he was led, like earlier writers, to idealize the barbarians to some extent and to contrast their freedom, simplicity and uncorrupted family life with conditions among the Romans. Tacitus' chief works, essentially annalistic in structure, are the *Histories* (c. 105-09), which began the history of Rome with the political crisis of the year 69 and recounted the story of the Flavians; and the *Annals* (c. 115-17), which covered the preceding period from the death of Augustus. Of the former only the detailed beginning, which does not go far beyond Vespasian's accession, is extant; while of the latter the accounts of most of Tiberius' reign, the latter half of Claudius' and almost all of Nero's have survived. The typically Roman ethical and didactic motives dominated these works, but Tacitus also saw in the greater freedom of the era of Nerva and Trajan the opportunity of recovering the history of the imperial period for the truth. He touched upon many subjects including provincial affairs, public administration, social and economic matters; but his conception of events largely in terms of personality, his love of drama, his moralistic purpose and his social background caused him to devote particular attention to the emperors and their relations with the men of his class. Hence if he excelled in his discussion of politics, his onesidedness together with his highly unfavorable portraits of most of the emperors, including Tiberius, whom he held responsible for the beginnings of despotism, resulted in a distorted picture of the empire. Yet he realized that the republic's defects had led to its disappearance forever; the citizen, he believed, should pray for good emperors but serve those in power without insolence or servility. With a judicious use of personal knowledge, oral information, public and private records and secondary literature as sources, Tacitus reached higher critical levels than did Livy.

TAGÁNYI, KÁROLY (1858-1924), Hungarian social, constitutional and legal historian. Tagányi had a decisive and far reaching influence on modern Hungarian historiography. As archivist of the Hungarian State Archives he was industrious in collecting data on mediaeval documents. Utilizing all the source material available in Hungary, he solved many moot points of Hungarian mediaeval history by means of his extensive knowledge of philology and diplomatic. His work is very valuable because of the light it casts on analogous social developments and relationships among the Hungarian, Germanic and Slav peoples. His works are not comprehensive, but in many respects they are fundamental and break new ground.

Especially worthy of attention are his studies of the Hungarian common field system in which, looking back from the eighteenth to the thirteenth century, he shows that the original economic form of settlement of the village population was the field community. The common ground of the community was the joint property of the whole population; each individual had a claim to equal quality and quantity of land. Tagányi showed through numerous examples how this system was administered. In a number of articles and monographs he described the original establishment and the early history of the Hungarian *komitat* system, which, according to his account, constituted the economic organization of the royal domain and only in the fourteenth century became by gradual development the autonomous judicial organ of the nobility.

Erroneous notions about Hungarian social history led him to deal with many controversial questions in long polemical articles. These contend that Hungary did not experience feudalism proper but adapted many feudal social forms; social developments east of the truly feudal regions revealed similar trends and forms every-

where. Tagányi shed considerable light upon the Hungarian military system through his studies of border defenses in the Middle Ages. His article on the collected Hungarian common law is very instructive from the standpoint of comparative legal science. Citing numerous examples, especially those of related peoples taken from the literature of the entire world, he discussed the origin of Hungarian customs. In this way he illuminated the ancient Hungarian marital law, family law and inheritance law and explained the primitive contract of the Hungarian tribal chiefs in a very plausible manner. Although Tagányi never held a professorial chair, the younger generation of Hungarian historians regarded him as their teacher and master.

TAINÉ, HIPPOLYTE-ADOLPHE (1828-93), French philosopher, literary critic and historian. Taine, who shares with Renan the distinction of having been the outstanding intellectual influence in France in the last third of the nineteenth century, represents the conflux of widely divergent and usually irreconcilable French traditions. With the classical spirit and its predilection for oratorical eloquence and form he combined the passion for analytical inquiry and lucid ordering of abstract ideas which characterized Condillac, the ideologues and Stendhal; that he also shared the tendency to look for intellectual inspiration with the eyes of a cosmopolitan is strikingly evinced by the powerful influence exercised by Hegelianism upon his philosophy of criticism and by English empiricism upon his psychology. As literary critic Taine was labeled by Sainte-Beuve as the spokesman of a younger generation of critics whose outlook was scientific and positivistic rather than literary and artistic. The more precise interpretation seems to be that Taine, whose main bent was philosophical, conceived literary criticism merely as a method of applying and demonstrating his doctrine of determinism. A similar objective motivated his

treatment of art both in his lectures on the history of the subject at the École des Beaux-Arts and in the writings which were collected as *Philosophe de l'art* (2 vols., Paris 1880; tr. by J. Durand, New York 1875). His deterministic theory was, however, so paradoxical that its importance lies chiefly in the reactions which it provoked. Taine's one great philosophical work, *De l'intelligence* (2 vols., Paris 1870, 4th ed. 1883; tr. by T. D. Haye, 1 vol., London 1871), wherein he attempted to analyze and reconstruct the mechanism of thought, rounded out his brilliant pamphlet *Les philosophes français du XIX^e siècle* (Paris 1857; rev. ed. as *Les philosophes classiques* . . . , 1868) Although today outmoded, *De l'intelligence* effectively supplanted the psychology of the eclectic school, molding the taste of an entire generation after 1875 for experimental and concrete psychology.

It is only in the field of history that Taine's influence is still vital. After the war of 1870 he abandoned literary criticism and discontinued work on his treatise on will, a projected sequel to *Intelligence*, to concentrate on a study in political pathology designed as an inquiry into the causes for the dual catastrophe of military defeat and the Commune. To his natural pessimism his marriage in 1868 had added the element of morbid apprehension and engendered in him a haunting obsession with the necessity for the alignment of social forces against the spirit of disorder. In *Les origines de la France contemporaine* (6 vols., Paris 1876-93; tr. by J. Durand, New York 1876-94) he investigated the responsibility for the revolutionary peril and finally charged it to the entire French organism, to the shaping of which the whole historical development of the nation and all parties had contributed. As he turned his uneasy gaze successively upon the monarchy, the classical spirit, the revolution, Napoleon, the modern regimes and the multitude of other dangerous systems and maladies menacing the nation, he remained constantly alive to the contrast with the health and prosperity of the English political body and particularly to the melancholy antithesis between the expansion of Victorian England and the French disasters of 1871. Artistically the *Origines* constitutes Taine's most powerful work, but as a theory of France it has been correctly interpreted as an expression of partisan ideas. Nevertheless, it has exerted a tremendous influence upon the development of the French conservative school: for the Bourget of *L'étape*, the Barrès of *Les déracinés* and the Maurras of

Enquête sur la monarchie it has been the original demiurge.

TALLEYRAND-PÉRIGORD, CHARLES-MAURICE DE, PRINCE DE BÉNÉVENT (1754-1838), French statesman and diplomat. A member of the upper aristocracy, Talleyrand was educated for the priesthood. He had, however, become imbued with the doctrines of Voltaire and other *philosophes* and his reputation as a free-thinker served to retard his rise in the church, although he was appointed bishop of Autun in 1788. Elected to the Estates General in the following year, he took part in drafting the Declaration of the Rights of Man and the Citizen. In his *Rapport sur l'instruction publique fait au nom du comité de constitution à l'Assemblée nationale* (Paris 1791) he proposed a plan for a national system of public education which advocated universal free primary education and which was remarkable for its general insight into an essential feature of democracy. Talleyrand suggested that church property be nationalized and he was among the first to take the oath to the Civil Constitution of the Clergy.

In 1791 he resigned his bishopric and soon afterward began his career as a diplomat, in which capacity he was to serve every government in France, with the exception of the Terror, for almost half a century. He went to England for Louis XVI to persuade that country to maintain neutrality and later returned to London, with the permission of Danton, on the pretext of continuing his mission, although his

chief concern was to escape the rising Terror. From England he sent his famous *Mémoire sur les rapports actuels de la France avec les autres états de l'Europe* (London 1792), in which he argued that France must not attempt territorial aggrandizement but must concentrate upon domestic reform. Ordered to leave England, he came to the United States in 1794 but returned to France two years later, after being apprised that his name had been taken off the proscribed list of émigrés.

He served as foreign minister from 1797 to 1799 under the Directory and held a similar post under the consulate and empire until 1807, when he incurred the displeasure of Napoleon because of his speculations and his attempts to moderate the emperor's foreign ambitions. As foreign minister he did much to pave the way for the rise of Bonaparte and served as his principal adviser and agent in numerous peace negotiations.

Soon after his retirement Talleyrand began secret negotiations with Napoleon's enemies, despite the fact that he remained a member of the emperor's council. In 1814 he drafted the act of abdication voted by the Senate and served as head of the provisional government during the allied occupation of Paris. He was chiefly instrumental in the restoration of the Bourbons, and Louis XVIII in turn appointed him minister of foreign affairs and plenipotentiary to the Congress of Vienna. In the Peace of Paris he had succeeded on the plea of legitimacy in maintaining the French boundaries of 1792. At Vienna by adroit manipulation he broke up the League of the Powers and united England and Austria with France against Prussia and Russia. By this alliance Talleyrand prevented Russia from absorbing Poland completely, while only a part instead of the whole of Saxony went to Prussia.

After Waterloo the hostility of his many enemies caused his dismissal, but he continued to sit in the Chamber of Peers, where true to his liberalism he protested against French intervention in Spain. In 1830 he helped Thiers place Louis Philippe on the throne and secured a liberalization of the constitution. As ambassador to England from 1830 to 1834 and as envoy to the London conference he contributed greatly toward the maintenance of peace and the recognition of Belgian independence and neutrality. A brilliant diplomat with a shrewd insight into the historic forces of the period, Talleyrand at times displayed statesmanship of a very high order, but his brilliance and practical intelli-

gence were too often counteracted by his unscrupulousness and venality.

TÁNCICSICS, MIHÁLY (1799-1884), Hungarian peasant socialist. The background of oppression of the Hungarian peasantry which led to Tánicsics' struggle on their behalf is vividly described in his autobiography, which is perhaps the only reliable and detailed account of Hungarian peasant life before the Revolution of 1848. A self-taught man, he began to publish articles in 1837, and in 1846 his fight for freedom of the press resulted in imprisonment, from which he was freed by the revolution. His election to the Hungarian lower house in 1848 made him the first and until 1918 the only representative of the peasant and working classes in the legislature. In his periodical, *Munkások újsága* (Working men's press, 1848), and in the Diet he advocated a radical solution of the land problem. During the period of reaction he was again subjected to seven years' imprisonment.

The first Hungarian exponent of socialism, of which he had learned during his travels in Germany, France and England in 1846, Tánicsics was also a staunch republican. If the vagueness of his socialist and republican ideas and his uncritical intellectual approach led him to accept these views as compatible with a fanatical nationalism, his courage and moral strength made him nevertheless an outstanding and fearless supporter of every principle or practical measure which he was convinced was just.

Táncsics wrote about forty books and pamphlets on a variety of subjects ranging from politics and cooperation to philology and the natural sciences; his works were published in an unfinished collection of twelve volumes, *Művei* (Works, Budapest 1873-85).

TANEY, ROGER BROOKE (1777-1864), American jurist. Taney was born in Calvert county, Maryland, of a landed slaveholding family and was educated at Dickinson College. After admission to the bar in 1799 he was a member of the Maryland house of delegates for one year and from 1827 to 1831 served the state as attorney general. At first a Federalist, he was alienated from the party because of its opposition to the War of 1812, and allied himself with the Jacksonian Democracy.

As attorney general in Jackson's cabinet from July, 1831, to September, 1833, Taney drafted that part of the latter's famous Bank Charter Veto Message of July 10, 1832, in which Jackson took the position that the president was not bound by the interpretation placed upon the constitution by the Supreme Court. He left the attorney generalship to become secretary of the treasury, in order to carry out Jackson's decision to withdraw the government deposits from the Bank of the United States, after McLane, Jackson's secretary of the treasury, had refused to do so. Because he was Jackson's chief adviser in the fight upon the bank, the Senate in 1835 failed to confirm Taney's nomination to the office of associate justice of the Supreme Court. But when he was named for the office of chief justice upon the death of John Marshall, his confirmation followed on March 15, 1836, after a bitter conflict, the personnel of the Senate having changed in the meantime. Taney remained chief justice until his death, occupying the office for a longer period than any other incumbent except his immediate predecessor.

Taney vies with Marshall for first place as the creator of the judicial power, which is the pivot of our constitutional system. Although Marshall first enunciated the doctrine of the right of the courts to declare unconstitutional the acts of their own legislature, in *Marbury v. Madison*, decided in 1803 no act of Congress was declared

unconstitutional so as to affect a decision until well toward the end of Taney's career, in the *Dred Scott* Case, fifty-four years after *Marbury v. Madison* and seventy years after the adoption of the constitution. This step was indeed a prelude to the Civil War.

But while Taney was the first to make practical use of the theoretical right claimed by Marshall for the judiciary, he was in many respects the antithesis of his predecessor and undid much of his work. Marshall, it has been said, was a "supreme conservative," who had the misfortune of becoming chief justice after the great defeat of his party in the "Revolution of 1800," and *Marbury v. Madison* was itself an echo of that great defeat and in a way a "back-fire" of the vanquished army of Federalism. Taney, on the other hand, was caught fairly early in that wave of "westernization" of the United States the first effect of which was the "Revolution of 1800," the second the War of 1812 and the third Jacksonian Democracy. Although he had been brought up as a Federalist, and therefore was opposed to the War of 1812 before it was declared, he supported it heartily after its inception, while the New England Federalists plotted secession at the Hartford Convention. The nationalism which was one of the chief characteristics of the "westernization" of the country, and which brought forth Marshall's really great decisions of the series from *McCulloch v. Maryland* to *Brown v. Maryland*, was evidently absorbed but slowly by Taney, and it was never permitted to run to excess, as it threatened to do with Marshall and Story. But the progressivism which was the essence of that great historic movement became Taney's chief characteristic during his maturity, and it was his historic mission to engraft it upon the American constitutional system.

Taney's accession to the chief justiceship was considered at the time in the nature of a revolution. At the very first term of the Supreme Court at which he presided he delivered his greatest opinion, in the *Charles River Bridge* Case, which to the consternation of Justice Story and the conservatives emasculated Marshall's decision in the *Dartmouth College* Case, which had held a corporate charter to be a contract whose obligation could not be impaired, by introducing the doctrine that nothing is granted in a charter by implication. But like all such "revolutions" it strengthened the existing order by preventing the growth of monopolies and making peaceful progress possible, at least until Taney himself,

caught in the net of slavery, attempted to block further progress by his "conservative," but really revolutionary, decision in the Dred Scott Case.

It was this decision which warped posterity's judgment of Taney. It was denounced as a crime, but if so it was the crime of a system. Taney was probably the greatest of the chief justices. The equal in general ability of John Marshall, he excelled him as a lawyer and as an enlightened statesman, always barring his one fatal error. This error was not, however, entirely wiped out by the Civil War, as is generally assumed. For in the Dred Scott Case Taney invoked the due process clause of the Fifth Amendment in the revolutionary sense which has become established since the enactment of the Fourteenth. But on the other side of the ledger must be entered his definition of the "police power" in the License Cases as "the power of sovereignty, the power to govern men and things." Had this definition of the police power been adhered to, it would have constituted an effective check on the later abuse of the due process clause.

TAOISM. The term Taoism is generally applied to the school of philosophic thought connected with the names of Lao Tzu and Chuang Tzu as well as to the religion professed by the Taoist monastic organizations in their temples and monasteries. It comprises also a great many so-called magical practises, such as exorcism and fortune telling; and in fact all religious manifestations in China which cannot be attributed to either Confucianism or Buddhism are frequently classified loosely as Taoism. Actually the concepts which form the bases of both popular and philosophic Taoism are fundamental to all Chinese thought with the exception of Buddhism, which is of foreign origin although it has absorbed much that is truly Chinese. Any distinctions between the different

schools of thought, at least in the earlier period, are thus largely artificial.

Taoism is derived from the word *tao*, which means the way, or path, in which all things move, change, are renewed and continue. *Tao* has no creative aspect, for the Chinese have been little concerned with cosmology and have tended to view the world rather as the sum total of ever recurrent phenomena. The Chinese, an agricultural people, living in a climate with clearly marked seasons, have been interested in such manifestations of nature as light and darkness, heat and cold, summer and winter, life and death, male and female. These contrasting aspects of natural phenomena are not opposed to each other in any strict sense but are rather mutually complementary, constituting by their combined operation a sum total. The life of man is completely regulated by this dualism: in spring with the recurrence of heat and light boys and girls cooperate in the recrescence of natural life by dancing, singing and mating; in summer man goes into the fields and cultivates the land; in winter, the season of death, he retires to his home and lives a secluded life. The royal *tao*, or conduct of the king, who is the truest of men, corresponds entirely with the *t'ien tao*, heavenly *tao*, or the course of natural phenomena throughout the seasons.

The alternations in nature, the total of which constitute *tao*, are described in an early text in the *Yi-ching* (*Yi King*, Book of Changes, tr. by James Legge, Sacred Books of the East, vol. XVI, Oxford 1882) as "an alternation of *Yin* and *Yang*." Graphically, the character for *yin* denotes the shady side of a mountain, that for *yang* the sunny side; these are the two sides between which in the spring festivals boys and girls move, crossing and recrossing the stream in alternating dances and choruses, thus also performing a *tao*, or complete road. From their concrete meaning *yin* and *yang* came to be used as general names for the two mutually opposing and cooperating categories: the dark, cold, wet and female as opposed to the light, warm, dry and male. All phenomena and all relationships express this interplay of *yin* and *yang*.

Of the two schools of thought which have been differentiated as Confucianism and Taoism the former has emphasized *tao* more as kingly behavior, the ritual and moral rules necessary for the functioning of a feudal society of cultured people, whereas the latter has stressed the metaphysical and mystical side of *tao* and represents an anticultural tendency.

The first articulate philosopher of Taoism was Lao Tzu, said to have been born in 605 B.C. and to have been an older contemporary of Confucius. The evidence on which these statements are based is, however, very unconvincing; actually nothing is known concerning his life, and the name Lao Tzu signifies merely "the old philosopher." He is the reputed author of a book known by his name (*Tao-teh-king*, tr. by James Legge, Sacred Books of the East, vol. xxxix, Oxford 1891, p. 1-124); later commonly called the *Tao-tê-ching*, it was probably composed in the fifth century B.C. Two other books attributed to Chuang Tzu and Lieh Tzu develop ideas similar to those of Lao Tzu. There is very little information available concerning Chuang Tzu (Sacred Books of the East, vol. xxxix, p. 125, and vol. xl, p. 232), who is generally placed in the fourth century B.C. Some authorities hold that Lieh Tzu was a personality invented by Chuang Tzu; and in fact the two books have much in common, although there is a certain distinct individuality of style in some chapters of Lieh Tzu, which may have been composed sometime between the writing of the Lao Tzu and the Chuang Tzu. The latter is a very brilliant and profound work, far above the level of the school to which the author belonged.

The thought of these philosophers cannot be understood unless they are regarded as mystics, who probably continued the shamanistic practises which produced the religious ecstasy known to the old sorcerers and magicians. Theirs is a philosophy that springs from religion and not from purely metaphysical thought. The mystic unity with *tao* was believed to produce magical powers over life, intensifying and prolonging it. If one "takes care of one's life," says Lao Tzu, "a rhinoceros will find no place to gore one, nor will a tiger find a place in one to plant his claws or a weapon to cut one with its blade." There are allusions to breathing practises whereby a man may regulate his pulse so that it is in harmony with that of the universe and thus prevent all waste of vitality.

Imbued with a sense of mystic unity with the all pervading law of change, the Taoist fathers share the profound conviction that everything is fleeting, transitory and relative: the *tao*, or the way in which a thing develops, flourishes and perishes, is the only certain and permanent principle. Mutation takes place continuously without any apparent effort and is thus able to produce all things. This effortless action the Taoists call *wu-wei* (non-action) and indicate as a

model for the conduct of man, who should never use forceful intervention and should abstain from all cultural pursuits, which the gentlemen of the period of the Taoist fathers prized so highly and which were encouraged by the Confucianists. The heights to which Chuang Tzu soared in his poetical speculations concerning the relativity and transitoriness of things could be followed by only a few; for the mass of its adherents Taoism constituted essentially a method of preserving the life force by the assimilation of the conduct of the individual to the law which operates in all things.

Taoism as a philosophy had nothing to offer to the state, which was a man made, artificial product; its magical practises could have significance only for the ruler himself, who groped for transcendent power over life and longevity. It is significant that Ch'in Shih Huang Ti, who in 221 B.C. initiated the reforms which destroyed all the institutions from which the Chou kings had derived their prestige, should have had a firm faith in the efficacy of Taoistic practises. So also did Wu Ti of the Han dynasty (140-86 B.C.), although in his official measures he attempted to restore at least a fiction of the Chou institutions. These institutions, advocated by the scholars who claimed adherence to the Confucian school, provided the new Han empire with its cultural forms and gave the emperor some of the religious prestige and majesty which had been an attribute of kingship from antiquity.

In the fourth century A.D. a great Taoist master, Ko Hung, better known as Pao P'u Tzu, popularized alchemy as a part of Taoist doctrine. At a very early date the Chinese had believed that certain substances, such as jade and cinnabar, were life giving; and when gold had been accepted as the highest standard of value about the fourth century B.C., the same quality was attributed to it. Thus from the search for the elixir of life there developed an interest in alchemy, which after the tenth century took an esoteric turn and aimed at utilizing not the material substances but their souls, or essences. Later particular metals were regarded as related to special parts of the human body and alchemy became concerned primarily with the reconditioning of the mind and physique.

Taoism also developed a monastic organization. The Taoist masters had probably early turned to living as recluses, either alone or in small groups. When Buddhism appeared in China, possibly about the middle of the first century, it was found to have much in common

with Taoist practises and ideas; and its success in China was doubtless due partly to the fact that it assimilated as far as possible the views which Taoism had evolved. The latter, however, borrowed even more than it gave. Although the origins of the Taoist monastic system are still obscure, it certainly imitated the organization, rites and sacred literature of the Buddhists. It adopted ceremonies for the initiation of its monks (*tao shih*) and nuns (*tao ku*), who made vows very similar to those of Buddhist priests, the six principal ones being to refrain from killing any living being, eating meat, drinking wine, lying, stealing and marrying. From these were derived no fewer than three hundred rules for the conduct of the monastics. According to Taoism the monastic life is not essential for salvation but merely makes possible the observance of the minute rules of the true Taoist. Each monastery is practically independent, and there are no close connections between the various cloistered groups.

Besides the monastic organization of Taoists there is an organization of lay masters, who live in the world and are married. They represent especially the element of sorcery in Taoism and are its most eminent magicians, generally handing down the art from father to son. At their head is the so-called Master of Heaven, T'ien Shih, who is often mistakenly called, by western writers, the Taoist pope. He generally lives at Shang Ch'ing, in the province of Kiangsi and claims to be a descendant of Chang Tao Ling, who is said to have lived in the second century A.D. and to have discovered the drug of immortality. Chang Tao Ling probably incorporated into a religion the current magical practises and the doctrines of Lao Tzu; about 190 his grandson Chang Lu established a small independent principality in the province of Shensi, which included a church with a well organized hierarchy, whose members exorcised demons and cured the sick. This religious organization has continued to exist and the Master of Heaven, a title officially recognized since 748, is the chief exorcist of demons and purveyor of charms against disease.

Taoism as a religion has a rich pantheon, partly inherited from time immemorial, partly formed under Buddhist influence. It has "venerable ones," modeled after the Buddhas, and "immortals," imitations of the Buddhist arhats. There is a Taoist triad, similar to that of Buddhism, consisting of Yuan Shih T'ien Tsun, "the venerable one of the first origin," who

reigned in the past; Yü Huang T'ien Tsun, "the venerable jade emperor," who has reigned since the tenth century and is considered the most important of the gods; and Chin Ch'ueh Yü Chen T'ien Tsun, "the venerable one of the jade dawn of the golden gate," who will reign in the future. Yu Huang T'ien Tsun, perpetuation of the god of classical mythology, Shang Ti, lives in a palace in the highest heaven, where he presides over a number of celestial officials. Under him are various ministries—thunder, wind, water, fire, time, literature, riches and epidemics—whose incumbents may change from time to time. The Taoist clergy seem to have incorporated certain popular deities in their pantheon and to have created others for reasons of symmetry and parallelism. Some, like the god of riches, are very popular. The jade emperor also has a hierarchy of gods to assist him in his task of governing the world. The chief of them is the "Emperor of the Eastern Mountain," the T'ai Shan, in the province of Shantung. He acts as a regent on earth for the jade emperor, but his principal function is to preside over human life and fix dates of birth and death. For a time he was even regarded as the god of the dead. Assisted by his enormous staff he regulates human life in detail, adjusting each individual's fate in strict accordance with his sum total of merits and demerits, meting out rewards and punishments. Subject to his orders are the gods of walls and moats, who are the divine counterpart of the officials in human life. Meritorious officials are called to this function after death. Under the control of the deities of walls and moats are the local tutelary gods, descendants of the classical gods of the soil, and the family gods, of whom the chief is the kitchen god.

Popular practises, such as finding a good site for a grave, called *fêng-shui*, are frequently classified as Taoistic. They have their origin in old conceptions connected with *yin* and *yang*, the points of the compass and the "elements," water, fire, wood, metal and earth, which are also fundamental to philosophic Taoism.

It is indeed in many respects impossible to establish definitely what is or what is not Taoism, for as a religion it is a blend of many elements. Not only Buddhism but the popular animistic religion has contributed to its dogmas, and it has perhaps been influenced also by Zoroastrianism, which appeared in China during the Tang dynasty. A number of its divinities received official recognition in the state cult, generally

regarded as Confucianistic, which prevailed until the advent of the republic.

Religious Taoism probably reached its height in the thirteenth century. Since then it has declined, although it still retains a strong hold upon the masses. As a philosophy it attracts the mystically inclined; and in the West the teaching of the Taoist fathers, although often misunderstood, has exercised a certain influence.

See AZEGLIO, MASSIMO D'.

TARDE, GABRIEL (1834-1904), French criminologist and sociologist. Tarde served for many years as a provincial magistrate before he became the director of criminal statistics at the Ministry of Justice and later professor of modern philosophy at the Collège de France. In his earlier works, *La criminalité comparée* (Paris 1886, 5th ed. 1902), *La philosophie pénale* (Paris 1890, 5th ed. Lyons 1900; tr. by R. Howell, Boston 1912) and *Études pénales et sociales* (Paris 1892), he criticized the classical and Italian criminologists, particularly Lombroso, and defended the thesis that the causes of crime are preponderantly social. He contended, however, that irrespective of the nature of the causes the responsibility for crime is to be attributed to the psychological personality of the criminal. These studies already foreshadowed Tarde's sociological contributions, which manifest his thorough distrust of dogma and his interest in vital, concrete and variegated facts which cannot be

reduced to rigid systems. He preferred the more complex and subtly shaded works of such historians and critics as Renan and Sainte-Beuve to the inflexible, grandiose schemes of Comte, Spencer and Taine. While his intellectual development was somewhat affected by his early study of Hegel, he was influenced most by Cournot. He opposed Durkheim, whom he considered too doctrinaire, just as the latter regarded Tarde as too subjectivistic; hence, while Durkheim undertook to develop sociology along the lines of Comte, Tarde devoted his attention primarily to social psychology. The logic and laws referred to in the titles of his works *La logique sociale* (Paris 1894, 4th ed. 1913) and *Les lois sociales* (Paris 1898, 8th ed. 1921; tr. by H. C. Warren, New York 1899) were, in his opinion, concerned only with psychological phenomena, with the beliefs and desires of men. Tarde rejected Spencer's term evolution as too ambitious and employed in its place the word transformation (*Les transformations du droit*, Paris 1892, 8th ed. 1922; and *Les transformations du pouvoir*, Paris 1899). In *La psychologie économique* (2 vols., Paris 1901) he sought to supplant abstract systems of political economy by the study of concrete facts.

Tarde distinguished between different types of human beings, whom he regarded as kinds of monads exercising an influence upon one another by a process comparable to wave motion. Some persons, not necessarily the greatest, are inventors, while others limit themselves to repetition according to the laws which Tarde developed in his best known work, *Les lois de l'imitation* (Paris 1890, 5th ed. 1907; tr. by E. C. Parsons, New York 1903). The manifold consequences of the clash of waves of influence in the individual formed the subject of his *Opposition universelle* (Paris 1897). Conflict does not necessarily ensue since it may be resolved in adaptation or in a dynamic equilibrium which is forever being destroyed only to be restored. Repetition, opposition, adaptation, are thus the three aspects of the universal rhythm. Tarde's faith that opposition could culminate in a peaceful adjustment was clearly set forth in a curious utopia, written in his youth and posthumously published, *Fragment d'histoire future* (Lyons 1904; tr. as *Underground Man*, London 1905), in which he envisaged an ideal society, completely emancipated from coercion and based entirely on disinterested love.

TARIFF. A customs tariff is a schedule of rates of import or export duties. The practise of levying duties upon commodities crossing a political frontier goes back to ancient times. At first such duties were only for revenue purposes, but with the growth of mercantilism and nationalism in the sixteenth and seventeenth centuries they began to be used also to protect domestic industries against foreign competition, to promote a favorable balance of trade and to punish and diminish the power of foreign countries. Export duties, at first of major importance, were gradually abolished and tariffs came to consist mainly or wholly of import duties, except in tropical and subtropical countries, where the revenue objective was dominant and the mass of the native population could be reached more effectively and conveniently by export taxes on their major products than by any other form of tax. When the protectionist objective first made its appearance, there was some tendency to use import prohibitions instead of import duties; but the severity of such measures and their stimulus to smuggling led to their gradual extinction during the period from about 1750 to 1850, and before the World War they survived only as quarantine measures against diseased or noxious plants or animals or as applied to objectionable commodities, such as drugs, obscene articles and, in backward countries, firearms and alcoholic liquors. They returned for a time during the World War and the subsequent period of reconstruction and are now again important in the form of contingents or quotas. The import prohibitions of the past were rarely absolute and generally applied only to imports in the absence of special licenses or exemptions, which were often granted extensively for a price or as a reward to favorites or when a scarcity of domestic supplies threatened.

In their early development import duties were

levied not only by each petty state but by individual towns and provinces and by local feudal barons. As the small states were absorbed in larger national units, however, the local tariffs were gradually abolished, until as a rule each national unit had only one tariff, applied at its external frontiers. Local tariffs survive in modified form in some countries, as in the case of the *octroi* in France and the *likin* in China. In a few cases, notably the German Zollverein, Canada, and the British colonies in Africa, the unification and centralization of tariffs preceded, in the form of a customs union, the establishment of political union on a national basis. In countries with large areas and with imperfect means of internal transportation the process of amalgamation and unification of local tariffs has only partially or only recently been completed, and different tariffs have been maintained at different frontiers, as in the case of Russia, China, Mexico and Honduras.

During the mercantilist period (c. 1600-1800) the use of tariffs as instruments of power and of national rivalry as well as for more purely economic purposes led to the imposition of discriminatory duties and prohibitions on the products of hostile countries, especially during the frequent periods of actual hostilities. Peace treaties between the major powers often included or were accompanied by tariff agreements providing for the abolition of prohibitions, for reductions of duties and, in some cases, for most-favored-nation treatment. Friendly countries, on the other hand, were bound more closely to one another by preferential tariff treatment, notably in the case of the Methuen Treaty of 1703 between England and Portugal. In the nineteenth century there was less relation between tariff policy and *haute diplomatie*, but tariffs have continued to the present day to be used occasionally as a means of exercising pressure on or punishing an unfriendly country (e.g. the tariff controversies of France and Italy, 1888-99) or of securing economic or political concessions from other countries in non-tariff matters.

In the seventeenth and eighteenth centuries tariff bargaining and tariff controversy were important only in the relations between the major powers (England, France, Holland, Spain), where they constituted a vital element in balance of power tactics. During the first half of the nineteenth century some of the minor European countries engaged in extensive tariff bargaining on a purely economic basis, and England strove

to make the movement toward freer trade more general and more rapid by endeavoring to obtain reductions in foreign tariffs in exchange for the reductions in its own tariff which it was determined to make for internal reasons. This so-called policy of reciprocity was attacked by extreme free traders as wrong in principle, and, in spite of its apparent success in the Cobden Treaty of 1860 with France, English statesmen finally concluded that to make the reform of the English tariff dependent on the receipt of reciprocal concessions from other countries would retard English reform without substantially speeding up the liberalization of foreign tariffs. After 1860 England engaged in tariff bargaining only to a limited extent. The strictly revenue character of the English tariff restricted the concessions England could give to modifications of its revenue duties, which for fiscal reasons it was reluctant to grant. Whereas England immediately granted gratuitously to all countries the important tariff reductions which it pledged to France in the Cobden Treaty, France extended them to other countries only in return for concessions embodied in a series of important commercial treaties, which initiated an active course of tariff bargaining in which most of the continental countries participated. This bargaining continued until the outbreak of the World War and was immediately resumed upon the cessation of hostilities. Except for reciprocity treaties with Canada (1854-65) and Hawaii (1875-1900) and a few minor tariff arrangements in connection with peace treaties and boundary and fishery settlements, the United States until 1890 followed an autonomous non-bargaining tariff policy. Under the tariff acts of 1890, 1897 and 1909, however, attempts were made to secure tariff concessions from foreign countries in return for the pledge of withholding punitive surtaxes authorized under these acts or as compensation for concessions from the general tariff embodied in tariff treaties negotiated under authority of section 4 of the Tariff Act of 1897. The limited range of commodities on which these acts authorized penalty duties and the failure of the Senate to ratify the tariff treaties negotiated under the act of 1897 resulted, however, in only meager gains from these negotiations, and in 1913 tariff bargaining was abandoned and a return made to the traditional autonomous tariff policy.

With the exception of the period from 1860 to about 1875, initiated by the Cobden Treaty, the general trend of tariffs has been almost con-

stantly and universally upward since the beginning of the seventeenth century. The period of protectionism is commonly contrasted with the period of mercantilism as one of more moderate restriction on foreign trade, and this contrast is valid to the extent that the nineteenth century was marked by the disappearance of export taxes and prohibitions, the substitution of import duties for outright import prohibitions and the liberalization of navigation laws. But so far as import duties were concerned, the rates of duty of the seventeenth and eighteenth centuries were moderate as compared with the rates prevailing in the nineteenth century and even more so as compared with those in the period after the World War. In the tariff laws of the early part of the nineteenth century dutiable commodities were ordinarily specifically enumerated and unenumerated commodities were free of duty. The reverse is the common situation today: all goods not specifically mentioned in free lists or in the dutiable schedules are assimilated for customs purposes to the dutiable commodities which they most closely resemble, and free lists are steadily shrinking. The definite adoption by England in 1932 of a policy of high tariffs; the widespread movement in recent years of both opinion and practise on the part of the large countries toward self-sufficiency, or autarchy; the substitution of belief in the virtues of economic planning for the nineteenth century adherence to the *laissez faire* philosophy; and the intensification of trade barriers under the impact of the depression following 1929, of unstable currencies and of falling price levels appears to presage further progress in the suppression of trade in the immediate future.

The concessions resulting after 1860 from the tariff bargaining of European countries led to the existence alongside the statutory rates of lower rates established by the tariff treaties. These lower rates were extended or generalized either to all countries entitled to most-favored-nation treatment or, as in the case notably of England, to all countries whether or not they had treaty claims to such extension. From these treaty concessions there resulted a conventional schedule consisting, for each tariff item on which such concessions had been made, of the lowest rate provided for in such treaties as well as the statutory or general or autonomous schedule; although for countries which automatically generalized their tariff concessions to all countries the conventional schedule was the only effective one. In some cases the concessions made in

tariff treaties were percentage reductions from the statutory rates without surrender of the right to raise the statutory rate and thus also the effective conventional rate. Whenever the concessions consisted of the pledge of a duty not to exceed a specified rate, whether or not this rate was lower than the statutory rate, the rate was said to be bound or consolidated during the life of the treaty of longest duration containing such rate.

The practise of tariff bargaining tends to give rise to objections on the part of the legislative branch of a government on the ground that it takes from them the power of control over minimum rates of duty, and that even when tariff treaties embodying reductions from the statutory rates require legislative ratification, such ratification is in practise assured because of the embarrassment to the government and the disturbance of international relations which would result from failure to ratify. The domestic industries which are subject to foreign competition tend also to object to tariff bargaining on the ground that it deprives them of any guaranty that an existing level of protection will not be diminished on the initiative of an executive authority over which their influence is less direct than over the elective members of the legislature. In response to the demand of its legislature Spain in 1877 adopted the device of a dual schedule statutory tariff, with the "maximum" schedule constituting the ordinary tariff and the lower, or "minimum," schedule constituting the minimum rates which could be granted to other countries as the result of tariff bargaining. The maximum-minimum type of tariff was adopted also by France in 1892, by the United States in the Payne-Aldrich tariff (1909-13) and after the World War by Rumania, Belgium, Jugoslavia and several other countries. In the successive revisions of the French tariff after 1892 the differentials between the maximum and the minimum rates were steadily increased so as to enlarge the scope for bargaining. Other continental countries which practised tariff bargaining, notably Germany, continued to adhere in the main to the general-conventional type of tariff, but through modifications introduced into both the two types tended to approach each other in their characteristics. The countries using it found that the maximum-minimum type had disadvantages in bargaining because of the rigid limits which it set to the concessions that could be made and because the full range of possible and therefore presumably contemplated

concessions that could be made was disclosed in advance. As the result of a protracted series of acute tariff controversies with other countries, resulting in several cases in costly tariff wars, France was obliged to grant on many items rates of duty lower than those provided by its minimum schedule in order to secure tariff concessions or even merely non-discriminatory tariff treatment from other countries. Although in each case these conventional rates became effective only after they had been enacted into law by the French legislature as revisions of the existing minimum schedule and thus became statutory, or autonomous, in form, this was only a face saving procedure and did not effectively conceal the fact that the statutory minimum schedule had been encroached upon through executive action. In Germany, on the other hand, the agrarian interests were sufficiently powerful politically to secure the enactment in the tariff act of 1902 of minimum rates from which no reductions could be made by treaty.

Many countries have inserted in their tariff laws provisions for penalty duties or punitive surtaxes, higher than or additional to the maximum rates otherwise specified in their tariffs, to be imposed at the discretion of the executive on imports from countries which do not grant to the export products of these first countries non-discriminatory or "equitable" tariff treatment. These are commonly regarded as drastic measures to be invoked only in extreme cases and there have been but few instances of their actual application, usually as the result of the unsuccessful outcome of negotiations for a tariff treaty involving reciprocal concessions from the general or maximum schedules of the respective tariffs. The United States, under section 3 of the Tariff Act of 1890 and section 3 of the Tariff Act of 1897, designated with unintentional irony the "reciprocity provisions" of these acts, applied the discriminatory surtaxes authorized therein to imports from several Latin American countries which refused to grant the United States concessions from their ordinary single-schedule tariffs; in 1904 and from 1906 to 1922 Brazil reluctantly granted to the United States preferential tariff treatment in submission to the threat that otherwise a discriminatory surtax would be imposed on its coffee. The contingent duty provisions which since 1890 have been a minor feature of American tariffs, and which provide for the imposition of higher than the ordinary duties on specified commodities when imported from countries that levy on similar or

related commodities if these are imported from the United States duties higher than the American ordinary duties, are a special variant of the punitive surtax and are moreover clear violations of American most-favored-nation obligations.

Tariff bargaining provisions are punitive in form when the ordinary duties are the lower ones and are concessional in form when the ordinary duties are the higher ones. For the punitive form it can be argued that: its application involves a change in the tariff treatment of only the country to whose commodities it is applied, whereas a tariff concession is ordinarily generalized under the operation of the most-favored-nation principle and is therefore shared by most if not by all countries; it does not involve a reduction of protection to domestic industry below the level contemplated when the tariff law was enacted; it is less likely than tariff concessions to result in impairment of the revenue-productivity of the tariff. It can be argued for the concessional method that it is less likely to excite the hostility of the countries with which tariff negotiations are being conducted, because in appearance at least it is a less drastic and aggressive method and therefore is more likely to prove an effective bargaining device. In practise the punitive method is unlikely to be used except as a retaliation against overt tariff discrimination; and where the objective of the tariff bargaining is to secure special concessions, whether exclusive or not, from other countries rather than the elimination of special adverse discriminations, the concessional method is almost invariably relied upon. Where the extension of the lower minimum, or conventional, schedule is made almost as a matter of course to most countries, as is frequently the case, and only one country—or a few countries—is subjected to the maximum, or general, schedule, the method used is in effect punitive, even though it be concessional in form.

It seems clear that with the exception of the period 1860-75 tariff bargaining has in general contributed to a raising instead of a lowering of the effective tariff barriers to trade, and in any case since the 1870's active tariff bargaining and the rise of effective tariff levels have gone hand in hand. It has been a common practise to enact tariffs higher than was desired for purposes of protection to domestic industries and also higher than would otherwise be acceptable to the legislatures, on the plea that they would subsequently be reduced through tariff bargain-

ing. In many cases the subsequent tariff negotiations failed to reduce the effective rates to a level as low as that which had been contemplated either by the drafters of the tariff law or by the legislature itself. The adoption by one country of a high tariff obviously intended to give leeway for tariff bargaining stimulates other countries to raise their tariffs in preparation for the ensuing tariff negotiations. Even if such negotiations result in a reduction of the rates of the effective tariff to a level not higher than that which would have been adopted in the absence of anticipation of tariff bargaining, there is often a substantial interval of time during which a higher level of duties prevails. On the other hand, if any country abstains from tariff bargaining, even if it follows a free trade or very low tariff policy, it deprives itself of a means of retaliation against discriminations and is likely to find that the commodities in which it is especially interested are made subject to higher rates of duty than the similar or indirectly competitive products of other countries. Attempts under the auspices of the League of Nations to check the upward trend of tariffs or even to maintain the status quo by means of multinational tariff treaties have so far either failed from the start or have resulted in agreements of limited importance, of short duration and of incomplete execution. Nevertheless, given the failure of bilateral tariff bargaining in the past to result in a lowering of tariff barriers and the improbability of any substantial tariff reductions in the near future as the outcome of unilateral action, the method of multilateral agreements remains the only procedure which offers any prospect of success in bringing about a general lowering of tariff levels.

During the period following the World War more rapid adaptations of tariffs to changing circumstances were secured by a number of different expedients. legislative revision of tariffs at shorter intervals, the making of tariff treaties subject to early termination and, more important in many countries, the giving to administrative authorities of general grants of power to change the effective tariff rates without prior reference to the legislative authorities.

The first important measure granting authority to an administrative agency to change the tariff rates was section 315 of the United States Tariff Act of 1922, providing for a "flexible tariff." This act authorized the Tariff Commission, upon its own initiative or upon request by interested parties, to investigate the costs of

production of dutiable commodities in the United States and abroad and to report to the president what changes in the existing duties, upward or downward, would be necessary to equalize these costs. The president was then authorized to proclaim such change in duties, subject to the limitation that no change could exceed 50 percent of the statutory rate. This procedure has been called "scientific" tariff making; but while the investigation of differences in costs can be conducted on a scientific level, the basic formula of equalization of costs as a guide to tariff policy has no validity unless it be a scientific objective to suppress foreign trade with approximate completeness. The sole commercial incentive in foreign trade is the difference in the prices of commodities as between different countries, and the prices tend to correspond to the money costs of production. Effective equalization of foreign with domestic costs through tariff rates would therefore destroy all motive for the importation of foreign commodities. All that can be said for the formula is that once Congress in its wisdom has decided what foreign products should be excluded, the formula is fairly well adapted for the determination of the minimum rate of duty which will suffice for this end. The flexible tariff has not succeeded, as its advocates had hoped, in "taking the tariff out of politics" or in providing an effective procedure for the rapid and comprehensive revision of the tariff to meet changes in competitive conditions. Its net results have been a comparatively small number of changes in rates, affecting only a small proportion of the items in the tariff, with a preponderance of increases in rates over decreases.

The British Import Duties Act, 1932, provided for the appointment of an Import Duties Advisory Committee and authorized the Treasury to increase the duties on any commodities, subject to limited exceptions, by an amount not exceeding that recommended by this committee. This in form and in execution has already proved a much more far reaching measure than the American flexible tariff, since it provides only for increases of duty, does not set any statutory limit to the amount of increase, does not restrict the committee or the Treasury by any formula and subjects the committee and the Treasury to no limits except that the only commodities on which increased duties can be applied are such as were chargeable with the general ad valorem duty in the 1932 tariff and are either luxury articles or articles produced or

likely to be produced in substantial quantities in the United Kingdom.

In Canada, Australia and South Africa a substantial degree of flexibility in tariffs has been introduced in the guise of antidumping legislation, which permits the customs authorities whenever a domestic industry is encountering severe competition from imported commodities either to raise the valuation of the imported commodity for duty purposes regardless of its foreign, domestic or export price or to apply so-called antidumping duties whether dumping, strictly interpreted, is taking place or not or under some circumstances both to raise the valuation and to apply the extra rates of duty.

During the war many countries, both belligerents and neutrals, supplemented their tariffs with export and import licensing and quotas or contingents in order to economize shipping, to conserve materials and foodstuffs for essential military and civilian use, to control their balances of international payments and to check trade with enemy countries. They also made use of these quotas as bargaining devices to secure supplies of essential materials from other countries, to obtain the use of foreign shipping and to acquire means of withholding neutral supplies of materials from enemy countries. These licensing and quota measures were steadily moderated or abolished as peacetime conditions were reestablished, but their number and importance began to grow again even before the world depression made its appearance; and under the stimulus of shrinking foreign trade, fluctuating exchanges and severe and protracted unemployment they increased rapidly, until in 1934 in a number of countries and especially for agricultural commodities they rivaled or exceeded in importance import duties as methods of regulating foreign trade. They were used to preserve a given minimum proportion of the domestic market for domestic producers, to protect national currencies against exchange depreciation, as a protection against further price deflation, as bargaining instruments to secure from other countries more favorable treatment for exports and as elements in programs of national economic planning. They vary so much in form from country to country and commodity to commodity as to defy classification, but several distinct types predominate. There is first the simple commodity quota or contingent; the quota may be a total, or "global," one or may be publicly apportioned among the respective foreign sources of supply. Then there is the exchange

quota, limiting imports by controlling the amount of foreign funds that accrue from exports or otherwise that may be used to pay for imports. The exchange quota may be apportioned by countries, by commodities, by importers or by a combination of these. Both commodity and exchange quotas may be of the barter type, whereby the quota assigned to a particular country is made to depend on the size of that country's purchases of domestic commodities either in general or of a specified kind. There is the "mixing quota," which need not be an import quota in form; this is a requirement that processors use a specified minimum percentage of domestic materials, as, for example, of wheat in milling flour. Finally, there is the type of quota which makes the grant of an import license dependent upon the purchase by the importer of a specified proportion of the similar domestic commodity, as illustrated by a Latvian provision requiring the purchase of ten tons of domestic sugar for each ton of foreign sugar for whose importation license is granted. In some cases the quotas are not absolute but can be exceeded upon payment of a higher rate of duty on the excess.

The quota method has spread because of its important administrative advantages over ordinary tariffs, especially in dealing with emergency conditions. The quotas are rarely if ever fixed by statute and are ordinarily therefore subject to administrative discretion. They are thus quickly adaptable to changed conditions. Quotas can be used to control the volume of imports or the domestic prices of the commodities in question or the balance of payments, with much greater precision and rapidity than can ordinary import duties. They are powerful bargaining instruments. They serve in at least two ways to evade treaty obligations when these appear troublesome. First, it is an open question whether most-favored-nation pledges apply to import quotas in the absence of express provision; and attempts to find a uniform, reasonable and simple formula for equality of treatment with respect to quotas seem destined to fail. It is possible moreover to conceal discriminations in quotas by refraining from public assignment of national quotas and by apportioning them through manipulation of the distribution of individual import licenses. Secondly, they make possible additional restriction of imports even when the import duties have been bound or consolidated, by treaty. There are also disadvantages connected with the use of the quota

method. It is a delicate instrument and requires skilful and honest administration if commercial disorganization is not to result, and the necessity of apportioning the quotas among rival importers opens the way to wholesale corruption. When the quotas are used for bargaining purposes, there inevitably results a disproportionate restriction of triangular trade, which is not obviously more disadvantageous than bilateral trade; and the barter quota system presses with special and undeserved severity on countries whose imports happen to come only in slight degree from the countries to which its exports mainly go.

The variety of forms which import duties take is great, and new forms are constantly making their appearance. It is possible here only to describe briefly the more important variants. *Ad valorem* and specific duties are dealt with in a separate article under that title; and dumping, exchange dumping and bounty countervailing duties are discussed in the article on dumping. The duty on a manufactured commodity often includes an element, known as a compensatory duty, intended to offset for domestic manufacturers the higher costs of the raw materials used in their manufacture resulting from the import duties on these raw materials. In American and Canadian tariff practice the compensatory duty is generally made equal to the duty which would be levied on the raw materials if imported. In many cases, however, the raw materials actually used are of domestic origin and their price does not exceed the foreign price by the full amount of the duty. In some instances the domestic raw material is even cheaper than the foreign and is an export commodity. The compensatory duty therefore frequently conceals an additional measure of protection to the domestic manufacturer. The British Horticultural Products (Emergency Customs Duties) Act, 1932, established seasonal duties on products which ripen earlier in foreign countries than in England and thus are supposed to skim the cream off the English market by their earlier appearance; in Canada the same result of a degree of protection varying with the season is attained by application of arbitrarily higher valuations for customs purposes by the customs authorities, so that the imported commodities are subjected both to higher effective ordinary rates of duty and to so-called anti-dumping surtaxes. Australia in its 1921-22 tariff law introduced the device of deferred duties, intended to encourage the establishment of new

industries, which were actually to be applied only when the domestic industries were able to supply substantial quantities of the commodities in question.

In the early tariffs of the United States and in other old tariff laws are to be found zone duties, or duties graded according to the distance of the country of origin. The purpose of such differentiation cannot easily be determined, and such duties are now rare. Resembling in form at least this type of regional differentiation, however, are the provisions for lower duties on products originating in limited zones along the frontiers, which were common in the days when land transportation was difficult, have just been revived under an old treaty in the so-called Geneva Zone and survived until recent years in other localities. The various proposals in recent years for Baltic, Balkan, central European and even European customs unions or preferential arrangements have also aimed at differentiation of duties on essentially a geographical basis.

A sliding scale duty is a duty, specific or ad valorem, where the specific rate per unit or the percent rate ad valorem is made to vary, usually inversely, by stages or continuously, with the market price of the commodity in question. The English corn laws from 1660 to 1846 are the important historical examples of import duties of this type; and Bavaria (1826), Sweden (1830), France (1831), Holland-Belgium (1834-35) and Portugal (1837) for a time followed the English example in their import duties on grain. Sliding scale import duties are rare today, but when the American tariff act of 1930 was in process of enactment, the adoption of such a duty on sugar was seriously considered. The purpose of sliding scale duties is to assure to domestic producers a stable (or minimum) price for their product which will be independent of the variations in the world market price. Students of the English corn laws have almost universally concluded that they failed to accomplish this purpose, and there has been a tendency to infer from this supposed failure that sliding scale duties are necessarily ineffective as a price stabilizing device. But the early English corn laws were crude and badly designed. It is impossible to determine from their rates what domestic price they aimed at, and they suffered from the defect that the price upon which the rate of duty was made to depend was the domestic instead of the foreign price. Until the Napoleonic wars England was still on an export basis with respect to grain in good harvest years, and at such times import

duties were bound to fail as regulators of the domestic price. The corn laws moreover suffered from slack and corrupt administration. Under the improved but still imperfect 1842 corn law, which historians have tended to neglect, the annual average price of wheat in England from 1843 to 1845 inclusive varied only within the surprisingly narrow limits of \$1.50 and \$1.54 a bushel. The corn laws were repealed in 1846, not because they had failed to stabilize grain prices but because the policy of agricultural protection was abandoned. For a commodity where domestic output would be substantially below domestic consumption at the price level desired, there is no obvious reason why a properly designed sliding scale duty could not effectively stabilize the domestic price.

Where treaty obligation or public opinion stands in the way of levying or increasing duties to the extent desired by the government, it is often possible to restrict imports by other devices. These substitutes for import duties, often referred to as indirect protection or as administrative protection, may take the form of: arbitrary valuations for customs purposes, as notoriously in Canada; boycotts of foreign goods in government purchases and contracts; consumer boycotts instigated by the government, as in the case of the Chinese boycotts and the government subsidized "Buy British" campaign in England; burdensome marks of origin requirements, as notably in the United States; embargoes on imports of vegetable or animal products in the guise of sanitary regulations; preferential railway rates for domestic commodities; or costly or troublesome customs formalities.

As tariffs grow higher and more protective in aim, they tend to become more detailed in the classification or "specialization" of commodities and rates, particularly where the duties are predominantly specific in form. It has often been charged that specialization of rates has been carried to its present extent largely in order to evade most-favored-nation obligations. There are only a few well authenticated instances, however, of deliberate specialization to this end, and the increasing specialization of rates can be explained adequately on other less objectionable grounds. It is significant in this connection that the United States, which has engaged in tariff bargaining to only a very limited extent, has steadily increased the degree of specialization in its tariff and has carried it about as far as any other country.

To prevent importers from forestalling an impending increase of duties announced in a bill but not yet enacted into law, a number of countries provide by a standing law that during the interval between the introduction of a government bill proposing to raise existing rates of duty and its final enactment into law, the commodities affected shall be subject to interim duties equal to the proposed higher rates, the excess over the hitherto prevailing rates to be refunded if the increases should not be adopted. In Great Britain such provision is now supplemented by a measure which empowers the customs authorities at any time within three months of the presentation of a forthcoming budget bill to refuse entry of goods in excess of the amounts which appear to them "to be reasonable deliveries in the circumstances."

There is no acceptable way of making a precise quantitative comparison of the "height" of tariffs as between countries or for the same country at different periods, if by height is meant the extent to which the tariff is restrictive of imports. Where the costs of production at home and abroad differ by a small margin, a low rate of duty may suffice to prevent a large volume of trade. If a simple average of the rates of duty specified in the tariff is used, all the tariff items carry equal weight in the computation, although their economic importance will vary greatly. If the rates are weighted by the importance of the commodities in the import trade, a duty so high as to exercise a prohibitive effect on imports will carry less weight than a low revenue duty on an important non-competitive commodity. If the rates are weighted by the importance of the commodities in domestic consumption, purely revenue duties which do not seriously affect the course of trade, protective duties prohibitive of import and nominal duties which because they apply to commodities that would not be imported even in the absence of any duty on imports have no effect whatsoever, are all given equal weight if the commodities to which they apply are of equal importance in domestic consumption. The percentage of imports admitted free of duty, although commonly used as a measure of the severity of tariffs, is an especially misleading index, since such percentage may be high, as in the United States, not because the tariff is low in any significant sense but because the height of the duties on potentially competitive commodities is such as to restrict their import to small amounts and because no revenue duties are levied on strictly

non-competitive commodities, such as coffee, tea and tin, which are important articles of import.

Tariff measures are everywhere framed and enacted by substantially the same procedures followed in connection with other fiscal or revenue measures. In the United States, for instance, the standard procedure is for a tariff bill to be drafted by (or for) the House Ways and Means Committee after public hearings, then presented to the House, where after being freely subjected to amendment it is voted on and if passed is sent on to the Senate. There it goes to the Finance Committee, which usually also holds public hearings, revises the House bill extensively and submits it to the Senate for further amendment and passage. The bill then goes to the Conference Committee of both houses, where further changes are made. It then is resubmitted to both houses and if passed by them is sent to the president for his acceptance or rejection. But comprehensive tariff revision is an extremely arduous and complicated task, demanding, if it is to be efficiently accomplished, a great mass of technical and economic information about the nature of commodities, price and cost conditions, trade relations with other countries, treaty obligations and other matters. In most other countries the drafting of tariff legislation is an executive matter and is in the hands of a government department which has a permanent technical staff equipped to carry out this function, and amendments offered by individual members of the legislative bodies cannot be submitted to a vote without the consent of the government. In the United States, however, the drafting of tariff measures is a prerogative of Congress which it insists upon retaining. A succession of executive agencies charged with the duty of investigation and in some cases of advice on tariff matters, the Revenue Commission of 1865-66, the Commissioner of Revenue, 1866-70, the Tariff Commission, 1882, and the Tariff Board, 1909-12, were short lived, Congress either abolishing them or failing to keep them alive—because they were responsible to the president instead of to Congress or were associated with a previous administration which had gone out of power or were supposed to be partisan, or had failed to produce acceptable results—and they had no significant influence on the course of tariff policy or even on the technical quality of tariff legislation. In 1916, however, in response to a wide belief that the economic transformation resulting from the World War would

make necessary more efficient and more systematic means of providing the information essential for intelligent legislation on tariff matters, Congress adopted, as part of the revenue act of that year, a provision for the creation of a non-partisan tariff commission, consisting of six commissioners appointed by the president as well as a substantial technical and clerical staff, which was to serve Congress and the president as a fact finding agency but was not to have administrative functions. President Wilson appointed as commissioners a distinguished and able group, with an outstanding economist, Professor Taussig, as chairman. Until 1922 the commission was in fact a research organization with high scientific standards, and its publications were of exceptional quality. By the Tariff Act of 1922, however, the Tariff Commission was assigned the administrative function of finding the rates of duty which would equalize costs under the flexible tariff provision enacted in the same year; and this task, with its inevitable political entanglements, for a time overshadowed the more purely research activities of the commission. Bad appointments, internal dissension, the exercise of illegitimate pressure on members of the commission by the president and the defects of the formula in which the commission was obliged to find adequate guidance for its tariff equalization activities led to an impairment of morale and a distinct lowering of standards, later somewhat improved. The influence of the commission since its foundation on the more technical phases of tariff legislation, however, has been substantial and by universal acknowledgment beneficial.

In other countries where tariff measures are drafted in government departments having permanent technical staffs, there is less need for such an organization as the United States Tariff Commission. In Great Britain, however, and in most of the British dominions somewhat similar agencies have been created, whose main function usually is the administration of the flexible features of the tariff laws but which also, as, for example, in the case of the Australian Tariff Board, report on more fundamental questions of tariff policy and on the mode of operation of existing tariff legislation. There is as yet, however, no parallel elsewhere of the extensive research staff of the United States Tariff Commission nor, as far as permanent official agencies are concerned, of the comprehensive studies which it has published.

It is foolish to expect that the tariff can ever

be "taken out of politics" through the transfer to a non-partisan agency of the task of tariff revision. Legislatures may delegate tariff revision to special agencies, as in the case of the British Import Duties Advisory Committee set up in 1932, but such an agency will be permitted to operate only as long as its personnel is sympathetic with and carries out the policy which the majority party in the legislature approves; and the impression which it may give to the uninformed of being a non-partisan agency may enable it to execute on behalf of its political sponsors a more extreme policy than the latter would dare to apply directly. Given the objectives of the legislature, a scientific tariff can be conceived in the sense that it is as well designed to attain these ends as objective investigation and technically competent economic analysis can make it. But there is no scientific method of determining what objectives the legislature ought to wish to serve by means of tariffs, nor is there much likelihood that legislatures and economists can ever be brought into substantial agreement as to what are the most effective means of attaining any objectives or as to what will probably be the consequences of the means actually employed.

TASTE. That the term for discrimination in art, dress and conduct should be the name of one of the senses is no accident of history. It is rooted in the formal analogy of taste in food with taste in aesthetic and social objects. Taste is the "choosing" sense. It is the typical context of immediate and unreflecting judgments of the acceptable and the unacceptable. Governing the admission or rejection of food, it makes no intermediate discriminations but only absolute decisions. In its relation to appetite the sense of taste is also the locus of refined stimulation and diversified individual pleasure, which depend on the quality and variety of food.

The extension of the concept of taste to art, dress, manners and conduct reflects the existence of conflicting appeals and varied individual inclinations in these fields. Such choices are possible as a persistent condition only in highly developed societies, with competing individuals and classes, secularized arts, mobile standards and a diversity of goods. The exercise of taste, that is, the act of judging, becomes an important event or practise among the individuals of the dominant class who are occupied mainly with pleasure and for whom consumption and display, as affirmations of rank and personal worth, impose a constant concern with fashions and the qualities of precious or refined objects. In such societies taste has a broad and a restricted meaning: the first, in the plural and indefinite sense of special appetites or inclinations (tastes); the second, in the more definite eulogistic sense of refined discrimination and conformity to an ideal canon in art or conduct (good taste). This can be illustrated by the distinction between a

taste for poetry and taste in poetry. The two are related in so far as certain tastes are regarded as meritorious, apart from the specific discrimination within that taste; for the taste is itself considered a kind of choice among a variety of tastes of unequal value. Where poetry is common to everyone and where the same songs are commonly enjoyed, as in a primitive group, the concept of taste is hardly present. In modern societies, on the other hand, not all refined discrimination constitutes taste. The choices of an artisan or peasant, however subtle or exact, are not considered acts of taste, unless they apply to objects valued by the leisure class or to situations of relaxed enjoyment and polite intercourse. Taste is identified with good taste and good taste with the taste of the upper class, just as "high society" and *haut monde* become society and the world. Good taste pertains to "a certain delicate pleasure of the *gens du monde*" (Montesquieu).

In so far as the dominant class believes that its conduct and interests do not issue from exterior compulsions, like the conduct of the lower classes, but from considerations of the aesthetic pleasure of free individuals, the concept of good taste is extended to the larger activity of the class. Even virtue and religion may then be in good or bad taste, and political ideas may be evaluated in the same spirit. Good taste becomes the aesthetics of conduct, the aptitude for manners and politeness, the knowledge of the formal practises, the arts and choices most favorable to the enjoyment of the conditions of upper class life. It is not equivalent merely to etiquette, which consists of the formalities governing fixed situations (although lapses from etiquette are errors of taste), but applies also to the maintenance of agreeable sociability in novel situations where etiquette and morals are not concerned. It corresponds to tact in difficult personal encounters and constrains individuals from aggressiveness and ostentation in groups assembled for a common pleasure. It is not arbitrary or personal and can therefore be rationalized as a body of objective principles derived from the nature of man and of civilized society. Like other truths, the laws of taste are acquired but gradually and only through the progress of society; hence the notion of true taste especially in art as a connoisseurship parallel to knowledge in science, and the common aristocratic description of social progress as the progress of taste, realized by the upper class.

Good taste is fixed through education and life

in a socially closed and fairly homogeneous group. Those who enter from without cannot have the complete experience which makes certain practises possible without thought. They lack the directness of taste which is common to the closed circle. Requiring long cultivation, the absence of good taste betrays the parvenu, and requiring wealth and leisure it exposes the economically declassed. It is accessible only to those of a certain standard of living and upbringing, hardly to the poor and the provincial. Hence good taste becomes a canon of exclusiveness and lapses from it, whether of individuals or of nations, are identified with social or cultural inferiority. Violations are stamped as barbarous, vulgar, plebeian, boorish, cheap and mean. Voltaire expressed the view of the French aristocracy of his time when he wrote that "true taste has been confined to certain countries in Europe." The possibility of good taste is sometimes conceded to a commoner as a sort of inborn talent or genius; this concession gives a natural basis to the aristocratic pretension to innate superiority. But when the tastes of the upper class are appropriated by the lower, these tastes are considered vulgarized and the upper class acquires new tastes which are inaccessible to the lower and express a superior wealth, leisure and cultivation.

Such appropriation of tastes is inevitable, either because of the constant relations of master and servants and the role of the servants in preparing the homes and the functions of the rich and in raising their young or because the wealth of the upper class depends on manufacturing and commercial enterprises, which grow with the extension of various tastes among the lower classes. The importers of tea and silk cannot frown upon the consumption of tea and silk by a lower class but will reserve for themselves choicer and less accessible goods. In a mobile society the tastes of the rich exercise a deep attraction on the lower classes; and this imitation, where it is connected with the acceptance of the cultural superiority of the rich, reinforces a conservative dependence on the latter and loyalty to the existing structure of society. Strong oppositions between classes, differences in economic interest, crystallize differences of taste even in such things as clothing and manners. Tastes become symbols or slogans, clear signs of partisanship. The tastes peculiar to the enemy are therefore stigmas and are decried as lacking in taste, if the lack of taste has become a sign of inferiority. The taste of the discredited

upper class in periods of social antagonism is attacked as decadent and sterile, but a newly established power may imitate the taste of an older aristocracy to legitimize its own superiority.

The taste of the dominant class is also affected by its stable or defensive relation to other classes. When defensive, good taste may become the preservation of traditional modes and forms and the avoidance of the new; when stable or progressive, it may admit and even welcome novelty. Good taste is then the choice of the unostentatious, the unpretentious, in new fashions begotten by the leisure class itself. But good taste is essentially conservative, for while it is poor taste to be behind the times, it is still worse to be ahead. The concept of the tasteful (unlike the tasty) expresses the conservative sense of taste; it refers to the discreet and restrained and conventional in art. Two tastes can coexist within the same class, like the *grand* and *petit goût* of the eighteenth century—the one, official, dignified and conservative, the other, informal and light. This may be due to a real division within the dominant class or to a hierarchy of tastes within a single group, adapted to varied occasions and purposes.

Since tastes are a body of practises dependent on the wealth and power of a class, they are extremely responsive to every force that affects the material condition of the class. The larger changes in artistic taste, which are called period styles, like the Empire style, the style of Louis xv, the Biedermeier, are clearly related to the ideologies and situations of the dominant class. The style undergoes an internal development following the general tendencies and interests of the group in which this style functions. Like the neoclassic, it may be insurgent and moralistic at first and later purely official and weak. The importance of class in taste may be seen readily in the differences between peasant and court arts in the same region; such differences transcend ethnic uniformities. And the importance of the general mobility of society for the changes in taste may be seen in the relative fixity of styles in historical cultures with stable institutions and economy, as in Egypt. The analogies of art styles to manners are due to their common locus in a given culture, class and historical situation and to the close interrelations of functions of art and social intercourse in a particular class. Certain elements of taste, forms of courtesy, artistic and intellectual interests, various amenities of life, as progressive acquisitions of society, persist far

beyond the class or culture in which they arose, if they are successful in regulating human intercourse and in satisfying enduring human needs.

Although taste is itself dependent on the productivity of society and the economic system, it has also an important place in the economy. The development of varied and refined appetites promotes the production of luxuries, which in turn entails the extension of trade, colonialism, new home industries and technological progress. This is illustrated by the part played in modern economy by the production and distribution of tea, coffee, tobacco, alcoholic drinks, silks, perfumes, automobiles, objects of art and by the rapid changes of fashion in clothing. Travel for pleasure is a taste (inseparable from shopping and luxury) which is important in the balance of international trade. Writers of the eighteenth century considered the tastes of the rich the real mainspring of prosperity. Industries rose and disappeared with the taste for certain objects. The widely diffused taste for luxuries, like wines or silks or porcelains, may be the economic mainstay of a large region. The prestige of the taste of a country in matters of art is the source of its market; and the resemblance of goods to those used by the most accredited members of an aristocracy has a great influence upon their sale among the middle classes and is an important element in advertising. Where uniqueness or novelty is an element of taste, the standardization of goods made for popular consumption operates between special limits which affect technique and the organization of labor.

TATISHCHEV, VASILY NIKITICH (1686–1750), Russian historian and administrator. Tatishchev served as an officer in the Russian army from 1705 to 1720, visiting in the course of his duties Poland, Germany, Holland and Sweden. He revisited the latter country in 1723–27 for the purpose of engaging foreign engineers and scientists. His administrative work was centered in the eastern provinces, sparsely settled and barely touched by civilization; he was in charge of the state mining and smelting works in the Urals and in Siberia and served as governor of the Orenburg and the Astrakhan territories, mapping out settlements and fortifications and pacifying the native tribes. He managed, however, to take a hand in politics. At the accession

of Anna Ioannovna in 1730 he sided with the lower nobility, who disapproved of the "conditions" imposed on the empress by the aristocratic oligarchy. Although a convinced believer in the beneficence of absolutism for a country as vast and unenlightened as Russia, he drafted the constitutional project known as that of Prince Cherkassky, providing for two chambers—one aristocratic and one representative of the gentry as a whole—to advise the czarina in matters of legislation and administration. In addition to administrative duties Tatishchev was given the task of preparing a historical geography of Russia. He compiled as a result an encyclopaedia (*Lexikon rossiysky*, 3 vols., St Petersburg 1793), mainly geographic, left unfinished at letter K, and a history of Russia to 1533 (*Istoriya rossiyskaya*, vols. i–iii Moscow 1768–74, vol. iv St. Petersburg 1784, vol. v Moscow 1848), an uncritical but complete collation in slightly modernized language of all the ancient chronicles known at the time, with an introduction on the origins of Russia based on foreign sources.

Tatishchev belonged to the first generation of intellectuals, who were encouraged by Peter the Great to transplant to Russia the enlightenment and practical efficiency of the West. His philosophical outlook was that of utilitarianism borrowed from the founders of the doctrine of natural law and natural religion—Grotius, Pufendorf, J. G. Walch (author of *Philosophisches Lexicon*) and others. His opposition to religious traditionalism is reflected in his "Testament" (*Dukhovnaya*, St Petersburg 1773, improved ed. Kazan 1885; French translation by R. P. J. Martynof, Paris 1860), which abounds also in advice on estate management; his belief in education permeates the *Rasgovor dukh priyateley o polze nauk i uchilishche* (Utility of science and the school, Moscow 1887), which advocates an extensive system of secular schools for the gentry to be maintained from monastery funds otherwise wasted. In so far as it is original the *Istoriya* too is rationalist and pragmatic; it shows that Russia prospered under autocracy before 1132 and after the accession of Ivan III and declined under aristocratic rule. Like all Tatishchev's writings it exhibits the strong sense of practical reality which he developed during his long and arduous administrative career.

TAX ADMINISTRATION is applied taxation. It embraces the entire procedure from the initial determination of the tax obligation under any tax law to the enforcement of penalties for a default on that obligation. As such it is established partly by the legislation imposing the taxes and partly by the rules and regulations that may be promulgated by administrative officers. Although it is ordinarily regarded as a ministerial function, it is constantly subject to review and possible correction by the courts, for the act of taxation always involves the taking of private wealth for public uses and the taxpayer is entitled at every turn to the protection afforded by the constitution.

While the organization, the forms and the procedure of tax administration vary greatly with different taxes and jurisdictions, the essential steps are the same in all cases. The first involves the determination of the meaning and application of the tax law. This phase of tax administration may be performed by the issuance of formal regulations or of detailed instructions to taxpayers and officials, or it may be carried out informally through personal conferences and office correspondence. Federal and state tax administration has been characterized increasingly in recent years by the publication of regulations, manuals and other formal instructions. Public authority nowhere makes this fundamental step sufficiently thorough to obviate the apparent necessity of republishing the regulations, with annotations, as private commercial ventures.

The second step, the determination of the tax obligation under the law, constitutes the essence of tax administration and involves several processes: assessment, which means the determination of the tax base; establishment of the tax rate, if this is not fixed in the tax act; computation of the tax due; and review. Each of these processes may involve highly technical qualifications on the part of the personnel engaged in tax administration. Much of the difficulty encountered in taxation arises from the complicated and controversial issues involved in one or another of these processes.

Great differences exist under various tax laws in the formality and complexity of the several processes by which the tax obligation is determined. The assessment may be made by trained specialists or it may be left largely to the

taxpayer, with the official acting merely as a receiver of the tax returns. Both of these extremes may be found in the operation of almost any tax. At this point the tax administrator is often obliged to recognize the force of public sentiment, which may support, for example, a strict assessment of incomes but not of some forms of personal property.

Most of the auxiliary devices of tax administration exist in connection with the assessment. Thus under the property tax good administration requires a comprehensive system of records by which relative values may be determined and an appropriate system of property classification, even if all property is to be taxed at a uniform rate. Under the income tax, information returns are used extensively as a means of checking the accuracy of taxpayers' statements, and a rather elaborate system of espionage is maintained for the purpose of enforcing a complete return of dutiable goods under the tariff act. "Tax ferrets" have been employed in a few states to discover the owners of intangible property.

When the tax rates are established in the tax law, the administrator's only task is the determination of the appropriate rates under the given circumstances of the return. Property tax rates are an aggregate of all the rates levied for the purpose of various overlapping jurisdictions, such as the municipality, the school district, the county and often the state. The final rate cannot be determined until after the budgets of the several units have been established.

Computation of the tax due may be made tentatively by the taxpayer under any tax for which the rate is set in the tax act, subject always to clerical verification by the examiners of the return. In the property tax and in some kinds of business and excise taxes the original tax computation is made in the office to which the returns are rendered, and a tax bill is sent to each taxpayer.

The process of review may be either administrative or judicial. In so far as taxation questions are taken into the courts, the matter is carried outside the field of administration as such, although the court's decision may involve subsequent action by the tax administrator in the immediate case and in all later cases. Requests for a review of administrative action may arise at any stage of tax determination, but they are made most frequently in connection with the assessment. Once the correctness of the assessment has been established, the remaining steps

in determining the tax obligation are not likely to involve serious differences between the taxpayer and the administrative officer. Since assessment is so largely a matter of fact finding, better tax administration tends to regard the review of assessments as primarily a ministerial rather than a judicial function. The superior administrative officers will have or should have the facilities and qualifications for testing the correctness of assessments made by their subordinates, whether it be a question of property valuation, of the amount of taxable income or of the dutiable value of imports. Under any system of responsible government the courts are accepted as the final interpreters of constitutional meaning and legislative intent and the administrator is bound by these interpretations even if he does not agree with them. Any of the factual aspects of taxation may involve questions of constitutional meaning or of legislative intent and thus lead to litigation; but it is better always to exhaust the agencies of administrative review and adjustment before resort to the courts for determination of complicated questions of fact.

The final step, collection of the tax, may be bound up closely with tax determination, as in the case of the requirement under many income tax laws that the taxpayer shall make payment at the time of filing the return; or it may be dissociated from tax determination and the responsibility for collection vested in another group of officers, as is commonly done in the case of the property tax. Collection at the source is extensive in England for the income tax and for the local rates on property, but this method proved quite unsatisfactory in the United States, where its application was attempted in the early federal income tax acts.

All systems of tax administration provide penalties for violation of tax laws. They fall into two general classes, those applied for sheer failure to comply with the tax law at any point through neglect, inadvertence, inability or misunderstanding; and those for deliberate intent to evade. When there is no evident intent to defraud the government, tax penalties are ordinarily moderate, although in the case of the property tax failure to pay because of sheer inability may involve a severe penalty; namely, loss of the property or of the owner's equity in it through a tax sale. Sometimes interest at a substantial rate on the omitted amount of tax or on the delinquent tax is the only penalty until after a certain period of delinquency has elapsed. The penalty, when imposed in addition

to interest, is usually a stated proportion of the tax. A deliberate intent to defraud the revenues becomes a basis of criminal action against the offender under many tax laws.

The operation of any tax system and the attitude of taxpayers toward it are strongly influenced by the quality of its administration. It is often said that the defects of a bad tax may be substantially corrected by good administration, while bad administration may convert a good tax into an instrument of injustice. Good administration in this sense involves on the part of those responsible for it high qualities of intelligence, impartiality and moral strength. Heavy taxes do not seem so heavy when it is recognized that the tax laws are fairly and fearlessly enforced. The early state tax commissions were reasonably free of the patronage taint, but this cannot be said of many of them today. All of the important positions in the federal tax administration are patronage plums. Favoritism, whether partisan, sectional or personal, has no place in good government; but its consequences in tax administration, however manifested, are peculiarly disastrous and demoralizing.

The administrative framework of a tax system necessarily extends throughout the tax jurisdiction. The relation between the central and the local agents of administration varies considerably in different places and for different taxes, depending on the structure of the government and the destination of the revenue. In general there should be an effective concentration of the ultimate responsibility for tax administration. This does not require that such purely local taxes as municipal licenses should be administered by state authority, but it does imply that some degree of central supervision is beneficial, even with respect to the taxes which constitute the major sources of municipal revenues. Certain taxes, such as those on incomes, inheritances, business and intangible property, are dependent upon state rather than local administration for successful results.

For any unit of government the tax administration should be under a single tax department. The federal organization meets this requirement, for the secretary of the treasury is the nominal head of the federal tax system. Under him are two principal tax bureaus, in charge of customs and internal taxes respectively. Tax administration in the states follows no organization pattern. While most of them have a state tax department, headed by a commissioner or a tax commission, the functions of such departments

are by no means uniform. In some cases they do not administer all of the taxes levied for state use, although at least this degree of concentrated responsibility should be provided.

The authority of state tax departments over the principal source of local revenue, the property tax, also varies widely. Complete centralization of property tax administration is not essential to satisfactory results. Advocates of such centralization have never gone farther than to demand state appointment of the assessing officials, who naturally have a vital position in the equitable operation of this tax. The experience of Wisconsin indicates that proper state supervision of local tax officials is on the whole sufficient without obligatory state appointment. This experience also indicates that large local assessment districts are not essential, particularly for rural conditions. But the Wisconsin practise includes a unique feature of property tax administration which has contributed materially to the satisfactory results obtained through central supervision of locally chosen assessors. This is the supervisor of assessments, an official selected by the tax commission and in charge of a property assessment district which may include two or more counties.

The unitary state escapes the conflict of internal tax jurisdictions which besets the federal state. This conflict becomes more serious with the increased relative importance of interstate property ownership and business transactions. The administrative problems presented by such a situation are not beyond the capacity of competent state tax organization, although the adequacy with which these will function will depend upon the conditions under which the federal constitution and statutes may sanction state taxation of interstate commerce or business. The success achieved by the states in solving the problem of multiple taxation of inheritances indicates what might be done with other taxes. It should be no more difficult to secure interstate comity of tax administration than to secure general state acceptance of the basis of distributing federally administered taxes.

The attempt to eliminate interstate complications by an extension of the scope of federal tax administration as proposed by some fiscal writers may solve one problem, but it will create others quite as perplexing and difficult. Some state tax departments operate as economically as does the federal tax organization. Even if the various state tax departments could not function as smoothly as a gigantic federal tax machine,

the gains from the greater efficiency of federal administration claimed by the proponents of such measures would be, in the opinion of the writer, more or less neutralized by the resulting loss of state fiscal responsibility, the disintegrated morale of all state administration and the diminished sense of state independence.

TAX EXEMPTION. Narrowly conceived, tax exemption exists only when a taxing law or the constitution under which it operates specifically excludes from its scope a person or thing which would be taxable were it not for the excluding clause. This definition is unsatisfactory, however, in so far as it fails to cover many phenomena which have identically the same effect as a specific exemption clause. A tax may be levied on tobacco products, for instance, with cigars specifically exempted; or it may be levied on cigarettes, snuff and smoking tobacco, cigars alone being omitted from the list. Furthermore a mere reference to the law omits consideration of the final resting place of the tax burden; in the economic sense probably no person in any country at any time has enjoyed complete "tax exemption," in view of the existence of many indirect taxes shifted to consumers. Despite these defects of the narrow concept of tax exemption it is necessary here to treat the subject primarily in this light. To discuss what might be taxed were the language of the tax laws more general would be an illimitable task; and the ascertainment of relative degrees of tax exemption

involves problems of shifting and incidence. It must suffice to indicate that tax exemption provisions are merely instances of the general phenomenon of differential treatment under a tax system, and that the distinction between a specific exemption provision and another form of differential treatment is often merely formal.

Tax exemption in earlier epochs rested largely on a basis of social and political distinction. In ancient China, India, Persia and in certain parts of ancient Greece the aristocratic classes resisted taxation as a type of servitude. The existence of outright slavery as opposed to serfdom seems, however, to have led to rather general taxation of the upper classes, as for the most part the slaves were necessarily outside the group of direct taxpayers. Thus in Rome exemption of the upper class developed markedly only after slavery had given way in part to serfdom. Much of the tax exemption that developed during and after the decline of the Roman Empire was in effect an expression of independence: the more powerful temporal lords and the church refused to support the exchequer of the national or imperial ruler. In other instances exemption took the form of favors granted more or less capriciously by an absolute ruler who wished to reward his friends and supporters. At times during the mediaeval period taxes were comparatively insignificant as sources of revenue. Many of the exemptions from taxation in this period accrued to those who had as yet failed to rid themselves of military obligations by paying taxes in lieu thereof.

The reasons usually given for tax exemption in the modern state rest on different but still numerous bases. Many exemptions exist only because the person or thing exempted is reached through some other branch of the tax system. Some states of the United States, for instance, exempt automobiles from the property tax and levy the annual registration tax at a correspondingly higher rate. Some exemptions avoid undesirable double taxation: securities of various types are in some jurisdictions exempt from the property tax because the property which they represent is fully taxed, and reciprocal exemptions under death taxes have been used in the United States to avoid multistate taxation of the same property.

Still other exemptions are based on the notion that it is useless for the government to tax itself or its own agencies. Thus under the property tax a state usually does not tax its own property or that of its political subdivisions, nor does it al-

ways allow the subdivisions to tax one another's property or state property. In the state of New York in 1930, for instance, cities owned 53 percent and other governmental units 12 percent of all tax exempt real property. Such taxation would often be more than a meaningless transfer of funds: a city may own property located in another city within the same state, and under these circumstances taxation of the property by the latter city is sometimes permitted. A somewhat similar circumstance arises with state owned property and the local tax. A political subdivision may be put to a certain expense by the existence of this property yet be unable to recoup the expense through taxes. It has been argued also that government property in competition with private enterprise (e.g. public service corporations) should be taxed in order to protect the latter and to furnish a fair test of public ownership.

Still another type of tax exemption has arisen out of the necessity of maintaining the national and state governments in countries having a federal form of government organization. This is the basis for the (implied) constitutional exemption of the United States government and its instrumentalities from state taxation, the exemption of the states and their instrumentalities from federal taxation and the exemption of interstate commerce from state taxation. There would seem to be little objection, however, to abolishing these exemptions if discriminatory taxation were guarded against.

A subject which has aroused considerable controversy in recent years is tax exemption of government securities. In the United States federal obligations are exempt from state taxation, and securities issued by the states and their political subdivisions are likewise exempt from federal taxation. In addition the various authorities frequently grant tax exemptions to their own issues largely as a means of making the loan more attractive to investors. The tax exemption of such securities has been attacked on the ground that it impairs the effectiveness of the progressive rate feature of income taxes, in so far as the volume of securities issued becomes so great that their price sinks to a level allowing only for their attractiveness to low income or to no income tax payers. This affords wealthy taxpayers an opportunity to benefit greatly through escape of high taxes at a low cost. Recent studies in the United States indicate that such impairment of the progressive rate feature does in fact exist; but its extent, measured in terms of gross

revenue lost, is probably much less than is popularly supposed. For various reasons, chiefly perhaps because of the uncertainty concerning future tax rates which may considerably modify the attractiveness of such securities to the large income tax payer, wealthy investors hold far fewer tax exempt securities than might be expected. From this it might be deduced that the net loss to the issuing governments (tax revenue lost, minus interest charges saved) is small or negative, were it not that the spread between tax exempt and other comparable taxable bonds has in fact been slight and hence the amount of interest saved correspondingly small. Indeed large amounts of tax exempt bonds are held by educational and charitable institutions, which are entirely exempt as such. If these institutions be considered as among the marginal buyers, the spread between tax exempt government bonds and other high grade obligations may be considered to be attributable almost wholly to factors other than tax exemption. If this be true, the government may save almost nothing in interest by tax exemption. Under the federal-state relationship the present exemptions are in part an indirect "aid" from one governmental body to the other: the issuing government gains at the expense of the taxing government.

Some jurisdictions from time to time have felt it desirable to encourage certain types of economic activity. In recent decades under the property tax exemptions limited to a term of years have been granted certain new manufacturing enterprises, residences, farm improvements, vessels, hotels and other economic enterprises. Probably the exemptions have had the desired result to some extent, but for the most part it has been impossible to trace the effects. If the validity of singling out certain kinds of economic activity for encouragement at the expense of others in the community be assumed, direct bounties would seem preferable to tax exemptions; the cost is kept clearly before the public, and the bounty is a more flexible tool for the purpose than tax exemption. The political advantages and apparent simplicity of tax exemption, however, are evident.

Other activities commonly or occasionally encouraged through tax exemption are non-profit in character: religious institutions, labor organizations, non-profit cemeteries, the Boy Scouts, veterans' organizations and the like. Direct grants to such organizations would probably not meet with public approval; if they did not, it would of course be illogical to grant them tax

exemption. Other non-profit organizations, on the contrary, more clearly supplement work already carried on at government expense. Such institutions are those engaged in charitable, educational or health activities. Here the issue of direct appropriations versus tax exemption seems to be largely a matter of the extent to which the government wishes to exercise control over such activities. Direct appropriations in contrast to tax exemptions are usually accompanied or followed by governmental control of the activity thus supported. Some exemptions are clearly mere substitutes for appropriations which would not involve a problem of extension of control; for instance, exemptions to veterans, widows and orphans and government employees. Particularly here the appropriation of adequate and taxable pensions or salaries seems preferable to tax exemptions.

Other exemptions are granted chiefly on an administrative basis. The exemption of a large section of the population from income taxation is an example. Sometimes this has been justified on the ground that a certain minimum of subsistence should be exempt from taxation; but this argument has little force, inasmuch as the same governments that grant this exemption tax even the poverty stricken classes through various indirect taxes, particularly excises, customs duties and a certain part of the property tax. The occasional exemption of food under the sales tax probably expresses a feeling that the poorer classes already bear a heavy enough burden or that, if they are to be taxed further, they should be reached in other ways. The exemption of annual sales under a certain amount is almost wholly for the sake of administrative—and perhaps political—advantages.

TAX FARMING. See REVENUE FARMING.

TAXATION constitutes the chief financial resource of the modern state. In ancient times tribute and returns from the public domain loomed large in finances and, if present tendencies continue, the income account may soon be dominated by receipts from socialized industry. But in the democratic state of today the great bulk of the public revenue is supplied by compulsory levies, apportioned among the people according to the standards acceptable to their representative legislatures.

Historically taxation appears to have grown out of the voluntary contributions characteristic of all primitive societies. Gradually these contributions, freely given, became transformed into legal obligations of persons to perform services in support of a limited number of specified public objects. With the development of private property and commercial activity these legal obligations gradually evolved, first into fees and charges of various kinds, later into levies on exchange and transport and finally into compulsory contributions which were apportioned among persons according to general standards of equity and upon bases, such as property and income, which seemed most convenient at the time.

The taxes levied in the course of centuries have been profoundly affected in character and amount by the nature of the environment, economic, political and social. Taxation has changed from a simple to a very complex process with the evolution of economic life generally. Tax bases have varied as the economic factors at the foundation of economic life have changed in importance. Land taxation, for example, played a different role in the agricultural economy from that which it plays in the present industrial era. The development of the large territorial area for purposes of governmental and business administration has affected the choice of taxes for financing the activities of both the national states and the localities. Modifications in the form of the ownership organization of business, such as the advent of the corporation, have raised new problems and occasioned the introduction of new types of tax. Increased skill in administration, in the records of economic activity and in the technique of appraisal and valuation has created opportunities to refine the distribution of burdens among the taxpayers. Changes in habits of thought with reference to the measurement of economic strength have had their effect in changing the tax bases. Finally the gradual emergence of social ideals of justice and

equity have transformed the very foundation upon which tax systems are erected.

The evolution of taxation has been accompanied by striking changes in the attitude of the citizenship toward these compulsory levies. In Athens at the time of Pericles taxes were imposed largely upon foreigners and slaves, and in the ancient world generally, where tribute was an important financial resource, tax liability was usually considered a mark of bondage rather than of freedom. During the periods of feudalism and of absolute monarchies taxation so far as it was used at all was imposed with little regard to equity. Favoritism was common, the taxes often falling only on those classes which were without special influence. Indeed, so long as rulers were under no obligation to submit their programs of expenditure to parliamentary bodies for approval, the attitude of the taxpayers was usually strongly antagonistic. Since it was necessary to employ crude levies and it was discreet to use hidden ones, taxes on transactions and consumption reached their heyday. The development of representative government and of democracy created the first real opportunity to utilize effectively types of taxes which require for their successful administration a high degree of cooperation from the taxpayer. Only after the control of the public purse had been placed in his hands, was the taxpayer willing to make the disclosures and declarations necessary for the proper assessment of property and income taxes of the modern type. In very recent times the growing disparity between the patterns of distribution of political power and taxpaying liability consequent upon the wide extension of the suffrage and the development of highly progressive taxes has raised the question of the attitude of the taxpayer in a new and interesting form.

The precise content of the term tax is not always the same in the writings of scholars, in the language of legislators and judges and in the practise of those who keep the public accounts. There is little occasion for confusion as between compulsory payments in general, on the one hand, and gratuitous payments, such as gifts, subventions and indemnities, and contractual payments, such as land rentals and the purchase price of the products of governmental enterprises, particularly when they are not monopolies, on the other. It is with regard to the various types of compulsory payments that the difficulties of terminology arise. Such levies may have as their legal foundation either the power of eminent domain, the penal power, exercised

either independently or as the fiscally significant portion of the police power, or the taxing power. The legal power of taxation, however, is depended upon to sustain numerous charges which certain students of public finance are accustomed to distinguish from taxes in the economic sense. Bastable it is true makes the definition broad when he describes a tax as "a compulsory contribution of the wealth of a person or body of persons for the service of the public powers" (Bastable, C. F., *Public Finance*, 3rd ed. London 1903, p. 263). Likewise H. C. Adams defines a tax simply as "a contribution from the citizen to the support of the State" (*The Science of Finance*, New York 1898, p. 302). E. R. A. Seligman, however, prefers to restrict the content of the term to more narrow limits. Arranging the various types of public charges in a scale which varies inversely with the degree of the special benefit and directly with the importance of the public purpose, he distinguishes among quasi-private prices, public prices, fees, special assessments and taxes. The last three of these types commonly involve the use of the taxing power and are usually termed taxes in legal discussions.

The widely accepted definition of a tax as developed by Seligman in his early writings is this: "A tax is a compulsory contribution from the person to the government to defray the expenses incurred in the common interest of all, without reference to special benefits conferred" (Seligman, Edwin R. A., *Essays on Taxation*, 10th ed. New York 1925, p. 432). A special assessment is distinguished from a tax on the grounds that it is a payment made once and for all to defray the cost of a specific improvement to property and levied according to the particular benefit accruing to each property owner. A fee is distinguished from a special assessment on the ground that it is a recurring charge, and from a tax on the ground that the service financed by it confers a measurable special advantage on the taxpayer. Some writers (e.g. Plehn, Carl C., *Introduction to Public Finance*, 5th ed. New York 1926, p. 332) recognize no significant distinction between a fee and a special assessment.

It is obvious that, if Seligman's definition is interpreted so as to deny the application of the term tax to all types of charge in which special benefit is not merely an incidental result but is depended upon to some degree as the justification for the imposition of the charge or the manner of its apportionment, the resulting con-

tent of the term tax does not conform to the common usage of the legislator, the lawyer and the accountant. A pure tax, so defined, is in practise much more rare than is commonly assumed. A host of charges, generally termed taxes, falls without the bounds of the category. The strict definition is extremely useful for purposes of scientific analysis, but care must be exercised in applying the conclusions arrived at through that analysis to types of charges included by legal and accounting parlance within the scope of the term tax but excluded from the scientific concept by definition.

The danger of confusion from the use of a narrow definition is particularly great in the case of such charges as the gasoline tax and the business tax. In the gasoline tax special benefit is measured with a fairly high degree of accuracy and is certainly not "only an incidental result." Benefit is also important and not merely incidental as the justification for many business taxes and as the basis of their apportionment among the subjects of the tax. This is notably true, for instance, of the revised German *Gewerbesteuer*. Even the real estate tax, in its modern role in the American state, is largely if not predominantly affected by considerations of special benefit. In the municipalities of New York, for example, it has recently been shown that nearly 60 percent of the local taxes may be justified on the ground that the proceeds are expended for services of direct benefit to real estate owners (New York, State, Commission for the Revision of the Tax Laws, *Report*, Legislative Document, no. 77, 1932, p. 132). It should be observed that Seligman in his subsequent writings did not interpret his definition so narrowly as to exclude impositions of the type which in any degree utilize as a factor benefit to the group rather than special benefit to individuals. Moreover in his most recent contributions it is clear that as the result of his study of the problem of international double taxation Seligman has become convinced of "the fallacy of lumping all taxes together, as representing the principle of ability" (Seligman, Edwin R. A., *Double Taxation and International Fiscal Cooperation*, New York 1928, p. 103).

A fundamental question which arises at the very outset of any general discussion of taxation relates to its purpose and function. Is this purpose to be conceived narrowly, as merely the raising of money for the support of the fisc, or is it to be construed broadly to include the deliberate use of the tools of taxation to accomplish

economic changes which are considered socially desirable? The opposing points of view are well represented by Bastable and Wagner.

In all his writing in the field of taxation Wagner gave great weight to "socio-political principles." He considered it a primary function of government to regulate the distribution of wealth and urged the use of taxation as a means not only of raising sufficient revenue to meet the fiscal needs of the state but of consciously leveling the inequalities of distribution brought about by the workings of the market. Indeed even in defining taxation he stresses this function "of regulating and correcting the distribution and use of private property"

The case for the narrow conception of purpose as represented by Bastable rests largely upon the technical difficulties involved in the attempt to use taxation as a tool of social reform and the dangers of impairing its effectiveness for purely fiscal purposes involved in such an attempt. Distrust of the social ideals animating the adherents of the broad conception of purpose also undoubtedly plays a role. The abstract issue here raised is obviously one which will be disposed of by any writer as a corollary to his general political and social philosophy. As a practical matter the arguments in favor of the narrow view of the function of taxation are being rapidly undermined by the course of events. It is inevitable that this should occur if skill in administering complex taxes increases, if knowledge of their incidence and effects becomes more clear and dependable and if sentiment regarding the place of the state in the program of social betterment becomes more unified. Certainly, regardless of the manner in which the large compulsory levies characteristic of modern budgets may be apportioned among the citizens of a state, their imposition will have profound effects and repercussions upon the operation of economic forces and the welfare of economic classes. Since these effects will inevitably accrue even though they are completely ignored by the legislator, it seems the part of wisdom to recognize the raising of revenue as the primary function of taxation but also consciously to give preference to the types of taxes whose probable effects harmonize most closely with the prevailing social sentiment of the community. Few students of taxation will today dissent from the opinion expressed in the following sentence: "What is desirable is that taxes should be levied (a) without checking production; (b) without any avoidable waste; (c) without arousing an

effective opposing force, e.g. a sense of injustice; (d) without encouraging social evils. If social wealth is encouraged, or the sense of justice satisfied, or waste eliminated, or production increased, so much the better. There is no likelihood of our arriving at them any the quicker by taxing for revenue only" (Jones, Robert, *The Nature and First Principle of Taxation*, London 1914, p. 185).

It has been found convenient to classify taxes in many different ways for various purposes. The importance of some of the categories has varied greatly at different stages in the evolution of taxation, with the result that some of the classifications are of less significance than formerly. Those most commonly encountered are: according to the tax base, as property tax, income tax, inheritance tax and so on; according to the media of payment, as taxes payable in money and taxes payable in kind, in labor and the like, according to the regularity of levy, as ordinary and extraordinary taxes; according to the purpose, as general and special, such as school and road, taxes; according to the jurisdiction, as federal, state and local taxes; according to the manner of attaching the charge, as assessed and non-assessed taxes; according to the legal basis of liability, as taxes in rem and taxes in personam, according to the imputed economic source, as wages, profits and rent taxes; according to the stages of the economic process affected, as taxes on acquisition, possession, exchange and consumption; according to the nature of the rate structure, as proportional and graduated (progressive, regressive or degressive) taxes; according to the method of fixing the rate, as percentage and apportioned taxes; and according to the assumption regarding shifting, as direct and indirect taxes.

While the character and significance of most of these classifications will be understood without explanation, several of them, notably the last mentioned, require further elaboration. The distinction between direct and indirect taxes, so widely and so diversely drawn in present day discussion, appears to have been first utilized by the physiocrats. According to their analysis agriculture alone furnished a net surplus, and since taxes levied elsewhere finally came to rest upon this surplus, it was more economical and equitable to levy them directly there at the outset than to levy them indirectly through other subjects. Smith and Ricardo, while not accepting the economic theory of the physiocrats, utilized the terms "direct" and "indirect" taxes

in a similar sense, distinguishing between the taxpayer and the tax bearer and designating as direct the taxes where these persons were identical. Accurate identification of the tax bearer is a task which of course can be accomplished only by those who have a simple and complete faith in the adequacy of their economic theory. Mill made the test slightly more objective by substituting for the presumed actual result the intent of the legislature as to the person who should bear the tax. But even assuming definite information regarding the intent of the legislature, which often does not exist, few students are willing to accept that intent in place of their own hypotheses regarding the identity of the tax bearers.

The confusion in the general use of the terms direct and indirect has been augmented by special meanings which have come to be attached to them through usage in administrative and legal circles. Thus in France a direct tax has come to mean a tax which is administered by the Division of Direct Taxes of the Ministry of Finance, and such taxes do not include even all elements of the income tax; the tax on security income, for example, being assigned to the Registration Taxes Administration. Moreover the *contributions indirectes* comprehend only a small part of the taxes where the taxpayer is presumably not the same person as the tax bearer. The test in France makes a "direct" tax virtually identical with an "assessed" tax. In the United States the term direct tax was incorporated in the federal constitution adopted in 1787, and the restriction that such taxes must be apportioned among the states according to population was placed upon the use of such taxes by the central government. In interpreting this restrictive clause the courts have, gradually and with vacillation, evolved a definition which certainly does not accept the economic test of shifting as the determining factor in the classification. Capitation and property taxes are considered direct. Inheritance and franchise taxes are indirect. Even income taxes were first considered indirect but were later declared direct. The present federal income taxes, which are of course not apportioned according to the population test, are expressly authorized by an amendment to the constitution adopted in 1913. The term direct tax is also used sometimes in a highly specialized sense in certain localities, as in New York, where the phrase is commonly employed to describe the property tax which the state may and sometimes does impose on property in ad-

dition to the local taxes on this base. Finally, attention should be called to the classification recently developed by Seligman in connection with his analysis of the problem of international double taxation, in which, after pointing out that the "distinction between direct and indirect taxes is now recognized as not scientific, but only colloquial," he proceeds to identify indirect taxes with impersonal taxes on wealth irrespective of persons and to contrast this category with "direct taxes," defined so as to include "personal," "semi-personal" and "mixed" taxes. It is clear that whenever the terms direct and indirect are encountered care must be taken to ascertain the sense in which the writer uses them. Moreover in view of the qualifications and the uncertainty which surround the conclusions regarding shifting and incidence, even in the case of taxes which are assessed to the taxpayers individually, students are more and more inclined to avoid the use of these terms, despite their great convenience in any rough description or analysis of a tax system.

The intelligent formulation of a tax system assumes the selection of the particular forms of taxation which will best accomplish the desired results. Diversity of opinion regarding objectives is almost always present. In a later section the character of some of the results which students and statesmen have come to regard as desirable will be discussed. But let it here be assumed that agreement has been reached as to objectives; it remains to be decided, in the light of all available knowledge regarding the qualities and properties of the various alternative types of taxes, with what taxes and in what proportions the tax system shall be contrived.

Observers have long recognized that information regarding the amounts of money which various persons pay to the tax collector as the result of the imposition of a given levy is but the beginning of the knowledge that it is desirable to have regarding the results which may be expected to follow the act of levying a tax. The original pattern, according to which the tax is distributed upon its impact, is often radically modified by the action of the taxpayers, who may be in a position to relieve themselves of part or all of the burden which has been placed upon them. The process of transferring the burden of a tax to another, called the shifting of the tax, and the resulting new pattern of distribution after the burden has been readjusted through shifting, called the incidence of the tax, must also be determined. The two patterns may of

course in a particular case be identical. But it is important to determine whether these are in fact identical or whether they are different. It is indeed more important to know who bears the taxes than it is to know who pays them originally. In addition the imposition of a tax and its consequent shifting, if any, often set in motion forces which have extremely important economic repercussions, even though they are indirect and remote. Such repercussions as changes in the rate of saving, in the character and amount of production and consumption and in the forms of business organization are usually referred to as the influences and effects of taxation.

All this knowledge of the results of imposing a tax is desirable and indeed necessary if the task of imposing taxes is to be accomplished with precision and with confidence that the desired objectives will be attained. Unfortunately, however, this knowledge has proved very difficult to acquire by observation of the actual phenomena of economic life. It has been necessary therefore to proceed largely on the basis of what can fairly be termed only tentative hypotheses regarding the incidence and effects of particular tax measures.

A person who has been called upon to pay a tax can shift it to another person only if he has to others an economic relationship whose terms may be modified by virtue of the tax payment that he has been required to make. An understanding of what is likely to happen in a case of this sort will of course depend upon the accuracy of the knowledge with respect to the manner in which economic forces operate, particularly in the field of value and price. In the absence of adequate verified information based on objective, independent observation conclusions regarding incidence are bound to be largely inferences drawn from the particular systematic explanation of the economic mechanism which the writer chances to find most satisfactory. Theories of incidence are thus the stepchildren of economic theory, and their reliability depends upon the accuracy with which the economist is able to understand, analyze and describe the character and functioning of the general economic system.

Because of this necessary dependence upon economic theory in general, beliefs regarding the shifting and incidence of taxation have varied widely with the struggle to formulate a more and more satisfactory explanation of the operation of economic forces. For the physiocrats the prob-

lem of shifting was simple. They believed that agriculture alone furnished a net surplus, and that it was from this net surplus that taxes, wherever originally imposed, must ultimately come. Whatever the form of the tax, the incidence, in their view, was always on the land. On the other hand, the classical economists, reasoning on the basis of highly artificial assumptions, formulated elaborate sets of very definite conclusions, which often differed widely from one another; as, for example, those of Smith and Ricardo, the contribution of the latter being especially notable as the first truly systematic treatise on incidence. The complacent doctrine of "equal diffusion" has had a distinguished group of supporters from the time of Andrew Hamilton and Canard to the present day, and there are always those who are content to take the agnostic position that the entire problem is impossibly difficult. The view of the socialists, as expounded by Lassalle, is that all taxes except those on property and on personal incomes fall upon labor. The mathematical economists, including Cournot, Pantalone, Wicksell, Edgeworth and, recently in the United States, Hotelling, have attempted to apply their refined technique to this complex problem with results sometimes interesting and, to the practical mind, even startling. It is to Seligman, however, that the students of taxation are most deeply indebted for guidance and help in this field. In his classic treatise on *The Shifting and Incidence of Taxation* (5th ed. New York 1927) he has presented a comprehensive and critical review of the history of the doctrines and has elaborated in a masterly fashion the implications of the marginal analysis generally accepted by economists with respect to the various types of taxes which are of present day significance.

The shifting of taxes is not to be confused with tax evasion, or dodging, terms which apply to practises of escaping the imposition of taxes by illicit methods. It is also to be distinguished from the "minimizing" of taxes; that is, the reduction of legal tax liability to the lowest possible amount through the skilful utilization of every legitimate method, as, for example, reducing net income by claiming every possible deduction which the law can be construed to sanction. Furthermore the practise of avoiding taxes by the process of "transformation" should be recognized as something distinct from shifting. Transformation of taxes is applied to those rare cases in which the imposition of taxes leads to technical improvements in the business, the

value of which tend to offset the burden. Finally, some writers find it desirable to distinguish shifting from "capitalization" of taxes, a process whereby a taxpayer avoids becoming the tax bearer by insisting that the prospective tax burden be taken into account in arranging the terms of sale when he invests in the property subjected to tax (see CAPITALIZATION AND AMORTIZATION OF TAXES).

The term tax burden, as used in this discussion, refers approximately to the load after it comes to rest as the result of the process of shifting. It is not to be understood as describing the net balance which results from a comparison of the amount of the taxes borne by a taxpayer with the amount of the economic benefits he receives as the result of the expenditure of the taxes collected. It would be difficult indeed to arrange public affairs in such a fashion that no economic benefits would accrue to taxpayers as the result of the expenditure of tax collections. Indeed it is not unreasonable to expect that, even with all the imperfections of present day political organization and administration, the expenditure of tax money will generate benefits roughly equivalent to the amount so spent. In the case of any particular taxpayer his real tax burden is of course fundamentally offset by any economic benefit received by him as the result of the expenditures of government. Perfect articulation, if it were possible, between benefit and taxation should result in the elimination of all burden in this sense. It is with the incidence of tax payments, however, not with their cancellation through the receipt of benefits that this discussion concerns itself.

The orthodox analysis of the process of shifting and the calculation of the incidence of taxation approach the problem from the angle of price determination and deal with the numerous and subtle changes in supply and demand for commodities and services as they seek an equilibrium after the imposition of the levies. It is pointed out that the imposition of a tax disturbs the normal equilibrium and tends to increase the costs of production. Whether prices will be raised in the effort to cover these new costs is said to depend largely upon the attendant circumstances.

Among the significant factors that which is usually assigned the greatest importance relates to the presence or absence of competition. Under freely competitive conditions, it is argued, the tendency of prices to approximate costs of production at the margin raises a pre-

sumption in favor of the shifting of any tax which is so arranged that it enters into the costs of the marginal producer. On the other hand, under conditions of monopoly, where, according to the analysis, maximum net returns rather than costs of production tend to determine prices, the taxpayer cannot ordinarily hope to obtain a larger net revenue by increasing his prices and is therefore without an incentive to shift. Only therefore if the monopolist has not been shrewd enough to exploit the demand for his product to the full, is the imposition of a tax likely to cause a reexamination of his situation and a price adjustment.

In considering the possibilities of shifting under conditions of free competition it is customary to attempt to determine, on the side of supply, whether the article is produced at constant, at increasing or at decreasing cost per unit and to inquire, on the side of demand, regarding the degree of elasticity present. The less sensitive the demand in its reaction to a price rise and the less sensitive the costs per unit as the number of units produced is diminished, the greater the chance of shifting. The situation is well summarized in the following statement: "In the theory of incidence, two general propositions may be laid down. The first is that, other things being equal, the more elastic the demand for the object of taxation, the more will the incidence of the tax be upon the seller. And the second is that, other things being equal, the more elastic the supply of the object of taxation, the more will the incidence be upon the buyer. For the more elastic the demand, the more will the demand fall off, as a result of a given rise in the price of the object of taxation, and the less, therefore, will it be worth while for sellers to raise the price. And, on the other hand, the more elastic the supply, the more will the supply fall off, as a result of a given rise in the cost of production (including tax) of the object of taxation and the less, therefore, will it be worth while for buyers to resist the raising of the price. The sellers, in short, try to put the incidence on the buyers by reducing supply, the buyers try to put it on the sellers by reducing demand. The relative ability of the two groups to achieve their aims, with the minimum loss to themselves, determines the result" (Dalton, Hugh, *Principles of Public Finance*, 5th ed. London 1929, p. 53-54).

A second important circumstance relates to the nature of the tax, whether it is general or exclusive. A comprehensive general tax upon property or income is according to the theory

non-shiftable. Similar in character is the question as to whether the form of the tax is such that it falls upon the marginal producer. A tax upon surplus rather than costs may be expected to influence prices in a relatively indirect and unimportant manner. Furthermore it is desirable to know whether the capital used in producing the taxed article is mobile or whether it is fixed and poorly adapted to an alternative use. If mobility is absent, the chance that shifting will occur is considered to be less. Another significant circumstance often cited is whether the tax is light or heavy; a trifling tax will often be absorbed by the business man and not shifted in view of the risks involved in changing the prices of the commodity, especially if the commodity be one for which there is a "round," or customary, price. Complications may also be added by the use of a progressive rate scale in case the base of the tax is not a surplus. Moreover, if the commodity is an intermediate and not a final good, the case for shifting obviously demands reexamination in the light of the circumstances that surround the production and marketing of the article into which it is incorporated.

Theoretical conclusions regarding the probable incidence of taxation, such as those above outlined, can be applied to the analysis of a practical problem only with great difficulty. If the conclusions are to be valid, not only must the economic theory be sound and adequate but the conditions surrounding the particular levy under consideration must not depart materially from the assumptions made in the theoretical analysis. Since such assumptions are highly artificial, it is seldom safe to advance confident pronouncements regarding the incidence of a particular tax. Pure monopoly and free competition are not often encountered in modern business life. "Normal" conditions of supply and demand are abnormal. Conclusions regarding the incidence of a tax on the pure site rent of land may be applicable only in small part to the usual type of real estate tax imposed in an American community. A levy called a business tax on net income may be found upon analysis to be a very rough approximation indeed to the theoretical tax on pure economic profit, being as well a tax on interest, on rent, on earnings or on capital. This does not mean that it is impossible ever to be reasonably definite regarding the incidence of a particular tax, but it does imply that absolute assurance can seldom be attained. In this field modesty is a becoming virtue.

Among the specific forms of taxation which, because of their general character and the conditions ordinarily surrounding their application, the orthodox economist would usually expect to be borne by the payer and not to be shifted are the following: the general property tax, either in the form of a personal net fortune tax or in the form of an objective tax on all property, and the general personal income tax, the inclusive character of the above levies tending to make shifting difficult; the business tax based on net income, so arranged as to avoid a charge against the marginal producer; the tax on the site value of land, in the form of either a charge upon the annual rent or a charge upon the selling value founded on that rent; the tax on monopoly profits; the tax on inheritances and estates and the poll tax. On the other hand, shifting would ordinarily be anticipated in cases of the numerous property taxes with restricted bases, such as the house tax and the mortgage tax and the various excises and charges upon transactions and sales, including the gross receipts taxes.

The discussions of shifting and incidence in the literature of public finance have only slightly been affected by the recent works of economists in the field of prices. It even seems doubtful whether the implications of the writings of Alfred Marshall have been given the consideration they deserve. The studies of demand curves by statisticians, such as Ezekiel and Schultz, the conception of the bulk line producer developed by Taussig and Secrist, the importance of overhead costs as a factor in price determination emphasized in the writings of J. M. Clark and the new studies of "imperfect" and "monopolistic" competition are full of suggestions for the student of public finance. It is, however, perhaps fair to state that while the recent efforts of students of prices raise doubts as to the adequacy of the marginal analysis, they have not as yet succeeded in establishing in its place a generally accepted alternative theoretical framework.

If the amount of verified knowledge concerning the shifting and incidence of taxation is disappointingly slight, the knowledge relating to the more remote influences and effects is even more negligible. Yet the debate regarding specific tax measures is necessarily carried on largely in terms of what are alleged to be influences and effects. The real estate tax is opposed because "it discourages home ownership." The tax on the net income of corporations is attacked because "it drives manufacturers out of the

state." The application of the federal income to gains from appreciations in the value of property is criticized because it "interferes with the orderly marketing of property." The tax on personal property is argued against on the ground that it "prevents the rich from establishing a residence in the jurisdiction." Complaints are common that certain types of taxes "stifle initiative," "repress production" and "discourage saving." It is contended that the protective tariff diverts economic effort from its normal channels and brings about an uneconomic distribution of economic resources among different employments and different localities.

While the greatest difficulty and uncertainty attach to the effort to attribute certain specific influences and effects to undifferentiated taxes of broad application and of moderate rates, it is usually a simple matter to devise a specific tax, of narrow application and with high rates, to accomplish some desired effect upon economic behavior. The issuance of banknotes by other than national banks has been effectively prevented by a specific federal tax. The consumption of certain harmful drugs has been discouraged by the imposition of heavy taxes. Moreover there doubtless exists considerable opportunity under such a general tax as the income tax to introduce modifications which will produce similar results. Thus in most modern statutes taxable income is so defined as to offer definite encouragement both to individual saving and to reinvestment of corporate earnings in the business. Of late definite proposals have been made by certain students of the business cycle looking toward a radical modification in the definition of taxable income designed to encourage spending and to penalize saving.

The foregoing discussion concerns itself with the scientific problem of attempting to determine the consequences which may be expected to flow from the imposition of various types of taxes. It now becomes necessary to revert to the problem of objectives. Instead of attempting to determine what will happen in case a certain tax is imposed, the effort is now to define what men ought to wish to happen as the result of imposing taxes. What are the standards by which the quality of a tax should be judged?

Discussions of this topic usually start with the four justly famous propositions laid down by Adam Smith, "the evident justice and utility" of which, have, he remarked, "recommended them more or less to the attention of all nations." These propositions, to which Smith himself ap-

plied the unpretentious term "maxims," may be summarized as follows: equality: "The subjects of every state ought to contribute towards the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state"; certainty: "The tax which each individual is bound to pay ought to be certain, and not arbitrary"; convenience of payment: "Every tax ought to be levied at the time, or in the manner, in which it is most likely to be convenient for the contributor to pay it"; and economy in collection: "Every tax should be so contrived as both to take out and to keep out of the pockets of the people as little as possible, over and above what it brings into the public treasury of the state" (Smith, Adam, *The Wealth of Nations*, ed. by Edwin Cannon, 5th ed. London 1930, vol. ii, p. 310-12)

While Smith's principles lack both comprehensiveness and precision and the maxims are more or less incommensurate and inconsistent, they have proved to be exceedingly stimulating. Writers since Smith have elaborated his list of desirable qualities, have analyzed and developed the conception of equality and have attempted to assign relative values to the maxims in cases of conflict. T. S. Adams contended that temperance in taxation is of more importance than most of the maxims appearing in Adam Smith's list, and in assigning relative values he placed both certainty and temperance above equality (National Tax Association, *Bulletin*, vol. xix, 1933-34, p. 3) Arthur T. Hadley emphasized the inconsistency among the maxims. "What if the first two requirements (which are the most fundamental general principles, the third and fourth being largely matters of administrative detail) be found to conflict with one another? What shall we do if the pursuit of equity demands sacrifice of certainty, and if all the methods of taxation which promise a sure return seem to leave some men untouched who can best afford to pay?" Hadley's answer was to give preference to certainty, recognizing, however, that as administration and taxpayers' cooperation improved it might be possible ultimately to "make equity our primary object as well as our ultimate goal" (*Economics*, New York 1896, p. 450-52). Seligman suggests a classification of canons into a primary and a secondary group. In the secondary group he places the fiscal canons of adequacy and elasticity, the administrative canons of economy, certainty and convenience

and the economic canon of harmlessness, or innocuity. In the primary group he places the social canons of universality and of uniformity. Except for the canon of uniformity and equality, these maxims deserve little comment within the limitation of this discussion. With respect to universality, the general doctrine that everyone should pay, it may be pointed out that the problem resolves itself largely into an analysis of permissible exemptions from taxation (*see* TAX EXEMPTION) and of double taxation (*q v*).

It is the canon of uniformity and equality which has most excited the interest of students and statesmen in recent decades and which has become the battle ground of great popular struggles. Although the general concept of faculty or ability to pay is very old, Adam Smith's pronouncement that equality demands contributions from subjects "according to their respective abilities" stimulated discussion and analysis which are still under way. John Stuart Mill developed the concept of equality in terms of individual sacrifice. "It means," he said, "apportioning the contribution of each person towards the expenses of government, so that he shall feel neither more nor less inconvenience from his share of the payment than every other person experiences from his" (*Principles of Political Economy*, new ed. by W. J. Ashley, London 1909, p. 804).

At this point there becomes apparent the great advantage for purposes of theoretical analysis of Seligman's insistence that charges justified by or apportioned according to benefit be excluded by definition from the concept of taxation. Mill disposed of benefit as a basis for taxation, not by definition but by a cavalier dismissal in the following terms: "Government must be regarded as so pre-eminently a concern of all, that to determine who are most interested in it is of no real importance. If a person or a class of persons receive so small a share of the benefit as makes it necessary to raise the question, there is something else than taxation which is amiss, and the thing to be done is to remedy the defect, instead of recognising it and making it a ground for demanding less taxes" (p. 805). With respect to local taxes, however, he reversed his position and advocated an arrangement which would throw the burden "on those to whom the service is rendered" (p. 862). Moreover Mill of course did not foresee the enormous development of governmental functions which has come about, resulting in traceable benefits and forming the foundation for the modern demand that specially

benefited individuals and classes should assume some degree of responsibility for the costs involved.

Mill identified equality of sacrifice with minimum sacrifice: "... sacrifices . . . should be made to bear as nearly as possible with the same pressure upon all, which, it must be observed, is the mode by which least sacrifice is occasioned on the whole" (p. 804). Later writers have been quick to draw the distinction which Mill failed to recognize. Pigou's recent discussion of the point is illuminating, and his conclusion is that least aggregate sacrifice rather than equal sacrifice is "the one ultimate principle of taxation" (Pigou, A. C., *A Study in Public Finance*, London 1928, p. 61).

The distinctive contribution of Seligman to the discussion of uniformity and equality in taxation was an acute criticism of the sacrifice theory as inadequate and unworkable and the development of a broader theory of faculty which includes both the notion of relative sacrifice on the side of consumption and the idea of relative power of acquisition on the side of production (Seligman, Edwin R. A., *Progressive Taxation in Theory and Practice*, 2nd ed. Princeton 1908, ch. 1v). This broadening of the theory makes possible its utilization in defense of both the special taxation of privileges of various sorts and the use of progressive rate scales.

In the field of progressive taxation as in the field of shifting and incidence Seligman's work has established itself as authoritative. His monograph entitled *Progressive Taxation in Theory and Practice* has played a large role in the remarkable development in the use of graduated rates. Although there are sporadic instances of the use of progression in earlier times, the principle has come to be generally accepted and to be widely applied only in recent decades. During the World War rate scales rose to heights formerly unheard of. Progression finds its chief usefulness in the field of income taxes and death duties, but it is also utilized in net fortune taxes and in special taxes, such as taxes on land whose purpose is to discourage large holdings, and in business taxes of the excess profits type, designed, in the language of Stamp, to "skim the richer crocks of cream." The application of progressive rates to business income has been generally opposed by students of taxation on the ground that it represents a mistaken effort unless the purpose is to discriminate against mere size. The popularity of progressive taxation in recent years is doubtless traceable to no small part to

the opportunity it offers in a democratic state to place added burdens upon the group which, while economically strong, is often politically weak. This opportunity has been particularly attractive because of the failure of the students of the subject to produce an acceptable theoretical foundation for the determination of any definite rate of progression as the ideally just rate. Perfect smoothness in the scale it is true has been achieved in some instances by the legislative enactment of mathematical formulae, but such devices, useful as they may be, do not serve to answer the questions as to how rapidly and how high the rate scales should progress. In concluding his discussion of justice Hugh Dalton (*Principles of Public Finance*, p. 94) observes that equity in taxation is "an elusive mistress, whom perhaps it is only worth the while of philosophers to pursue ardently and of politicians to watch warily." This elusive mistress has, however, exercised a powerful influence upon events in the realm of taxation in recent years and seems destined to play an even more important role in the period which lies ahead.

In view of the large number of factors which enter into the formulation of a tax system in any country it is not surprising that endless variety should result. Some countries are rich and others are poor, yet the poor may require larger revenues to finance their activities than the rich. Some countries are highly developed economically and others are backward; in some the government is highly centralized, in others it is highly localized; in some a high order of administrative skill is available, in others the standards of administration are low; in some the sense of social responsibility is well developed and in other countries it is almost non-existent; in some conditions are highly homogeneous and in other countries they differ widely from section to section. These and many other factors complicate the task of selecting the types of taxation to be used and serve to multiply the variations in the systems of taxation which result.

It is impossible in brief compass to describe systematically the tax systems of any of the leading countries. A few observations regarding general characteristics and trends must suffice. In the first place, the more advanced countries evidence a decided trend in the direction of emphasis upon the income tax. In Great Britain the degree of dependence upon this type of tax is greater than in any other country; there the income tax is indeed the backbone of the system. Even the local rates on real estate are based

fundamentally on the income norm. In general business taxes have been avoided. The death duties and the excises on a restricted list of articles supplement the income tax and the local rates

In contrast with that of Great Britain the tax system of France is very complex and diversified, its net effect being to place very heavy dependence upon business taxes of various types. The income tax is of recent origin and plays a minor role. Most of the lucrative taxes are of the type little emphasized in England—taxes upon business transactions and operations of various sorts.

In the tax system of the United States, although income taxation has developed greatly during the last two decades in the realm of federal and state finance, the taxation of property still remains the striking feature. In contrast with France real estate is depended upon to carry a very large share of the aggregate burden. In contrast with England there is a notable use of business taxes, mostly taxes on corporations, but the taxation of business does not approach the extreme reached in France. Consumption and sales taxes, in spite of a recent trend in this direction in the states, are relatively insignificant. The sums collected through charges based on benefit, such as special assessments and gasoline taxes, are very large.

The academic influence has been perhaps greater in Germany than in any of the countries mentioned above, and Germany possesses the most highly developed and well rounded system of all. Under the stress of post-war conditions Germany has reorganized its tax system along very interesting lines. To the federal government has been delegated all the "ability to pay" taxes, including the income and net fortune taxes. The central government also has the customs duties, the sales tax and the death duties. The revenues of the Reich, however, are shared to a very substantial extent with the states and their political subdivisions, which have in addition the various "benefit" taxes, such as the *Gewerbesteuer* as well as the real estate taxes, and certain excises and fees.

Because of the ease with which the base may be segregated according to territorial lines real estate is almost universally depended upon as the foundation of the local tax systems, but by reason of the variation in the functions vested in the local authorities as well as the variation in the use of supplementary revenues the resulting burden on realty is not uniform. Under modern

conditions of rapid transportation and communication the localization of the tax base in the case of income, inheritance, business and even consumption taxes is becoming progressively more difficult and the trend is consequently in the direction of greater and greater centralization. This trend is especially evident in the United States, where state administration has already largely replaced the traditional local administration and where even state administration now threatens to give way to federal administration in the case of several of the most important types of tax. In spite of the fact that such a development runs counter to the traditional conception of the federal type of organization, it seems highly probable that substantial changes in the tax system of the United States along the lines of the German development will soon become imperative.

TAYLOR, FRED MANVILLE (1855-1932), American economist. Taylor was born at Northville, Michigan, and received his collegiate education at Northwestern University. From 1879 to 1892 he was professor of history and politics at Albion College. He finished his doctorate at the University of Michigan in 1888 and in 1892, having attracted favorable attention from the economics faculty, notably from Professor Henry C. Adams, he joined that university as assistant professor of political economy; he became junior professor in 1894 and professor in 1904. In 1926 he was given the honorary degree of LL.D. by his alma mater and in 1928 was elected president of the American Economic Association. He retired as professor emeritus in 1929.

Taylor came to the study of economics from that of politics, and his early interest centered in the practical or applied phase of the subject. A number of closely reasoned and lucidly written papers on the problem of money culminated in 1906 in a volume entitled *Some Chapters on*

Money (Ann Arbor). The same year, however, he began to print in leaflet form for class use material on general economics, which by 1911 had grown into his book, *Principles of Economics* (Ann Arbor; 9th ed. New York 1925). From that time forward Taylor's energies went into the field of theory, into the successive hobbies for which he was noted, and more particularly into teaching.

Taylor's influence on American economic thought was extensive and profound and was felt outside the country as well. It was exercised chiefly through his teaching, especially of the instructors who taught under him, many of whom achieved distinction. His contribution went far beyond the doctrine expounded to the communication of a deep respect for both the vital importance and the strenuous difficulty of correct analytical thinking in the study of economics. Taylor feigned no charitable feeling for carelessness or stupidity, and this attitude at times gave him a somewhat stern demeanor; yet he was to an extraordinary degree loved as well as respected by all who knew him. His course in the elements, although rigorous and formally logical, was genuinely popular with the undergraduate students.

Taylor's ultimate interest centered in economics as the study of the conditions affecting general welfare and social justice. He was a political conservative on intellectual grounds, seeing no panacea for the shortcomings of the economic order in the substitution of politics for business as the controlling principle. The economic doctrine for which he stood was in detailed content less remarkable than the method and spirit of instruction that he pursued. He followed the neoclassical economic theory, but with a strong Austrian bias. Taylor was one of the leading expounders of the later Austrian position. His modifications of this doctrine in the interest of greater realism and correspondence with fact have not all been accepted as improvements by later theorists. His work was formally published late in life, at a time when the general drift of interest in economics, especially in the United States, was away from formal theoretical analysis toward various other approaches, especially that of statistical description. Such fashions in doctrine come and go; but some general principles of economy and waste cannot lose importance while the race retains any disposition to think intelligently about its material problems. The general type of economic thought and the mental attitudes toward economic problems

fostered by Taylor cannot for long lose their interest for thinking men.

TAYLOR, FREDERICK WINSLOW (1856-1915), initiator of scientific management in the United States. Taylor's activity and contribution responded to the needs of the second stage in the industrial revolution, which became pronounced about 1880 when productive capacity began distinctly to outrun the capacity of the market to absorb goods at profitable prices. Whereas previously emphasis had been placed largely upon obtaining capital, expanding plant and equipment, increasing limitations of the market now made imperative a more efficient use of productive equipment to cut costs and raise profits. Taylor was the first conscious exponent of this necessity, and the scientific management which he founded has since spread throughout the industrial countries of the world. One of its more elaborate forms is the movement for rationalization of industry. Trained as an engineer, Taylor, while working as a gang boss in the employ of the Midvale Steel Company, became involved in a controversy with workers which led him to seek the exact content of a day's work. He was then led into a series of experiments in mechanical engineering, into the field of management, into the discovery of tempering tool steel to permit of high speed metal cutting operations and into the renovation of shop management. Always Taylor's goal was to determine best or standard ways, tools and materials by scientific method and experimentation and to create a control sufficiently extensive, intensive and flexible to permit the standards once set to be maintained. More important, however, than any tangible achievement was his demonstration of the possibilities of management in achieving economical gain through the establishment of standard practises based upon scientific methods. From the labor angle Taylorism was not simply a system of "time and motion" standards to insure more efficiency; it included a policy of placing "on the side of management" an increasingly larger part of the working force.

Some critics hold that Taylor did not appreciate the difference between an engineering problem and a labor problem. Hoxie has pointed out

that scientific management in operation was a less perfect instrument than its founder indicated. Organized labor has frequently asserted its opposition to scientific management on the ground that it has not operated in a humane fashion. Without doubt the practises of the business world which have often been labeled scientific management have fallen far short of even Taylor's ideals. To some social engineers he represents a plea for a complete realization of the arts of production. But Taylor apparently did not understand that as long as the arts of production are carried on in terms of profit making rather than of goods making, the social implications of scientific management cannot fully be realized.

TAYLOR, JOHN (1750-1824), American publicist. Taylor practised law from 1781 to 1792, sat in the Virginia legislature for ten years and served in the United States Senate for three short periods. Apparently, however, he preferred to devote himself to activity as a publicist and as a plantation owner. He regarded agricultural life as the means to the development of man's noblest impulses. This strong predilection for agriculture colored both his economic and his political ideas.

The ablest theorist of the early state rights school, Taylor had a pronounced spirit of political independence. His writings, all pervaded by a deep antagonism to centralization and to industrial interests, were extremely influential in the south. In a number of pamphlets and in *An Inquiry into the Principles and Policy of the Government of the United States* (Fredericksburg 1814) he opposed Hamilton's ideas concerning a public debt, exclusive privileges for corporations and bounties to capitalists, which, he felt, would create a moneyed aristocracy and permit it to thrive at the expense of the landed interests. This work also contained Taylor's answer to Adams' *A Defense of the Constitutions . . . of the United States* (3 vols., London 1787-88), which advocated aristocratic government. An

ardent admirer of Jefferson, he did not hesitate to criticize the Jefferson-Madison foreign policy which culminated in the War of 1812.

Taylor challenged boldly the reasoning of Chief Justice Marshall in accordance with which the federal government, under the constitution, could exercise sweeping authority. The employment of such powers, Taylor held, would destroy that division of powers between the federal and state governments provided for in the constitution; accordingly he suggested the principle of interposition by the states to resist encroachments upon their rights. If the federal government remained limited in authority, no special geographical interest could, through control of that government, produce discord by passing legislation that bore heavily upon other sections. These ideas are developed most thoroughly in *Construction Construed* (Richmond 1820) and later in *New Views of the Constitution of the United States* (Washington 1823).

Arator (Georgetown 1813; 6th ed. Petersburg, Va 1818), a collection of essays by Taylor, was the first important work on agriculture published in the south. It discussed methods of improving cultivation and the effect of political factors on agrarian situations. The book was widely read and gave a strong impetus to agricultural studies.

TEACHING PROFESSION. If a profession be defined as requiring a culture broad enough to allow its work to be viewed in a perspective of social values, as entailing a systematic technical preparation for the development of skills and as providing financial and social rewards adequate to attract persons endowed with distinguished intellectual and personal qualities to permanent careers in a given field, it is open to question whether the vocation of teaching may yet be characterized as a profession in the same category as law and medicine even in modern, educationally advanced communities. In earlier times teaching seldom figured as a profession in this sense. Frequently it was not even a distinct

vocation, because it was performed by persons or classes who were simultaneously engaged in other important vocational activities.

Among primitive peoples little or no formal teaching is to be found. The elementary school first appeared in a rudimentary form in ancient Egypt; those who taught in such schools enjoyed little social prestige except in the case of the high official who instructed the royal princes and certain sons of the wealthy in a school in the king's palace. In their temple colleges the priesthood taught those who wished to devote their lives to religion or to medicine and trained the youths to become scribes. Teachers of vocational subjects were honored mainly, however, because of their proficiency in the arts they taught rather than as teachers. In Biblical days among the Jews the first teachers outside of the family were the priests, but later teachers rigorously selected on the basis of their knowledge, maturity, morals and interest in youth were frequently drawn from the laity and were paid from public funds and exempt from taxation.

In Sparta teaching was under state control and had strictly utilitarian aims. City elders chosen for the task of training youth from the age of seven to thirty were carefully selected for their proficiency in the art of warfare as well as for their patriotic zeal and were treated with marked respect. In Athens, on the other hand, although a law urged all citizens to give their sons an elementary education, the state set no definite requirements relative to the preparation, certification or supervision of teachers. There was, however, no religious control over teaching by a powerful priesthood. Consequently there appeared a variety of private, secular elementary schools, differing in quality of instruction with the ability of the individual teachers, who were for the most part slaves or provincials treated with disdain. Prolonged preparation for teaching was first evidenced in the age of Pericles with the advent of the sophists, who charged fees for their services, an innovation regarded as reprehensible by their opponents, who taught with no utilitarian end in view and who expected no recompense save presents from their pupils or donations from interested patrons. In early Rome teaching was again a family function. A system of secular schools gradually developed under the republic. It was encouraged by Julius Caesar, who conferred the franchise on the professions of liberal arts and medicine alike. Later emperors extended their favor to educators by establishing a definite scale of salaries in all

branches of the profession and by exempting its members from military service. Municipalities scattered throughout the empire founded and maintained their own schools, the salaries of those who served in them being derived partially from taxes and partially from fees.

During the Middle Ages teaching was confined almost exclusively to the Catholic clergy. Although elementary instruction was generally neglected by the church, parish priests were frequently expected to teach grammar to the children of their parishioners without remuneration save occasional gifts. Secondary schools attached to cathedrals served as training centers for priests. A special church dignitary, the *scholasticus*, had charge of the appointment, certification and supervision of the teaching corps of these schools. Under the stimulus of an expanding commercial life mediaeval cities increasingly encouraged the teaching of reading, writing and "reckoning" in the vernacular, without the sanction of the church, which compelled the use of Latin in all its institutions. Such instruction was provided by a heterogeneous group, including itinerant priests and nuns, "traveling writers," secular city clerks and women eager to earn an extra pittance.

The position of teachers appears not to have improved very much after the Reformation during the sixteenth and seventeenth centuries. Lacking resources for the establishment of new schools to replace the Catholic schools they had closed, Protestant states were forced to fall back upon such minor church functionaries as the sexton or chorister for the provision of elementary instruction. When it was impossible to secure the services of these officials, laymen were used; but their appointment ordinarily extended for only one year, they were often paid less than policemen and the sole quality they were officially required to possess was piety. There were scattered efforts to improve instructional methods and the preparation of teachers, notable among which were the Jesuit schools for secondary education in which the teachers were thoroughly trained. Both in Protestant and in Catholic countries, however, the Latin, or grammar, schools remained largely in the hands of the clergy. As a rule schoolmasters in secondary schools in Europe acquired a relatively high social standing mainly because of their learning or their close connection with the church. In the New England colonies they stood next in the social hierarchy to the clergy, and it was not uncommon to exempt them from military serv-

ice and the payment of certain taxes. Throughout this period the lot of elementary lay teachers was less favorable than that of their more highly educated confreres. For the most part the former consisted of men and some women, with no formal training beyond elementary subjects; sometimes they were itinerants who taught school for only a few months at a time, sometimes bond servants, as in the southern part of the United States, sometimes cobblers, tailors or old women willing to devote their spare time to teaching the barest elements of learning to children. The meager wages of all classes of teachers were drawn from the church, town rates, voluntary or charity subscriptions, as in England, fees from parents or payment in kind, as in many parts of the United States.

The turning point in the attitude of the teacher was inspired by Rousseau's contention that the child rather than the subject matter should be the pivot of education. Early in the nineteenth century Pestalozzi and his disciples gave body to this concept through their development of formal pedagogical methods. In the teacher training schools which they helped to establish they attached a hitherto unknown dignity to the role of elementary teaching as a logical corollary of the belief that mankind could be regenerated by proper educational methods if and when employed by adequately prepared teachers.

Prussia was the first modern state to apply this point of view in the development of a public elementary educational system. In the nineteenth century the Prussian schoolmaster became a professional teacher whose preparation embraced a course of special study in a seminary, who had to fulfil and maintain certain prescribed qualifications and who was accorded security of tenure and definite opportunity for career advancement. With the advent of the German Empire in 1872 the elementary teacher attained the status of a full fledged civil servant whose professional interests were safeguarded by law. The German state then greatly enhanced the social importance of the teaching profession by inaugurating free, secular, common schools with attendance compulsory for all children.

Modern Germany set the pace in developing specialized professional training for elementary teachers. Between 1871 and 1918 a series of reforms established high training requirements, which were further raised during the republican period from 1918 to 1933. Normal schools of the traditional type gradually

gave way to a new kind of teachers' college of university rank, notably in Bavaria and in Prussia, where fifteen *pädagogische Akademien* were established by 1931. In other German states, of which socialist Hamburg was outstanding, the local university conducted the preparation of elementary teachers; while in other regions teacher training institutes affiliated with the universities were set up. The course of these notable efforts to raise standards of elementary teacher training was somewhat impeded by the inability of the Reich government to subsidize education in the states during the years immediately following the World War.

Other European countries came only gradually to realize the capital significance of a corps of highly trained public school teachers for the political, social and economic development of the national community. In England the teaching staff ceased to owe allegiance to denominational or charitable organizations only during the last decade of the nineteenth century, when the elementary school system became largely tax supported. The first English schools for the special training of teachers grew out of the monitorial system and the pupil-teacher centers established early in the century. These training colleges, as they were called, were originally denominational institutions, but eventually they were subsidized by grants from the central government. Control over them is now maintained jointly by the college authorities or by local public educational bodies and by the Ministry of Education at London; the former were allowed wide discretion to vary courses and pedagogical methods and the latter was insured minimum standards of instruction and examination by a flexible scheme of regulations and inspection. Teacher training departments have been established also in a majority of the newer English universities. Since 1928 a full time secondary education until matriculation in a training college or a university training department has been required of candidates for an elementary teacher's certificate. In contrast with the centralized system of certification which prevails on the continent teachers' certificates in England are issued by county and municipal educational authorities or by the governing bodies of training institutions. The teacher does not acquire civil service status but becomes merely an employee of a local educational authority. Uncertified teachers, with a preparation equivalent to the requirements for admission to a training college, still form a considerable part of the total

elementary teaching corps, but relatively their numbers are declining. Similarly the traditional pupil-teacher centers, which are now used only for the preparation of rural teachers, will probably disappear when the full effect of recent reforms is realized. Throughout the nineteenth century English elementary teachers were recruited in part by state scholarships, or bursarships. In 1925 the Board of Education declared its intention to reduce the number of such special aids; many local educational centers, however, still provide scholarships, awarded competitively, as the basis for free admission to training colleges and university training departments.

In France the first *école normale* for training male secular elementary teachers was founded by the Convention as early as 1794. A law passed in December, 1832, authorized a similar institution for each *département*; schools for women were established later. A long and bitter struggle was necessary before the teaching corps was completely laicized. Since the establishment of the Third Republic, however, the official status of public elementary teachers has been uniformly guaranteed by a series of general laws beginning in 1881 and extending down to the period following the World War. This legislation is based upon the principle that before temporary appointment each candidate must possess a certificate of professional capacity corresponding to his function. Successful applicants for the normal schools receive state scholarships providing free instruction, board and lodging on the condition that they sign an agreement to teach at least ten years in a public school or refund to the state the cost of their maintenance. Notwithstanding recent provisions for classroom observation and practise teaching as a part of the three-year normal school course, the keynote of the French training system is a rigorous emphasis upon intellectual attainment rather than upon the mastery of educational methods. France holds strongly to the nineteenth century notion that teachers as servants of the national state should be trained to carry out detailed regulations as prescribed by the Ministry of Education and that there is therefore little room for the exercise of initiative by the individual teacher.

Until the advent of Fascism the Italian system of preparing elementary teaching personnel followed generally the lines of the French. The Gentile reforms of 1923, however, departed sharply from traditional practise. Italian normal

schools were replaced by a new type of training institution, the *Istituto magistrale*, which provides a seven-year course wholly cultural in character. The new arrangement substitutes for specialized professional training the proposition that the successful teacher must be imbued with the aspirations of the nation.

The attempt in the Soviet Union to combine study and productive work and to give education in the fundamental principles and skills that underlie all labor has led to the establishment of seven-year schools with a unified system of poly-technical education. This program and the fact that elementary school education has recently been made compulsory throughout the Soviet Union have overtaxed the resources of the teachers' training schools. In 1930, for example, an additional 7,000,000 children were admitted to the schools and in the school year 1931-32 the teachers' training institutes could provide fewer than 14,000 of the 92,000 new elementary teachers called for; the remainder were recruited from the ranks of young Communists trained by special brief courses. The second Five-Year Plan provides for drastic extension and improvement of teacher training facilities. Teachers have recently been ranked in the highest category of labor along with industrial workers; they are entitled to food and manufactured articles at special terms and are provided with the best medical, hospital and other social services.

The United States exhibits great diversity of patterns of elementary teacher training, including high schools, state and local normal schools, teachers' colleges and schools of education in universities. Until well into the nineteenth century the preparation of grammar school teachers took place in private academies, of which the earliest was founded by Benjamin Franklin in 1756. Massachusetts in 1838 was the first state to adopt legislation for public normal schools; other states followed soon after but normal schools expanded markedly in number and importance only toward the end of the century. American practice has evolved steadily from admitting students to these normal schools directly from the elementary schools in the direction of requiring some secondary school work, if not always graduation from high school.

Notwithstanding the extensive development of state normal schools the rapid expansion of public school systems created until recently such a shortage of trained teachers as to lead to the establishment of other institutions for teachers' training, notably county normal schools and one

or two-year training courses in high schools. Meanwhile an increasing proportion of the better state normal schools were granted collegiate status, with the right to grant degrees upon the completion of a four-year course. By 1930 there were in the United States 331 normal schools and teachers' colleges with an aggregate enrolment of 210,000 students. In addition the majority of American colleges, junior colleges and universities, through their departments of education, contribute to the training of teachers as well as of school principals and supervisors.

The exercise of control over the certification of teachers in the United States was originally lodged with local school authorities, whose jurisdiction was limited to special districts particularly in rural areas, to municipalities or to counties. Within the last generation, however, in order to elevate standards state departments of education have tended to assume this function or at least to share it with local agencies. In twenty-nine states certificates are now issued exclusively by the state superintendent or state board, while in the other nineteen states the function of licensing teachers is divided among the state and counties, cities, institutions of higher learning, normal schools, teachers' colleges and independent school districts. It is not uncommon to find a situation such as that in Wisconsin, where more than a hundred different authorities have the power to grant certificates. In recent years there may be noted a further tendency to specialize teachers' licenses by type of school or subject to be taught. Whether based upon examination or scholastic credentials, the minimum qualifications required for the certification of elementary teachers still remain relatively lower in the United States than in Europe, although a constant improvement in standards may be observed over the last two decades.

Technical training for teaching at the secondary level has had a later development than that for elementary schools. This is explained in part by the fact that secondary education remained for a longer time under the control of the clergy, which was concerned only with morals and conformity to the faith, and in part by the persistence until recently of the view that secondary schools should be but feeders for colleges and universities, the emphasis in selection of teachers thereby being placed upon knowledge of subject matter. The first steps toward the special preparation of secondary teachers, taken by France and Germany early in the nineteenth century,

had nationalist as well as professional ends in view, as part of an effort to bring secondary education under state control. Thus Napoleon in 1808 established the *École Normale Supérieure*, which along with the universities prepares a male student élite for the highly competitive examination leading to the diploma required for an appointment to a state *lycée* for boys; a similar normal school is now available for women candidates preparing to teach in *lycées* for girls. There also exists in France the municipal *collège*, a secondary school of somewhat lower grade, financed in part locally, for which a special four-semester course in a university, leading to the *licence d'enseignement*, suffices as the minimum qualification for teaching. Two years of additional preparation as *Referendar* in a university is a prerequisite to teaching in the German *Gymnasien* and the *Oberrealschulen* for boys and the *Lyzeen* and *Oberlyzeen* for girls, which are governed and financed jointly in varying degrees by the central state and the communes. Successful candidates receive the title of *Studien-assessor*; final appointment as *Studierrat*, based upon a difficult merit ranking by the Ministry of Education, is rarely given before the applicant reaches the age of thirty-two. While the national Board of Education in England has not defined precisely the qualifications for instructors in the various types of secondary schools, it has since 1902 exercised some control over training through money grants to local educational authorities. About 75 percent of English secondary teachers are university graduates.

The nation wide development of free, public high schools in the United States since the 1880's has accentuated both the numerical and the social importance of teachers in the secondary schools to a degree not equaled elsewhere. Yet, as in the training of American elementary teachers, the preparation of high school instructional staffs conforms to no uniform national pattern, unless it be the requirement, now found in every state, of a college degree for the highest grade of certificate for senior high school teachers, with two to three years as the minimum for junior high school work. All states moreover have come to require a certain number of hours of work in either educational psychology, principles of high school teaching or directed teaching. In 1923 there were still as many as thirty-five different ways in which prospective teachers might enter high school work. Among the most potent influences for improving the standards of high school teaching in the United States has

been the growth of accrediting associations of colleges and secondary schools, of which the North Central Association, founded in 1894, ranks first in importance.

For a long time the teachers of literary subjects were either indifferent or opposed to the rise, in the twentieth century, of vocational schools, the introduction of manual training in the academic public schools and the appearance of kindergarten and nursery schools. This attitude grew out of a feeling of class superiority based partly upon the traditional idea of what constituted an education and partly upon the fact that handwork and industrial training originated in schools for paupers, juvenile delinquents or the children of peasants or laborers. Gradually, however, the success of Frobel's kindergarten work and the influence of democracy in the United States tended to liberalize the point of view of both teacher and public. Impetus was given to the movement by the founding in New York City of a college for training teachers in handwork and the industrial arts, an institution which later expanded in function and became Teachers College of Columbia University. Not only in the United States but in most European countries as well vocational training is now provided by a variety of technical, commercial and agricultural schools, supported by public and private funds and designed to prepare thousands of children of laborers, farmers and the lower middle classes for non-professional pursuits. These schools provide new sources of teacher employment, as do the public and private nursery schools and kindergartens, which are being established in constantly increasing numbers, and the continuation schools for industrial workers, labor colleges, correspondence schools and night schools in urban centers.

The status of teachers in the well established private and parochial schools of the academic type is by and large not as advantageous as in state supported institutions, although in countries like France and Italy there is a tendency in the better Catholic schools to approximate the qualifications for instruction set by the public educational authorities. The quality of the teaching staffs in the misnamed public preparatory schools in England, such as Eton and Harrow, and in certain wealthy private schools of similar standing in the eastern part of the United States is usually high.

Expressed in quantitative terms, the teaching profession constitutes one of the largest occupa-

tonal groups in contemporary society. In the United States, for instance, where popular education has advanced furthest, more than 2.1 percent of all persons gainfully employed belonged in 1930 to the school teaching profession. During the preceding sixty years the number of teachers of all categories below the college level increased almost tenfold. While the rate of increase has been considerably slower in European countries, except in Soviet Russia, teachers have everywhere increased more rapidly in number than have members of the other liberal professions. In Great Britain nearly one half of all the employees of local governmental authorities are teachers, as is also true of the states and thousands of local units in the United States; the elementary and secondary teaching corps in Germany accounts for a fifth of the entire civil service of central and local governments; and in France 17 percent of all persons on the pay roll of the national treasury are teachers.

As indicated in the accompanying table, the aggregate number of both privately and publicly employed elementary and secondary school teachers in the leading countries has in recent years reached an impressive figure. In spite of the great expansion of popular secondary education during the last half century elementary instruction still requires the services of from three fourths to nine tenths of the entire body of public school teachers in European countries and in the United States. The ratio of elementary to secondary teachers is higher in French and Italian public educational establishments than elsewhere, although if parochial schools are included it is closely comparable to that prevailing in Germany and England.

Since the middle of the nineteenth century a striking phenomenon has been the admission of increasing numbers of women to the vocation of

teaching. In the United States women teachers now dominate by a ratio of five to one, while in Great Britain they are about two and a half times as numerous as men teachers. In France and Italy the men have succeeded in holding little better than an even numerical balance with the women teachers. On the other hand, men outnumber women in the German schools by nearly three to one. In all countries the intrusion of women has been much more marked in the primary schools than at higher educational levels, although 65 percent of the teaching personnel of American high schools was in 1930 composed of women, a proportion similar to that in most continental elementary school establishments. In the elementary schools of the United States male teachers constitute but 10 percent of the total staff. Notwithstanding the clamor of some educational authorities against alleged evils of excessive feminization, the proportion of women teachers appears to have increased. During the severe economic crisis of recent years, however, strong sentiment has been voiced in favor of the employment of men who were heads of families in place of married or even of single women.

Prior to the economic crisis there was a substantial improvement in the economic and social status of the teaching profession. While nearly all types of teachers benefited therefrom, the most marked advance was in respect to the staffs of national educational establishments in Europe and of urban school systems in England and the United States. Standards of compensation for rural teachers, especially in countries whose public educational system was not under central control, remained very low. In relation moreover to the material rewards offered by liberal professions, like law and medicine, the economic situation of the entire teaching class below the university level had not become sufficiently

Figure on teachers in France estimated by author.

favorable to attract an adequate number of persons of first rate ability. The economic differential against the teacher may be seen clearly from a study of the incomes of various occupational groups in the United States for 1926: the average salary of teachers, principals and superintendents in the public school was \$1275 as compared with the \$1908 average wage of high grade clerical workers and the average of \$2010 for all gainfully employed persons.

Uniform salary schedules for each class and level of the teaching profession are fixed by national law in most continental countries, including France, Italy and Germany, although in the latter salaries are paid by provincial and local authorities. In England the minimum scales of compensation for public school teachers have recently been standardized by national agreement, local school authorities suffering a reduction in national grants as salaries fall below these minima. As a rule in Europe base salaries are provided with a scale of increments up to a specified maximum, receivable at intervals varying with the period of service, the acquisition of additional training and the service rating. In France and certain other states supplementary allowances are granted in proportion to the number of dependents and the cost of living in the locality of employment, together with such perquisites as reduced railway fares and free tuition for the teacher's children. In the United States, where teachers' remuneration is determined by local authorities, great variation in the scale of pay exists, although since the World War many states have enacted minimum salary laws applicable to all their teachers. For secondary teachers salary ranges are everywhere considerably higher than for instructional personnel at the elementary level. An organized movement for a single salary schedule for both levels has appeared in the United States.

Practise varies with regard to the compensation of women teachers. In France, for example, there is no differentiation on account of sex, but in England the remuneration of women remains appreciably below that of men. In the United States about one half of the city school systems pay higher salaries to men and the discrimination tends to vary inversely with the size of the city. Both in Europe and in the United States professional organizations of teachers recently have favored equal pay regardless of sex.

The average annual compensation of public school teachers rose during the World War and in the post-war period before the effects of the

economic crisis were felt; in England it mounted from £119 for male elementary teachers, £74 for women and £104 for both in 1913 to £324 for men, £217 for women and £245 for both in 1931; in the United States the average annual salary for secondary as well as elementary teachers increased from \$525 in 1914 to \$1420 in 1930; when the latter figure is corrected in terms of the cost of living index it amounts to \$851. In many countries teachers' salaries have recently suffered drastic reductions; in some cities in the United States teachers' salaries have remained unpaid for months. The economic situation of the teaching profession has suffered severely along with that of the impoverished middle classes as a whole, especially in those countries where there has been extreme inflation.

Prior to the economic crisis the profession of teaching had been gaining considerably in economic drawing power through the widespread enactment of legislation providing for disability pensions and retirement annuities. Scarcely a public educational establishment in Europe now functions without some sort of pension system for its instructional personnel, while in the United States one half the states have adopted state wide systems and most others have authorized city and county school authorities to establish local retirement systems. Many private schools moreover have joined private annuity insurance schemes, of which the Teachers Insurance and Annuity Association established by the Carnegie Foundation for the Advancement of Teaching has been one of the best known. Most of the public teachers' retirement systems are based upon small annual deductions from salaries, supplemented in some instances by government contributions, with provisions for retirement at a minimum prescribed age of from fifty-five to sixty or at the completion of a prescribed period of service, with a superannuation allowance varying in amount with the average salary during the last few years of active service and the total number of years of service. In the main teachers' pension plans conform closely to the pension systems for other public employees in administrative, clerical or technical work.

Paralleling the adoption of salary classification and pension systems there was notable progress toward more reliable guaranties of security of tenure as well as provision of definite opportunities for economic and professional advancement after initial appointment. In France and Italy national legislation limits both suspension and discharge to cases of serious misconduct

or professional incompetence, only if and when such action is recommended by a disciplinary council on which the staff is represented; the accused has the right to see his *dossier* and to appeal to the higher authorities in the Ministry of Education. On the other hand, British teachers lack full civil service status and have indefinite tenure; their positions are held during the pleasure of the local employing authority, although in practise dismissals are rare even on educational grounds or for personal misconduct and the right of appeal to the courts may always be resorted to. While academic tenure is less well protected in the United States, a number of state legislatures have enacted laws for continuing teachers' contracts for a specified period of more than one year. In states where the duration of contracts of employment is governed by municipal ordinances or the regulations of local school boards, the typical procedure is either to limit contracts to one year, with annual reelection thereafter, or to engage teachers for an indefinite period subject to termination without cause at the end of any year. Political interference with staff tenure is still common, particularly in the smaller cities and rural districts in the United States.

The degree of academic freedom enjoyed by the modern teacher may be said to vary with the extent to which security of tenure is adequately guaranteed. But even with statutory guarantees against the infliction of disciplinary penalties without proper cause the *esprit de corps* of the teaching profession frequently suffers as a result of official regulations prescribing narrowly what shall or shall not be taught in the classroom, especially as regards subjects like patriotism and evolutionary science. Nor is the teacher free from those community pressures focused upon him by sectarian and superpatriotic groups.

With a view to combating a certain complacent lethargy which exists among large numbers of teachers efforts have been made in most of the better school systems the world over to encourage teachers to continue their professional training during the period of active service and to derive new stimulus through travel. In the United States bonuses, increases in salary and promotion to supervisory posts are not infrequently offered as the reward of continuation of training through university attendance and the acquisition of a higher degree. During 1926 to 1928 nearly one third of the entire body of teachers of the United States were in attendance at college or university summer sessions, the

cost of which to individual teachers was defrayed in part by two fifths of the school systems employing them. In Europe special continuation training courses are provided in many cities and foreign study for outstanding younger teachers is occasionally subsidized by state grants.

A significant index to the status of an organized profession is the rate of turnover of its personnel. In Europe voluntary withdrawals from teaching are comparatively rare, even in periods of relative prosperity, whereas in the United States the average period of teaching service ranges from seven to nine years only. Until the impact of severe economic stringency beginning in 1929 the demand for teachers greatly exceeded the available supply of recruits. With the rapidly expanding secondary school enrolment additional teachers had to be recruited at the rate of almost a million about every nine years. Because of the magnitude of the task of teacher placement private employment agencies, organized on a fee basis, sprang up throughout the country; there were 164 such agencies by 1931. In England likewise a serious shortage of teachers existed from 1900 until the end of the World War. In central Europe adverse economic conditions during most of the post-war period have operated to overcrowd the ranks of the teaching profession. Thousands of the annual contingent of university trained applicants for educational posts have, especially in Germany and Austria, been forced into prolonged unemployment because of the lack of openings not only in education but in other occupations. After 1930 a similar situation developed in the United States, where it was estimated in 1933 that there was a surplus of at least 100,000 teachers, many of whom had to resort to federal and state relief funds in order to live. In view of the general tendency to contract public school budgets an indefinite oversupply of experienced and potential teachers appears to be in prospect. This is in sharp contrast to the situation prevailing in the Soviet Union, where the constantly expanding educational program demands a vast further increase in facilities to supply a sufficient number of experienced teachers.

Professional and trade union organizations of teachers have struggled to improve their status. Class consciousness developed first among the rank and file of elementary teachers. As early as 1870 in England a National Union of Teachers was organized. Originally open only to elementary school teachers, it expanded in 1889

into an association which all classes of teachers were eligible to join. By 1914 its membership had reached 90,000 and in 1932 it numbered 143,000, or almost three quarters of the entire corps of public elementary and secondary teachers. A variety of special and regional associations have also been established. In the 1880's French *instituteurs* organized in defense of their economic interests and civic rights and eventually became a powerful national *syndicat* with a membership including over two thirds of the total teaching personnel in the primary schools. In less militant fashion a separate association movement developed among *lycée* teachers early in the present century. Although there have recently been signs of a rapprochement of the two groups, the organized secondary teachers still remain organically aloof from their elementary confreres and exhibit a decidedly more conservative type of group behavior. In the German Empire teachers of every rank and grade united in national professional associations. The *Deutscher Lehrerverein* was the most important association of this type during the German Republic. Although the leaders of most of these associations were men, women were attracted into their ranks in large numbers, in some instances forming a majority of the total membership. The attitude of the public authorities toward the independent professional organization of teachers in England was on the whole favorable, as it was likewise in Germany until the recent Hitler decrees amalgamated all teachers' associations into a single unit under the aegis of the National Socialist party. In France, however, the *Syndicat National des Institutrices et Instituteurs* has clashed with the government on a number of occasions over the right to teach pacifism in the classroom and over participation in protest strikes along with the other syndicalist groups of state employees. For a generation French elementary teachers have conducted active propaganda for educational self-government under the slogan "The schools to the teachers!" A number of educational reforms as well as a marked improvement in the economic conditions of teachers must be credited to the influence of teachers' associations in every European country. For example, the English National Union of Teachers has labored successfully for superannuation allowances, national salary schedules, better facilities for training of teachers, reduction in the size of classes, relief from compulsory extraneous tasks and professional

initiative in matters concerning school time tables, schemes of work and methods of teaching. In several countries, largely as a consequence of the efforts of teachers' associations, joint advisory committees and councils have been set up and teaching staffs share directly in the formulation of public educational policy.

In the United States the teachers' association movement has not yet attained as wide a development or exerted as much influence as in Europe. The largest American group is the National Education Association, organized in 1870 and incorporated in 1906. It grew slowly and by 1917 had only 8500 members. In the following fifteen years its numbers increased to 200,000, but seven ninths of all American elementary and secondary teachers are still outside its fold. The National Education Association has not functioned primarily as a fighting group concerned with promoting teachers' professional interests but has been rather an organization for the assembling, interpretation and dissemination of information on current trends in education. It publishes a journal, a yearbook and periodic research bulletins, holds annual conventions and has recently devoted considerable effort to the development of model codes of teaching ethics; thirty-three state teachers' associations had officially adopted such codes by 1930. In the main the National Education Association has been so dominated by the administrative elements in its membership that it cannot be said to have served materially the vital interests of the teaching corps.

Partially as a reaction against the conservatively managed National Education Association local teachers' leagues were formed early in the present century. Certain of these local leagues in the larger cities united in 1916 to form the American Federation of Teachers, which at once affiliated with the American Federation of Labor. Frankly trade unionist in outlook, this organization, following a phenomenal expansion just after the war, settled down to a slow but steady growth. By 1933 it comprised 20,000 individual members and 269 locals distributed through every state in the United States. Most of these locals, however, are still minority groups. To achieve its objective, the American Federation of Teachers relies upon arousing public opinion and influencing legislative bodies rather than upon any form of direct action, such as strikes. Already it has done much to secure advanced state legislation relative to tenure, salaries, pensions and the like, and it works

constantly for experimentation with progressive instructional methods and for a better general realization of the social dignity and value of the function of teaching. Other local teachers' groups, especially in metropolitan communities, have advocated and used more militant tactics to counteract the retrenchment policies that are imperiling the present standards of the teachers.

Since the World War there have been attempts to establish professional organization among teachers on an international scale. As an outgrowth of the World Conference on Education called by the National Education Association at San Francisco in 1923 a World Federation of Education Associations was formed. Chiefly British, Irish and American in membership, this federation has held biennial conferences at Edinburgh, Toronto, Geneva, Denver and Dublin. Reflecting the conservative point of view of the National Education Association, it tends to confine itself to facilitating the interchange of information and ideas and to creating a better understanding of British and American educational problems. A more militant organization is the International Federation of Teachers' Associations, which consisted in 1934 of 534,000 individual members from twenty-one European and four Latin American countries; these include France and England, but exclude Italy since the advent of Fascism and now Germany, whose Nazi delegates were expelled in August, 1933. This federation maintains staff headquarters in Paris, publishes a quarterly bulletin and holds annual congresses. Although its activities are focused in part upon ways and means of improving the professional and economic status of teachers, its primary concern is to wage a concerted fight against the forces of nationalism and clericalism in European education. Thus the federation vigorously advocates the revision of history textbooks so as to make them less bellicose and more internationalist in their emphasis. The teaching profession is at present far from being a united, effective factor in the struggle for international cooperation, but the leaders of the federation understand the strategic position which teachers hold and what they could achieve in the promotion of such causes were they to utilize their opportunities.

TECHNICAL EDUCATION. See VOCATIONAL EDUCATION.

TECHNOLOGICAL UNEMPLOYMENT. See UNEMPLOYMENT.

TECHNOLOGY. The character of the modern world, which reached its full development in the nineteenth century, is most intimately bound up with the profound transformation of the technical means of production. In earlier epochs there were great technical advances, as, for example, the improvement in the technique of applying horse power during the Middle Ages. Such inventions, however, appeared merely as isolated changes in production and never resulted in any fundamentally new method of production. The significance of modern technology did not become clearly evident until the expansion of industry on the European continent in the nineteenth century, when the intensification of competition hastened the development of technical progress and promoted its rapid extension. Although a technological conception of history is to be rejected, it must nevertheless be admitted that modern technology was one of the most important conditions which made possible the rise of the industrial system.

The economic nature of modern capitalism is historically bound up with the development of technology. This characteristic quality, which has made the capitalist system so effective, has given rise to an enormous increase in physical

production. It is this quality which distinguishes capitalist production from that of previous epochs and not division of labor, which is age old and which was widespread also during the Middle Ages. Standardized mass production likewise is not a peculiar characteristic of the capitalist era. All static cultures, including the economic systems of the Far East, had standardized mass production on a national scale long before the advent of capitalism. It was modern machinery, however, which made possible the rapid increase in volume of production; and this in turn was the necessary condition for speedy industrialization, for the opening up of pre-capitalistic countries and for the rise of the general standard of living simultaneously with an increase in population. In short, however much the significance of intellectual and spiritual factors for the growth of technical development may be emphasized, it is certain that the dynamics of capitalist economy is bound up intimately with modern technology. As a result of the shift of all heavy work as well as a large share of the finishing work to machines driven by natural power the curve of production was able to rise sharply above the curve of population increase and great individual and social wealth, characteristic of capitalism, was made possible. This vast and sudden increase in wealth was related also to other economic, social and psychological conditions. Of the economic factors only that of the increase in the volume of money, due to increased production of the precious metals, need be mentioned here. Only with an increase in the volume of money could there have been such a tremendous increase in production without at the same time a serious repercussion on the price level.

Capitalism is further characterized by the scientific basis upon which it rests. The production process during the first phase of modern industrial development was still dependent upon skilled labor and upon the training of the worker in handicraft. With the development of technology, however, programs and plans have been shifted to the preparatory stages of production and production itself has been concerned merely with the mechanical realization of the engineer's plans. Thus the work performed in industries, as distinguished from transportation and trade, has become monotonous, often reduced to a few mechanical manipulations.

As production becomes more mechanical, it becomes also more scientific. The precision and tremendous speed of mass machine production.

the utilization and combination of new materials, the fundamental significance of chemical processes—all are based on the systematic and scientific work of the engineer and have taken the place of the older traditional techniques, which developed organically and which were mutually dissociated. In the same way the construction of commercial and production industries is possible only when established upon scientific foundations. Conversely, modern natural science has developed rapidly with the technical aids with which modern industry has provided it.

The cultural implications of the modern production process are far more difficult to grasp. Max Weber and Werner Sombart stressed chiefly the spirit of calculation in capitalist economy. This spirit, they maintained, was reflected back in all aspects of life and created or at least made possible the rationalism of the modern era. Weber, however, also called attention to the rational character of magic and traditional cultures. In these cultures too life is regulated in strictly schematic fashion. It is therefore not true that exact economic calculation began only with the coming of capitalism or with the advent of commercial capitalism. What happened was that the methods of exact economic administration were refined to an extraordinary degree and extended over wider fields. Furthermore the rationalist methodology of the economic system has psychologically transformed the modern man and has pushed into the background the power of irrational forces. But it must not be forgotten that this rationalist spirit became infused into the spontaneous development of science and social organization long before the advent of modern technology. This rationalist tendency represents the dissolution of the mystical element in the consciousness of man, the illumination of all obscurities and enigmas and, as Max Weber put it, the "disenchantment of the world." It was, however, brought about by both science and technology and reflects the decline in the force of religious values.

The relations between technology and social consciousness are very much more complicated. The systematic building up of individual industries and the rational administration of the work are accompanied by sudden and incomprehensible market disturbances. In these disturbances and crises the production process suddenly becomes paralyzed. This change in the general economic situation invests the entire modern production process with an aspect of mystery and, particularly where there are long

depressions, creates the disposition to look at things irrationally. The monotony and the drabness of work perhaps also serve as influences in the same direction. The most modern and most rational technological development thus is accompanied by the appearance of irrational mass movements. There are undoubtedly other causes for these movements, but modern technology does play an important role in that it makes the whole social process more mysterious.

Influenced by technological development, the economic and social structure of the nineteenth century reveals still more acutely the very characteristics which emerged in the industrial revolution: the tendency toward large scale industry, organization and social disciplining of the workers; the decline in skilled labor; the rise of entrepreneurs who organize a strictly rationalized production to fit the market situation; and the creation of a commercial system which develops and expands the market. With the expansion of modern industry there comes also a transformation in social relationships. Whereas the period up to the industrial revolution was dominated by the opposition between the forces of conservatism and the revolutionary bourgeoisie, the following period witnessed the emergence of the conflict between entrepreneurs, capitalists and workers. The question of equitable distribution of the social product is a difficult one because of the antinomy in capitalist production whereby wages not only figure as costs of production but are at the same time also a source of purchasing power. Whereas the lowering of wages up to a certain level is often a necessary condition for the realization of profits, it may likewise involve a danger for profits. These difficulties have been augmented by the growing importance of machinery, for the increased burdens of fixed costs render difficult the determination of this correct distribution and make error so grave.

There are other special characteristics of the capitalist epoch which are even more intimately related to modern technology. The modern period has often been called that of the engineer. Industry and railroads are the most outstanding features of the new world. These were vociferously acclaimed not only because they netted fabulous earnings to the ruling groups but also because they provided undreamed of sensations for the great mass of the bourgeoisie and the workers. An increasing number of production industries, developed out of the traditional handicrafts, were systematically reconstructed

and were drawn into machine production by the growing concentration of capital. In this way a whole army of technical auxiliary forces arose with academically trained men at the top but with the mass of workers engaged only in routine work. And since the industrial system also required a personnel for the sale of the commodities and for public management, there developed also an army of commercial employees and public officials. In this way technological development accelerated the process of bureaucratization, so that a large quota of the gainfully employed were taken from the immediate production processes and shifted to administrative departments.

The increased importance of engineering for production has not been accompanied by a corresponding increase of influence of the engineer in production, society and politics. The engineer's attention is concentrated upon technical progress rather than upon the conditions requisite to economic success, which depends upon the relation of cost to yield. The entrepreneur of the nineteenth century was seldom a technician, but he was always on the watch for inventions which looked promising. He financed the high costs of testing and installing new inventions; he developed a market and thus carried the technical idea into the economic world. Only a few engineers become captains of industry and of these only those who have an insight into the problems of economic organization and finance. Singularly few engineers become great political leaders. The great mass of technical functionaries constitute but a passive element in the whole complex structure. They exert much less influence upon the character of the production process and upon the selection and elaboration of technical ideas than does a foreman in a smaller plant, who exercises a determining influence on technical, organizational and even personal matters. The average technician, even when expertly trained, is more easily replaced than such a foreman.

The great increase in productive powers during the nineteenth century is, then, a result of technological development. Three factors are to be distinguished in this process: the transfer to the machine of complicated motions, the acceleration and intensification of this movement by mechanical power and the introduction of new articles of demand or the satisfaction of old needs through the consumption of new articles. This increase in productive forces has resulted in an enormous per capita increase of the social

product. Even if there be accepted a high estimate of the losses brought about by economic crises, it cannot be denied that nineteenth century Europe and America witnessed an unprecedented rise in the standard of living. During the first half of the nineteenth century in England and to a still later time on the continent the zeal for extension and construction of modern technical equipment was so intense that the strongest pressure upon wages, due to the increased possibilities of capital investment, brought no reaction upon the commodity market. The maintenance of the standard of living on a low level, despite enhanced efficiency of labor, was made possible by the rapid disintegration of the old handicrafts and the simultaneous increase in population (in England the decline of agriculture as well) which flooded the labor market. In the next period, in the continental countries after the 1880's, the working classes and officials came to receive an increased share in the social product. The importance of the consumer was also increased thereby. During the three or four decades before the World War and as a result of the increased industrial production and growing efficiency in transportation the living standards of skilled workers and functionaries began to approximate that of the petty bourgeoisie. This was not yet true of the unskilled and agricultural laborers. With the improved conditions of the European workers came also increased prestige and influence of labor organizations and trade unions, which prevented a rapid drop of the workers' standard of living during the crisis. There was, however, but incomplete security against sudden impoverishment and thus only for certain groups of the proletariat. For machine production pushes the older workers out or forces them into less remunerative posts. In times of depression or in highly mechanized industries such degradation may come to workers when they are as young as forty. Nevertheless, despite the insecurity of individual workers, despite the fact that individuals may sink to the lower strata of the proletariat, the cultural development of the workers has made great progress under the influence of a rapid advance in the standard of living.

The new technology has also had a powerful effect upon the political changes which have occurred since the middle of the nineteenth century throughout the world. The countries of the Near and Far East, with the exception of Japan, soon came under the control or influence of European and American powers. Railroads,

telephone and telegraph communications together with modern instruments of warfare gave to the western governments so superior a position that any colonial uprising was hopeless. So great did the power of the western nations become that even the nominally independent states of the Asiatic east were turned into "spheres of interest" as a result of tacit understandings between the great powers. The ascendancy of European influence was furthered also by great capital investments for the construction of railroads, harbors and the like. Since foreign capital investments usually go hand in hand with exports to the debtor countries, their growth was again tied up with the increased technical capacity of western industry. World opinion—similarly under the influence of technical successes—gave impetus to an unlimited belief in progress, which permitted no doubts as to the cultural superiority of the European nations. Even nations of the Far East were inspired by the same ideas, as is borne out by the enormous enthusiasm with which Japan took over European and American methods. Although this naive enthusiasm of many peoples for technical progress and their belief in its cultural significance subsequently lost intensity, the decisive political changes had already occurred and could not be undone.

The significance of technical progress for social change is complex in character. The most striking social characteristic of the first stage of modern capitalism was the rise and concentration of an industrial proletariat. Social composition was later differentiated by the numerical growth of non-independent middle groups and by the unexpected resistance of the peasants and artisans to their destruction by large scale industry and superior oversea competition. The middle groups made use of the technical advances in both agriculture and handicrafts. Technical progress therefore did not hinder but in a certain sense emphasized the differentiation in social stratification wherever a democratic form of government gave the individual groups an opportunity effectively to serve their own interests. In this connection it is important to note the growing political significance of the class of intellectuals, which increased numerically with extraordinary rapidity. This was a phenomenon accompanying the modern industrial system; and in the severe crises in the post-war period these groups constituted the principal cadres for the formation of fascist parties. The revival of older romantic notions is also of significance in

this connection. In a socialist society these technological facts have a quite different bearing. This is proof that technical development is not unequivocally determined along one line in the social and political field. Thus whereas in western Europe electrification served to improve the economic position of the small producers, in Russia Lenin made it the foundation of socialization even in agriculture. Electrification carried out by a socialist state not only increases the instruments of political power but also makes impossible any production outside the collective economy. This ambivalence of influences, depending on the distribution of political power, is one of the most powerful arguments against a technological interpretation of history.

It is still too early to evaluate the long run significance of modern technology. Sooner or later it may lead to a planned economy with predominantly collectivistic economic measures. These measures can hardly be considered as necessary and inescapable consequences of technological development. Such measures may appear inevitable, however, during economic crises, which increase in intensity and duration as a result of the technological characteristics of modern production and which result in heavy unemployment.

The most recent period since the war has been influenced particularly by the effects of technical progress. Wars have always been accompanied by an advance in technical efficiency. During a war no difficulties confront the financing of new production, even by credit inflation. In modern wars every means of facilitating production improves the position of the warring state and in war time there is an almost boundless demand on the part of the state for agricultural and industrial products of all sorts. The tempo of technical progress therefore is unchecked.

The specific features of technical progress are the extension of the use of machines to new fields, which results in a great saving of human and animal power and the rationalization of already existing machine production. Technical progress has probably never been so universal as during the present era. Only thirty years ago the medium and small scale establishments of European industry were not yet entirely freed from handicraft technique. Today an ever larger share of production is carried out with the most modern methods. The tempo of technical progress is probably more rapid today than it ever was before, in respect to the depreciation of invested capital and in respect to the need for new

investments and the elimination of labor power.

These lines of development are cut across by counter tendencies. Thus capital requirements for new production and expansion of production are often greatly reduced by technical advance in the manufacture of the means of production and they are shifted to meet the needs of organization and marketing.

The causes of the recent acceleration of technical progress are as follows: the systematic promotion of all improvements in production during the war years; the continuation of similar economic conditions during the inflation period, which promoted all kinds of investments; the dissemination of scientific methods, which are now systematically developed in research institutes for almost every industry, and the reciprocal enrichment of individual fields of research.

The substitution of machinery for human and animal power is often considered the chief characteristic of modern technology. This, however, has been the fundamental principle of modern industry for many decades. More important is the fact that this principle is more widely utilized today and that the machine replaces the human hand also in the finishing processes of production. Even today, however, and for a considerable time to come only a small part of the theoretically available power will really be applied to production and transportation.

A decisive and still unsolved problem is that of the effect of technology upon the labor composition of industry and the extent to which modern technology is responsible for permanent unemployment. Both opponents and proponents of the theory of technological unemployment often are satisfied merely to refer to experience. The latter emphasize the fact of mass displacement, and the former point to the absence of permanent unemployment during the period of major inventions and changes in the technique of production during the nineteenth century. Experience, however, does not provide an adequate argument. Displacement could have been compensated by counter tendencies, and not all inventions are of the same nature. As for compensation, it does not come about automatically. In order really to compensate for displacement by the creation of new permanent positions there is need of new capital, new orientation of the workers, initiative on the part of entrepreneurs and discovery of new fields for investment. Older economic theorists took all these conditions for granted on the basis of nineteenth century experience. This is not conclusive, for many

of the inventions of that century, such as the railroads, created new needs which resulted in a general expansion of the productive system. Today the greater portion of technical advance is purely labor saving and thus creates unemployment. In theory as well as in practice the process is quite different in the two cases.

It is the surface facts of rapid technological development and mass displacement which have led to the concept of a new technological era. Completely neglecting the severe disturbances of war, inflation, customs and currency barriers, many writers tend to ascribe the general crisis to technological development. Such theorists fall into an error opposite to that of the orthodox economists. The latter always subscribed to the idea of an automatic establishment of equilibrium and did not take into account the possibility of compensations such as occur in the course of time. They operated with the undisputed facts of displacement. According to the statistics of the United States Department of Labor ("Digest of Material on Technological Changes, Productivity of Labor, and Labor Displacement" in *Monthly Labor Review*, vol. xxv, 1932, p. 1031-57) per capita production in all industrial groups increased 49 percent from 1899 to 1925, with an increase of production of 172 percent and an increase of 87 percent in the number of employed. In individual industries the rise in efficiency was still greater: paper 62 percent, chemicals 114 percent, metals 125 percent, tobacco 191 percent and transportation 1016 percent. On the other hand, other branches of production reported a lesser increase in efficiency: textiles 20 percent and leather 3 percent. The increase in efficiency up to 1925 was perhaps not much greater than in the preceding decades, but it continued in the following years. The absolute increase of production per man, however, was now much greater since it rested upon a broader base. The effects of this increased efficiency coincided with a less rapid growth in population, and therefore the other circumstances which accentuated the crisis prevented speedy compensation for unemployment. Particularly important in this respect was the almost complete stoppage of the international flow of capital, which made more difficult the discovery of new investment opportunities. On the other hand, the fact should not be overlooked that despite monopolies and tariffs the reduction of costs which is brought about through technical advances ultimately leads to price reductions which, under favorable conditions, make possible the reem-

ployment of a large number of the unemployed.

A purely technological viewpoint is misleading in the examination of this process. The fact that present day workers are assisted by a much greater and rapidly increasing amount of mechanical horse power becomes an economic and above all a social problem only when prices and income do not respond to changed market conditions promptly enough to effect an alteration in the structure and scope of production. The change would be sufficient if the utilization of all existing capital could thereby secure the employment of all labor power. Technical advances which result only in saving labor can be incorporated into the system of production without disturbing the labor and capital market only under certain conditions: when the loss of purchasing power and capital values resulting from the depreciation of old investments is made good; when there is assured an additional flow of capital to finance these investments and to absorb the displaced workers, in addition to the financing of investments which are needed to absorb the normal increase in the number of workers; when, during the period in which this flow of additional capital is made available, there is no overstepping of the bounds which are necessary to prevent inflation and with it a severe setback; when fields of investment for such additional capital, whether it be in extending existing production or in creating new types, are opened up; when the volume of production can be expanded by a lowering of prices and eventually of wages; finally, when there is compensation for those disturbances which arise from the fact that enterprises are burdened with debts that were profitable only at the former price level and former market situation. Since during a period of rapid technological progress not all these conditions can exist, severe disturbances are brought about which may thus be traced back to advances in technology.

In popular discussion the disturbances arising from technical progress are considered in relation to the argument concerning purchasing power. It is asserted that the purchasing power necessary to absorb all the goods produced lags behind technological capacities. From another angle this amounts to saying that income and price are not adapted to the new supply. The purchasing power argument is in this sense correct and it is implicit in all theories of business cycles. The decisive problems, however, of re-establishing a new equilibrium cannot be solved simply by the creation of new and additional

purchasing power whenever the market comes to a standstill and unemployment sets in.

Still less plausible are the theories of the technocrats. As a result of the increase in technical equipment and horse power the technocrats advocate a new social organization of production with the introduction of a new standard of value. Naïvely too they urge the creation of a new monetary unit. If this demand really means more than the mere substitution of a new name for the existing system, then it implies the creation of a new system of relative prices based on a technical rather than an economic unit. No particular proof is necessary to show how impossible and essentially absurd this idea is. It would lead to false evaluation of capital and labor and to new disturbances. The tendency, resulting from the great increase in technology, to entrust the direction of production and even economic direction to the engineer would have meaning only if there could be set up a commercial economy based on technical units of production. Even a fully planned economy, however, must calculate in terms of economic units, for its main problem also is the proper application of the available production elements; and the evaluation of these is derived not from their horse power but from their relative scarcity.

The effects of modern technology in the political field are decisive. The World War revealed how rapidly technical progress can move when once it is unleashed and how profound its effects can be. The deadlock of open warfare, the maintenance of armies of millions of men in trenches and the fact that attack could be made only after months of preparation—all these were results as well as causes of the modern technique of warfare. The increasing use of airplanes and the motorization of armies, which characterized the World War, created new tactical and strategic possibilities and needs. Modern warfare with its demands upon both the armies at the front and the population at home, with the necessary organization by the state of all industrial and agricultural production and the rationing of every necessity of life, brought about such a comprehensive organization and such an enormous concentration of power in the state that the way was thus prepared for the dictatorship of the totalitarian state. The totalitarian state too has grown up on the foundations of modern technology, which created the means for mass propaganda of all sorts. In addition there are the modern technical means of mass domination through violence, as in street fighting. It is not

to be assumed, however, that modern technology has completely broken down the movement for the emancipation of the individual. The modern system of production can permanently pursue its inherent dynamic impulses only if there is freedom in the intellectual sphere.

The philosophies of modern technology are mutually contradictory. The influence of technology, like that of every social institution, is open to more than one interpretation. It was first generally assumed that modern technology on the whole made human labor more monotonous when handwork was transferred to the machine. It is true that many of the modern labor functions are spiritually deadening, but it must not be forgotten that many tasks in agriculture and handicraft are likewise monotonous. On the other hand, modern industry has created a great number of functions which require unlimited concentration and skill. In view of the enormous increase in trade and communications and the need for quick changes in methods of production it is not at all certain that the number of really monotonous tasks is particularly large or relatively larger than before, although the kind of monotony is today more exacting and more destructive to the nervous system. It is a distortion of historical reality, however, to consider slave and serf labor as more inspiring than modern factory labor. The absurdity of such romantic idealization is revealed in the contrast between the intellectual level of the dull peasant groups of earlier centuries and that of the enlightened urban and industrial working class of today.

The skeptical attitude toward contemporary culture is unjustly linked up with modern technology. Technology has in fact given rise to measures counter to alienation from nature and monotony of urban life. The absurdity of the typical apprehension of intellectuals that security is becoming too great has been revealed by the course of historical events. The cultural dangers of our era are indeed, like everything else, conditioned by technology but only indirectly. They are connected with the problem of the masses, their concentration in cities and their incorporation into cultural institutions which had previously served only small groups of the élite. The older classical educational ideals were shattered by the broadening of the base of the educated classes and the greater turn to practical tasks. At the same time the possibility of intellectual relations with the masses provided a basis for demagoguery, which developed within democracies and which during economic crises was

able to destroy democracy. The emancipation of the lower classes thus leads to a crisis which threatens to destroy all the values of the bourgeois world and the entire sphere of intellectual freedom. Modern technology is concerned in this process only in so far as it supplies the means for mass domination; it could, on the other hand, be made to serve quite different social systems and ideas.

Decadence, another characteristic feature of the contemporary cultural situation, is influenced but not wholly determined by technological development. Only in so far as decadence comes about primarily in periods of great but unequally distributed wealth and in so far as increased productivity is dependent on technological development is decadence conditioned by technology. The looseness of this dependence is illustrated by the peoples of the Far East, who have thus far withstood the psychic influences of modern technology. The Japanese in particular have managed to absorb modern technique without losing their attachment to their own traditions, history and family cohesion. The cultural crisis of Japan which threatens the whole foundation of Japanese life has been brought about not by the labor process but by the social problems of capitalism.

Marx reduced all crises in European history to an ever recurring contradiction, founded in the dialectic of history, between the increasing productive forces and their relationship to social exploitation. This thesis is undeniably applicable to the present situation, and the prevalence of the purchasing power argument is an economic expression of this fact. Upon the solution of the inner contradictions, that is, the elimination of the hindrances to the utilization of technological potentialities, ultimately depends the possibility that society may do away with the permanent dangers of crises and provide for cultural productivity together with an undisturbed dynamic course of production. For technology in itself is indifferent. The real cultural problem involved in such an industrialized society would not be caused by psychical dangers inherent in the character of work under modern technology but would rather be bound up with the problem of the masses. Much of the danger involved, however, could be overcome by the utilization of technological possibilities.

TELEPHONE AND TELEGRAPH. The economic and social benefits consequent upon the development of the telegraph and telephone are well nigh immeasurable. Although these industries employ about 1 percent of the wageworkers in the United States, they play a most important part in all phases of public and private life. Previous to the invention of the telegraph communication was, generally speaking, tied to transportation. Except for such devices as carrier pigeons, beacons and smoke signals messages had to be carried by man. The telephone and telegraph brought the rapidity of light to communication and thus combined

with other factors marvelously to transform modern life.

Trade previous to the organization of companies furnishing these speedy methods for general dissemination of information involved tremendous risks. Purchases had to be made without knowledge of price changes in the locality in which goods would later be sold. Traders with private channels of communication could take advantage of other business organizations and the public because of advance information regarding events of national and business importance. Grain and security exchanges without the telegraph and the telephone could not function in anything like their present form. In general, electrical communications have played an important part in the development of those far flung markets upon which modern large scale industry depends. This fact is emphasized by the use of the telegraph by the railroads as a practicable means of communication. Some method of high speed communication is essential in the operation of a great railroad system. All parts of the organization must be subject to immediate orders from some central office. At a later period the telephone somewhat displaced the telegraph in railroad operation. Finally, speedy means of communication have stimulated the formation of large corporations with offices or representatives at distant points and have also facilitated communication between officials of a large organization within the same building.

On the political side the telephone and telegraph have cooperated with the railroad in binding together the various geographical sections of great nations. The entire world is now quickly informed of events of national and international interest either through the newspapers or otherwise as a result of these electrical instruments of rapid communication. They have assisted the government greatly in transacting its affairs both in peace and in war and with the assistance of oceanic cables have brought great changes in the conduct of international relations. The telephone and telegraph, as most strikingly demonstrated during the World War, play an important part in the direction of armies at the battle front, for the commanding officers of a modern army must always be in touch with all branches and divisions of the fighting force.

On the social side the telephone especially has added safety, comfort, convenience and a wider range of human contacts. The individuals with whom one may converse are now largely a

matter of choice rather than of proximity. The telephone has in certain respects decreased the loneliness of life on farms and in other isolated parts of the country. A considerable amount of social benefit has resulted from research work in connection with the art of telephony. Incidental to its primary objectives this research has laid the foundation for the development of the talking moving picture industry and for television. It has developed an artificial larynx and has been of great assistance in the work of aiding the deaf to hear.

The invention of the telegraph is generally credited to Samuel F. B. Morse, although partially successful systems using the needle telegraph were in operation in both England and Germany a number of years before Morse was able to demonstrate the practicability of his invention. There seems to be no scientific reason why the telegraph and later the telephone should have been invented by Americans. Certainly most of the scientific work basic to the invention of the telegraph had been done in Europe. Morse first conceived the idea which resulted in his magnetic telegraph in 1832. Because of his own extreme poverty and a lack of general public interest it was three years before he was able to build even the crudest model. His first instrument was a kind of printing telegraph driven by an eight-day clock. It was only after the telegraph had come into successful commercial operation years later that the simple manual key and the Morse code were devised.

The government of the United States was interested in the development of some form of telegraph, but although President Van Buren and other government officials and congressmen were favorably impressed by Morse's practical demonstrations, it was not until 1843 that Congress finally made an appropriation for this purpose. The sum was \$30,000, and plans were immediately made to build a line from Washington to Baltimore. By May, 1844, messages were being sent. One year later Congress refused the opportunity to buy Morse's rights for \$100,000, partly on the advice of the postmaster general, who feared that great financial loss might result. This settled the policy that in the United States the industry, in contrast to the general practise elsewhere, should be developed by private capital rather than as a government venture in connection with the postal department. In 1934 the government of the United States is operating only a few very minor telegraph and cable lines; these are used primarily for the transaction of

government business but will also transmit commercial messages.

The early development under private capital took place through the organization of many companies. The first were financed mostly by people of small means with contributions from \$100 to \$1000. A contract was made in each case with Morse and his associates by which the company was granted the rights to use the Morse patents in exchange for a portion of the stock, in some cases as much as one half. In 1856 the Western Union Telegraph Company was formed as a result of the consolidation of several companies. During the ensuing years it rapidly extended its control over other companies by lease or stock purchase. Even at this early date it gave evidence of the dominating position it was to attain in the field of telegraphic communication.

In 1854 Morse, who had experimented with submarine cables, appealed to Cyrus W. Field for enough money to lay a cable from Newfoundland to Cape Breton, Nova Scotia. Field immediately proposed instead to lay one all the way across the Atlantic Ocean. Europe had had several rather unsuccessful experiences with submarine cables as early as 1845. Real success waited upon the discovery of gutta-percha and the later invention of a machine for applying it to copper wire. This machine was invented by Siemens in Germany about 1848. Shortly thereafter cables were laid across the English Channel, the Irish Sea, the North Sea, the Baltic and the Mediterranean. Enthusiasm was easily aroused in England, and Field organized the Atlantic Telegraph Company to raise £350,000. Morse, hampered by his lack of technical knowledge, had only a nominal connection with the technical staff. Unfortunately at the beginning good engineering knowledge was sacrificed to commercial haste. After 380 miles had been laid in the summer of 1857 the cable broke and the end was lost. The season was considered too far advanced for any further attempt that year. Before the next summer Field raised more money to manufacture cable to replace the part lost and to make an improved type of laying machine. In 1858 the second attempt met with repeated misfortune because of storms and technical errors, but the cable finally was laid. Communication began and for a month the cable rendered service. Then, since it was overloaded with too much electric pressure, it gradually weakened and fell into hopeless disrepair. Field retained his confidence in the project

and by tremendous effort again raised capital, but the American Civil War broke out and further attempt was abandoned until 1865. Despite improved technical knowledge and equipment the cable again broke in mid-ocean. Field made one more successful attempt to raise funds, and at last in 1866 the final effort was crowned with success. From that date cable communication between the two hemispheres has never been interrupted. Additional cables to the total number of 21 have been laid across the Atlantic without any fundamental change in the methods worked out during this period.

The telephone, as it finally came to be developed by Alexander Graham Bell, furnishes an illustration of an invention based upon an earlier invention. While it appears that Bell planned eventually to make the telegraph talk, the immediate objective of his research was to discover some means by which the same pair of wires could carry several messages at the same time without interference. Quite unexpectedly he discovered how to use electricity to transmit speech. By February 14, 1876, the same day on which Bell filed his application for a patent, Elisha Gray filed a caveat for a new art of transmitting vocal sounds telegraphically. Very expensive patent litigation brought out the fact that the two methods were dissimilar and that Bell's was the one which promised further development. For many years the business world was indifferent to the possibilities of Bell's invention, and no one with financial means could be found to finance its development. A few friends with limited resources gave him all the help in their power, but it was some time before business men became aware of the great financial possibilities inherent in the invention.

Most of the early experimental telephone conversations were carried on over telegraph circuits. The first line exclusively for telephone use was built in 1877. This early type made no use whatever of the idea of a central exchange. The connection was merely between two points, for example, a man's home and his business. The idea of an exchange came later and with it the need for companies to build and operate them. The lack of large funds determined the procedure of Bell's financial backers. Local interests were united to form companies, and in return for the use of the Bell patented apparatus a certain amount of their stock, from 30 to 50 percent, was demanded. This laid the basis for later acquisitions and permanently identified them as Bell companies. The guiding policy,

developed from the beginning and continuing to 1927, was to manufacture and rent the instruments to the operating companies rather than to sell them or the right to manufacture. In 1927 all telephone instruments were sold to the operating companies.

The early companies served only a limited district with no outside connections. It was not at first practicable to attempt to establish long distance telephones. Gradually improvements in technique and the desire for an extended range of communication led the Bell interests in 1884 to set up intercompany connections. This laid the basis for the development of the long distance service. Really long range communication, however, had to await the turn of the century and Pupin's invention, an induction coil placed at intervals about the wire, preserving the vibration and resonance and lengthening the possible distance of transmission. It was after this invention that the phenomenal expansion of the industry set in; the number of telephones in use rose from 339,000 in 1895 to 10,523,000 in 1915 and to 17,424,000 in 1932.

In common with many other industries the telegraph and telephone had their early development through many small companies, out of which a few large ones came to dominate the field. Exploitation of Bell's profitable patent rights was carried out by several companies taken over in 1880 by the American Bell Telephone Company; this was superseded in 1899 by the American Telephone and Telegraph Company, which remains the holding company for the stock of the Bell operating companies and the operator of the long distance lines. While there are still about twenty-five telegraph companies in existence in the United States, most of the business is handled by the Western Union Telegraph Company and the Postal Telegraph and Cable Corporation.

The Western Union and its affiliated companies not only operate throughout the United States but also control an extensive telegraph and cable service in other parts of North and South America as well as cable connections with Europe. In its earlier years the company was the object of considerable speculation and in the 1880's was under the control of Jay Gould, who had threatened to organize a competing service. The Western Union has been kept clear of the telephone business. In 1909 the American Telephone and Telegraph Company bought a considerable amount of the Western Union stock with the intention of operating the companies

harmoniously. It was contended that the companies were more complementary than competitive and that considerable economy would result from the use of certain lines for both telephone and telegraph circuits at the same time. The arrangement aroused widespread public criticism and the threat of a government investigation. As the result of government action the American Telephone and Telegraph Company agreed to dispose of its holdings in the Western Union and to take no steps leading to combination with a competing company without the consent of the attorney general or the Interstate Commerce Commission.

The Postal Telegraph and Cable Corporation, sometimes called the Mackay companies, is the other large organization in the telegraph field in the United States. The Mackay interests started to acquire telegraph and cable operating companies shortly after the beginning of the twentieth century, engaging in a severe competitive struggle with the Western Union group. In general their telegraph business has not extended as widely into the smaller districts as has the Western Union's. The Postal has cable lines across the Pacific as well as the Atlantic and along the coast of North America. It has utilized its telegraph lines for the development of a long distance telephone service in certain parts of the United States, and in 1928 it initiated a radio service which is planned to reach all important points in Europe and the Orient. In 1928 control of this group of electrical communication companies was acquired by the International Telephone and Telegraph Corporation. The Postal Telegraph and Cable Corporation was created to control the Mackay companies as a part of the International Corporation's world system, which includes cables, telephones, telegraphs, radio and equipment manufacturing companies in about 30 countries.

The telephone industry was the subject of keen competition following the expiration of the basic Bell patents in 1894. Many of the so-called independents operated in districts not served by Bell companies, but many others challenged the supremacy of the older systems by invading their territory in direct competition. This was particularly true in the agricultural states of Iowa, Indiana, Illinois, New York, Missouri, Ohio, Wisconsin, Michigan and Minnesota, where it was charged that the Bell companies were not giving adequate service at satisfactory rates.

Some of the new companies were organized

with ambitious programs and large authorized capitalization. In spite of their inability to furnish long distance service they secured subscribers by capitalizing upon the unpopularity of the Bell companies and promising lower rates. Many of them grew to a considerable size and some of them prospered. The greater number, however, were financial failures. The telephone is the most monopolistic of industries as service is of greatest value only when it enables the subscribers to communicate with all telephone users. Consequently the better established Bell companies reduced their rates and improved their service to meet the new competition. Many of the independents in their eagerness for profits neglected depreciation with disastrous financial results. Many raised rates above those originally promised. Some were purchased by the Bell companies. The outstanding results of this period of competition were certain questionable promotion schemes, improvement in the quality of Bell service, some reduction in rates, establishment of several sound independent companies and a distinct social loss to certain communities where competing companies continued to operate.

During this same period many mutual and farmers' lines were established. Most of these were in districts where it was not commercially profitable to organize a company, and they were built and operated generally by persons deriving benefit from the service. Some charged small rates but others none at all, repairs being made by the subscribers or a fee charged when necessary. Many of these companies still exist in rural sections of the United States. Following the check upon absorption of independents by Bell companies as a result of the Western Union incident in 1909, certain independents agreed with Bell competitors to divide their territory and arranged for the sale of property to one another. In 1921 Congress passed an amendment to the Transportation Act of 1920 which permits consolidation of telephone companies with the consent of the Interstate Commerce Commission. Independent telephone companies have from time to time formed associations for mutual benefit and a number of holding companies have been organized for closer cooperation. But the Bell system is still dominant (Table 1). The various telephone companies in 1929 had an aggregate capital investment of \$4,070,000,000 and operating revenues of \$1,172,000,000.

The American Telephone and Telegraph Company performs two main functions in the

TABLE I

DISTRIBUTION OF TELEPHONE SYSTEMS IN THE UNITED STATES, 1932

| | ALL UNITED STATES TELEPHONE SYSTEMS AND LINES | BELL SYSTEM | ALL OTHER SYSTEMS AND LINES | |
|--------------------------|--|----------------|---|---|
| | | | REPORTING ANNUAL INCOMES OF \$10,000 OR MORE | REPORTING ANNUAL INCOMES OF LESS THAN \$10,000 |
| Systems and lines | 44,828 | 25 | 893 | 43,910 |
| Telephones | 17,424,406 | 13,793,229 | 2,401,002 | 1,140,175 |
| Calls of system | 30,048,165,513 | 25,061,085,648 | 4,039,372,665 | 947,707,200 |
| Employees | 334,085 | 281,350 | 39,413 | 13,322 |
| Fixed capital investment | 4,791,902,525 | 4,269,268,095 | 465,437,613 | 57,196,817 |

system it dominates. It operates the long lines service and it owns the controlling interest in the Bell operating companies. Its long distance service not only covers the entire United States by connecting with the independents but affects the rest of the world as well. Most of the long distance service to and from the North American continent has been developed in connection with radio.

The American Telephone and Telegraph Company, in addition to determining policies for the Bell system, performs certain services for which it receives a license fee. One outstanding service is the manufacture of instruments and other telephone apparatus by the Western Electric Company. The Western Electric, one of the early manufacturers under the Bell patents, later secured exclusive contracts to manufacture instruments and still later became the purchasing agent for the entire Bell system. This arrangement is provided for under contract and is defended upon grounds of efficiency. The American Telephone and Telegraph Company owns almost all of the stock of the Western Electric Company, but the latter sells its products quite as readily to independent companies.

The outstanding item of telephone equipment the manufacture of which is not dominated by the Western Electric is that used for automatic service. The Automatic Electric, Inc., reports that it has produced 75 percent of the automatic equipment in use in the world. It has manufacturing plants in the United States, Canada, England and Belgium. Independent companies in the United States made use of automatic equipment during the period of its development, while the Bell companies ignored it. As a result such equipment was manufactured by a company controlled by independent interests. By reason of its early start it has maintained a dominating position.

Speech was first sent experimentally across the Atlantic Ocean in 1915. In 1927 the first commercial system was opened to traffic between New York and London. By 1932, 30 transoceanic radio-telephone circuits were in operation. The subscriber in the United States could be connected with 33,000,000 other telephones, or 91 percent of those in the entire world. The problems basic to improved service are the development of the transmitting end, so that power may be radiated more effectively toward the receiving station, and the working out of more refined selective, or filtering, circuits, so that the receiving end will receive as little as possible from directions other than that of the transmitter. Work has been begun upon a transatlantic telephone cable between Newfoundland and Ireland. If successful this cable will be superior to radio because of the greater privacy and the avoidance of static noises and fading.

The nature of telephone and telegraph industries is such that for the most part the service can be furnished best by large organizations. This is easily apparent in regard to telegraph and long distance telephone service, where national or international systems are desirable. It is obvious too for the local telephone service in all except small and isolated communities, because the greater the number of subscribers the more valuable is the service to any one of them. Small operating companies can, however, continue to exist in some communities. A peculiarity of the industry is the fact that an increase in the number of subscribers involves greater fixed and operating expenses per subscriber. For each new line added to the system each of the lines already connected must be given facilities for an additional connection. This augments the complexity of switchboards and the number of exchanges.

The financial problem for these companies is primarily one of raising large amounts of fixed capital rather than frequent smaller amounts of working capital. The possibility of raising long time funds for large corporations has encouraged their development in the districts where expensive modern equipment is necessary. Capital has been secured from sales of stock and bonds and from earnings. Since the World War large amounts of stock have been sold to its customers by the American Telephone and Telegraph Company, which has around half a million stockholders. Because of the nature of the assets comparatively few of the bonds are secured by mortgages. Much of the investment is in physical plant located on public property. The holding companies of course have invested a large part of their capital in securities, and consequently collateral trust and debenture types are in wide employ.

The large fixed capital investment, which for both industries in 1929 amounted to \$4,482,000,000, has made difficult curtailment of expenditures when business declines. The telephone operating companies whose subscribers are reluctant to relinquish service have met with slight difficulty under depressed economic conditions, but there is considerable variation in the income of telegraph and long distance telephone companies where use varies with business activity.

Obsolescence is a minor problem with telegraph companies. Telephone companies have witnessed much greater changes in technique; the Bell laboratories have indeed been responsible for a large percentage of such changes. In the case of companies operating under conditions of monopoly innovations are not likely to be of financial importance, since equipment can usually be scrapped just as slowly as desirable from the standpoint of the enterprise. Although technical changes have not been introduced rapidly enough to create any great financial problems, there have been changes in technique which have caused displacement of labor. The complete conversion of manual to dial telephones would eliminate about two thirds of the manual operations. At the end of 1932 about 41 percent of the world's telephones were of the dial type; in the United States the percentage was slightly less. The exact amount of employment which has been eliminated cannot be stated, but the estimates for the Bell system offer some indication. In 1921 the average operator in this system handled 279 completed

calls per day. If there had been no change to dial telephones or no improvements in operating technique between 1921 and 1930, 233,000 operators would have been required at the 1921 average number of calls per operator. As a result of the technical changes which did occur, however, the business was handled by 180,000 operators.

The development of the teletypewriter, or printer's telegraph, has had a similar effect in the telegraph field. The teletypewriter may be connected to different subscribers by a switchboard much as a telephone is connected. An individual trained as a typist can write on the teletypewriter and all connected instruments anywhere in the country will type the message in unison with his own. The speed of the printer is about twice that of the Morse operator. In the sending of commercial messages this means a reduction of more than 50 percent in the number of operators. In the case of the news organizations, since one instrument can be used to send to any number of receivers, the displacement may be much greater. In 1931 it was estimated that in this field one operator was as effective as fifteen under the Morse system. The effect in the case of news organizations, however, has not been serious, because much more news is sent than would be possible under the older system. In 1915 the news organizations employed 1125 operators, and in 1931 this number was reduced to 921. The figures available for a majority of the telegraph offices in the United States in 1925 indicate that 7231 Morse operators were employed along with 4227 printer operators, while in 1931 there were 1793 Morse operators and 9795 printer operators. This change has called for workers who have merely typists' training and in general has meant a shift from male to female workers. Brokerage and investment houses are rapidly installing teletypewriters. Recent data show that railroad telegraphers are being gradually replaced.

Despite these improvements in efficiency there has been no absolute displacement of labor in the telephone and telegraph industries, for expansion of service has outstripped advances in efficiency. But the rate of increase in new employment has fallen steadily in recent years (Table 11), primarily because of greater operating efficiency.

Under private ownership such as prevails in the United States some form of government regulation is essential. The systems were taken over by the government for military reasons during

TABLE II

EMPLOYMENT* IN TELEPHONE AND TELEGRAPH INDUSTRIES, UNITED STATES, 1909-27

| YEAR | TELEPHONE | TELEGRAPH |
|------|-----------|-----------|
| 1909 | 125,000 | 28,000 |
| 1919 | 248,000 | 49,000 |

the World War, although they had not broken down. The lines were subsequently returned to private operation. Regulation has taken the form mostly of supervision by state commissions. Quite generally the commissions have exercised control over rates of local telephone companies. They have given relatively little attention to quality of service, which is difficult to measure. In more than half of the states permission of the commission is required for the issuance of new securities.

The federal authorities have done little by way of the Interstate Commerce Commission. The commission prescribes the accounting system to be used, and since 1921 it has had the power to forbid any consolidations of which it does not approve. In the case of each proposed merger the commission considers not only the economic factors involved but the basis upon which securities are to be exchanged or sold. Outside of the United States most of the land telegraph systems and about 70 percent of the telephones are operated by governments. Generally in both North and South America most of the telephone service is furnished by private companies, while for the remainder of the world it is furnished largely by governments. The rates charged by private companies appear to be somewhat higher than those of government operated systems.

Statistics as to the number of telephones for every 100 members of the population show that the United States leads by a considerable margin for the smaller communities. For cities with 50,000 or more inhabitants ranking countries are Canada with 22.8, Sweden with 22.2 and the United States with 21.9; Denmark, Norway and Switzerland are next in order. Bell statisticians have compiled partial estimates indicating the distribution of the world's telephones in 1932. According to these figures the number of tele-

phones per 100 of the population was 12.5 for North America, 2 for Europe, 0.7 for South America, 0.1 for Asia, 0.2 for Africa, 0.9 for Oceania; the world average was 1.8. The figures for the countries in the various continents vary in general with the standard of living of the whole population rather than with the volume of the nation's business.

Three groups of interests have struggled for control of the international means of communication and the world's privately operated telephones outside the Bell system. The Bell companies remain aloof from this struggle, except for the efforts of their ally, the International Telephone and Telegraph Corporation, and endeavor merely to arrange satisfactory connections for their subscribers with all parts of the world. The three most active groups in the international field are the International Telephone and Telegraph Corporation, the Associated Telephone and Telegraph Company and the L. M. Ericsson Telephone Company, Ltd. In 1933 the International was attempting to conclude a transaction which would give it a 35 percent voting interest in the Ericsson company and thus reduce the three groups to two.

The International Telephone and Telegraph Corporation, which operated 803,459 telephones in 1932, is the largest of these enterprises and through its subsidiaries supplies telephone services in eleven countries. It has grown rapidly since 1920, when it operated 40,750 telephones. Its cable, telegraph and wireless services are world wide. Through All America Cables, Inc., it connects the United States with points in the West Indies and Central and South America. Commercial Cables operates services to Europe and to Honolulu, the Philippines and the Orient. The Postal Telegraph system operates throughout the United States and has connections in Canada and Mexico. The International company is incorporated in the United States, where most of its financing has been done, although it operates no telephone service there. It has an exclusive contract to distribute the Western Electric products in all countries except the United States, Canada and Newfoundland. The Ericsson company, a Swedish concern, which had 200,000 telephones in 1930, is considerably smaller. With the financial backing of the Kreuger and Toll Company it had embarked upon an aggressive competitive career, which was suddenly checked by the financial collapse of the latter company. The Associated Telephone and Telegraph Company has the financial

Telephone and Telegraph — Temperance Movements 567

support of American and British capital. Besides its extensive manufacturing interests it controls or has substantial interest in properties in the United States, England, Canada, the Philippines, Colombia, Venezuela, Belgium, Portugal, India, Hongkong, Australia and elsewhere.

The most important field for the rival extension of these international groups is Latin America. Both in telephone and in telegraph development these countries are far behind Europe and the United States. Compared with the United States, which in 1933 had 18 miles of telegraph lines for every 100 inhabitants, and Canada, which had 35, the Latin American countries had less than one half mile for each 100 inhabitants; in many localities this service is considered very inadequate. While the land telegraph systems are quite uniformly under public ownership, the governments in general have favored the development of telephone services by private capital. Figures for the different countries vary, usually with economic conditions. For the whole group there are fewer than 2 telephones for each 100 of the population as compared with almost 16 in the United States. The struggle between the contending interests, primarily British and American, is bound up with general financial and imperialist objectives.

TEMPERANCE MOVEMENTS are almost as old in the history of humanity as the use of intoxicating drinks; indeed in virtually all societies in which intoxicants have been consumed attempts have been made to encourage or enforce temperance, if not prohibition. The Chinese assert that as early as the eleventh century B. C. one of their emperors ordered all the vines in the kingdom to be uprooted. Priests of ancient India and Persia encouraged temperance and the Buddhists taught total abstinence. The Mogul emperors in India attempted to prohibit the liquor traffic. Certain Hebrew sects also counseled abstinence and the Moslems preached abstinence, although they did not always observe their own precepts.

Apart from religious preaching against excessive drinking, various ancient societies advocated temperance or prohibition for political reasons. Plato observed that the Carthaginians were forbidden to drink wine while on a military campaign and that magistrates were not permitted to drink intoxicants. In Rome at various times emperors sought to curb drinking. In the New World the Aztecs punished drunkenness among the young with death and tolerated liberal drinking only on holidays and among the very aged. Thus temperance is not a modern phenomenon, having been advocated or enforced in many societies throughout history.

In mediaeval times temperance never attained the dignity of a movement, because the manufacture of wine and beer was not sufficiently widespread to allow of much intemperance. Even in areas where a relatively large supply of liquor was obtainable, the mediaeval peasant was not given to excessive drinking. The situation changed somewhat after the thirteenth century, when distilled instead of fermented liquors came to be more common. Aqua vitae (brandy) geneva spirits (gin) and usquebaugh (whisky) were manufactured in increasing amounts. It has been asserted that these stronger drinks were

popular in northern Europe because of the cold and damp climate. This is not entirely true, as is indicated by the case of Denmark, which consumed three or four times as much liquor as its northern neighbor Norway before the latter country adopted prohibition. In general, however, there has been heavier consumption of hard liquors among the north Europeans than among the south Europeans. Modern temperance movements usually had their inception in the north temperate zones rather than in the southern countries.

But even after strong drink was being widely manufactured, not all sections of the population were free to consume it. At times high taxes made the price prohibitive for the poorer strata of society. In England the tax on spirits was virtually removed in 1690 with the result that cheap gin, brandy, whisky and rum were available to all groups in the population, and drink consequently became the universal habit of the English poor. The fact that the poor could get "drunk for a penny; dead drunk for tuppence" aroused mixed feelings among the ruling classes, who, when they became intoxicated, did so at greater cost and with less speed. These felt that temperance should be part of a general movement for social reform and therefore they came to advocate it vigorously, particularly toward the end of the eighteenth and the beginning of the nineteenth century.

By the eighteenth century the beginnings of the modern factory system were already in evidence and there was manifested a desire for a sober, serious and conscientious working force. But the temperance movement was not entirely attributable to the changed economic conditions. The employers' problem was to habituate a handicraft, agricultural population to continuous work in a factory. Because this required a radical change in working habits, generous drafts of liquor might be as effective, from the employers' point of view, as abstinence or temperance. Benjamin Franklin, when he worked as a youth in a London printer's establishment, observed that wages were regulated to provide for liberal drinking during the course of a working day. In fact many of the early factories furnished liquor allowances. It is a plausible assumption that the early days of the factory system encouraged rather than discouraged drinking. In some cases the drinking among factory workers became so excessive that it stimulated a movement for prohibition rather than for temperance.

As the years passed, reformers and investigators of the drink problem came to consider not so much the conditions under which drunkenness was being produced as the concomitants of drink—poverty, slums, crime and child delinquency. Thus in the United States at the end of the nineteenth century the so-called Committee of Fifty in investigating these problems reported that among 13,402 convicts intemperance was directly responsible for crime in 16.87 percent of the cases, a primary cause in 31.2 percent and a factor in 49.9 percent. The committee attributed to liquor 25 percent of the relief cases which came to the attention of organized charity, and it reported further: "As to the general percentage of the destitution and neglect of children due to the liquor habits of their parents, we get 44.92 per cent which, when the intemperance of guardians and others is added, increases to 45.83 per cent."

There seemed moreover to be a growing interest in temperance among certain employers who required a steady labor supply and increased industrial efficiency. The attitude of these groups may best be illustrated by the answers to a questionnaire sent by Herman Feldman to employers during the period of prohibition in the United States. Out of 175 firms answering questions on the subject of the individual productivity of the worker 101 attributed an increase in productivity to prohibition; only 3 reported a decrease. Out of 223 firms answering on industrial accidents 74 claimed a reduction due to prohibition and none claimed an increase. Concerning attendance at work on Monday and the day after pay day, out of the 287 replying 184 employers noticed improvement attributable to prohibition and only 3 reported the contrary.

Indeed agitation for temperance had begun long before industrialists openly came to its support. In the United States the temperance movement as an organized force dates from 1808 with the churches as leaders of the crusade. In 1829 Ireland witnessed the rise of a similar movement, which soon spread to Scotland and to England. It is important to note that these early agitations had both compulsory and voluntary features; thus in the United States advocates of drink reform at first stressed the compulsory aspects by seeking to pass laws prohibiting the manufacture and sale of alcoholic beverages.

Before long the temperance crusade took on international characteristics. The Independent Order of Good Templars, which was founded in

Utica, New York, in 1851, soon expanded to Canada and England and thence to the Scandinavian countries; before the century was over active branches were to be found in Australasia, India, south and west Africa and in South American countries. In 1909 a world prohibition conference was held in London and resulted in the foundation of the International Prohibition Confederation, whose aim was to conduct propaganda not only in European countries but in other parts of the world where there were large industrial populations. An organization with somewhat similar purposes was the World League Against Alcoholism, which appeared in 1919.

The movement was strengthened further by a woman's auxiliary, the National Woman's Christian Temperance Union, founded in Cleveland, Ohio, in 1874. This organization soon boasted branches in every state in the union, and under the leadership of Frances E. Willard spread rapidly to other countries. The World's Woman's Christian Temperance Union eventually claimed societies operating in some fifty countries. The temperance cause gained a hearing likewise in the school systems of many lands. In English schools the teaching of temperance was first initiated in 1852; similar efforts were made in other European countries, with perhaps less success. In the United States, thanks to the efforts of the Woman's Christian Temperance Union, virtually every state passed laws making anti-alcohol instruction compulsory. In fact such instruction in the United States had been initiated before the passage of mandatory legislation largely because the religious interests, which had dominated early education, were opposed to drink. To a lesser extent temperance leaders concerned themselves with the scientific study of the effects of alcohol on the human organism and with the dissemination of their findings. While their research activities have not been particularly important and most advances in the field have been made by scholars working independently, it is undoubtedly true that the general interest in the subject aroused by temperance agitation has encouraged impartial investigations.

Throughout their activities temperance societies have relied on the churches for much of their backing. This has been true particularly in the United States, where many of the Protestant Christian denominations came to associate godliness with temperance and often with total abstinence. In some respects it was this alliance

with the churches which made the temperance movement most effective; thus fully 30,000 churches cooperated with the Anti-Saloon League of America from the time of its founding in 1895.

It is not unlikely that the temperance movement has contributed to the decreased consumption of alcoholic beverages since the beginning of the twentieth century. On the other hand, the strong advocacy of prohibition by some of the societies, notably the Anti-Saloon League, may have contributed to the reaction. The temperance societies became more and more extreme in the measures they championed. At first they were content to use moral and religious suasion to induce people to become temperate or abstemious. Perceiving that this approach was not always successful, they began to advocate some sort of control and were instrumental in bringing about regulation of the conditions of sale and consumption of liquor, high fees for liquor licenses and sometimes state or governmental monopolies for the manufacture and sale of liquor. Charges of inefficiency and corruption were advanced against these controls in many countries and efforts were directed toward complete prohibition.

The World War contributed to the prohibition movement, since some countries, notably Russia and the United States, imposed prohibition on the military forces while others diverted much of their production to non-alcoholic goods considered more essential to military operations. After the war Russia and the United States extended prohibition to the entire population. Other countries by higher license fees and taxes lowered the consumption of alcoholic beverages. In fact with the exception of wine liquor consumption declined from 1900 to 1929. It is impossible, however, to determine how much of the decline was attributable to temperance as an organized movement.

In all of the prohibition countries there was some divergence from the general trend. Consumption fell off shortly after prohibition was inaugurated and then began to curve upward. Prohibition was widely attacked in the name of temperance. Illicit trade in liquor grew rapidly and there were many evidences of excessive drinking. The Scandinavian countries which had attempted prohibition, followed by Soviet Russia and finally by the United States, repealed their prohibitive legislation in the hope of encouraging temperance rather than abstinence. Increasingly it began to be felt that those coun-

tries which had regulated the liquor trade instead of abolishing it had been most successful in furthering the temperance movement. In the United States with the repeal of the Eighteenth Amendment federal control was terminated and the regulation of liquor trade was turned back to the states. Some states retained state prohibition; others regulated distribution of liquor by high license fees, taxes and control over hours and conditions of sale.

TEMPLE, SIR WILLIAM (1628-99), English statesman and author. Temple, the son of the master of the Rolls in Ireland, was educated at Emmanuel College, Cambridge. He traveled widely on the continent, gaining first hand knowledge of conditions in France, Spain and the Netherlands. Upon the restoration of the Stuarts he became a member of the Irish Convention, but when the Parliament was prorogued in 1663 he removed to England. He entered the diplomatic service and through his work particularly in Holland contributed greatly toward adumbrating the balance of power policy which ultimately frustrated the aims of Louis XIV of France. Temple served for a while in the reorganized Privy Council designed to stand between Charles II and his Parliament, which soon proved unworkable because it sought to combine executive functions with those of criticism and control. The remainder of his life he passed in retirement in Surrey, pursuing his studies and cultivating his garden.

The most important of Temple's essays is the

Observations upon the United Provinces of the Netherlands (1672). All English economic writers of the period exhibited great interest in the Dutch and many of their ideas can be traced to Temple, who knew Holland well. He made an interesting attempt to assess the factors which went to the making of that country. In his view economic progress was to be explained by the fact that a given area was densely populated. Thus he contrasted the prosperity of Holland with the backwardness of Ireland; the latter, although well endowed by nature, was sparsely populated, while the former had little natural advantage but a large population. Apparently he was not altogether aware that in this reasoning he confused cause and effect. While he found the spring of economic endeavor in the size of population relative to the land available, he had much to say about contributory factors. He stressed the importance of religious toleration, of the Amsterdamsche Wisselbank, of the low rate of interest, of moderate customs duties, of the specialization of towns on different trades and of easy intercommunication between them by inland waterways. He explained how the Dutch became the "common carriers of the world" and how they had won the ascendancy in the East India trade and had largely ousted their rivals from the Baltic. But his theoretical assumptions on such questions as the balance of trade and personal parsimony were typical of his time. The *Essay upon the Advancement of Trade in Ireland* (1673) may be considered an appendix to his more important work. Here he laid down the same general principles, with special reference to the resources of Ireland and suggestions as to their development. In his *Essay upon the Origin and Nature of Government* (1672) Temple criticized the doctrines of the social contract and the state of nature and inclined to the patriarchal theory of the state. He anticipated the later doctrines of Montesquieu, Savigny and Maine in his emphasis on custom and family as mainstays of law and the state. In his *Of Popular Discontents* he advocated the building of a workhouse in each county, compulsory labor for the able bodied unemployed and the abolition of the death sentence for common theft and robbery; the last suggestion was made not on humanitarian grounds but to prevent criminals from escaping a life of hard labor by an easy death.

TERMINALS. The principal function of the railroad is to transport passengers and commodities from place to place. The service includes not only the actual movement on the line but also convenient and orderly reception and discharge where the line movement begins and ends. These two elements of terminal and line are complementary and interdependent or to use a better word in its full meaning, they are coordinate. The capacity of the railroad to produce transportation may depend upon either. In the early days of light traffic the limiting factor ordinarily was the line. From the beginning of the present century it has customarily been the terminal. The recurrent traffic congestions and car shortages in the United States up to 1923 were due in greater part to inadequacies in terminals. The freedom from such embarrassment during the record breaking traffic in 1926 and 1929 may be credited in large part to the heavy expenditures, beginning with 1923, for terminal improvements.

The word terminal when used in connection with railroads has a broader meaning than that usually given. It includes not only the termini, or extremities, of the road as a whole but also the extremities of the parts, or divisions, into which the road is divided for purposes of train operation. The terminal may be final or intermediate. For the New York Central Railroad, New York and Chicago are final terminals; Buffalo, Cleveland and many other places are intermediate terminals. In a broad sense every station on the line performs terminal service of a kind, but the word terminal is understood generally to include the facilities at the extremities of the line and at its divisional points and connections with branches and other carriers.

The prescribed accounting classification recognizes, in certain primary accounts, a distinction between line and terminal, but it is not possible exactly to divide the total operating and capital costs. For the railroads as a whole the terminal operating expenses are about one third of the total. The terminal part of the total in-

vestment is much larger, probably in excess of one half. The capital investment in the Grand Central passenger terminal in New York City is over \$100,000,000. The average capitalization per mile of line of all railroads in the United States, in 1930, including terminals and equipment, was \$77,343. On that basis the capital cost of that one station is equivalent to the capital investment in nearly 1300 miles of the average railroad.

The traditional theory that the traffic getting possibilities and the economic well being of a railroad depend in large part on the central location of its city terminals was applied generally, wherever practicable, in the early days of railroad location. In most of the metropolitan areas large tracts of land are devoted to railroad terminal purposes. Such real estate is relatively high in value, the tax burden is heavy and as a rule the facilities cannot be expanded except at prohibitive cost. With the advent of the motor vehicle the recent tendency has been to depart from the traditional theory and to locate the terminal outside of the central area, the motor vehicle being utilized as the collecting and delivering agency. Since the railroads have begun the collection and delivery of freight by trucks, the rails have been constructively extended to every part of the city, the strategic value of central location of terminal has been minimized and the economic cost of door to door transportation has been reduced.

One characteristic of railroad passenger terminals is their excessive cost in both capital outlay and operating expense. This may be attributed in substantial part to public pressure actuated by civic pride, the demand that the buildings shall be monumental and beautiful as well as utilitarian. The Pennsylvania Railroad passenger terminal in New York, for example, is a heavy drag on the net income of the railroad, but the building is "a thing of beauty" and it has been one of the greatest factors in the remarkable improvement in the surrounding area. Such imposing and unduly expensive terminals compare unfavorably, from the economic point of view, with the New York terminal of the Hudson and Manhattan Railroad Company, accommodating the downtown suburban passengers of the Pennsylvania Railroad. The passenger facilities are in the basement of two large office buildings. The waiting rooms are without grandeur, but the facilities serve their purposes with fair adequacy and at a minimum of economic cost. Additional reasons for questioning the

wisdom of the heavy investments in large passenger stations are that railroad passenger traffic has been declining since 1920 and that for the railroads as a whole the passenger service is not self-supporting.

There are three units in the typical large passenger terminal, as follows: the station building with its train shed, the passenger car yard and the engine house. The waiting rooms are centrally located, surrounded by the ticket offices, the telegraph and telephone rooms, the dining rooms, the information bureau and the news stands and other concessions. Adjacent to the train shed midway, which lies between the waiting rooms and the trains, there are baggage rooms, parcel rooms and the offices of the taxicab and baggage transfer companies. Stations as a rule are designed to afford easy access to and from the streets, a free flow of traffic by the shortest route from street to train and convenient locations for accessorial services.

The passenger yard ordinarily is located outside the center of the city. There the cars are stored between trips and are cleaned and otherwise conditioned for service. Separate facilities are required for Pullman cars and diners. These several facilities are necessarily extensive in a terminal such as the Grand Central in New York, where there are heavy peak loads of suburban traffic coincident with the arrival and departure of many through trains. Movement of the empty cars to and from the storage yard must be made with precision on a carefully worked out schedule, or else there will be interference with the regularity of train movement.

The engine house and appurtenant facilities usually serve the freight and yard locomotives as well as those in passenger service. The location of the engine house is determined by the combined needs of the three services. Every locomotive needs "grooming" between trips. Approaching the house the locomotive passes the coaling station, where it is loaded with coal, water and sand. Then it moves to the ash pit, where the fire is cleaned. Next it moves via the turntable to its assigned track in the house, where it is cleaned, inspected and put in requisite mechanical condition for the next trip. The engine house employees take care of minor repairs between trips. The periodical general overhauling and extensive repairs are made in the general shops.

In the freight service there are six units in the typical terminal: the freight station; the transfer platform; the classification yard; the repair

tracks; the engine house; and the miscellaneous accessorial facilities. The freight station consists of the offices; the freight house with its track served platforms; the team, or bulk, delivery tracks; and facilities such as track scales and cranes. In large stations there may be separate facilities for inbound and outbound freight. The freight house and platforms are used for less than carload shipments brought to or taken from the freight house door by shippers and consignees and moved through the house and to and from cars by railroad employees. Carload shipments are loaded or unloaded on the team tracks by shippers or consignees. The function of the transfer platform, which may be a part of the freight station or located in the classification yard, is to consolidate the many small shipments for numerous destinations into through cars.

The heart of the freight system is in the classification yard. It is usually located well outside of the city where the large acreage necessary is not prohibitive in cost and where additions may be made when required. Such yards are of two general types, final and intermediate. The Markham yard of the Illinois Central near Chicago is of the first type; the Altoona yard of the Pennsylvania, in the heart of the coal region, is of the intermediate type. The Markham yard is used to classify cars from or to the Chicago district and the many connections in that territory; the Altoona yard takes care not only of the cars originating or terminating at Altoona but also of the trains which move through Altoona eastward and westward.

An intermediate yard consists primarily of the following three units in each direction, with auxiliary facilities: the receiving unit, in which the inbound road locomotives place their trains; the classification unit, in which the cars are sorted according to prearranged plan; and the departure unit, in which the classified cars, made up in trains, are placed for departure. The cars when placed in the receiving yard are inspected and marked for the designated classification track. They are then pushed by a yard locomotive to the summit of a hump, from which the cars run by gravity to the proper tracks. The car marker in the receiving yard, the foreman at the hump and the towermen who operate the switches have advance information which enables them to direct the cars to the proper tracks. In the modern yard the towermen operate also the mechanical car retarders, or track brakes, which control the speed of cars until they enter the classification track. In the older yards the

speed is controlled by car riders, who operate the hand brakes. A train of one hundred cars may be "shuffled" by hump switching in twenty-five minutes. The cars are thus placed together and may be taken from the classification tracks to the departure yard in train units or moved to delivery tracks of connecting carriers, placed at the freight station or on industrial sidings or transferred to repair tracks, storage tracks, stock pens or the icing plant as may be required. A similar process is employed in the opposite direction. The principal difference between the intermediate and the final classification yard is that the latter receives and dispatches through trains in but one direction, while the intermediate yard receives and dispatches in both directions. The situation in the final terminal, however, is ordinarily more complicated than in the intermediate, inasmuch as the final terminal has more work in handling receipts and deliveries to freight houses, steamship piers, coal wharves, storage warehouses, grain elevators, industrial sidings and rail connections.

The engine house has already been described. The auxiliary facilities depend on the nature of the traffic. If, as at Altoona, the engine house is a concentration point for coal, there must be track scales equipped to weigh each car in motion as it passes over the hump. If there are many cars of livestock, the yard may be designated as a resting point and equipped with stock pens and facilities for feeding and watering. If there is much perishable freight, there may be icing facilities. If conditions require, there may be tracks assigned for cars held for reconsignment or diversion. There must always be tracks, properly equipped, for car repair work.

The terminal has often been called the graveyard of the freight car. Time studies of car movement indicate that but 10 percent of car hours are spent on the road between terminals, the remaining 90 percent being spent at terminals. A substantial part of the terminal delay is unavoidable, as shippers are given two days, exclusive of Sundays and holidays, to unload and two days to load each car; but the greater part of the terminal time is consumed in the course of movement in yards, at freight stations and at interchange points. In the case of one railroad an expenditure of less than \$5,000,000 in the complete revision of its two principal terminals saved enough in operating expenses to pay for the capital investment in less than ten years. The principal saving was in freight car days, but of equal importance was the increase in traffic

resulting from the marked improvement in public service.

Each of the large metropolitan areas has its own set of transportation problems. Chicago is the nerve center of inland rail transportation. New York is the greatest American port. Philadelphia, Baltimore, Norfolk, New Orleans and all of the important Pacific coast ports have their peculiar problems of coordinating rail and water movement of freight. Municipal or state ownership of piers and to some extent of connecting tracks and belt lines is common on the Pacific coast and the Gulf of Mexico. In the New York metropolitan area there exists the Port of New York Authority with certain powers to unify operations. In inland cities there are no notable instances of the kind, but there is some degree of voluntary cooperation between the railroads in joint management of terminals and belt lines. In the case of Chicago most of the railroads entering the city in its early days constructed separate terminals. During the past half century there have been a general revision of all rail facilities, a substantial degree of coordination in the use of belt lines and a more general adoption of the principle of the union passenger station. The freight house facilities in the heart of the city are served by far outlying yards, and the heavy interchange of cars is effected by belt lines which encircle the city. Desirable progress has been made, but much more remains to be done in effective unification in the public interest. Progress has been made also in the New York metropolitan area. The activities of the Port Authority have brought improvements in coordinating the transportation facilities, rail and water, on both sides of the harbor. The problem is complicated by the necessity of transferring cars by floats and lightering freight from the railroad to piers and alongside ship.

The desirable degree of unification of rail facilities in metropolitan areas has been retarded by a natural disinclination of railroads favorably situated to share their advantages with competitors. Public interest, however, is so vitally affected by the efficient use of all facilities in the common good that there is likely to be further governmental initiative in bringing about public ownership and operation of rail as well as water terminals. The Interstate Commerce Commission in 1920 was given power to require joint operation of terminals under fair terms to the proprietary companies, but up to 1934 it indicated its reluctance to take action. It is likely that when the problem of railroad consolidation is

disposed of, the commission will undertake comprehensive unification of terminals.

TERRITORIAL WATERS. This term may be applied to a state's marginal sea, to its inland waters or to both. The marginal sea extends outward from the low water mark or from the so-called seaward limit of bays, straits or river mouths. Inland waters are those inside the marginal sea and within the state's land territory. A state's relations to these two areas are clearly distinguishable: since it has full sovereignty over inland waters, including the right to exclude foreigners therefrom, these waters are unquestionably territorial; its jurisdiction over the marginal sea is less complete, for there exist

certain well recognized "servitudes" (so-called), such as the right of innocent navigation, in favor of the vessels of other nations, and for this reason many authorities deny that marginal sea is territory. A number of writers on international law distinguish two types of jurisdiction in coastal waters: virtually complete jurisdiction in so-called territorial waters, as, for example, that of the United States within the three-mile limit; and restricted rights based upon special needs, such as customs regulation, over an extent of open water adjacent to the territorial sea. Such is the control which the United States exercises within the twelve-mile limit.

The idea of the marginal sea is a relic of the old claims to sovereignty of the high seas. After these claims had been abandoned as anachronisms, the littoral state was nevertheless allowed to secure its various interests in waters near its coasts. Bynkershoek introduced the idea that national dominion should extend to cannon range; and this principle, expressed in the maxim *Terrae dominium finitur ubi finitur armorum vis*, was generally accepted, although the enforcement of many laws extending far beyond this distance continued. For some years England and the United States have regarded three marine miles as synonymous with cannon range and together with certain other states now urge this distance for the marginal sea, especially for purposes of neutrality and for fisheries. Other states have refused to accept this standard as a minimum for any purpose, insisting upon from four to twelve miles. Many governments, regardless of their claim in this respect, have enforced their revenue, neutrality, fishery, sanitary, navigation and traffic laws for distances varying from four to sixteen miles. Several states confine jurisdiction for all purposes within the limits claimed as the marginal sea. Others have been inconsistent, protesting a jurisdiction which in fact they have exercised. Like the "battle of the books" waged centuries ago between Selden and Grotius over the question of sovereignty of the high seas, at present there is a spirited controversy as to the width of the marginal sea. Out of the welter of claims no understanding has been reached beyond the agreement that the minimum is three marine miles and that all states have jurisdiction therein for most purposes—to make arrests and to enforce revenue, health, fishery, pilotage and traffic laws. International arbitration has furnished no definite decision. Treaties reflect the lack of uniformity in national practise. They

limit marginal seas for general jurisdiction to distances ranging from three to thirty miles; for purposes of the revenue laws limits of from nine to twelve miles are designated in the Helsingfors Treaty of 1925 between eleven European countries; while the distance a smuggling vessel can traverse in an hour is prescribed in the "rum treaties" made during the period from 1924 to 1930 between the United States and seventeen countries. In some of the rum treaties the three-mile limit for territorial seas was affirmed, while in the others and in the Helsingfors Treaty the parties retained their respective rights and claims with respect to the extent of this sea. The Conference for the Codification of International Law held under the auspices of the League of Nations in 1930 failed to reach an agreement upon the subject.

The waters of bays and river mouths whose entrances do not exceed six miles in width are considered inland, and the seaward limit from which the marginal sea is measured is a line drawn from headland to headland. If the entrance is over six miles, no uniform rule applies, although the general tendency is to fix the limit by a line from headland to headland if the entrance is not more than ten miles; while if it is greater, the limit is usually fixed as a line across the bay or river mouth at the first point where the opening does not exceed this distance. Certain large bays, such as the Delaware and Conception, are treated as territorial for historical reasons.

Even if a marginal sea of uniform width should be decided upon, it would be impracticable to prohibit the enforcement of any laws beyond it. The narrow belt which generally constitutes the territorial sea has been found inadequate in modern times for protection of neutrality, revenue or fisheries, especially in countries dependent upon the fishing industry or menaced by smugglers. A state should accordingly be allowed to secure these interests without regard to the limit of the sea. A wider zone for the enforcement of revenue as compared with fishery laws might be allowed some governments, while under certain conditions the reverse might be true for other states. This approach would not violate the freedom of the seas, for states already have certain jurisdictions on the high seas.

TERRITORIES, UNITED STATES. See POPULAR SOVEREIGNTY; SLAVERY.

TERRORISM is a term used to describe the method or the theory behind the method whereby an organized group or party seeks to achieve its avowed aims chiefly through the systematic use of violence. Terroristic acts are directed against persons who as individuals, agents or representatives of authority interfere with the consummation of the objectives of such a group. Destruction of property and machinery or the devastation of land may in specific cases be regarded as additional forms of terroristic activity, constituting variations of agrarian or economic terrorism as a supplement to a general program of political terrorism. The term does not appear to be applicable to violent clashes or even to systematic resorts to violence in conflicts of an industrial nature, such as may occur between

workers struggling to secure recognition and status as an organized body and employers who fight these efforts; nor does it apply when violence results from the fact that racketeers have gained a foothold in an industry. Such phenomena may be described as manifestations of intimidation rather than of terrorism.

Intimidation differs from terrorism in that the intimidator, unlike the terrorist, merely threatens injury or material harm in order to arouse fear of severe punishment for non-compliance with his demands. The intimidator will resort only to the degree of violence needed to insure collection of tribute or to force certain persons to abstain from committing overt or covert acts. Having committed a crime or engaged in criminal practices, usually through hired underlings, a racketeer or an employing company whose anti-union labor "protective" machinery has been apprehended in unlawful acts will seek the protection of the law through influential politicians, purchasable attorneys and accommodating judges. The attitude of the political terrorist is entirely different. He imposes the punishment meted out by his organization upon those who are considered guilty or who are held to interfere with the revolutionary program; thus he serves notice that his organization will be satisfied with nothing short of removal of the undesired social or governmental system and of the persons behind it. The terrorist does not threaten; death or destruction is part of his program of action, and if he is caught his behavior during trial is generally directed primarily not toward winning his freedom but toward spreading a knowledge of his doctrines. Intimidation and the practices of violence resulting from it are a logical consequence although an extreme manifestation of the struggle among persons or conspiratorial groups for pecuniary reward in an acquisitive society based upon vested rights and the possession of capital wealth. Terrorism is a method of combat in the struggle between social groups and forces rather than individuals, and it may take place in any social order. Those who appear on the terroristic scene, whether as protagonists or as victims, stand as representatives of social groups or of systems of government. Violence and death are not intended to produce revenue or to terrorize the persons attacked but to cause society or government to take notice of the imminence of large scale struggles. The terroristic act committed in secrecy by one person or several is conceived as the advance notice of what may be expected from mass action. It is

usually employed where other methods of propaganda are not permitted.

Resort to terrorism is not the exclusive monopoly of political organizations and parties. A group of any other character seeking the relocation of power may deem it expedient to use terror and may organize for this purpose. The nature of the power contested may vary greatly; it may be the dominance of one nation over another or the oppression of one economic class by another. A conflict between the supporters of two substantially different systems of government may also call forth terroristic tactics. Terrorism as a method is always characterized by the fact that it seeks to arouse not only the reigning government or the nation in control but also the mass of the people to a realization that constituted authority is no longer safely entrenched and unchallenged. The publicity value of the terroristic act is a cardinal point in the strategy of terrorism. If terror fails to elicit a wide response in circles outside of those at whom it is directly aimed, it is futile as a weapon in a social conflict. The logic of terroristic activity cannot fully be understood without a proper evaluation of the revealing nature of the terroristic act.

Terrorism differs in several important aspects from such phenomena as mob violence, mass insurrection and governmental terror. Terror practised by a government in office appears as law enforcement and is directed against the opposition, while terrorism in its proper sense implies open defiance of law and is the means whereby an opposition aims to demoralize a governmental authority, to undermine its power and to initiate a revolution or counter-revolution. While the terrorist party makes no pretense at legality, legitimate government must at least formally adhere to law. In the absence of directly supporting legislation governmental terror is made to appear as justified by a declaration that a state of emergency exists, usually followed by the issuance of special decrees. The moral and political justification of the terrorism of a revolutionary or counter-revolutionary party, on the other hand, proceeds from its consideration of existing government as a usurper of the people's power or of the historic rights of a certain dynasty or class.

Although it is based upon the practise of violence, terrorism differs essentially from what is described as mob violence. Terrorism is carried on by a narrowly limited organization and is inspired by a sustained program of large

scale objectives in the name of which terror is practised; mob violence, although it may conceivably break out in response to a terroristic act, is ordinarily unplanned and uncontrolled, brought into action by some immediate and not necessarily rational motivation and follows no precise program.

Mass insurrection is ideologically most akin to terrorism, but it too is not necessarily premeditated and is likely to occur without painstaking preliminary preparation. The initiation of a mass insurrection may be one of the objectives of a party which employs terrorism as a revolutionary method; in such a case the relation between the two may be one of means to an end. Generally, however, the two phenomena are not linked in the theory of revolutionary strategy. In a situation where mass insurrection as a means of attaining certain political aims is within the realm of possibility the terrorist method appears unnecessary, although it is not impossible that the removal of a conspicuous representative of the functioning government might prove the starting point for mass action or at least accelerate its pace. The Blanquist conception of revolutionary insurrection seems to be related to terrorism in the importance it attributes to detailed preparation and to the conspirative methods. Likewise the careful preparation of revolutionary forces appears in Bolshevik theory to be a revolutionary weapon similar in type to terrorism. But in addition to the essential distinction that neither Blanquism nor Bolshevism lists terror among its chosen instrumentalities of action, there are vital differences between the three concepts. The Blanquists conceived of armed insurrection as the task of a well organized and strictly disciplined band of trained fighters who might carry out their purpose whenever success seemed reasonably certain. Once successful the revolutionary party would proceed to enforce its program, whether or not the latter had gained a substantial degree of acceptance among the people. Blanqui's army of insurrectionists throughout the long period of his leadership between the 1840's and the 1870's at no time claimed more than a few thousand men. Blanquism in practice if not in theory is the technique of a *Putsch* or coup d'état. Differing entirely from this concept is the Bolshevik idea of armed insurrection, which regards the latter at the most as a link in a chain of revolutionary circumstances, a final weapon to be employed only after all preliminary measures have been completed. The frequently quoted statement, ascribed to

Trotsky, that a few well trained, select shock troops may at a propitious time seize the government and change the course of history represents neither Trotsky's nor Lenin's ideas of a revolutionary overturn. Bolshevik revolutionary strategy is rooted in the acceptance of mass movements as the basic force which will effect the shift of social power from the capitalist class to that of the workers. Lenin repeatedly stressed the need of winning the masses to the party's ideas before a decisive action could be precipitated.

Terrorism as a means of achieving national emancipation was exemplified in the so-called Anglo-Irish war led by Sinn Feiners between 1919 and 1921. Its objective was forcibly to eradicate English control in Ireland and to establish Irish unity. Destruction of the property of the English government and of conspicuous Irish sympathizers with English rule, shooting of police, attacks on police barracks and ambushing of British soldiery with bombs, rifles and revolvers were among the means used in this internal struggle. Terrorism in this particular case bordered on guerrilla warfare and it was based upon the expectation that the non-combatant population would fall into line with the victorious side; terroristic means were used to force the issue. The revolutionary party claimed its justification in the right of the Irish people to national self-determination and made its terroristic practices appear as retaliatory action against the British reign of terror in Ireland.

Terrorism as a revolutionary technique was for many years an accepted tenet of anarchism. The writings of Bakunin with their emphasis upon violence as a method of achieving social change were the inspiration if not the actual source of this doctrine. The idea of "the propaganda of the deed" was developed in the years following Bakunin's death by Kropotkin, Brousse and others, who stressed the failure of generally accepted methods and the educative and publicity value of acts of terrorism. This theory was translated into action principally in the last two decades of the nineteenth century, especially in the Latin countries. In Germany and Austria-Hungary, where the anarchist movement was relatively weak, there were only a few *attentats*, but police measures proved quite ineffectual in France, Spain and Italy in dealing with the assassination of many government officials. Among the anarchists in the United States Johann Most was the foremost

exponent of terrorism, while the outstanding attempts to propagandize by the deed were the assassination of McKinley by Czolgosz and the shooting of Frick by Alexander Berkman. The method advocated by the syndicalists is one of direct mass action rather than of individual terror.

The fullest expression of the theory and practice of terrorism is to be found in the functioning of the famous Russian revolutionary organization—the executive committee of the *Narodnaya Volya* (People's Will), formed in 1879. Its spectacular activity began in the late 1870's under the name of its predecessor, a society called *Zemlya i Volya* (Land and Freedom), and it attracted attention with the shot fired by Vera Zasulich at General Trepov, the commandant of St. Petersburg, as an act of revolutionary revenge for the flogging of the revolutionist Emelyanov, which the general had ordered. In 1879 Solovev made an unsuccessful attempt to shoot the czar and in the following year a revolutionary workman, Khalturn, succeeded in dynamiting the czar's dining room at the Winter Palace, where the royal family was to entertain a large official assemblage; they were saved only by an accidental delay in the opening of the function. In 1881, however, Alexander II was killed by a bomb. Such an effective start encouraged the *Narodnaya Volya* (also called *narodniki*) and its activity spread despite the efforts of the government to exterminate the organization at all costs. As in the case of all revolutionary movements, it was not governmental persecution but popular reaction which determined its future.

The party's own view of its method of action was expressed in paragraph 2, section D, of its program, which defines destructive and terroristic activity as follows: "Terroristic activity, consisting in destroying the most harmful person in the government, in defending the party against espionage, in punishing the perpetrators of the notable cases of violence and arbitrariness on the part of the government and the administration, aims to undermine the prestige of the government's power, to demonstrate steadily the possibility of struggle against the government, to arouse in this manner the revolutionary spirit of the people and their confidence in the success of the cause, and finally, to give shape and direction to the forces fit and trained to carry on the fight" ["Programma Ispolnitelnogo Komiteta, 1879 g." (Program of the Executive Committee, 1879), reprinted in *Sbornik programm i pro-*

grammnikh statey partii "Narodnoy Voly" (Geneva 1903) p. 3-8].

The motivation of the party's recourse to the terroristic method was, as frequently stated, that at that time it appeared the only possible way of achieving political change. The purpose of this change was explained in paragraph 1, section V, of the same program: "By this overturn, in the first place, the development of the people will be to proceed independently and in line with its disposition, and, in the second place, many purely socialist principles common to us and the people will gain recognition and be supported in our Russian life."

The spokesmen of the party stressed the following principles of their movement: that the use of terror was not an end in itself but only a means to effect the transference of power from the government to the people; that the party proposed to seize and retain power only until a form of popular government could be determined upon by a constituent assembly; and that it would not decree revolutionary reforms and impose its desires upon the people but on the contrary would aid the latter to express its own will, to which the party would submit.

This political program, unusual for its modesty and self-negation, sounds crudely naive and almost unbelievable in an era of historic struggles between fascism, on which declining capitalism stakes its own survival, and communism, the fighting essence and pragmatic realization of classical socialism. But in its time and situation this self-negation of the terrorists had roots in the specific conditions of Russian life. The psychology of terrorism is that of romantic messianism. The Russian terrorists imagined that because certain conditions of landownership forced the Russian peasant community to adhere to a quasi-collectivist form of land utilization, the peasants were the carriers of the purely socialist principle germane to the very nature of the Russian people. These potential socialists were supposedly awaiting an energetic impulsion from the revolutionists, and the explosion of a bomb thrown at a cruel czarist officer was expected to awaken the people from their lethargy. But although many bombs were exploded and numerous officials and members of the ruling order assassinated, the masses failed to respond. Their passivity and total lack of rebelliousness at first spurred the terrorists to more and more daring ventures. The program of the party called for widespread mass activity to arouse the peasants, the workers and the pro-

ressionals. Essentially, however, terroristic activity produced results contrary to its professed purpose for it centered party activity on the one tangible thing, organization of the terror, to the exclusion of all other contemplated work; and it fostered in the intelligent elements among the masses as well as among the revolutionists the idea that revolution was the task of the self-sacrificing terrorist. Terroristic activity thus was the joint product of trust in a metaphysical, peculiar fitness of a certain people for socialism or its contemporary equivalent, the "good life," and of distrust in the capacity of the people to organize a fight for the economically comprehensible things which at all times were the leaven of organization. The fact that the forces of the terrorists were generally recruited from young students and the descendants of the economically depressed elements of the nobility may account in part for the romantic orientation of the movement; but it is likewise true that this romantic aspect attracted the intelligentsia and left the peasants and workers cold. Support of terroristic activity came for the most part from the liberal bourgeoisie, a group which everywhere abounds in lovers of vicarious experience.

Terrorism was revived in 1901 when the Socialist Revolutionary party came into existence and proceeded to carry on the tradition of the older movement. But in the meantime economic development had led to the rise of a working class. Industrial changes, defeat in war and a complicated international situation which had repercussions in politics and finance made terrorism appear outmoded as a revolutionary method, although it still aroused admiration. The rising mass movement and the spread of nation wide economic and political strikes made terror irrelevant and unnecessary. Moreover the government had learned how to place its agents at the core of the central Fighting Organization of the party; the provocateur Azef, for example, instigated several assassinations of members of the czarist family. These factors together with the opening of the Duma led the party to abandon terrorism in 1906. Three years later, however, this resolution was revoked, and terroristic activity continued until the World War.

Terroristic methods were tried once again in Russia, after the revolution of 1917, upon the cessation of the temporary political alliance of the Socialist Revolutionary party with the Bolsheviks, when the former declared war on the Soviet regime. The assassination of the German

ambassador to Russia, calculated to create an international conflict embarrassing to the Bolsheviks, and finally an attempt upon Lennin's life were the outstanding results of the campaign. But the "propaganda by the deed" failed to achieve its aim; the masses of the people did not respond, seeing no reason for joining a movement which appeared to hold no promise for them.

As a complete revolutionary tactic terrorism has never attained real success. Governments, whether conservative or revolutionary, are not inclined to retreat before acts of terror directed against key persons. The will to power is not weakened by the exercise of power, and positions made vacant through the explosion of bombs are readily filled. On the other hand, the will to revolution requires a stronger force than the heroism of isolated individuals or even of small, well organized groups. The art of revolution must be sustained by the interested will of a large proportion of the population and by concerted mass operations.

TERTULLIAN (c. 160-c. 220), church father. Quintus Septimius Florens Tertullianus was born in Carthage, the son of a Roman captain. Educated in Rome, he was active there for a long time as a respected juriconsult. Later he became the most powerful defender of rising Christianity in his native city against the Roman state and the gnostic heresy. Toward the end of his life he became chief of the pneumatistic sect of Montanists opposed to the Roman church and the primate of Rome. He not only enriched the language of early Christianity with words and images from the Roman military service and Roman jurisprudence but also laid down for future ages the juristic exegesis of Roman law as a model and instrument for the theological exegesis of the Word of God. The decisive importance which the legal concepts of *meritum* and *satisfactio* assumed in his dogma is characteristic of the juridical nature of his approach, as is his conception of atonement, which, in the manner of a bilateral legal transaction, is inseparably connected with salvation as the repayment of a due reward. The creed is likewise legally interpreted and its contravention appraised as an illegality.

It was of importance to the development of the church that this experienced jurist differentiated between the absolute validity of the divine commandment and its practical enforcement, which while demanding legal regulation nevertheless may change with the times. Thus in addition to the law of faith, the *lex fidei*, there appears the law of regulation, the *lex disciplinae*. In this way Christian life itself was subordinated to the force of law, and the bishop as well as the episcopal councils, which hitherto had exercised essentially charismatic-pneumatic functions, became as bearers of the apostolic charisma the appointed embodiment of ecclesiastical discipline; that is, definitely established organs of administration.

Tertullian was interested in economic questions only in so far as they touched the new norm of Christian life. He did not attempt, as do modern theorists, to clarify and explain economic interrelations but directed his attention to the problem of what economic pursuits were permissible to the Christian and what were forbidden. Paul's pronouncement that each was to

remain in the occupation to which he was born had been maintained in essence for the first two centuries of Christian history. Now that the immediate resurrection of the Lord was no longer expected, however, not only were astrology and secular pedagogy, for example, declared impermissible, but all commerce was stamped as of doubtful character, and dealing in incense and other spices was labeled anti-Christian since these materials might be used for heathen sacrifices.

TESTS, MENTAL. See **MENTAL TESTS.**

TEXTILE INDUSTRY

HISTORY AND ORGANIZATION. The textile industries were the pioneers of industrialism as it spread around the world from England, even as they were the first industries to adopt the factory system. In the older industrial countries, such as the United Kingdom, Germany, France, Switzerland and the Netherlands, as well as in Japan, China and India they have maintained their original lead when ranked either by value of products or by the number of workers employed; whereas in practically all other countries, with the exception of Australia and Canada, they are outstripped only by foodstuffs or by important raw material industries, such as wood. In the United States in 1929, the textile industries ranked first in average number of workers, second to foodstuffs in value of product

and second to machinery in value added by manufacture. This position of major importance is due largely to the use of textiles for clothing and household purposes. New uses have appeared with the development of modern industry and agriculture in the demands for electrical insulation, belting, rubberized fabrics, felts for paper making and cartridges, upholstery for railroad cars and automobiles, cords and baling materials and hospital supplies. The demand for clothing is relatively inelastic; increase in income results in the use of silk instead of cotton rather than in a proportionately increased consumption of fibers. Hence the rank of the textile industries, which have been declining in relative importance with the rise of the metal and machine industries, will in the future depend upon expansion of the industrial uses of textiles.

Textiles have been used since very ancient times, as is shown by samples which have been found on all continents: bits of linen of the Swiss lake dwellers of the neolithic period; a fragment of cotton cloth excavated in the Indus valley belonging to the period between 3500 and 3000 B.C.; a piece of cotton cloth discovered in a cave at Grand Gulch, Utah, which American anthropologists have dated between 2000 and 1000 B.C.; cloths of wool, cotton and hair found in the prehistoric grave sites of coastal Peru; a woolen cloak found in a peat bog of southern Sweden. Whether the almost universal primitive knowledge of the textile processes is to be attributed to diffusion from Asia or to independent origin is a matter for further research, but its wide dispersion in remote antiquity is an established fact.

As the great ancient civilizations rose to power, skill in the making of textiles was developed as an art, as is shown by the exquisite Dacca muslins, the shawls of Kashmir, the "Babylonian garments," the linen tapestries of ancient Egypt, the beautiful byssus fabrics made in the Egyptian temples and the bird and flower silks of China. Examples of these eastern luxuries were brought back to Greece and Rome by the conquerors of Asia. Trade sprang up to satisfy the new appetite for luxury, followed by knowledge of processes as Asia gradually receded in importance and the foundation of modern civilizations emerged. It was not until the industrial revolution, however, that European culture added anything fundamental to the technique of textile fabrication.

Although the earliest domestication of sheep is traced to Turkestan, it is probable that knowl-

edge of their domestication reached Europe early in the neolithic period. In ancient times in both Greece and Rome the fabrication of textiles remained a household industry except for a few specialties, such as Corinthian blankets, cloaks from Pellene and embroideries from Chios, Miletus and Cyprus; both civilizations continued to import their luxury fabrics from Tyre, Sidon, Alexandria and the nearby islands which had learned the arts from Babylonia and Assyria. In Egypt during the Ptolemaic period, as formerly in Babylon, the textile industries were organized. Cloth making became a royal monopoly and wool and cotton were converted in royal mills and in the temples, which were given special privileges. Others worked under license and were obliged to sell to authorities at fixed prices. Later, during the economic supremacy of Byzantium, the most numerous among the corporations were those of the textile industries, famous for their production of precious fabrics, such as richly embroidered woolens and fine linens.

By the end of the Middle Ages Italy had become the center of the textile industry. It is estimated that at the beginning of the fifteenth century Florence employed 30,000 workmen in 300 factories, Milan 60,000 workers and Venice 16,000 workers; the last mentioned produced the finest of the Italian woolen cloth and sheer linen. The *arte di calimata* of Tuscany monopolized the purchase of English wool and the half finished work of Flanders and northern France; it was rivaled by the *arte della lana*, the Florentine association of merchants and manufacturers. By 1306 Florence manufactured 100,000 pieces of woolen cloth yearly. After the twelfth century their competitors were the workshops of Catalonia, the Balearic Islands, Brabant and Flanders (Fleming was synonymous with weaver); while in France, in Picardy, Ile-de-France, Champagne, Normandy, Bourges and Languedoc textile manufacture became the most important form of industrial activity. Germany manufactured coarse woolens and coarse linens; semifine linen and table linen were produced in Catalonia, Champagne, Languedoc and Normandy; sailcloth was made in Brittany and Galicia. Fine cloths were the romance of the Middle Ages, demanded for display by prince and prelate and the new bourgeoisie. During this time also the use of linen for garments developed as one of the refinements of living.

Although the continental industries had depended chiefly on English wool, which was

England's one important export during the late Middle Ages, it was not until the fifteenth century that English cloth became a serious competitor on the continent. Opinions differ as to the extent of Britain's indebtedness to the migrations of skilled artisans from Flanders, Holland and France from the time of William the Conqueror through the Middle Ages, but there can be no doubt that the craft was greatly enriched thereby; as, for instance, in the production of the new draperies and new techniques in the finishing trades, in which Holland had become proficient. Progress was made during the reign of Edward III, who refused to wear any but British cloth, encouraged foreign cloth makers to settle in England and prohibited the export of wool. By the fifteenth century the making of cloth had become "the grttest occupation and lyving of the poore people of the land" and it continued for three hundred years as the chief source of the wealth of England. Toward the close of the seventeenth century wool manufactures were valued at £8,000,000, of which an amount valued at £2,000,000 was exported. Although the industry was widespread, it was centered in Yorkshire, Norfolk and the southwest.

In all probability China was the birthplace of the silk industry, although there is evidence that wild silk was spun in Persia and India at a very ancient date. Sericulture and the fabrication of silk cloth were an integral feature of the culture of China at least three thousand years B.C. The secret was carefully guarded, however, until the fall of the Chin dynasty, when refugees fled to Korea. From there the knowledge of sericulture was carried in the third century B.C. to Japan, where the industry was sponsored by the royal families. Sericulture spread westward in the third century A.D., when it was introduced into Khotan and then into Byzantium. Until its capture in 1204 Constantinople remained the western center of the silk industry, both for the production of raw silk and for the fabrication of precious cloths. Meanwhile the Arabs had become familiar with the Persian industry; in the eighth century they had carried their knowledge to Spain and in the ninth to Sicily, whence it probably spread northward to Italy.

Sericulture and silk weaving developed in the Italian cities during the twelfth and thirteenth centuries, especially in Lucca, where an industry organized on merchant capitalist lines was built up for the production of cloths of gold and

silver, damasks, satins and velvets. Light silks were made in Catalonia and Valencia. Silk was imported through Genoa from Asia Minor, Greece and Spain to supplement the domestic supply, and the lustrous products were marketed at the great fairs, especially those of Champagne and Flanders, or on order from royalty or the papacy. From Italy the industry spread throughout Europe and to England; supremacy passed to France as civil wars demoralized Italian economic life and skilled artisans were encouraged to migrate.

By 1700 silk manufacture fostered by ambitious rulers had been introduced as a luxury industry into all the countries of Europe. It flourished fitfully in most countries, while in France it became firmly established by Colbert, who encouraged sericulture and aided it in other mercantilistic ways. Although in England an industry of considerable size was developed—40,000 persons are said to have been included in the silk guild in 1661—and the weavers of Spitalfields acquired some fame, it was able to survive, even when aided by the importation of Italian craftsmen and the Flemish and French refugees, only under protection amounting at times to absolute prohibition of foreign silks. Since England was able to hold its own in the other textiles, the failure of English silk goods to compete with the French must have been due in part to inability to produce raw silk either at home or in the American colonies.

Cotton was the last of the textiles to reach Europe. The earliest records of cotton weaving are to be found in the Chinese classics of the third century B.C. In all probability the people migrating from the central plains of Asia brought the technique as well as a knowledge of the plant with them to India, and by 800 B.C. the industry had advanced so far in India that there was a surplus for export. After the trade routes on both land and sea had been opened up by Alexander the Great, Susa became the first trade center outside of India, and Egypt discovered the uses of the plant. Cotton textiles never attained great importance in Greece, where they were a luxury of the upper classes; and they were imported comparatively late by Rome, where cotton remained a luxury import and no attempt was made to fabricate it. In their westward sweep from Arabia the Moslems brought the culture of cotton and the art of its manufacture to Spain. Under their influence all types of stout cotton fabrics were manufactured, and Barcelona, Granada, Cordova and Seville

became famous for their product. After the expulsion of the Moslems the industry waned

Cotton made its first effective entrance into European industry as an adulterant in wool and linen mixtures. By the twelfth century a fustian industry had been established in Italy and its products had penetrated Europe. First Genoa and then Venice became the great centers for the distribution of supplies, and by the fourteenth century cotton was crossing the Alps to supply the fustian industries of Vienna and the towns of Swabia, Flanders and Holland. It was the fustian industry which laid the basis of the fortunes of the Augsburg families, like the Fuggers, who carried the cloth to distant parts. When the Walloon and Dutch immigrants crossed the channel to England in 1554 they undoubtedly brought the industry with them, but it did not become firmly rooted until the seventeenth century. By then its production was established, particularly in Lancashire, although the export of fustians from England was small compared with the trade in wool and linen.

Meanwhile the various East India companies were importing increasing quantities of cotton and silk fabrics, especially calicoes, muslins and chintzes. In response to protests from the silk and woolen producers the importation of printed calicoes and a variety of checked and striped materials was forbidden in England, France and several European countries. The demand for these fabrics led to the development of domestic color printing on linen and Indian calico and in lesser degree on wool. Although printing on cloth had been practised in Europe as early as the fourth century, having come from the East through Persia and Egypt, it did not influence the new technique, which was developed simultaneously in the seventeenth century in Holland, France and England, probably through Indian influences. The success of the English in this branch of the industry, coupled with the protection unintentionally brought on by the woolen manufacturers, was one of the reasons for their subsequent preeminence in the cotton industry.

By the end of the seventeenth century the textile industries, wool, linen, silk and cotton, had spread throughout Europe. Because capital requirements were slight, except for certain kinds of finishing equipment, the development depended chiefly on the migration of the artisan. Throughout the Middle Ages this was accomplished by direct importation, by emigration of political or religious refugees and by invasion, as in the case of the Saracens. Since the simple

processes themselves were indigenous household arts, there was always a supply of workers accustomed to the industry and capable of practising it as a by-industry.

The methods of production and sale of textiles during the Middle Ages were similar in all countries. Wherever craft guilds developed, guilds of weavers were among the first to be created; second came the organization of fullers and dyers. As trade widened, these groups sometimes gained a monopoly of the trade, as in Venice, while more generally trading companies, such as the Teutonic Hanse and the Dutch and English chartered companies, arose to search for markets and monopolize them. With the development of transportation and the widening of the markets local supplies of raw materials became insufficient, and the merchant capitalist appeared to carry the risk and to organize the many operations in the production of cloth. Although the guild system lingered, the merchant seems to have become an almost universal figure in the cloth industries of the continent and England, rising to power either by way of the marketing functions or through the control of raw materials. It was his function, as described in the Statute of Artificers . . . , "to put cloth to making." Josiah Tucker speaks of one person who "buys the wool, pays for the spinning, weaving, milling, dyeing, shearing, dressing etc. . . . is the master of the whole manufacture, from first to last, and perhaps employs a thousand persons under him. . . . This is the clothier." Sometimes he enlisted isolated workmen, in other instances artisans grouped in crafts or corporations. When industry moved into the country districts to escape the restrictions of the guilds and the regulations of the towns or to find additional craftsmen, as it did in the Low Countries, France, Germany, England, Scotland, Poland and Bohemia, his managerial functions became more important. As he gradually extended his activities, he became known as the merchant capitalist.

As yet little capital had been needed for production. It has been estimated that hand cards cost a few pence, a spinning wheel a shilling or so and a loom six to twelve shillings. The fibers were first combed or carded by hand, drawn out with a slight twist and finally spun into yarn. Although the distaff and spindle were still in use, the spinning wheel had become part of the household equipment. Looms, which were somewhat more elaborate, were set up in the cottage or in adjoining sheds.

Except in the chemistry of dyes and printing and the use of water power in the fulling of cloth, there was little change in the technique of the manufacture of cloth throughout the Middle Ages. The only two inventions of importance were the Dutch loom for small wares, which wove 12 to 24 pieces simultaneously, and Lee's knitting frame invented in 1589, used for wool and silk. The farmhouse or the worker's cottage was the scene of production for all the textiles, with the exception of the special, or public, mills used for fulling and teagling. Both on the continent and in England there were isolated instances of large scale production, but they were not the dominant type. There were, however, silk throwing mills which were using water power, one of the most famous of which was the Lombes factory at Derby on the Derwent, established about 1718.

In the application of power driven machinery, which ushered in the industrial revolution, the cotton textile industry led the way. Several reasons have been suggested in explanation of the fact that the new methods were applied first to cotton. It has been pointed out that cotton fiber is more uniform and stronger than wool and better suited to mechanical manipulation, even though it was less easily adapted to the earlier machinery; that the cotton industry was new and less hampered by tradition, statutes and a tenacious group of producers; that cotton was cheaper and more desirable than linen, and there was the growing African slave market to be supplied; and that the industry was well protected from Indian competition.

Expanding markets and the divisions between the processes stimulated inventions. Kay's fly shuttle (1733) sent weaving ahead by increasing the speed and enlarging the width of the cloth and made it possible for one weaver to use the product of 8 to 10 spinners, whereas formerly the ratio had been one weaver to 5 or 6 spinners. The demand for yarn as well as the need for improvement in quality for warp threads turned the attention of inventors to spinning; Hargrave's jenny (1764), Arkwright's roller spinning frame (1768) and Crompton's mule (1779) made possible the simultaneous spinning of a large number of threads and improved both the quality and the strength of the yarn. In addition Arkwright was able by means of a carding invention to apply power to the whole sequence of the operations of carding and spinning under one roof. Whereas a handwheel spinner could spin only 4 skeins a day, a mill spinner tending

90 spindles could produce 180 skeins. The heyday of the weavers followed, lasting until the successful application of Cartwright's power loom (1789) after 1813. Three other important inventions were Bell's development of cylinder printing for calicoes (1785); Whitney's cotton gin (1793), which made possible a sufficient supply of cheap raw material; and Jacquard's loom (1801) for the weaving of intricate patterns, first used in silk weaving and later adapted to cotton weaving.

With the application of steam power to these machines in 1785 the technique for the mechanization of the cotton industry was completed, while its swift development was facilitated by the decision in the same year that Arkwright's patents were null and void. Factories employing 150 to 600 hands sprang up on the river banks, and output increased at a prodigious pace to meet the demand, as is shown by the fact that imports of raw cotton and wool to England increased from 5,100,000 pounds in 1781 to 145,600,000 pounds in 1820.

This development was not characteristic of the other textiles or of other countries. In Great Britain there was a lag in the mechanization of the wool and silk industries. In the wool industry the power loom appeared as a serious competitor to the weavers in the late 1830's, but it did not become general until the 1870's, and the hand loom weavers lingered on until the end of the century. The resistance of wool to mechanical treatment, the more restricted market for it and the conservatism of old crafts may explain the delay. Both silk and wool are more expensive than cotton and their products are more specialized. Hence they do not cater to as large a market or offer strong inducement for standardization. In the silk industry the power loom was not introduced until the 1860's. In fact it was not until the American market, with its tremendous purchasing power, developed in the twentieth century that real industrialization appeared in the silk industry.

The factory system did not get under way in other European countries until after the middle of the nineteenth century. The British policy of prohibitions was in part responsible and helped Great Britain to maintain its differential advantage. Skilled artisans were forbidden to emigrate and were penalized by loss of citizenship and confiscation of property. It was forbidden to export tools or utensils used in manufacturing cotton or cotton and linen mixed as well as sketches, models or specifications, and

offenses were punishable by fines and imprisonment. France, although second in world spindleage, was producing in 1835 only one fourth as much cotton as Great Britain. Raw materials cost more, the industry was scattered and capital charges for equipment were higher. The real period of expansion in France began in the 1860's, when its spindleage was about 6,000,000; the United States succeeded to France's rank when the latter lost its Alsatian spindles to Germany after 1870. In 1885 one third of the French output was still woven on hand looms. In Germany there were only 658,358 cotton spindles by 1840; these had increased to nearly 2,000,000 by 1860. After the Franco-Prussian War a period of real expansion followed, and by 1901 Germany was in possession of 8,435,000 cotton spindles. Weaving progressed more slowly; in 1878 over one half the weaving was done on hand looms, which persisted up to the World War; the bitter struggles for survival on the part of the linen weavers have been among the tragedies of economic history. By the 1870's the factory system had been introduced in the Netherlands, with Twente as the center. Italy had 715,000 spindles and Russia 3,000,000 spindles. Thus on the continent industrialization appeared much later and proceeded at a more leisurely pace. It is in fact not yet completed, for the hand loom is still used in the rural districts of every country. Except in silk no continental textile industry presented any challenge to the British supremacy.

Great Britain found rivals, however, in the United States and Japan, the one challenging its rank in world production, the other its position in world trade. In the United States the textile industries were the first to be established. Although the spinning wheel was a familiar article of household equipment, the mercantile policy of the mother country had developed a dependence on British exports. When the new country was cut off from supplies by the series of wars from 1776 to 1815, cotton and woolen industries were established. From the outset the cotton industry led all other manufactures in amount of capital invested, number of persons employed and value of product. It was localized in New England, especially in Massachusetts, where there was water power, a market, free capital and a labor supply. By 1830 the United States was second only to Great Britain in amount of cotton consumed and third in number of spindles, and by 1860 it had one sixth the number of spindles of Great Britain, slightly

fewer than France and nearly three times as many as Germany. Rapid increase continued and Great Britain's differential advantage was narrowed. In 1860 American spindleage was only 16 percent of British spindleage, in 1900 it was 42 percent, while just before the World War it had reached 56 percent.

Protected by tariffs, which in the 1890's averaged between 41 and 45 percent, the cotton textile industry in the United States was able to retain the domestic market and to shut out the British and European producers. It produced two inventions, peculiarly adapted to its own needs, which were to have significant effect on future dispersion of the industry, the ring spindle (1831) and the Northrop battery loom (1894). The ring spindle can be operated by less skilled operatives, it is continuous rather than intermittent, it takes less room and it makes it possible for one operative to tend a greater number of spindles. The Northrop battery loom saves running time, can be operated by women, takes less skill and permits great increase in the number of looms per operative. Without these two inventions the spread of the industry to Japan and to the southern states of the United States as well as to all backward industrial countries with their untrained labor supplies would have been greatly retarded.

Although the mechanization of spinning preceded weaving in the older industrial countries, the spread of the textile industries in the newer industrial countries has been characterized by a reversal of the process. Since weaving sheds can be operated on a simple scale with less capital and require therefore a smaller market, they are usually the first to be established in the agricultural countries. Yarns are imported from the industrialized countries, to supply both the new industry and the hand looms. Gradually the yarn importing country begins to spin as well, leaving the exporting country with a surplus supply. The latter in turn adds more looms to absorb its surplus yarn, as has been the case since the World War in Japan and Belgium. In this way, with no change or with even a decline in demand, output is enlarged. British exports of yarn, for example, have fallen about 36 percent from the 1909-13 average as compared with the 1930-32 average, while exports of piece goods have dropped about 68 percent.

The method of growth appears to have been the same the world over. The British attempts to keep their new inventions at home continued until 1843, when with the repeal of the protec-

tive legislation the movement began which was to establish a textile industry throughout the world. There is now scarcely a cotton or wool textile plant which does not possess machinery of British origin. Although the United States, Germany, France and Switzerland are also exporters, their aggregate exports do not equal those of Great Britain, which during the decade following the World War accounted for about 60 percent of the output of the British industry. In addition to the movement of machines there has been a movement of whole plants from the less prosperous regions of Lancashire to Jugoslavia, India, China and Australia, while in the United States one and one half million spindles have been shipped from New England and set up in the southern states. Wherever necessary these shipments, especially to the Far East, have been accompanied by highly skilled workers to instruct the natives.

The world trek has been aided further by international capitalists seeking the most lucrative investment for their surplus funds and industrialists who have taken advantage of lower costs to transplant their own productive units. British capitalists established mills in India and in China, after the Treaty of Shimonoseki in 1895; and the post-war shipments of textile machinery from England to China, India, Egypt and Jugoslavia have been financed in no small degree by money raised in London, at a time when Lancashire could not raise sufficient capital to modernize its mills with automatics. In the United States northern interests taking advantage of cheap labor, low taxes and laxer labor legislation have played a large part in the erection of textile mills in the southern states. The movement of the textile industry to the south gained momentum between 1870 and 1880 and by 1925 the south exceeded the north in spindleage, having already exceeded it in yardage. Between 1920 and 1930 the south gained 3,355,000 spindles, while the other states lost 7,591,000.

Tariffs have probably been the most important influence in the international migration of the textile industries in that they have led foreign capitalists to establish plants within tariff walls to evade import taxes. In the tariff history of the great industrial countries the textile capitalists have been the first proponents of protective tariff and have carried on the major offensive; this is true particularly of the cotton manufacturers of France and the wool and cotton manufacturers of the United States. Every country in the world now has some form of

import control of textiles; even the Netherlands has succumbed to import quotas. The rate structures are complicated and are very sensitive to the degree of protection necessary in the country's relation to the advancement of any given branch of the industry. In France, for instance, it is the cheaper products rather than the specialties which are protected. Usually rates are first imposed on coarse goods, while yarn is admitted free to feed the infant weaving industry. As spinning develops, coarse yarns are included in the schedules, followed as technique improves by rates on piece goods of finer weave; fine yarns are the last to be protected, since they are generally the last to be manufactured.

The localization of the cotton textile industries before 1914 in Lancashire, New England and central and western Europe obscured the tendency toward wide diffusion; and it was scarcely realized that these industries were not dependent on special, local conditions. The raw materials are easily packed and transported, they are imperishable and always convertible and their prices are governed by a world market. Progress in mechanization, especially in ring spinning and the automatic loom, has developed machinery to the point where skill is of little value; and the local labor of the mountain whites or the Japanese girls temporarily recruited from the rural districts can be trained to compete with the spinners of Lancashire. The industry can utilize the surplus labor supply of women and children often familiar with the household art. Whereas formerly water power, followed by accessibility to coal, was a determining factor, a steam turbine operated by electricity has eliminated this dependence. Even atmospheric humidity, which was considered a matter of importance in Lancashire and New Bedford, can be produced satisfactorily by air conditioning. Provided there is a sufficient market, textile mills can easily be installed and operated throughout the world; and the primary factors in international and regional competition have become wages, running hours, labor legislation, business management and currency levels.

Until the World War the cotton and wool industries of Great Britain presented a history of unbroken expansion, except for the Civil War period, and their dominance over world markets was uncontested. The number of persons employed was double that of any other industry. Cotton products amounted to about one fourth the total exports and comprised over half of the world trade. Nevertheless, the cotton industry

was employing proportionately less of the total number of workers, and Great Britain's position in world trade was being challenged. By 1913 all of the countries of Europe had important cotton textile industries, in Japan, China and India the industry had gained a foothold; while in the Americas, in addition to the United States, there were growing industries in Canada, Mexico and South America.

The World War hastened these movements and changes and because of violent dislocation undoubtedly aggravated the severity of the readjustments. By cutting off British exports of cotton piece goods, which in 1913 amounted to 73 percent of the total world exports, it stimulated the export trade in countries with established industries, such as Japan; while in other centers it offered a type of protection which fostered the growth of domestic industries, as in Australia, Argentina, Canada, India, China and Brazil. The spirit of nationalism awakened by the war and the Treaty of Versailles has been accompanied by industrial ambitions which have led to the building of new textile mills. By the revision of boundaries textile units were broken up, a situation particularly disastrous for the industry because of the ease of replacement. France acquired from Germany 1,891,450 cotton spindles and 50,258 cotton looms in Alsace-Lorraine; these Germany promptly replaced at no great cost during the inflation period; Poland fell heir to the mills of Łódź built to supply the Russian market with coarse goods as well as to Austrian mills. Estonia, which formerly had no foreign trade, received 750,000 spindles and has been forced to export. In the break up of the Austro-Hungarian Empire, Czechoslovakia, with a population of 13,000,000, acquired 79 to 90 percent of the textile industries built to supply a population of 52,000,000. The spindles of Austria were separated from the weaving sheds of Bohemia. The cost differentials arising from disordered post-war finance served further to increase equipment and push sales, as, for instance, in the Netherlands and later in Japan.

Although the significance of comparative figures is complicated by various factors, such as differences in types of spindles and looms, hours of running, speeds and the post-war changes in boundaries, as well as by incomplete reporting, available statistics for the cotton industry indicate that there has been a general increase of 9.88 percent in world spindleage since 1913. There has been a decline of 1.5 percent for Europe including Great Britain or an increase of

11.76 percent excluding that country, a rise of 3.87 percent in the Americas with the United States included or 70.31 percent without the United States and a vast increase, amounting to 137.41 percent, for Asia. Figures for the last sixty-three years indicate a decline in annual percentage increase of spindleage until 1929, when an actual decrease set in for the first time since the industrial revolution. Although an annual decrease of world spindleage has continued since then, increases have been recorded for eleven countries (Soviet Russia, Spain, Poland, the Netherlands, Finland, Hungary, Denmark, India, Japan, China and Mexico), indicating that some displacement is taking place.

The derangement of international trade in the textile industries has been one of the immediate repercussions of post-war dispersion and increased productive capacity. Whereas before the war Great Britain, which exported approximately four fifths of its cotton piece goods output, dominated world trade with 58 percent of world exports by value of product, the nearest competitor being Germany with 10 percent, in 1930 the former's percentage had fallen to 40 percent. Although the other principal countries, with the exception of Germany and Switzerland, shared among them England's percentage losses, the lion's share went to Japan. Rising from a position of comparative unimportance twenty years ago, Japan has swept forward in the industrial world, building up its empire on cotton textile exports as Great Britain did a hundred years before. Its textile industry, subsidized by the government, is highly centralized in organization (the Japan Cotton Spinners Association controls at least 97 percent of the spindleage); its finished products are exported largely by three companies, which also purchase the raw cotton; and it pays very low wages, thus increasing its competitive power. It has searched aggressively for markets throughout the world, first in the neighboring oriental countries, then in India, Australia, the Middle East and Egypt and finally in the Balkans. The margin between British and Japanese exports of cotton piece goods was narrowed, until in 1933 Great Britain lost its lead in yardage export, a position which it will probably never regain.

With old markets shrinking as native industries develop, the quest for new markets has been keen. Whereas before the war Great Britain was the only country with a world market and the other countries confined themselves to certain areas, keen competition and rivalry are

now characteristic of any market where there is a demand for textiles, whether it be in the Balkans, on the Gold Coast of Africa or in Peru, where incidentally the huge Indian market is an impressive stake in the struggle. Since the industries of Great Britain, Japan, Belgium, Czechoslovakia, the Netherlands and Switzerland must export over half their output and those of Italy and France well over a third, these countries are making every attempt to safeguard markets over which they have any control. Colonial markets are being reserved largely for the mother countries; the policy of empire preference, adopted at the Ottawa Conference, has given more favorable terms to British textiles; while the new bargaining trade agreements of Great Britain are designed to protect England's textile exports in the countries with which it has bargaining arrangements.

Military demands during the World War added to the dislocation of foreign trade in wool and hastened the movement toward the East which was already under way. Japan is now practically self-sufficient in the production of woollen textiles and is rapidly increasing its output, as is also the Soviet Union; while in Australia, which has suffered from surplus stocks, there is a drive toward the fabrication of wool at home. The United Kingdom, France and the United States still consume the most wool, followed by Germany, Japan, Italy and Belgium. In 1926 the United Kingdom, the leading exporter of wool products, shipped more than twice as much as France and Germany, which came next in importance (*see* WOOL).

The future of the export trade will depend on the speed of industrialization in the Orient and on economic conditions. As a style fabric wool has an elastic demand, and much of the European interchange of tops, yarn and cloth is due to success in specialization. Any estimate of future demand must take into consideration the tendency toward the use of lighter clothing, omission of linings and the substitution of knitted garments, which may nevertheless be made of wool yarns. On the other hand, the spread of the clothing industry has enlarged the market for standardized materials, the luxury demands for certain fabrics have been increasing and, most significantly for the immediate future, there is a trend toward the adoption of European clothing by the peoples of the Far and Near East.

Except in the Orient silk has continued to be a luxury industry. Of the older industries it is

the least mobile and the least mechanized, although the fiber lends itself easily to the machine process. Since it is too expensive for a large market, the important factors from the outset have been the cheapening of the raw material and the development of higher standards of living. The needed stimulus was furnished by the higher wage levels in the United States during the World War and the post-war decade, when the American industry alone increased its consumption of raw silk by 225 percent. The center of the silk industry has shifted from Lyons to New York. Although comparative statistical data are lacking, it is estimated that there were in 1933 between 270,000 and 300,000 power looms, at least 40 percent of these being in the United States, and over 600,000 hand looms, only a small percentage of which produce commercial products.

Although the manufacture of artificial silk was practicable before 1914, there are few plants with a pre-war history. The first rayon factory was started at Besançon, France, in 1889 and was followed by similar enterprises in the other industrial countries of Europe, in England and in the United States. Their promising development was soon checked by the World War, when many of them were commandeered for military purposes or were deprived of chemicals or labor. The dearth of textiles which followed the cessation of hostilities as well as the high prices of other fibers and the demand for luxury fabrics created an excellent setting for the growth of the new industry. The annual world rayon output increased from 52,120,000 pounds in 1920 to 660,155,000 pounds in 1933. The two countries showing the most phenomenal growth are the United States and Japan. Beginning production on a commercial scale in 1911, the United States ranked fifth in production in 1913 and by 1922 had gained first place. Since then it has continued to produce twice as much as its nearest competitor. Meanwhile Japan, which produced only .42 percent of world output in 1923, captured second place in 1933, producing 13.5 percent of the world output.

Unlike the other textiles, rayon spinning is concentrated in a few units. The industry has not spread rapidly, as capital investments in plants are large, the success of the producers depends on mass production, yarn is easy to ship and secrets are carefully guarded. About ten large concerns control approximately 70 percent of the world production. National associations have bound domestic producers into man-

ageable groups, which in turn have developed a complicated network of foreign affiliations, patent agreements and technical collaboration. In 1927 there was formed an international cartel based on an agreement between Courtauld, whose American subsidiary is the American Viscose Company, the Vereinigte Glanzstoff-Bemberg of Germany, which also has large investments in the United States, and the Snia Viscosa; later the Dutch Enka joined the combine. Other influential groups include the Tuzize group, the Celanese group and the Duponts.

According to statistics available for the United States rayon has definitely become a substitute for silk and cotton in knit goods and has reduced their consumption. In woven goods it has played a dual role. As a complementary fiber it has undoubtedly stimulated the demand for certain cotton fabrics by making them more attractive, while in the case of broad loom silks it has displaced the silk in the cheaper grades. In Lyons it is reported that 75 percent of the looms are working on rayon instead of silk, while the ratio of French exports of rayon and rayon fabrics to silk and silk fabrics shifted from 9 to 115 in 1926 to 9 to 8.6 in 1931. Its general gain as compared with other fibers in the United States is evident from the statistics assembled in the adjoining table. Further progress in substitution will depend on chemical research and the price relationships among the fibers. Since the World War the prices of raw cotton, raw wool and silk have fluctuated wildly, while the price of rayon, the controlled fiber, has declined steadily, both absolutely and relatively.

The size of plants in the textile industry varies from the small mill employing fewer than a hundred persons to the huge plants producing standardized goods in Great Britain, the United States, Japan and the Soviet Union. In general small concerns are most numerous except in the case of rayon. In France and Holland the introduction of electricity is now tending further to decentralize the textile industries. Not only is the small or medium sized plant, frequently family owned, most typical, but the amalgamation movement has proceeded at a much slower pace in these industries than in others and big combinations are few in number even in Germany and the United States.

A tendency to elaborate specialization, both in the cotton and in the wool industries, has been carried to the extreme in Lancashire. Not only is every function a specialized industry, but whole towns concentrate on the production of

separate counts or special fabrics. In cotton the separated functions may include raw cotton merchandising, spinning, yarn merchandising, weaving, finishing, packing and merchandising, while in the worsted industry they comprise wool buying, top making, combing, spinning, warping, weaving and finishing. Because of the importance of the character of the yarn the woolen industry generally incorporates all of the processes in one firm. In the United States it has been more usual

CONSUMPTION OF MAJOR TEXTILE YARNS IN THE UNITED STATES, 1900-32

to combine spinning and weaving, since in both wool and cotton fabrics the tendency has been to produce standardized cloths not requiring a wide variety of yarns, whereas in England the employers have testified to the demand for variety of product.

Confronted with narrowing markets and the competition of a new textile, the textile industries in capitalist countries are poorly organized to cope with the problem of surplus capacity. Numerous schemes to control production and

marketing have been tried with varying success: cooperative marketing in the Netherlands, Belgium, France, Great Britain and the United States; voluntary price fixing and limitation of output or the quota system in Czechoslovakia, Austria, Great Britain, Italy, Belgium, Poland and Switzerland. The Lancashire Cotton Corporation, which has been aided by the Bank of England, represents the most successful attempt to reduce surplus capacity through rationalization. According to its general scheme over one hundred mills have been absorbed, about a quarter of which have been scrapped and the others, with over 7,000,000 spindles, have been reconditioned. The Soviet Union, on the other hand, is continuing under its second Five-Year Plan to increase production in cotton, silk, woolen and linen textiles to meet the needs of a vast and growing domestic market, a counter movement of expansion which is characteristic of the other non-industrial countries all over the world.

ETHEL B. DIETRICH

LABOR. The textile crafts are among the oldest of human occupations and are practised by all primitive peoples. When man scratched the story of his deeds in the rocks, he was already making, dyeing and ornamenting fabrics. In all the ancient civilizations of Europe and Asia the textile craftsmen attained extraordinary skill, particularly in design and color, and contributed greatly to the development of pride in workmanship. The early Mexicans made cloth and the more primitive Indians to the north perfected the art to a marked degree. The technology was of the simplest. For ages spinning was done by means of a wooden spindle, rotated directly by hand; the spinning wheel was not developed until toward the end of the Middle Ages. There was more progress in the looms used for weaving, but this also was slow until the changes wrought by the industrial revolution.

While in the great urban centers of the ancient civilizations there were textile factories, usually employing slave labor (the Romans established such factories in Britain), the manufacture of textiles was in general a home industry, the work being performed mainly by women and children. Alongside of both factory and home industry flourished the highly skilled craftsmen who produced finer goods; these all but disappeared in western Europe after the breakdown of the Roman Empire. Up to the early Middle Ages wool and flax were used almost exclusively

in the manufacture of woven goods; the raw material was raised on the lands of the villagers and farmers, and spinning and weaving were a regular part of the household routine. The growth of a flourishing merchant class and the rise of the towns between the twelfth and the fourteenth century created new conditions which ultimately removed much of the work of textile production from the home. Cotton fibers brought from the Orient offered active competition to the flax and wool which the peasant raised and painstakingly prepared for spinning on his tiny farm. The day of the rough homespun which everyone could produce was passing, especially because of the demand by the nobility and the wealthier merchants for finer textures, more beautiful colors and distinctive patterns. Cottagers who had supplemented scanty earnings by spinning linen and woolen cloth for the local market found it impossible to pursue both callings. The heavy rough hand of the tiller of the soil could not produce the fine thread the trade demanded, and workers began to devote themselves wholly to the fashioning of fine fabrics on their hand looms. The rise of a class of highly skilled craftsmen and soon afterward its division into independent manufacturers and journeymen employees, who worked in the small shops and primitive factories on a piece basis, and poor artisans, who bought raw materials from the large dealer and sold him their finished product, followed as a matter of course.

Cut-throat competition soon made some form of protective organization imperative. The guilds were the earliest answer to this need. They fixed prices, set standards of quality, determined the number and training of apprentices and in general kept a firm hand on the textile trade. They encouraged the development of skill among the craftsmen and rigorously supervised the quality of workmanship. The introduction of machinery was generally opposed. For two centuries these guilds were able to maintain their hold in all the important countries of Europe. Many of the guilds were very large; in England in 1661 the silk guild numbered some 40,000 persons, including women and children. A product of the new economic forces developing within feudal society and bound up with the rising bourgeoisie, the guilds were a powerful factor in the fight of the mediaeval towns for civic independence against the dominant nobility. The guild of the English weavers obtained the right of marketing and autonomy before the emergence of municipal

government. In Brussels an international federation of forty-two towns and cities was formed to limit the supply of workers and to exclude others from blacklisted towns. In Lancashire the wool guild, under the civic constitution, had full control of employment and of all matters connected with capital and credit. Although masters and journeymen were ostensibly united fraternally within the guilds, there soon developed organized struggles of the journeymen workers, whose interests were becoming more and more distinct from those of their masters. In Ghent in 1345, in a "strike" in which hundreds were killed, and again in Leyden in 1478 textile workers successfully fought for their demands. As the guilds, primarily because of an inability to take advantage of new technical developments, began to decline, the antagonisms between masters and journeymen assumed more acute forms.

Although many changes took place in the technology of textile manufacture and the early factory system made steady progress, textile workers up to the second half of the eighteenth century were generally independent craftsmen. Production, whether in the cottage or in the small factory, was carried on by means of simple hand machinery. Then the series of inventions which ushered in the industrial revolution completely transformed the status of the textile worker. The spinning jenny, the water frame and the mule put an end to hand spinning, although weaving for some time still remained largely a manual industry. With the introduction of the power loom, however, hand weaving began rapidly to decline and by 1816 was in complete collapse. For the worker this readjustment period was one of unspeakable suffering. Old skills suddenly became useless and women and children flocked into the mills to do the unskilled work of tending machines. These helpless workers, most of them taken from almshouses, were bound out for from seven to twenty-one years. It has been estimated that in the early days of the factory system 20 percent of the employees were women, 35 percent men and 45 percent children; less than one quarter of those employed in the British textile factories in 1839 were adult males over eighteen.

In Great Britain the new machinery aroused resistance among the workers it displaced. The introduction of the spinning jenny in 1767 was accompanied by a series of riots; in 1779 mobs of infuriated men sacked and burned the factories of Arkwright, the inventor of the water frame. Between 1811 and 1816 the famous Luddites

conducted a well organized campaign of machine smashing in all parts of the country. At Blackburn in 1826 more than a thousand power looms were destroyed in three days as a protest against the factory system, under which half the town was living on public charity. In Germany the Silesian weavers rose in revolt in 1844 against the machine, and similar uprisings followed in Saxony and other districts.

As the terrible aftermath of uncontrolled exploitation became apparent, Great Britain made an effort to correct some of its worst abuses. A crusade against child labor, which was greatest and most abused in the textile factories, was the first indication of awakening social consciousness. Robert Owen demanded the legal abolition of all child labor. Sir Robert Peel, himself the employer of a thousand children, brought the question to the attention of Parliament in 1802, and the first of a series of factory acts was passed as a result of the storm of disapproval his revelations brought forth. These laws provided for a minimum of sanitation in the factories, forbade the binding out of children under nine, restricted labor to twelve hours a day and prohibited night work for minors. In 1847 the ten-hour day for young persons and women, with half time for children, was established. By these acts the working hours of three quarters of all persons employed in the British textile industry were regulated.

These developments fostered the process of workers' organization, a difficult undertaking, since Parliament, alarmed by the growth of secret societies among the textile proletariat, had enacted legislation in 1800 against all efforts to organize for higher wages and ten years later had increased the severity of these laws after the Luddite movement. But organization progressed despite legal bans. In 1808, after Parliament had refused to accept minimum wage legislation, the Manchester cotton weavers struck for an increase; in 1812 there was a general strike of the Glasgow weavers, in which 40,000 looms were stopped. Disappointed by the failure of their minimum wage campaigns, the textile workers for a brief time joined in the vanguard of the parliamentary suffrage movement, then veered once more to industrial action in 1818, when a new strike wave broke out in various parts of the country.

In Germany too the textile worker became the pioneer of labor organization, but here the growth of unionism was slower and less spontaneous. The old journeymen's associations had

fallen victim to regulations and prohibitions under an era of mercantilism. In Prussia the code of 1794 forbade journeymen to associate and to hold meetings. The Industrial Code of 1845 undermined further the feeble efforts at labor association. In Great Britain the labor union was a direct outgrowth of the journeymen's guilds; in Germany no such traditions remained and it was left to the political labor movement at a later date to take the first steps toward the creation of labor unions. It was the uprising of the Silesian workers in 1845 that led to the first attempt to organize textile labor. Four years later the first weavers' society (Weber Verein) was formed with twenty-eight branches. In 1868 a congress in Berlin created a central body for all branches in the industry and was instrumental in building up the *Verband der Farber, Weber und Fabrikarbeiter* "for joint action in the stoppage of work." Finally in 1874 the *Deutsche Textilarbeiter-Verband* was formed.

Although France lagged behind England and the old domestic system and the handicrafts prevailed until after 1825, the industrial revolution produced the same results but on a smaller scale. One of the earliest attempts at organization among the French textile workers was the *Union d'Ouvriers des Tisserands*, which was formed after a strike in 1821. The two great revolts of the Lyons silk weavers in the 1830's, while they had revolutionary republican implications, were essentially strikes of the modern trade union kind, with no element of opposition to the machine. In 1814 Belgian spinners organized to provide for their members in case of illness, old age or death; but the opposition of a powerful employer caused the dissolution of the organization. Throughout the nineteenth century every attempt of the Belgian textile workers to organize was suppressed under the anticombination law.

In the New World the North American colonists had attained considerable skill in textile work before the beginning of the eighteenth century; by the end of the century the real development of textile manufacture on a commercial scale had begun. After the Revolutionary War the scarcity of labor made possible the employment of women and children to an extent previously unheard of. In 1831 in twelve large cotton manufacturing states 58 percent of all employees in the cotton mills were women and 7 percent children under twelve. Rhode Island textile manufacturers employed entire families

in their mills, housing them in company dwellings and providing for their needs from company stores. Massachusetts at first frowned on child labor, but it was not long before young girls were brought into the mills from all over the countryside and boarded in company houses under the supervision of matrons employed by the factory owners.

The first strike on record in the United States occurred in Pawtucket, Rhode Island, in 1824, when mill girls went out against a wage cut and for the ten-hour day. In this period women rather than men seem to have led in aggressive action, because they constituted the overwhelming majority of the workers. In many of the strikes led by these militant women processions, banners and even gunpowder played an important part. The first labor organizations of textile workers were sporadic affairs. They were usually branches of British trade unions, although some of them were affiliated with central labor bodies in the United States. Organization was seriously interfered with, since the existing conspiracy laws forbade associations organized on class lines; thus the leaders of a weavers' union in Connecticut were sued for damages by the employers and were imprisoned on a charge of conspiracy to ruin the latter's business. As was generally true of American labor at that period, the textile workers in their meetings discussed questions of suffrage, prison reform, free public schools and other problems of the day as much as their own immediate interests.

During the early part of the nineteenth century the introduction of new improved machinery displaced considerable factory labor. In 1844 James Leach, Chartist leader, published figures to prove that in 1841, 35 representative factories in Great Britain employed 1060 fewer mule spinners than in 1829, although the number of spindles in these factories had increased by almost 100,000. In 1831 the ring spindle was introduced into America and did away with the highly skilled mule spinners by making it possible to use women and young children in their place. Technological change continued until virtually all branches of the textile industry were highly mechanized. This process was accelerated after the 1870's. Today the human element is reduced to a minimum; every process is mechanized, from the handling of the raw material to the packing of the finished product. It has been estimated that the work done in a factory containing 200 steam operated looms would, if performed by hand, give employment

and support to 2000 persons and that a modern weave room containing 200 power looms operated by 25 weavers produces the equivalent of the output of a community of 60,000 craftsmen, their wives and children in the early days of home production. In the first twenty-five years of the twentieth century, the period which saw the shift to electric power, the productivity of the individual worker was increased approximately 25 percent. Mechanization is now greatest in the rayon plant, where apparatus in series and remote control have made production almost completely automatic and reduced labor to a very low minimum.

Despite the enormous increase in mechanization and labor saving devices the total number of textile workers grew because of the industry's expansion. In the United States employment reached a peak in 1923, with 1,715,293 workers, but fell to only 1,707,526 in 1929. Since the World War, however, the textile industries manufacturing cotton and woolen goods have been in a depressed condition, with a great increase in both unemployment and part time work and many large wage reductions. Rationalization and the competition of rayon were important factors, particularly in the decline of the cotton goods industry. Another important cause was the overexpansion of the industry during and after the World War, with the consequent intensification of international competition.

As a result of depressed conditions in the cotton goods industry the income of the mill workers in the United States dropped about 30 percent between 1920 and 1930. In practically every country wages fell from 10 to 20 percent below the average for other industries. Wage cuts were accompanied by an increase in hours of labor. These developments were resisted by the workers. Many strikes were waged in the United States. In France the textile federation, which had been virtually destroyed during the war, was revived. During the period of peak prices there were more strikes in textiles than in any other French industry. A series of sharp conflicts between 1924 and 1928 swept over Germany, Czechoslovakia and Austria. Even in Japan, where government suppression of trade unionism is almost axiomatic and both the cotton and the silk manufacturing industries employ female labor to a large extent, a number of widespread strikes took place. In China too, where the spinners and weavers are organized in guildlike unions, strikes rose sharply from 8 in

1918 to 201 in 1926; in India 808 out of 1739 strikes fought from 1921 to 1929 were in the textile industry.

Labor conditions are especially bad in the newly developed textile industries of formerly economically backward countries, which reproduce the worst conditions of the industrial revolution in England. Vast numbers of children are employed. Wages are extremely low. In Japan thousands of young girls are employed in cotton mills and housed in unhygienic dormitories inside the factory walls. Hours of labor are high. A study made by Dr. Ta Chen in 1931 showed that 100,000 of the 130,000 Shanghai cotton workers investigated were women and children, who worked an average of almost 11 hours per day. In India British capital has produced the beginnings of the mill village system of housing with its attendant evils. An elaborate system of fines cuts still further into the already low wage of the Indian textile worker. Despite rapid expansion unemployment has made its inroads in these newly developed textile nations.

The competition of Japan has deprived the British cotton industry of many foreign markets; Manchester since the war has been in a state of chronic depression. The American cotton goods worker found his worst competitor much nearer home. Labor difficulties coupled with the high overhead of production in the old established communities of the northern states impelled many of the mill companies, particularly those producing cotton goods, to transfer their plants to the undeveloped communities of the south, where the men and women of these agricultural regions, wholly without industrial experience, worked for rates one third lower than those in the north and in turn caused a sharp depression of wages in the entire industry. Wages are low in the industry as a whole; in 1929, at the peak of prosperity, the average yearly wage of all textile workers was only \$1000.

Unionism developed later and much more slowly in the south than in the other regions of the United States. A sort of political feudalism and a highly effective system of blacklisting made it easy to suppress organizations wherever they were started by forcing union men out of the state to find work. But in the late 1920's the growing industrialization of the south furnished the basis for more permanent organization, even in the smaller towns. Usually with the aid of outside agencies independent unions and study classes on economic and civic problems were created. Progress was, however, slow. Southern

cotton mills employ white labor almost exclusively, so that the Negro is not responsible for the backwardness of labor organization.

To meet the competition of the southern mills the old textile producing centers made a serious effort to put their plants on a more efficient basis. In 1922 the United States textile industry launched a campaign for the elimination of surplus equipment and wasteful machinery, the introduction of automatic looms and ring spindles and the setting up of efficiency wage schemes. The famous Pequot plan, in which union and manufacturer cooperated to increase the productivity of the undertaking, became the by-word of modern management until a serious strike raised doubts as to its feasibility. A similar process of rationalization has been going on in other countries. This does not involve introduction of new machinery so much as intensification of labor, according to a report on rationalization presented to the Congress of the International Federation of Textile Workers' Organizations held in Berlin in 1931. The congress therefore adopted a resolution recognizing the "employment of all technical measures . . . as an inevitable accompaniment of private capitalism" but imposed on all affiliated organizations the "obligation to continue to oppose all measures by employers which, under the guise of rationalization and without improved production or working methods, tend only to excessive exploitation of the worker in order to increase profits."

The world wide depression which set in after 1929 dealt a heavy blow to an already overburdened industry. Unemployment increased by leaps and bounds. The Austrian industry reported 13,000 out of work. In Germany only 44 percent of the workers in the textile trade were employed in 1931, and in Great Britain unemployment in the ranks of the cotton mill workers rose from 12 percent in 1928 to 38 percent in 1931. Wages fell to still lower levels, although several determined attempts were made, as, for instance, in the strike of 250,000 British textile workers in 1931, to fight the longer work-day and the intensification of labor growing out of the industrial crisis. Both employment and wages declined disastrously in the United States.

The growth of the rayon industry, whose competition is responsible in part for the depressed condition of the older textile industries, has not been accompanied by union organization; almost no unionization in this field exists in Italy, Germany, England, France and the United States. The major reason is the highly

concentrated nature of rayon production and its control by a few monopoly enterprises. Moreover the rayon producers are united in an international cartel which controls about 85 percent of the world output. An important element contributing to the non-organization of labor is the jurisdictional dispute, which has grown to international proportions, between the factory workers, who claim those who work in the rayon industry for their own because they are employed in chemical production, and the older textile workers, who look upon them as producers of textile products.

In 1932 the International Federation of Trade Unions reported that 16 national organizations in every important country of Europe were affiliated with the International Federation of Textile Workers' Associations. These organizations claimed a total membership of 925,000 in 1928, which fell to 862,000 in 1932 as a result of the world economic crisis. The United Textile Workers of America, which is not affiliated with the International Federation of Textile Workers' Associations, reported to the 1933 convention of the American Federation of Labor a membership of 20,000 as against more than 30,000 in 1928. There are several opposition unions with a very small membership. In 1933 the membership of the International was again radically decreased when National Socialist Germany, following the example of Fascist Italy eight years before, dissolved the independent textile union with its membership of 280,000. Great Britain with about 350,000 members is the largest of the affiliated organizations; France follows with about 70,000 textile operatives in two rival unions, Belgium with 65,000 and Czechoslovakia with 55,000.

Much of the weakness of labor organization among textile workers is inherent in the industry itself. The shifting of the industry from Europe to Asia and, in the United States, from the north to the south, bringing in its wake unemployment and low wages, seriously threatens the existence of labor unions. The predominance of woman and child labor, by nature transitory and difficult to organize, and the rapid elimination of skilled labor are additional factors preventing effective union organization. Unions in Europe as well as in America have attempted to meet some of these difficulties by adopting a policy of cooperation with the industry based upon an alleged identity of interests between employer and employee in solving its fundamental problems. Such cooperation has shown a marked tendency

to make the union a personnel agency for the management rather than an instrument serving the interests of the workers, and to place the management of the union in a position where its primary concern becomes the making of profits and the insuring of uninterrupted production rather than the building of a militant and self-reliant organization of workers. In the United States the problem of textile labor union organization centers around the question of northern and southern production. If the southern field is permitted to go uncared for, a powerful non-union, trustified industry will become firmly established. The south may prove to be a more favorable field for organization than has been supposed. In the north the industry is being re-organized, old plants are being scrapped and concerns are going out of business. In the south there is a growing industry with new machinery and new methods. As the southern "hillbilly" grows accustomed to improved living standards, he may become dissatisfied with prevailing conditions and turn to organization. Finally, textile unionism will have to learn that the fight for better conditions must be waged on a large scale. Minor struggles are no longer effective against an industry combined in powerful associations and subject to the control of the banks. The worker must branch out from his narrow trade union point of view to the support of a labor movement which recognizes a solidarity of interests between all workers and the necessity of expressing this solidarity by mass action on the political as well as on the economic field.

THAER, ALBRECHT DANIEL (1752-1828), German agronomist. Thaer, a physician by profession, engaged in agriculture as a hobby. He was spurred on to scientific writing mainly by his reading of the works of English agronomists, notably Arthur Young. His *Einleitung zur Kenntnis der englischen Landwirtschaft* (3 vols., Hanover 1798-1800; 2nd ed. 1801-06) not only described the conditions in England but also presented Thaer's views on the applicability of English institutions to German conditions. After Thaer had developed his small experimental establishment into an agricultural research institute which soon attained wide recognition among his contemporaries, he was called to Prussia in 1804 and proceeded to establish the Akademische Lehranstalt des Landbaues on the estate of Moglin (Mittelmark). He became professor at the newly founded University of Berlin in 1810. His chief work, *Grundsätze der rationalen Landwirtschaft* (4 vols. Berlin 1809-12, new ed. in 1 vol. 1880; tr. by W. Shaw and C. W. Johnson, 4th ed. New York 1852), was translated into many languages and established Thaer's reputation as an agronomist outside of Germany.

Thaer considered agriculture as an art whose function was to aid the farmer in the realization of the highest possible net yield by means of proper methods of calculation and observation. For this reason he attacked not only all the legal restrictions which prevented the distribution of land among the best cultivators but also all those traditional hindrances which prevented its fullest utilization. While Thaer cannot be regarded as the inventor of the system of crop rotation, he was the first to establish its superiority to the traditional primitive three-field system. As a result of the incorporation of potatoes, turnips and leaf crops into the regular system of rotation the conditions of the fields and the maintenance of the livestock improved both qualitatively and quantitatively, and the landlord secured greater freedom in respect to the individual organization of his economy. Thaer was justly renowned as the father of agricultural science and rational agriculture. His scientific contributions together with the reforms of agrarian law which he sponsored, and which liberated the landlord from the restrictions of collective forms of landownership and land utilization, resulted in the tremendous progress of German agriculture in the first half of the nineteenth century.

THAYER, JAMES BRADLEY (1831-1902), American jurist. Although he was one of the few really notable American legal scholars, Thayer did not enter upon his academic career at Harvard until he had practised almost twenty years in Boston. With Langdell, Gray and Ames he did much to establish the fame of the Harvard Law School, where he taught constitutional law and the law of evidence. As a constitutionalist he stood for a liberal construction of the constitution, and as a writer in this field he contributed a graceful but miniature biography of John Marshall. His seminal work, however, was his *A Preliminary Treatise on Evidence at the Common Law* (Boston 1898), which has become a recognized classic of Anglo-American legal literature.

Although the law of evidence had been long in

developing, neither its history nor its basis was clearly understood. Evolved by trial judges in the heat of forensic dispute, it constituted a veritable maze of rules. It was Thayer who showed that while it was an illogical it was a "by no means irrational patchwork." Stimulated by Brunner's work, he believed that he could bring order into the confusion by tracing the development of the jury system in England. While he was not the first to suspect that the law of evidence was a product of the jury system, he was the first to demonstrate the influence of the older modes of trial. The law of evidence had grown with the transformation of the jury from a body of neighborhood witnesses into a body of impartial triers of fact. If the jury was to be controlled, much that was logically probative had to be withheld from its consideration. The law of evidence thus developed as an exclusionary system. Many of its rules really represented the application of principles of procedure or of substantive law. Moreover Thayer was no blind devotee of the exclusionary system but urged its simplification by the judiciary in the exercise of its rule making powers.

Thayer's accomplishment was both historical and dogmatic. His preliminary treatise was followed by the monumental work of Wigmore, who worked out in detail the individual rules of evidence. Thayer's achievement in tracing the history of the jury system is unchallengeable. But his rationalization of the system of evidence as a necessary corollary of the jury system still presents certain difficulties. The rules, for instance, were supposed to be applicable in equity trials and before judges sitting without juries. No purely exclusionary rules developed in continental jury practise.

B., and others, in *Harvard Law Review*, vol. xv (1901-02) 599-600, Hall, James Parker, in *Great American Lawyers*, ed by W D Lewis, vol. viii (Philadelphia 1909) p. 345-84, Beale, J. H., "Langdell, Gray, Thayer and Ames—Their Contribution to the Study and Teaching of Law" in *New York University Law Review*, vol. viii (1930-31) 385-95.

THAYER, WILLIAM ROSCOE (1859-1923), American historian and publicist. Thayer was the son of a Boston shipping merchant. From 1871 to 1874 he attended St. Paul's School, Concord, and passed the next two years and a half abroad studying with tutors, mainly in Italy. He entered Harvard in 1877, graduated in 1881 and embarked upon a journalistic career.

In 1885 he returned to Harvard for his master's degree, taught there in 1888-89 and then withdrew to a life of study and writing, also editing the *Harvard Graduates' Magazine* from 1892 to 1915. He had developed interests in literature, music and painting and particularly in Italian history from 1848 to 1870, "an era which," as he said, "forms one of the noblest episodes in the history of any country."

In 1893 he published *The Dawn of Italian Independence* (2 vols., Boston 1893), a study dealing primarily with the period from 1815 through the revolutions of 1848 and 1849 and designed to serve as an introduction to a projected life of Cavour. After a nervous breakdown which interrupted all historical work for several years he brought out *Short History of Venice* (Boston 1905), a historical synthesis in which he eulogized the oligarchy and which contained two valuable chapters on art and civilization. He completed in 1911 *The Life and Times of Cavour* (2 vols., Boston 1911), a monumental, exhaustive, authoritative and vivid history of the period, brilliantly written, which placed the author in the forefront of American biographers and historians. Together with his other works on Italy it gave Americans a deeper and truer understanding of that country than they had hitherto possessed. The chief charge against it has been a bias against the papacy and the radicals who differed with Cavour. With the latter's political liberalism and economic *laissez faire* Thayer, as an independent in politics, was especially sympathetic.

He next undertook the *Life and Letters of John Hay* (2 vols., Boston 1915), a frank "personal biography and not a political history." During the World War and even before 1917 he played an influential part in winning American opinion in support of the Allied Powers. Their similar attitude to the war brought Thayer close to Theodore Roosevelt and led him to write *Theodore Roosevelt* (Boston 1919), "a personal narrative" and an "intimate biography of our greatest public man since Lincoln." He also published *The Art of Biography* (New York 1920) and a short life of George Washington (Boston 1922), whom he sought to "humanize." His miscellaneous essays on Italian subjects were collected in *Italica* (Boston 1908). Thayer conceded the necessity of thorough research but held that the historian should also be able to discern essentials, see vividly, interpret and philosophize and be an artist as well. His later works lacked the elaborate scholarship which distinguished his

Cavour, primarily because he lost the use of an eye in 1915.

THEATER. Although often considered, and with some justification, as merely one form of public amusement the theater at its best is essentially an art. For in addition to offering diversion from daily preoccupation and routine it may serve the more positive function of building up in the individual spectator a new pattern of inner experience in which are purged and reintegrated the emotions and ideals of the world of reality. The origins of the theater are to be found in the religious ceremonial and cult through which primitive peoples of all time have sought to promote the welfare of the tribe by incurring the favor of benevolent deities and placating the spirits of evil. One of the primary purposes of these elaborately contrived ceremonies was to induce a state of ecstasy in which the individual should be carried out of himself and liberated from the haunting fears and uncertainties of his daily life. In the dances based upon the principle of sympathetic magic the participants reached a degree of ecstasy where they felt themselves actually transformed into the benevolent or malicious being whose characteristics and movements they sought to imitate. Imitation, mysterious identification of the imitator with the being imitated, assimilation of the individual experience into the collective experience of the group: these distinguishing features of the primitive magic dance contain in germ the essence of theatrical art.

So conceived the theater is of necessity a social process. It loses its primary meaning and justification when it pursues other objectives than that of providing the vehicle whereby the collective spirit of an organic group may, by the process of identification, undergo at least momentary transformation. To this degree the theater has remained, despite its many corruptions, the most elemental of the arts, with the possible exception of the dance, since its very manner of presentation makes it impossible to forget its basic communal foundation. The modern delusion of conceiving art as the private expression of the inner nature of the individual poet or painter or musician is ruled out by the very nature of theatrical art. For even today the real theater is brought into existence only when a

crowd of spectators is actually assembled to witness together a performance, plastic and fugitive in nature, by living human beings.

Although it has preserved many of its original features, theatrical art has undergone the same process of differentiation and specialization of function that may be traced in economic, technological and intellectual evolution in general. The distraught participants in primitive religious ceremonial were at once dramatists, actors and audience; they generated the religious ecstasy and were in turn hypnotized by their self-induced magic. At a very early stage, however, with the appearance of the high priest or the leader of the chorus, the function of inducing ecstasy was taken over by a specialized individual or group. The ability of the choral leader to accelerate and amplify the ecstasy of the group as a whole by the particular intensity and suggestiveness of his bodily movements and expressions gave him a special status in the community and made of him a prototype of the actor proper. When tribal development had reached a stage where ceremonial could no longer be improvised on the basis of spontaneous cult and the appropriate mythical formulae had to be prepared and rehearsed in advance, a second actor was found to be helpful and eventually a text on which the actors could draw. The need of a sustained pattern of tonal and verbal elements, which made itself felt at a very early stage in community ceremonial, called into being a new and more intellectual talent, distinct in quality from the mere histrionic. The individual who by preparing the text unified and formalized the separate incantations became of the first importance in the theatrical process. The dramatist appeared, although he was to remain for a long period identical with the first actor. On the other hand, the great mass of the participants gradually receded further and further into the background, content to reproduce that which the dramatist had systematized and the actor rehearsed in advance. They became the public. Actor, dramatist and public—they and they alone have remained the crucial elements in the theatrical process. Furthermore a genuine theater comes into existence only when these elements are closely integrated; when actor and dramatist serve merely to articulate the sympathies and aspirations of the people as they undergo the hypnotic experience of identification across the footlights. Every theater, in the true sense of the word, is a unity, at the core of which is the living community finding some

vital part of itself reflected in the creations of dramatist and actor. It is therefore highly abstract to dissociate the theater from the drama and to conceive the former as merely a place of assemblage or a commercial institution or a laboratory for experimentation in stagecraft and scenic effects. For the theater, properly understood, is that artistic experience in which dramatist, actor and audience are fused into a momentary unity which through the magic of identification—today as at the beginning—brings release from anxiety and frustration.

Although in its origins and essential nature everywhere the same, the theater has at different periods and in various regions manifested a wide variety. The Asiatic stage is strikingly different from the European, especially as regards the role of the dramatist. In the Chinese theater song and pantomime predominate, while the interest in traditional stock types leaves little room for creative dialogue; and as a result the occasional attempts to introduce Chinese plays on to the western stage have proved uniformly unsuccessful. Japanese theatrical art has had a richer development, but even there the primary interest has always been in the actor rather than in the dramatist. In addition to the No dramas, which were designed to beguile the feudal aristocracy with elaborate music, choruses, dances and lavish draperies, there grew up the *Kabuki*, or popular theater for the masses. In the latter the masks of the No drama were laid aside so as to secure a more natural and realistic presentation, and women were used as actresses—a fact which in encouraging prostitution led to intermittent suppression of these theaters. The profession of acting was highly developed, families of actors arose who passed on the mantle from father to son over a period of centuries. The physical grace and skill of the Japanese actor, particularly with the sword and rapier, were exceeded only by the colorful eye of the Japanese for natural staging. Dramatic poetry, on the other hand, has never developed in Japan as a form of national or cultural expression; and since the present day Japanese theater is breaking up under European influences, no independent development of this kind is to be expected in the future.

In the *Yoruri*, or puppet, theater the Japanese have developed a type of theatrical art which has received only incidental recognition in the western world. Throughout the Orient, however, the value of the puppet shows, particularly as a device for reaching the children and the very

simple populace, has been widely appreciated. The sacred theatrical art of the Malays of Java, the *Wayang*, employs life size marionettes, sometimes as many as two hundred different types, which are manipulated—to the accompaniment of the orchestra and the songs and intonings of the directors—behind a thin white curtain, on which the spectators see reflected the rhythmic pantomime of the shadows.

A type of art much more closely akin to the European is to be found in the history of the Indian theater, which, in the opinion of a number of scholars, has revealed unmistakable signs of Greek influence. This hypothetical influence must remain in the realm of conjecture, however, especially since the great era of the Indian theater (500–600 A.D.) came nearly eight hundred years after the dissemination of Greek culture by Alexander the Great. Nevertheless, far more than in other countries of the Orient the dramatist was a figure of importance. In Indian dramas the alternation of serious and comic scenes according to carefully defined critical rules suggests deliberate literary experimentation as well as a body of systematic aesthetic criticism; while the enthusiasm of eighteenth century European critics, such as Goethe, over Kālidāsa's *Sakuntalā* has served to call the attention of later scholars to a number of similarities between the dramaturgy of India and that of western Europe.

The western theater, however, even more than western civilization itself derives almost entirely from the Greek. From the dances and processions held, particularly in Attica, in honor of Dionysus, the Asiatic god of fertility, there developed a crude form of choral antiphony between a leader on the one hand, who impersonated the god, and on the other the worshippers of the god dressed in goatskins. Thus arose the goat song, or "tragedy." At the Dionysiac festival in Athens in 534 B.C. Thespis, leader of the chorus, stood apart from his choral following and in reply to their chanting uttered a prearranged pattern of answers. Thus there emerged the first actor, known as the protagonist. The legendary cart on which he stood symbolized, according to the tradition of the cult, the ship in which the god Dionysus had been transported from Asia to the shores of Greece.

Within the course of the generation after Thespis there developed with unparalleled rapidity a new artistic form which was to constitute the most powerful influence in the subsequent history of the European theater: the Attic

drama. The city-state of Athens was becoming increasingly conscious of its power and influence. The forces of the oriental tyrants had been turned back and crippled at Salamis. The outstanding threat against Greek liberty was eliminated. A soldier who had fought at Marathon and later became an actor like Thespis sought to infuse the traditional cult of Dionysus with the spirit of the new Athenian age. In doing so Aeschylus built upon the innovation of his predecessor, but by adding a second actor made possible spoken dialogue and coordination of gesture and movement as between the two figures. The chorus, remaining as a symbol of the community cult out of which the new art form had grown, stood in the "orchestra," the center of the great amphitheater in which the Athenian citizenry assembled to view the action (*drama*) of principals and chorus. The individual actors who appeared on the "scene"—the narrow, raised platform abutting on the orchestra circle—with their raised boots (buskins) and immobile masks equipped with amplifiers to make their voices carry through the spacious open air theater, were singers rather than players in the modern sense of the word, and their performance was more like an oratorio, of Bach for example, than a straight theatrical presentation of the present day.

The dramatic effects, however, especially after Sophocles' introduction of a third actor, were of the most profound intensity. In *Prometheus Bound* and in the *Oresteia*, the only trilogy of the period to be preserved in its entirety, are to be found the richest expression of the defiance and the submissiveness, of the skepticism and the faith, which strove in turn to dominate the Greek spirit during a restless period of transition and readjustment. In *The Persians*, which dramatized the reaction of the Persian court to the news of Salamis, Aeschylus turned from the field of traditional legend and situation to the more dangerous sphere of immediate events. In the more serene generation which followed the work of Aeschylus was carried on, and in the process purged of much of its Promethean restlessness, by Sophocles, who as a boy had participated in the ceremonial dances held in celebration of Salamis. Sophocles, a member of the upper aristocracy which ruled Athens during the period of its highest development, typified more fully than either Aeschylus or Euripides the ideal of moderation and balance repeatedly echoed in Greek ethics from Solon to Aristotle. His deep piety and traditionalism gave way only occasion-

ally, as in the character of Antigone, to a realization of the implicit conflict between the individual's responsibility to the collectivity and his personal loyalties and affections.

The rapid transformation which the Greek drama underwent within a single generation and which caused it to become the expression of the dynamic Athenian citizenry came to an end with equal rapidity Euripides, born in the year of Salamis, was a thoroughgoing skeptic and rationalist, with little of the self-confident faith or the vigor of imagination of his predecessors. The religious element, along with the chorus which symbolized the religious origins, receded further and further into the background. The psychology of individual characters was treated more convincingly and more subtly; but the rounded projection of the individual on the stage was still lacking. Euripides succeeded, as Mommsen has suggested, in "destroying the ancient stage without being able to forge the modern." His direct influence on later generations, however, has been immeasurably greater than that of his contemporaries or predecessors. The later Attic comedy derives from him and his humanitarian sentimentalism far more than from the inspired masters of the "old comedy."

When the power of Athens was at its height, when theatrical presentations constituted a major feature of religious festivals, when the powerful aristocrats assumed the financing of the dramatic spectacles as part of their routine responsibility, when Pericles provided all needy citizens with the price of admission and compensated them for the time lost in attendance—in this unparalleled age the Greek stage developed a second form of theatrical art, the comedy. All frivolous elements were rigidly excluded from the tragedy and apportioned at first to the satyr drama, which was presented at the end of the conventional trilogy and constituted as a rule a parody of the myths and legends which elsewhere were treated with reverence and awe. Alongside of the satyr drama, however, there developed gradually from another feature of the Dionysiac festival the comedy, built up around the song of the revelers (*komoidia*) returning home from the festival, bearing aloft the phallus, symbol of fertility. The animal costumes, in which the village revelers were girt, were preserved in the choruses of the great Attic comedians, which included birds, wasps, frogs and the like. Aristophanes alone of the writers of Attic comedy has survived, a master of literary and dramatic portrayal with few peers. The po-

litical, the literary and often the most trivial private issues and rivalries carry across in all their vividness and freshness the two and a half millennia which have intervened. And yet this fantastic comedy, cosmological in its range, lasted but a brief moment. The new Euripidean and Socratic tendencies against which Aristophanes was continually inveighing continued slowly to undermine the older Periclean collectivity. With the collapse of Athens in the Peloponnesian War the populace seemed to lose the vigor and the zest to follow such restless flights of fantastic contrivance. The "new comedy," which grew up in response to the changed temper of the people and which for the same reason was found more congenial to later generations in Rome and Florence and Versailles, was tame, refined, urban amusement, which in the spirit of post-Euripidean Athens brought upon the stage individuals, and particularly types, drawn from the more cosmopolitan atmosphere of fourth century Athens. The comedies of Menander, supreme master of the new technique, dispensed with the chorus and turned away from the older political and ethical issues, and are best understood as expressions of a wearied and slightly disillusioned society which sought contentment and diversion in unpretentious situations and sentiments clothed in polished, well turned dialogue. The transition from the older religious dramas was furthered also by the gradual rise of professional guilds of players who traveled throughout the Hellenistic empire and, with a shrewd economic eye on the changing tastes of the public, introduced more and more the new type of refined sentimental drama.

As already suggested theatrical art arose from the fusion of the histrionic instinct with the emotional exaltation generated by rhythmic motion. At a comparatively early stage, however, two distinct currents flowed out of the primitive ceremonial unity and for a long period remained in separate channels. The emotional religious element predominating in the tragedy and comedy proper was in time counteracted by a form of theatrical entertainment known as the mime, the origins of which may likewise be traced to primitive religious cult and ceremonial. The stuffed belly and the phallus, which were the distinctive amulets of the mimic actor as late as the Christian period, are sufficiently clear indication that he was at one time a participant in the Dionysiac celebrations of the countryside. But with the decay of the older

community ceremonial the instinct for mimicry and the delight in masks and disguises and humorous antics cast off the religious and ecstatic elements, and the mime came gradually to devote himself outright to the task of amusing his audience. As his art became a daily occupation, the special festival character of theatrical entertainment dropped out of sight. Masks were laid aside and the appearance of women in the cast stimulated still further the general trend toward naturalism, while at the same time their presence was instrumental in degrading the status of the actor. At first these mimes confined their activities to their own vicinity or to immediately adjacent neighborhoods; but in time traveling companies began to be formed and to give performances at profitable centers scattered over a wider area. With the traveling mimes the profit motive became for the first time a major factor in theatrical enterprise. For hitherto, in keeping with its basic ceremonial character, the theater had been an essentially social institution, realizing its fullest possibilities in the service of the community. The injection of the profit motive involved a serious distortion of emphasis and introduced into the evolution of the theater a potential source of corruption, which in the future was to be escaped only under especially fortunate circumstances. It is characteristic of the mimes, who in many cases developed from unpretentious bands to large scale, lavish enterprises presumptuous enough to intrude even into the field of tragedy, that the peculiarly dramatic element, the text, played throughout an altogether insignificant role. Amusement being the first consideration, chief reliance was placed on tumbling and juggling and singing. Virtually nothing remains of the texts, even in the best known collection, the *Hypotheses*, made by Philistion and his collaborators under the empire.

The prestige of the mime was tremendously enhanced when the leadership of the western world and the heritage of Greek culture passed to Rome. It has been contended with some justification that the evolution of the mimetic art in Graecia Magna was influenced by the native Italic population. For the Italians have manifested throughout their history an extraordinary instinct for mimicry and at the same time a comparatively feeble dramatic talent. During the past century, for example, Italy has given to the world a succession of outstanding actors and actresses but never a drama of first rank. It has therefore been conjectured that only in the con-

genial soil of Italy could the technique of the mime reach its highest development.

Lacking a deeply religious or dramatic sense and yet extraordinarily endowed with mimic ability, the Roman people turned with alacrity to the theatrical art of the mimes. This art, in so far as it was not itself of Italian origin, built upon a closely related native growth, the *fabulae atellanae*. These farces received their name from the town of Atella, which was destroyed by the Romans in their wars against Hannibal and which thereafter was used by the people as a center for dumb shows. While the book drama flourished as the sport of the cultured minority, the *atellanae*, with their boisterous, crudely satiric peasant actor, developed the tradition of the mime to a genuinely popular art. In the latter days of the republic the actor acquired prestige incomparably greater than that of any dramatist. Roscius, an actor of Italian birth who died in 62 B.C., was a friend of Sulla and at the height of his influence enjoyed a yearly income of over \$50,000.

At a comparatively early date, it is true, when the Romans sought to refine the native culture by imitation of the Greek, still another and more negative manifestation of theatrical art made its appearance: the literary theater, which instead of expressing the needs of the entire community arose from the self-conscious efforts of a thin, cultured layer. Livius Andronicus, Ennius and Pacuvius, protégés of the new style aristocrat typified by the Scipios, imitated the humanitarianism and cosmopolitanism of Euripides just as Plautus and Terence sought, each in his way, to imitate the urbane wit of Menander. But these plays, which were never laid in Rome and which transplanted wholesale, with only slight adaptations here and there to local conditions, the little understood customs and practices of the Greek world, were naturally ephemeral and limited in their appeal and influence. It is true that an attempt was made, notably by Titinius around 200 B.C., to transform the *fabula palliata* of Greek comedy into a *fabula togata* built up around native Roman material, and that Naevius sought in the so-called *Praetextae* to dramatize historical themes, such as the early life of Romulus and Remus and the victory of Marcellus over the Celts; but all such attempts failed to establish a permanent tradition, lacking as they were in the creative power which could capture the imagination of subsequent generations. Of the *Praetextae*, the serious plays built up around national themes, one specimen has

come down, the *Octavia*, a highly realistic presentation of political events out of the life of Nero. Characteristically enough, however, the *Octavia*, like Seneca's bombastic imitations of the Greek tragedians, was never presented on the stage. From the literary theater of the age of the Scipios had developed, by the time of the Antonines, a rigidified closet drama, a peculiarly unnatural cultural growth. Quintus Cicero, the brother of the famous orator, while serving with Caesar in Gaul, whiled away two weeks of a weary northern winter by composing four tragedies, with which he was well pleased but which no one thought of bringing to the stage. The Roman state, in contrast to the Athenian, was radically hostile to the theater. For two hundred years it did not allow the construction of a permanent stage, and at every festival a costly wooden structure had to be constructed and shortly afterward torn down. It was not until 55 B. C. that Pompey was able to set up in Rome a stone theater. This nation of practical genius felt little need to clarify its inner problems or to stimulate its spiritual forces with theatrical art.

Under the empire theatrical entertainment became increasingly magnificent, with elaborate and bewildering changes of scene—as described, for example, by Apuleius—supplemented by dazzling water and fire effects. In this outlay of magnificence the true function of the theater was completely obscured. Instead of arising from the needs and aspirations of the people itself, the theater was used as an implement by those in power to lull the oppressed masses into a state of quiescence and indifference. When in the spectacular presentations of the empire actual criminals were forced to take the parts of fictitious criminals and stage executions became actual executions, the transition was made from the naturalism of the mime to the bloody gladiatorial contests of the circus. The nadir of theatrical art was reached—that inevitable degradation which results from the divorce of actor, dramatist and public.

The permanent influence of the later Roman theater is to be traced in the perpetuation of the mimic spirit even beyond the time when the prosperous troupes of mimes disbanded. During the thousand years which followed the break up of the Roman Empire the descendants of the imperial mimes wandered throughout Europe, entertaining the scattered feudal courts and village gatherings with their dancing, tumbling and juggling, interspersed undoubtedly with a

primitive type of theatrical entertainment and pantomime. Some indication as to the number of these mimes is contained in the fact that at a festival given by the tyrant of Rimini in 1324 fifteen hundred of them participated. But whatever their number they kept alive the histrionic tradition and technique and also added new elements when with the growth of towns in the late Middle Ages they shifted the sphere of their operations from the rural festivals to the more compact activities of the rising trade guilds. The Parisian guild of court scribes known as the *Basoché* was the first to set up a permanent troupe with a special hall for their farces. When, as not infrequently happened, an unusually talented or successful performer in one of these guild companies decided to make a profession of acting, he not unnaturally sought to join the visiting troupes of mimes.

In the less convivial atmosphere of the cloister and the cloister school the tradition of the Roman drama was kept alive after a fashion. In the tenth century the German nun Hroswitha wrote several plays in imitation of Terence, while the closet dramas of Seneca began long before the Renaissance to serve as a model for those who fancied themselves to be rediscovering the spirit of the ancient theater. In addition to serving as adjuncts of rhetoric and grammar in the school curriculum the plays were sometimes performed by groups of clerics and students.

But the most significant contribution of mediaeval Christianity to the evolution of the theater was the new type of drama known as the miracle or mystery plays. Arising within the cathedral as an elaboration of the *Quem quaeritis?* episode of the Easter ceremonial and later expanding to include other familiar scenes in the Christian cult, the mystery gradually came, in the process of technical refinement, to be saturated with secular elements. In time it was transferred from the choir to the cathedral courtyard and afterward was taken over by the guilds, which at great expense and in a spirit of keen rivalry developed a type of semihumorous popular entertainment less reverent and therefore more congenial to the increasingly ebullient spirit of the native burghers. Eventually a number of adjoining stages were set up on the market place, and companies were formed which made the rounds, giving a series of performances which not infrequently lasted throughout the day. From the combination of these popularized mystery plays with the guild farces deriving

from the mime tradition arose a mixed form known as the morality plays, which in an openly lay spirit treated allegorically the vices and virtues of mankind.

Although these various new types of theatrical entertainment supplied, particularly in England, not a little of the foundation on which the early modern theater was to build, the emergence of a real mediaeval drama was frustrated by the profoundly antagonistic attitude of the dominant institutions. The all pervading spiritualism of mediaeval Christianity not only left little place for the plastic, sensuous elements indispensable to a vital theatrical art but, even more than in the case of Greek religion and philosophy, magnified impersonal, supernatural forces at the expense of human activity and human will. Before the varied tendencies making toward an independent theater could be canalized it was essential that the older climate of opinion should give way to a new temper and a new spirit.

The transition from the old to the new, especially in so far as it affected the evolution of the theater, was primarily the work of the humanists, who sought to restore the human personality to its proper position at the center of the universe. Although the humanistic movement in its origins was predominantly Italian, its greatest impact in the sphere of the theater took place in England. England was rapidly rising as a naval and commercial power. Under the hedonistic regime of the Tudors mediaeval piety and asceticism were giving way to the pursuit of profit and national glory. The inertia of mediaeval traditionalism was being replaced by a new social and economic dynamic inhering in the new bourgeois classes, which were beginning to view with ill concealed jealousy the privileges of the depleted nobility. The rapid progress of the enclosure movement was driving an ever increasing number of families from rural England into the metropolis. The streets of London echoed with new cries and new boasts; the wharves were filled with new types of sailing vessels, manned by explorers who had seen new lands. A new art was awaited which would express the spirit of the new community. In 1576 Richard Burbage opened across the Thames the first real theater since antiquity. So great was the success of Burbage's venture that similar theaters sprang up right and left in the same outlying district. In a city with a population of only 300,000 the monthly attendance at the various theaters was 400,000, divided between the balconies, where the fashionable world looked

down on the unadorned stage, and the pit, where the boisterous groundlings stood packed together.

For the first time since the days of the Scipios the dramatist came again into his own. From the traditional technique of the morality plays the contriver of plays turned to the models of antiquity; but even where, as in Marlowe, the classical influence may be traced in long winded declamations studded with pedantic Latin words and neologisms, a new mobility of spirit and dramatic action, released from the encumbrances of Greek traditionalism and costume, soon made itself manifest. The aspirations and mounting ambitions of a people imbued with a dawning consciousness of its potential greatness found articulation in the defiant, self-confident apostrophes of Marlowe's Tamburlaine the Great, who strode the world in proud disdain, searching for glory which lay beyond the reach of the vulgar and the timorous. The theatrical innovations effected in the 1580's by such dramatists as Marlowe, Greene, Peele, Lodge, Kyd and Nash were built upon by a less learned rustic, "an upstart crow," who arrived in London when the prestige of the first generation of dramatists was at its height. Unlike the majority of these earlier and more Bohemian dramatists, Shakespeare, with all his genius for lyrical, subjective brooding, was primarily an active man of the theater: a secondary actor and minor stockholder in Burbage's troupe, conversant at first hand with the back stage art of casting and mounting a play and above all pre-occupied with the new problem of providing a permanent text which could be used over and over by director and cast in later presentations of the same play. For the theater, instead of being as formerly an adjunct of an occasional civic festival, was rapidly becoming a day in and day out commercial enterprise under private management. In planning these new texts Shakespeare, working at Burbage's side and with a discerning eye on the possibilities of the individual members of the troupe, showed a preference for themes and situations which had already achieved popularity with the audiences across the Thames. Neither the manager nor his youthful amanuensis was unmindful of the enthusiastic response of an adventurous age to the numerous tragedies of blood and revenge; the endless ghost scenes deriving from Seneca; the chronicle plays based on incidents from early English and Teutonic history and glorifying the past greatness of the "sceptred isle"; the revival

of the heroes of antiquity as summarized in the recent translations of Plutarch's dramatic lives; the narratives of returned travelers describing the life and culture of the city-states of Renaissance Italy; or, in a quieter key, the ballads and plays romanticizing the types and customs of rural England. The measure of Shakespeare's superiority to the hundreds of his theatrical contemporaries who were striving to accomplish somewhat the same end lies in the fact that in exploiting these accredited situations and themes he introduced a progressively richer poetic diction and rhythm and a more and more highly developed sense of the dramatic interplay of human character, and came gradually to forge an organic dramatic unity deriving from the innermost spiritual tension of the protagonist.

When in 1612 Shakespeare felt that he had accumulated enough wealth to retire in independence to his native town of Stratford on Avon, his position among his rivals was assured. Assailed by the vested interests at the outset of his career as an upstart intruder bedecked in borrowed plumage, he had during the intervening quarter century reshaped the temper and the technique of the English stage and in the end gained the approbation of so intransigent a classical critic and craftsman as Ben Jonson. Sensing the brutal love of sensationalism surging in the restless London populace, he had responded in his youth with the crude blood streaming scenes of *Titus Andronicus*; in his maturity he continued to refurbish such stock devices as the ghost and revenge motifs but constructed around them a drama of an individual whose inner struggles epitomized the intellectual and emotional uncertainty of a profoundly transitional phase of national development; in his old age, on the point of retiring, he drew upon the prevailing interest in remote lands of an age of discovery to divulge his inner artistic credo and, with a mastery of fully matured prosody, to reveal the true nature of poetry and of the poet as magician. The role of the living theater as a reflection and at the same time molder and guide of public taste is nowhere better epitomized than in the thirty odd manuscripts of Shakespeare, which after his death were assembled and gradually assimilated into the broader stream of the world's literary heritage.

The appeal of the Elizabethan theater to the boisterous populace, on the one hand, and to the ambitious hedonistic aristocracy, on the other, rendered it doubly suspect in the eyes of the

staid burghers, whose mounting claims to privilege were being canalized in the various types of revolutionary and religious movements known broadly as Puritanism. The Puritans were deeply influenced also by the ancient Hebrew antipathy to all types of plastic imagery, both in religious and in civic ceremonial. Their closing of the theater came just at the time when the vigorous strains of the early Elizabethan stage were thinning out into the romantic sentimentalism of Fletcher and Shirley and Ford. The intense anti-Puritan reaction which followed the Restoration resulted in a new type of drama which, although it drew more than has been generally supposed on late Elizabethan models, was essentially Gallic in spirit and construction and concerned primarily with providing amusement of a type that would appeal to Charles II and his courtly sycophants. The dramas of Shakespeare were reworked or adapted with an eye to making them conform to Augustan canons and taste, but in general the gallants and fops of Congreve and Farquhar and at a slightly later period the rise of the sentimental bourgeois drama as a reflection of the self-conscious, anti-aristocratic middle classes prolonged the eclipse of the Elizabethan stage. The swing back to Shakespeare, which began in predominantly literary circles, found its first sustained theatrical expression in the Shakespearean adaptations of Garrick in England and of the *Sturm und Drang* group in Germany. The vogue of Shakespeare in the romantic movement throughout Europe was perpetuated into the modern era of the commercialized theater by a succession of more idealistic actor managers, which may be traced from the Keans and the Kembles to Henry Irving and Ellen Terry, to E. H. Sothern and Julia Marlowe. During a period when the highest creative talent has been poured into poetry and the novel, Elizabethan revivals have served as the chief staple of those searching aesthetic and intellectual values in the theater. It was not until the later nineteenth century, with the general European reaction, led by Ibsen and Brioux, against middle class ideals and practises, that the theater in England, through the plays of men like Shaw and Galsworthy, assumed once again a role of social and intellectual leadership.

The fact that the Renaissance in Italy, which proved such a powerfully creative force in the fields of painting, poetry and science, contributed comparatively little to the development of the theater may be accounted for in part by the essentially non-dramatic character of the

Italians, as already noted in connection with the Roman theater, and in part by the paralyzing effect of classical models, which by the very factor of national tradition were more operative in Italy than elsewhere. Another contributing cause was the monopolization of the theater by the wealthy tyrants and aristocrats of the various city-states of Italy. Magnificently staged plays were given in the courts of the d'Este in Ferrara or of the Malaspina in Rimini, but the populace was rigidly excluded. Poliziano's *Orfeo*, presented in 1471, and Trissino's *Sofoniba*, forty years later, were essentially exercises in imitation of Hellenistic models, designed primarily for the amusement of the learned classes; even the comedies of Ariosto, Aretino and Machiavelli, for all their introduction of contemporary local color, were far beyond the reach of the populace. Popes and princes could commission Raphael to paint stage scenery or Leonardo to take charge of a theater, but the theatrical art of the courts remained at best inbred. It produced no drama of enduring intellectual or spiritual value.

The contribution of the Italian Renaissance to the broader evolution of the theater was confined to the architectural and scenic spheres. The style of the Teatro Olimpico, built by Palladio in Vicenza in 1580 with a permanent large scale architectural background, was brought to an end by the theater of Sebastiano Serlio, which introduced a deep stage. When the back of the stage became adjustable and could be changed and the side walls were converted into movable wings, when proscenium, ramp, lighting and intricate machinery made their appearance, scenic art and stage design took the form which they were to maintain for the next few centuries. Italian architects and engineers, as, for example, the illustrious Bibbiena family, carried the new technique to the capitals of Europe.

Theatrical art in its broadest sense is likewise indebted to Italy for the new operatic form, the origins of which are attributable in part to the efforts of certain learned groups to restore the technique of the Attic drama, with its chorus and musical accompaniment, and more directly to the craze for pastorals which seized the nature loving Italian aristocracy in the sixteenth century and pressed into its services the genius of even a Tasso and a Guarini. The elements of ostentation and luxury characterizing the pastoral have been carried over into the opera. Throughout its history the latter has remained

the favorite amusement of the court and of the rich bourgeoisie. Because of the lavish scale of presentation and the vast personnel required for a well balanced production, the opera has seldom proved self-supporting and has therefore of necessity been subservient to the taste and whims of wealthy patrons, public and private.

But however greatly the opera has satisfied large sections of the music loving Italian population, it was not likely that this essentially exclusive and aristocratic form of theatrical art could eliminate the need for popular entertainment catering to the deep seated histrionic instinct of the nation. It is therefore characteristically Roman that at the end of the sixteenth century, alongside of the lavish, aristocratic theater, there grew up the popular *Commedia dell'arte*. Troupes of professional actors traveling from town to town and gradually penetrating into foreign capitals made up their own text more or less as they went along. The same six types of characters always appeared in virtually identical situations, and reliance was placed chiefly on the spontaneity and native wit of the actor. This subordination of the dramatic to the histrionic has remained a peculiarly Italian characteristic. When at the end of the eighteenth century the classically minded Goldoni and the romantic Gozzi sought to supplant the impromptu type of comedy with a more formal drama they achieved only a temporary success. Neither they nor the more solemn tragedians like Maffei or Alfieri have contributed nearly so much to the evolution of the theater as have the great Italian actors and actresses—from Ristori, to Salvini, to Rossi, to Duse. By comparison with the histrionic skill of such actors the pompous pretentiousness of d'Annunzio or the chilly intention of Pirandello pales into insignificance.

In the evolution of the Spanish theater the role of the dramatist was much more influential than in Italy—a fact which may be attributable in part to the youthful vigor of the nation. It was not until the end of the fifteenth century, in the course of the wars against the Moors, that a self-conscious national unity was forged in the Iberian Peninsula. Classical pedantry and veneration for antiquity were much less pronounced than in Italy. The inborn theatrical sense of the nation, which as early as 1470 had brought forth the fantastic drama *La Celestina*, was therefore able to develop unhampered by artificial rules and to remain in immediate touch with the people. The distorting influence of the aristo-

cratic courts had also disappeared when the spirit of the Renaissance released the pent up love of the theater. Small, altogether unpretentious troupes wandered throughout the country, with their entire equipment packed on a pair of mules, and gave their shows, with practically no scenery, in the *corrales* or in the courtyards which were set aside for them in the larger towns. The leaders of these wandering players were called *autores*, and ones such "author," Rueda, who achieved no little distinction as a writer in the literary sense, became the pioneer of a dramatic literature which spread rapidly throughout Spain. Cervantes wrote numerous brilliant interludes which constituted an indispensable unit in the extended program of a Spanish performance. Lope de Vega, the greatest popular genius of the Spanish stage, produced during his adventurous lifetime two thousand dramatic compositions of various types. Although the thirty odd plays of Shakespeare have won for him a lasting acclaim out of all proportion to that of Lope de Vega, the influence of the Spanish author on the theater and on the great masses of the people and his prestige were immeasurably greater and more unique during his own lifetime.

A further indication of the vigor of the earlier Spanish theater is the persistence of the mediæval mysteries into the age of the Renaissance. Known henceforth as *autos* and presented only during the Lenten period, they were composed in large numbers by Lope de Vega and his prolific successors. The great era of Spanish drama lasted until almost the end of the seventeenth century. The dramatic work of Rojas, of Tirso de Molina, the creator of Don Juan, and of Moreto, the brilliant comic poet, although contributing to the richness of the Spanish theater, has been almost completely overshadowed by the dramas of Calderón de la Barca, which constitute the most highly perfected expression of Spanish ideals. Although less prolific than Lope de Vega, Calderón was a far more finished craftsman and his skill in extracting the dramatic values of the Catholic faith, of the monarchy and of the feudal sense of honor is unmatched in the field of theatrical art. His rigid veneration of traditional ideals, which has tended to detract somewhat from his appeal to later generations, is occasionally relieved by a sense of the vitality of the people, as presented half humorously, half tragically in *El alcalde de Zalamea*, or by a rich play of fantasy and imagination, as in *La vida es sueño*.

With the decline of Spanish power under pressure from the rising colonial powers of the north Atlantic the Spanish theater lost most of its vitality; with a few exceptions, such as the Calderón renaissance in certain quarters of the German romantic movement, the broader European influence of this once teeming theater was comparatively negligible. In the eighteenth century the Spanish theater submitted to the yoke of French classicism, and the romantic movement of protest was unable to root itself in the people. The love of the theater is still alive in the Spanish people, but dramatists capable of drawing strength from the masses have appeared as infrequently as have Spanish actors of international appeal and reputation.

Although the French had been particularly active during the later mediæval period in promoting both the mystery plays and the amateur guild performances, they were comparatively late in developing a modern theater. It was not until Richelieu and Louis XIV liquidated the long period of civil and religious dissension that attention was directed to the problem of developing a theatrical technique and literature commensurate with the position which France as a nation was rapidly assuming. The French dramatists drew heavily upon the classical tradition and incidentally, during the early stages, upon the Italian and the Spanish; but, actively encouraged by Richelieu, himself a theatrical amateur, they were not unmindful of the *étatiste* ideals shared by the Bourbon kings and their ministers. Napoleon, impressed by the spirit of lofty patriotism and of disinterested loyalty characterizing the heroes of Corneille, declared that such a dramatist was worthy of a principedom. In contrast to Corneille, Racine dramatized the more sentimental side of early Bourbon France, releasing a literary current which was to be amplified in the eighteenth century English novels and was to reenter the French theater in the diluted form of the bourgeois *comédie larmoyante* of Diderot. The prestige which the French drama has continued ever since to enjoy throughout Europe is attributable in the main, however, to the comedies of the traveling actor Jean Baptiste Poquelin, venerated and imitated in England, Germany and Italy as Molière. The comedy of Molière represents the full flowering of the Menandrian tradition, which had made itself felt in the Rome of the Scipios and in the Florence of Machiavelli and Aretino. But in spite of the fact that many of the familiar types are paraded once again, the

shrewdness of Molière's dissection and the frequent intensity of his moral and social indignation break asunder the conventional framework of moralistic comedy, revealing the sense of high tragedy and despair implicit in not a few of his situations and characters.

Molière's troupe of strolling players, located for a time at the Petit Bourbon palace in Paris, was consolidated by royal decree with the older theatrical company playing at the Hôtel Bourgogne; the new organization, known as the Théâtre Français, played in the Palais-Bourbon until 1689, when it moved into permanent quarters of its own. The protection of the central authority was a consideration of prime importance. The fact that Molière could dare to indulge his bitter sarcasm at the expense of the privileged estates—the clergy in *Tartuffe* and the nobility in *George Dandin*—is to be explained only by his status as actor to the king. Since the time of Molière every French government has without exception lent its influence and its support to the state theater; in this way the French stage has been able to enjoy a unique degree of prestige and influence. The unbroken tradition of acting and of histrionic training has brought to perfection the classic French style, with its sonorous declamation and its undercurrent of emotional pathos. While such a training undoubtedly runs the risk of degenerating into standardized mediocrity, it has on the other hand helped to develop some of the most highly endowed representatives of the histrionic art. Rachel and later Bernhardt came out of this school and the master of tragedy Mounet-Sully and Coquelin, who as Cyrano revealed in its highest form the French genius for comedy. This world famous institution, operated by its members somewhat as a joint stock enterprise on a charter signed by Napoleon in burning Moscow, has been a decisive factor in elevating the morale and in improving the social status of the acting profession. The great Talma was the friend and to a considerable degree the teacher of Napoleon. In 1810 the members of the Théâtre Français society took the initiative in forming an association of actors to institute an insurance fund for all members of the profession in France.

The theatrical life of the French capital—outside of the capital it still bulks small—was not, however, confined to the Théâtre Français. In contrast to London, which until well into the nineteenth century had only two officially chartered theaters, Paris at the time of the revolution

had more than thirty. And the influence of these smaller theaters dedicated in the main to outright amusement has been, at least externally, no less than that of the more august institution. It is true that the golden age of the seventeenth century has never repeated itself; but in almost every generation new formulae have been contrived for projecting the issues and temper of the day on to the boards. From the epigoni of Molière, Destouches and Marivaux, the descent may be traced through the bourgeois, sentimental theater of Diderot, the colorful but comparatively ephemeral romantic drama of Hugo and the all embracing virtuosity of Scribe to the skilfully dramatized social tracts of the internationally exploited Dumas *fils*, Augier and Sardou.

It is Beaumarchais, however, who seems to typify most concisely the essential genius of the French theater. The appearance of his *Mariage de Figaro* in 1784 has been repeatedly singled out as the first petrel heralding the coming storm, the first full voiced outcry of the third estate against aristocratic arrogance. And yet at the same time the adventures of this sharp tongued barber and valet served as model for thousands of farces which sought to engage the public with a slightly varied sequence of intrigues and which gradually found their way from the Paris boulevards to the other capitals of the world. This double influence epitomizes in a sense the world wide appeal of the French theater: an appeal due, on the one hand, to a unique power of penetrating social and political criticism and, on the other, to a sense of rapidly unfolding farce built up with a minimum of moral concern around the less spiritual elements of man. And at least in the state supported and state sponsored Théâtre Français this traditional vitality of the French stage as the expression of a rich community spirit has received also an appropriate form of organization.

The belated development of the German theater is to be attributed in large part to the external circumstances of German history. During the late Middle Ages mystery plays spread rapidly in Germany as in other countries and during the Renaissance the guild plays of the celebrated Meistersinger, notably Hans Sachs of Nuremberg, reached a comparatively high level of theatrical art. But the elements were not at hand for an independent self-sufficient theatrical development. The first contact of the Germans with a professionally organized theater was through the traveling companies of English

comedians, who during the early seventeenth century gave crude presentations of Elizabethan plays. Little resulted, however, from this contact except a few lifeless imitations, such as those of Jakob Ayrer or Duke Heinrich Julius of Brunswick; and with the outbreak of the devastating Thirty Years' War the art of the theater was completely submerged, along with the cultural and social life of Germany in general. The only persistent type of popular theatrical entertainment was provided by untutored groups of wandering German players and by the marionette companies, which had sprung up once again. With the exception of the pseudo-mystery plays cultivated, notably in Vienna, by the Jesuits as a phase of their Counter-Reformation offensive and the Italianesque operas and ballets flourishing in the courts of the regional princes, there was virtually no stage art until toward the end of the century, when a comedy troupe known by the name of its leader, Frederike Karoline Neuberin, was organized with the backing of Gottsched. Dedicated to a reform of the German stage, the new company in its first prologue burned in effigy the figure of the boorish Hans Wurst, the stock character of the illiterate traveling companies.

The work of the Neuberin group was instrumental in drawing the attention of wider circles to the necessity of a theatrical renaissance, a German theater which should develop in accordance with the native genius of the German people instead of depending upon the classical models of Versailles. This nascent sense of cultural nationalism, which was so pronounced at a later stage in the poetry, philosophy and music of the German romantics, seemed to revolve during this earlier period around the role of the theater as the new instrument of spiritual integration. Especially from the middle of the eighteenth century there followed a succession of impassioned appeals for a national theater in which the poet and thinker should serve mankind as the priest of a new humanitarian order.

The moving spirit of this new movement was Lessing, who in his youth had been sponsored by the Neuberin group in Leipsic. In 1767, at the request of a small circle of friends in Hamburg who were seeking to set up a German national theater, Lessing wrote the *Hamburgische Dramaturgie*, in which he attacked the imitation of the French as recommended by Gottsched; and in drawing attention to the superior richness of the Greek and above all of the Shakespearean drama he helped to popularize the concept of a

nationally grounded popular theater. At the same time in his *Münna von Barnhelm* he gave to the nation a comedy which by reason of its rich human values has continued to be presented even to the present day. His *Emilia Galotti* and his *Miss Sara Sampson* are examples of the new type of bourgeois drama—typified by *The Merchant of London* and the *Père de famille*—which had grown up as a response to the demand of the rising middle class to see a reflection of its own virtues and ideals rather than those of the obsolescent feudal classes. Similarly his *Nathan der Weise* is an expression of the new spirit of the Enlightenment, with its broad humanitarianism, religious toleration and cosmopolitanism.

In the generation of dramatists which followed the lead of Lessing the balanced rationalism of the Enlightenment was vigorously sacrificed to the fiery cult of irrational genius and emotion, as they were thought to be displayed in the imaginative flights of Shakespeare. But it is not likely that either Klinger, who christened the new movement with his drama *Sturm und Drang*, or any of the other members of this brilliant, undisciplined group of dramatists would be remembered were it not for the fact that Goethe in his youth was closely associated with them and in his *Gotz von Berlichingen*, based on an ancient feudal chronicle, gave vent to the conventional delight of the *Sturm und Drang* dramatists in the erratic, tempestuous feats and chivalric sentiments of mediaeval knighthood. In the course of his development as a dramatist Goethe, searching for a more disciplined form, turned gradually away from the Shakespearean tradition to the classical tragedy of Greece; while in the final section of *Faust* may be detected echoes of the mediaeval mystery plays. The richness of form and content characterizing all of Goethe's dramatic writing has exerted a persistent influence on the art of the German stage.

The work of Schiller, however, has been of far greater immediate influence on the development of the theater both in Germany and among the French romantics. In his earliest drama, *Die Räuber*, echoes of the *Sturm und Drang* are still noticeable, although they are subordinated to a new note of humanitarian morality and indignation against tyranny and social injustice—a note which reappears in *Fiesko* and even more intensively in *Kabale und Liebe*. Schiller was much closer to the French, especially Racine, than to Shakespeare; it was the work of Schiller—akin to Racine and yet proceeding beyond it—which

pointed the way to the French romantics of the 1820's in their attempts to break the hold of the seventeenth century classics. In trying to recapture the temper of the Greek tragedy of fate Schiller, like the French and like Goethe, consistently introduced a note of individual moral responsibility quite out of key with the essential spirit of the collectivist religion out of which the older drama had emerged. Schiller exerted his most enduring influence, however, in such a play as *Wilhelm Tell*, the setting of which enabled him to identify his youthful passion for freedom with the aspirations and strivings of an entire people. The vigor of his moral slogans and the dramatic intensity of his well contrived scenes continued for a long period to make Schiller the darling of the middle class public, not only in Germany but abroad.

None of Schiller's successors has approximated his influence; not even Heinrich von Kleist, the ill adjusted Prussian patriot who dreamed for a time of arousing his countrymen against the Napoleonic invader but in the end preferred suicide to the turmoil and perplexities of life. His attempt to evolve a new dramatic form which would fuse into an organic unity the essences of Greek and of Shakespearean drama had a considerable influence on dramatic technique in Germany but made little impression abroad. The Austrian Grillparzer, sluggish in nature and addicted to the sentimental; the north German Hebbel, with his fund of vigorous fantasy; Georg Buchner, who died in early youth and whose genius was not recognized until two generations after his death—these dramatists, despite their individual merits and despite their prevailing ideal of a national theater, were unable to forge a body of dramatic classics such as was forged in the early modern period in England and Spain and France.

The Germans of the classical period not only experimented continuously in dramatic form, but they tried repeatedly to set up the working organization of a national theater. The history of these attempts, which have continued to the present day, is a monotonous story of frustration. When Lessing's *Mmna von Barnhelm* was first offered to the public in Hamburg, it was discovered that the only way to keep the play running was to intrigue a larger public by introducing a troupe of rope dancers between acts. In spite of this strategy the enterprise soon came to an end, and Lessing spoke bitterly of the futility of trying to set up a national theater before there was a nation. Goethe, after trying for twenty-six

years to develop the stage of Weimar into a genuine art theater, gave up in disgust when the court society insisted on turning the house over to a performance by a trained dog. In Vienna, where Joseph II had issued a proclamation making the court theater a national theater, the obtuseness and the intrigues of the court bureaucrats continued to retard a healthy artistic development, nullifying the efforts of such reformers as the dramatist Schreyvogel and the director Heinrich Laube. In the generation after Goethe the poet Immermann set up a model theater in the prosperous city of Dusseldorf, but after three years he had to give it up because he could not raise the eight thousand thalers he needed. So it went until the advent of Richard Wagner, who strove diligently to make Bayreuth the home of the long dreamed of national theater—and who fortunately did not live to see it degenerate into a minor tourist center.

Perhaps the primary cause of these repeated failures is to be found in the essentially artificial character of these organizations. They represent the inevitable outcome of an attempt on the part of dramatists, directors and actors to impose a theater from above, unmindful of the fact that the theater acquires life only in so far as it is the expression of the people, who seek in the theatrical performance a reflection of something within themselves. Without this exchange across the footlights the essential illusion of the theater is a matter of the purest chance. The love of mimicry, so strong in the Latin races, is less pronounced among the Germans. Moreover the cultural life of Germany at that time was decentralized; each of the princes of the various German *Lander* had his own court theater; the prestige of a cultural capital was lacking. Thus even under the most favorable circumstances theatrical art remained a hothouse plant, and at worst it was the toy of a semicultivated, opinionated local boor. The general disillusionment was all the greater in light of the high hopes that had once been held concerning the role of the theater as a civilizing force.

For the masses of the people there were in the leading cities a few second rate theaters, known as *Volkstheater*, which purveyed a stale kind of amusement in the form of revamped successes of an earlier day. It was in Vienna, the outstanding theatrical center of the German world, that the popular theater began to be developed during the latter half of the nineteenth century by such talented directors as Raimund, Nestroy, Anzengruber and, around the turn of the cen-

tury, by the histrionic genius Girardi. But even there the hold of the commercial theater, with its cheap grade of entertainment, came to stifle any vital theatrical activity. In spite of the réclame it received the art theater movement, which had sprung up in France and Germany under the leadership of small cooperative enterprises dedicated to the pursuit of aesthetic ideals rather than commercial profit, gradually found itself hanging in mid air, unable to build a sound financial substructure. With the increasing tendency of the acting profession to form a separate unit in itself, private commercial management, motivated exclusively by the profit incentive, came to dominate theatrical enterprise; and the question whether the private entrepreneur was not corrupting the deeper social character and popular foundation of the theater became a more and more serious one.

From this point of view the most significant development in the recent history of the German theater was the founding of the *Volksbühne* in Berlin in 1890. This undertaking, at the outset altogether unpretentious, was primarily an attempt to instigate a reform of the theater from below rather than from above, particularly by providing entertainment for workers, who were kept away from the regular commercial theater by the expensiveness of the seats. An association was formed and each member contracted in advance for a definite number of seats. Since the producer was thus freed from all risk, a marked reduction in the price of tickets was possible. In place of haphazard buying of tickets for a single performance or series of performances there was substituted a permanent association of individuals who shared a common desire for theatrical entertainment, and for whom the actor and dramatist could work with a new sense of security. The Berlin *Volksbühne*—organized by Bruno Wille and forwarded by Georg Springer and Heinrich Nett—rapidly became, in spite of authoritarian opposition and many internal rivalries, a powerful organization whose membership ran into the thousands. It presented plays with its own cast and finally in 1914 erected its own theater, the most impressive of modern Berlin. It was not until after the World War, however, when the commercial theater showed signs of buckling under, that the *Volksbühne* movement found countless imitators throughout Germany. At its height the *Verband der Deutschen Volksbühnen* included three hundred units, with more than half a million members. A number of highly artistic *Wanderbühnen*

traveled about, giving several performances each year before local associations, even in the very smallest towns. Other theatrical associations sharing many of the characteristics of the *Volksbühne* were the chief support of many city and state theaters. The folk theater movement spread to Scandinavia, the Danube countries, the Netherlands and England, and an Internationaler Bund der *Volksbühnen* was formed. With the advent to power of the German National Socialists in 1933 the *Volksbühne* organizations in Germany were disbanded because of their connections with the outlawed Social Democratic party, and except in the case of the Berlin *Volksbühne* the name itself was suppressed. The same fate befell the *Bühnenvolksbund*, an analogous type of theatrical group which had ties with Catholic associations and the Center party. These older groups of theater workers have been replaced by a unified, nationalistic organization known as the *Deutsche Bühne*. In its unusually intensive program to bring the theater into line with the Nazi movement as a whole the government has organized a *Theater der Jugend* in Berlin and in addition a *Theater des Volks*, which by means of a system of traveling companies gives free performances for the workers not only in Berlin but throughout the country. The numerous Jews formerly connected with the theater have been systematically barred from further activity in any capacity.

After the reforms of Peter the Great and his vigorous attempts at westernization German, French and Italian influences began to make themselves strongly felt in the Russian theater. It soon became apparent, however, that there still resided in the people a deeply ingrained faculty for mimicry, a fact most clearly indicated in the appearance of the serf theaters, organized and directed by the feudal lords with companies composed of their retainers. Nevertheless, the Russian theater, despite the growth of a native dramatic literature, remained by and large, even on the imperial stages in St. Petersburg and Moscow, essentially imitative, drawing heavily upon western European models. It was not until the development of the Moscow Art Theater under Stanislavsky, as the culmination of the naturalistic movement in theatrical art begun by Zola and Antoine in Paris and developed by little theater groups in Berlin, that Russia may be said to have made any real contribution of its own to the development of theatrical art. It is significant that at the period when the naturalistic technique of Stanislavsky

was enjoying its greatest prestige, a counter swing in the direction of fantastic and expressionistic effects was made in the widely acclaimed ballet of Diaghilev and the scenic art of Bakst.

The revolt against naturalism, which had been a pronounced tendency of the new school of scenic art in the post-war theater—notably in the school of Gordon Craig and his American disciples—was carried to its extreme form by the theatrical leaders of Soviet Russia. Tairoff in the Moscow Little Theater proceeded along the most abstract cubist lines, sacrificing everything to pure sculptural effects; in his Theater of the Revolution Meyerhold played against bare stage walls, with his actors scattered here and there over fantastic gymnastic apparatus; others turned the theater into a glorified circus, with calisthenics, acrobatics and clowning. In the midst of the greatest diversity the common element seemed to be the desire to create something as different as possible from the traditional bourgeois theater. All of these strivings as well as the theatrical festivals of the soviets and the revues which dramatize the news of the day for the benefit of the illiterate testify to the deeply ingrained mimic instinct and talent of the Russian people. But it must be confessed that the attempt to set up a new, non-bourgeois theater has not as yet succeeded. For in spite of the richness and variety of this theatrical experimentation one crucial element is lacking: the creative dramatist capable of reshaping and integrating into an artistic unity the temper of the new society. Since the revolution the drama of Russians, while it has added not a little to the literature of the class struggle and proletarian program (see LITERATURE), has contributed less than had been hoped for in the way of a new art form.

The American theater has occupied a rather unique position. During its early history the British influence predominated. Although as early as the revolutionary period plays began to be written by American dramatists on native and often patriotic themes and although there was an ephemeral vogue under Dunlap, the American manager of the First Park Theater in New York, for the dramas of the Austrian Kotzebue, the great majority of the managers and actors in the seaboard centers were first generation Englishmen and their presentations did little more than reflect the current tastes of London. The new type of English bourgeois drama, typified by the Colmans, Cumberland and Mrs. Inchbald, alter-

nated with the comedies of Goldsmith and Sheridan and the plays of Shakespeare, which since the days of Garrick had enjoyed a sharp recrudescence of favor at the hands of such romantic Shakespearean actors as Edmund Kean and John Philip Kemble. The arrival of English stage favorites, such as Thomas A. Cooper, was an event of the first importance in the theatrical life of the new country. Even in the scattered theaters which from 1800 to 1850 catered, often in the crudest and most improvised settings, to the frontier population through the Ohio and the Mississippi valley English actors shared with Americans the trying problems of managership; and many English stars after completing their seaboard engagements were persuaded to give their regular London repertory before untired backwoods audiences.

As early as the 1820's, however—and especially after the phenomenal rise of Edwin Forrest, an American actor who won his first successes in the frontier theaters of the west, and of Charlotte Cushman and Julia Dean, American actresses who won international acclaim—native actors appeared in increasing numbers, and by the time of Edwin Booth and Joseph Jefferson and Ada Rehan they enjoyed a following in London almost as enthusiastic as that enjoyed by European stars in the expanding theaters of the United States. The growing cultural internationalism which became one of the distinctive characteristics of the nineteenth century is well typified in the growing exchange of theatrical wares and reputations between the United States, on the one hand, and the increasingly interdependent theatrical centers in England, France and Italy, on the other.

The transformation of the American theater in the course of the nineteenth century is even more significant as reflecting and accelerating the basic economic change which was taking place in theatrical enterprise during the period. Economic considerations have naturally been operative at all stages of theatrical history. The expense involved in presenting a well rounded stage play could not be ignored, even in an era of the highest cultural disinterestedness. When the Athenian aristocracy, the mediaeval guilds or the French monarchy shouldered this responsibility the problem was not serious. But when the man of the theater, intent on indulging his enthusiasm for the stage, was forced to rely on his own economic initiative, the response of the audience could be ignored only at the risk

of closing the theater. Until far into the nineteenth century the search after economic independence, as the prerequisite of experimentation and innovation in the artistry of theatrical presentation, offered discouraging complications to men of the theater—from the days of the American dramatist Dunlap to those of the untiring director-manager Augustin Daly.

The tribulations and repeated frustration of such devoted men of the theater as Daly and the Wallacks and Steele MacKaye heralded the end of an era of individual enterprise, conducted by men who had grown up inside the theater. At about the same time that the regime of economic *laissez faire* in general was eventuating in the recrudescence of corporate activity and monopolies, theatrical enterprise, particularly in the United States, began to show monopolistic tendencies; and for the two decades following the formation of the Theatrical Syndicate in 1895 by a group of six theater owners in New York and Philadelphia the activities of the older type theatrical entrepreneur, as typified by David Belasco and James O'Neill, were momentarily paralyzed. Composed of shrewd, ruthless capitalists with an eye for real estate and for the routing of theatrical companies but in the main—with the partial exception of Charles Frohman, the most enlightened of the group—indifferent to the traditional standards and spirit of theatrical art, the syndicate subordinated every element in the theater to its nation wide pursuit of profit. Standardized products were shipped out wholesale from Broadway headquarters not only throughout the length and breadth of the United States but to the more remote quarters of the English speaking world as well. Frohman through his London and New York offices drew into his hands the reins of the English speaking stage and at the time of his death in 1915 had built up an organization operating on an international scale and employing as many as 10,000 persons at an annual salary expenditure of \$35,000,000.

With the removal of Frohman rival groups, notably the Shuberts, equally gifted as realtors and merchandisers, broke the hold of the original trust, while at the same time perpetuating on a less ruthless scale much of its openly commercial method and spirit. Plays continued to be selected and cast with an eye on the far flung national and international market; the vivid personalities which Frohman had spent millions in developing and exploiting lived on and assisted at the birth of countless new "stars" on

whose drawing power the producer-speculator made still further investments; the ultimate power continued to reside in the hands of men whose theatrical lore could anticipate or at least rapidly adjust itself to changes in popular taste as reflected in the latest box office statistics.

The usurpation of power by the manager-producer generated inevitably a counter offensive among the actors, who adapted to the unusual conditions of the theater the technique of collective bargaining as it has been developed in the course of the trade union movement in other industries. A professional union of actors, which had been foreshadowed in the mutual benefit associations of French actors in the early nineteenth century, was first systematically organized in Germany in 1871; similar unions later spread throughout Europe and after the World War to the United States. The attempt to establish contacts between the actors' organizations in the different countries and to formulate a more widely effective and less halting program of defense against managerial arbitrariness and callousness has resulted in an international union with headquarters at Vienna.

A more deeply significant movement of protest against domination by the commercially motivated manager-producer was the little theater movement. Although its origins may be traced to the experimental theater set up in 1887 by Antoine in Paris—and imitated by Theodor Wolff and Maximilian Harden in Germany, by the Moscow Art Theater in 1890 and by Max Reinhardt's Kammerspielhaus in 1905—it did not become a widely influential force in the United States until during the war and post-war periods. Revolting against the standardized commercial play and scenery shipped from Broadway—the quality of which had become progressively lower with the inroads of the motion picture and the consequent cut in the profits of road companies—small groups of theatrical enthusiasts organized community ventures akin to the older cooperative stock companies which had flourished before the days of the trust. In some cases the group contented itself with presenting well known masterpieces of English, Irish and German dramatists; and the chief attention was frequently centered on problems of staging, lighting and scenic effects. In many others, however, a special attempt was made to encourage dramatic writing which would portray local customs and types and bring to an end the long reign of the international type of commercial drama, constructed according to the

abstract canons of the "well made play" and carefully stripped of those purely local elements which would not appeal to a world audience.

The attempt of these local cooperative theaters to reintegrate the work of the dramatist, the actor and the scenic artist and to reintroduce a spirit of intimacy between the audience and the players was carried out most successfully by the Provincetown Players, the group which first presented the plays of Eugene O'Neill, and by the Theatre Guild of New York, which not only has succeeded in weathering a period of increasingly severe theatrical depression but has aided materially in developing an American school of scenic artists and dramatists unsurpassed in the present day theater. The mounting tribulations and inactivity of the commercial producer, beset on the one hand by the loss of his favorite stars to Hollywood and by the general economic crisis on the other, have served to emphasize even more strongly the deep significance, for the future, of the local theatrical groups, which in subordinating their individual efforts to the realization of a common community purpose are in a sense reminiscent, despite the thousands of years that have intervened, of the primitive collectivity out of whose ceremonial developed the irrepressible art of the theater

THEOCRACY. See RELIGIOUS INSTITUTIONS, CHRISTIAN; PRIESTHOOD.

THEODOSIUS I (347-95), Roman emperor. Theodosius, born in Spain, was the last west-erner to occupy the throne of the Eastern Empire and the last emperor to rule over the entire west. He was confronted with two difficult problems, both of which he failed to solve. The first was the establishment of religious unity within the empire, which was being torn asunder by dissenting religious groups. Theodosius' idea was to create religious unity based upon the creed established at the Council of Nicaea in 325 and accordingly to eliminate all other Christian doctrines as well as paganism. He issued decrees in which he recognized only the "Catholic church"; that is, the church subscribing to the Nicene creed. He forbade "heretics" to hold assemblies and considerably curtailed their civil rights, especially as regards bequests, inheritance and the like. The Second Oecumenical Council convoked at Constantinople in 381 condemned the quasi-Arian heresy of Macedonius, who declared that the Holy Spirit was created. Pagan rituals were forbidden and the famous Serapeum in Egypt was destroyed. All these drastic measures deeply affected social and economic conditions in the empire, closely connected as they were with different religious doctrines, including paganism.

Theodosius was beset on the other hand by the problem of the Goths. After the battle near Adrianople in 378 under Theodosius' predecessor, Valens, when the Roman army was completely defeated by the Goths and Valens himself was killed, Theodosius realized that he could not master the Goths by force. Having decided to pursue a peaceful policy toward them he attempted to imbue the Goths with certain elements of Roman culture and to draw them into the ranks of the Roman army and administrative structure. Theodosius failed to realize that such a free growth of Germanism might menace the empire's existence. An anti-German movement took root, but he died before the reaction against Germanic preponderance broke out.

THEODOSIUS II, the Younger (401–450), Byzantine emperor for 408. Theodosius was not a gifted statesman nor was he particularly interested in matters of government; but he succeeded in gathering around him a group of very able and energetic men who contributed much to the significance of his reign in the internal life of the empire. Troubles in the church resulted in the convocation in 431 of the Third Oecumenical Council at Ephesus, which condemned the Nestorian doctrine but failed to end religious controversy. In 425 Theodosius founded or perhaps reorganized a university in Constantinople, where the most eminent scholars taught in Greek and Latin; they were paid from the imperial Exchequer and could advance to very high rank. This new Christian school became a dangerous rival of the famous philosophic pagan school at Athens. Under Theodosius the oldest surviving Byzantine code of law (*Codex theodosianus*) was promulgated. It contains decrees of the Christian emperors from Constantine the Great to Theodosius II. The code is a sort of summary of what the Christian religion had accomplished in the field of law up to that time; it became an important foundation for the code of Justinian and exerted great influence upon the legislation of the Germanic kingdoms in the west established in the fifth century and perhaps, through the *Breviary of Alaric*, upon the first Bulgarian kingdom. The walls built around Constantinople under Theodosius made the capital impregnable for many centuries and contributed much to the prosperity of the city.

THEOLOGY. *See* RELIGION; DOGMA.

THIBAUT, ANTON FRIEDRICH JUSTUS (1772–1840), German jurist. Thibaut studied at Göttingen, at Königsberg, where he absorbed the philosophy of Kant, and at Kiel, where he entered upon his academic career; subsequently he taught Roman law with unflinching success at Jena and at Heidelberg. His eminence as a jurist—he was equally famous as an organizer of musical life in Germany—may be ascribed to the harmonious unity of his mind, which combined the most valuable elements of the century of the Enlightenment with those of the period of romanticism. He was not only interested actively in the scientific and systematic study of judicial administration and reform but had also a deep insight into the historical development and philosophical principles of law. As a scientific positivist he constantly opposed the one-sided rationalism of the natural law jurists as well as the surrender to empiricism of the historical school.

Thibaut's most important work is his *System des Pandektenrechts* (2 vols. Jena 1803, 9th ed. by A. A. von Buchholz, 1846; tr. into English, 1 vol., London 1855), the first scientific system of the German common law, or pandects, and prototype of all succeeding textbooks. Many studies on modern Roman law were published in his *Versuche über einzelne Theile der Theorie des Rechts* (2 vols. Jena 1798–1801, 2nd ed. 1817) and in his *Civilistische Abhandlungen* (Heidelberg 1814, 2nd ed. 1827). His more philosophical *Theorie der logischen Auslegung des römischen Rechts* (Altona 1799, 2nd ed. 1807) is one of the best legal methodologies. While these works are now rarely mentioned, another of his studies, *Über die Notwendigkeit eines allgemeinen bürgerlichen Rechts für Deutschland* (Heidelberg 1814, new ed. 1840), is still famous, although it is merely a pamphlet. In it Thibaut made an eloquent plea for the codification of the German civil law, giving a description, which has remained classic, of the miserable condition of legal disharmony which prevailed because of the existence of the numerous German states and territories and appealing to the patriotic emotions evoked by the overthrow of French domination. Thibaut's position was, however, directly opposed to the reactionary politics of his time, when any struggle for Germany's political or legal unity was considered revolutionary, and to the romantic absorption of the German spirit, which called not for active reform but for historical contemplation. The pamphlet was immediately followed by Savigny's celebrated

reply, *Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Heidelberg 1815), which won a complete victory, although Thibaut's general ideas and practical proposals were far sounder than those of his great adversary. The continuance of the controversy served only to embitter the strife between the historical and positivistic schools. Germany had to wait more than eighty years for the vindication of Thibaut's ideas, which occurred with the promulgation of the *Bürgerliches Gesetzbuch* at the end of the century.

II, p. 69-88; Stern, Jacques, Preface to his edition of Thibaut, A F J, and Savigny, F. K. von, *Zum 100 jährigen Gedächtnis des Kampfes um ein einheitliches bürgerliches Recht für Deutschland* (Berlin 1914).

THIERRY, JACQUES-NICOLAS-AUGUSTIN (1795-1856), French historian. In order to find substantiation for the liberal political theories of which he was an ardent champion in the early days of the Restoration government Thierry turned to social history and a study of the struggles of "the people" against oppression. Beginning in 1820 he contributed to the *Courrier français* a series of articles dealing with the emergence of "the popular classes" during the period of the rise of towns and the establishment of chartered municipal government in the twelfth century. Later in the course of recasting these contributions for separate publication Thierry was led, as a result of his increasing bourgeois partisanship, to interpret this early "communal revolution" as the first beginning of the "bourgeois revolution" which was destined to find new expression in contemporary France. In spite of the romantic exaggeration implicit in such a thesis the *Lettres sur l'histoire de France*, which appeared in 1827 (8th ed. Paris 1846), has a genuine historiographical significance by reason of its emphasis on the hitherto neglected role of the people and the middle classes.

On the basis of this early work Thierry in 1833 was entrusted with the direction of an ambitious research project (*Monuments inédits de l'histoire du tiers état*), which at the beginning set itself the objective of bringing together into a single corpus all documents relating to the life of the French municipalities from the fall of the Roman Empire to the end of the Middle Ages. Great sheaves of material were collected by collaborators working together in the archives and

libraries of France. Thierry himself supervised the publication of two large volumes (1850 and 1854) dealing with Amiens and Ponthieu; and his preface to these volumes, entitled "Essai sur l'histoire de la formation et des progrès du tiers état" (published separately in 1853; tr. by F. B. Wells, 2 vols., London 1855), marks a great step forward in modern historiography. Two additional volumes of documents were published after his death. Although the researches embodied in the four volumes may properly be considered one of the most fruitful innovations of the historical movement in the post-Reformation period, the original objective had to be abandoned because methods of scholarship had advanced much faster than the initiators of the project had anticipated.

Like all the romantic historians Thierry sought to place the reader in what he called "the atmosphere of the period"; an aim which he realized with a greater degree of integrity and scrupulousness than many of his contemporaries. His famous *Récits des temps mérovingiens*, begun in 1833 and later published in book form (2 vols., Paris 1840; tr. as *Historical Essays*, Philadelphia 1845), reflects his desire to allow in so far as possible the representatives of that age to speak for themselves without benefit of author. In addition to popularizing the romantic formulae of "local color" and "the people," Thierry was responsible also, notably in his early work *Histoire de la conquête de l'Angleterre par les Normands* (3 vols. Paris 1825, 7th ed. 4 vols. 1846; tr. by W. Hazlitt, 2 vols., London 1847), for developing the concept of the "fusion of races" as a factor in the evolution of the unified modern states of Europe which had arisen out of the ethnic upheavals of the Middle Ages.

THIERS, LOUIS ADOLPHE (1797-1877), French statesman and historian. Thiers was born in Marseille and admitted to the bar at

Aix. He went to Paris in 1821 and at once plunged into journalism and the writing of history. The first two volumes of his history of the French Revolution appeared in 1823, arousing much interest in literary circles. With his friend Mignet he was one of the first to insist upon the use of original sources, especially public documents; and his work marks a distinct departure in this respect, despite the fact that his use of them was often prejudiced. His contemporaries also criticized as too fatalistic his emphasis upon causal relations. In the first volume Thiers boasted of his sympathy for the Convention and of his being the first to touch upon financial and social history. As he progressed, however, he became more conservative, and his later work on the consulate and the empire became more and more a panegyric of Napoleon.

Of far greater significance was Thiers' role as a statesman. He was devoted to the cause of the liberal bourgeoisie and was a staunch opponent of both the reactionary Bourbons and the radical republicans. As editor of the *National* in 1830 he not only led the revolt of the journalists but with Talleyrand, Laffitte and others brought about the selection of Louis Philippe as king. He was therefore closely identified with the July Monarchy from the start, holding several ministerial posts, including the premiership (1836). In 1840 he became prime minister a second time and during a relatively short period in office secured the return of Napoleon's body from St. Helena, began the fortifications of Paris, blundered seriously in backing Mehemet Ali against the sultan and tried to extricate himself by threatening war and the seizure of the Rhine. His fall cut short his chauvinistic talk, and for eight years he was in opposition to the policies of Guizot and the king. After the Revolution of 1848 he supported the Provisional Government and, as a member of the Constitutional Convention, opposed the radical leaders of the left as he did Louis Napoleon's usurpation of power in 1851. Despite his arrest and exile after the coup d'état he returned in 1852 but kept aloof from politics during the decade of the autocratic empire, giving all his attention to history.

In 1863 he was elected to the legislative assembly, where he championed the "necessary liberties" and denounced the emperor's foreign policies. He opposed the declaration of war against Prussia in 1870, urging inadequate reasons and lack of preparedness. During the war he visited different European capitals in a vain attempt to stimulate intervention. Tragi-

cally vindicated by the disastrous defeat of the Franco-German War, Thiers became the logical leader of the national reconstruction. Twenty-six departments elected him to the National Assembly, and he was at once chosen head of the executive power. In that capacity he guided France through one of the most critical periods of its history. He suppressed the Commune, carried through the difficult peace negotiations, in which he succeeded in retaining Belfort, reorganized the army, restored local government, paid the war indemnity and "liberated the territory." He was forced by the royalist majority to resign in May, 1873, because he would not support the restoration of the monarchy, but returned to the political arena for a brief period in 1877 with a vigorous manifesto in defense of the republic.

THIRD INTERNATIONAL. *See* COMMUNIST PARTIES.

THÖL, JOHANN HEINRICH (1807-84), German jurist. Thol, who was professor at Göttingen and Rostock, was the first to put the treatment of commercial law in Germany upon a scientific basis, and his authority was recognized in the contemporary codification of German commercial law. He not only prepared a draft of a law of bills of exchange for Mecklenburg but was a member of the conference which created the law of bills of exchange for the whole of Germany. He also served as a member of the commission which created the German commercial code.

Thol made a scientific system of commercial law by applying to it the juristic method then prevailing. This method was based upon rigid principles taken almost entirely from the Roman

law, to which Thöl adhered unconditionally. These principles after being subjected by him to logical analyses were then employed for the derivation of further legal consequences without consideration of the reason and purpose of the formulated rules. Thöl defended his system, which was embodied in his chief treatise, *Das Handelsrecht* (3 vols., Göttingen 1841-80; vol. 1, 6th ed. 1879, vol. II, 4th ed. 1878), in two controversial works, *Einleitung in das deutsche Privatrecht* (Göttingen 1851), directed at the historical school, and *Volkrecht, Juristenrecht, Genossenschaften, Stände, gemeines Recht* (Rostock 1846), attacking Beseler's glorification of popular legal characteristics.

Despite the dominance of the historical school, which at that time also flourished in Göttingen, Thöl did not pursue the historical development of the commercial law. Replying to his great opponent Levin Goldschmidt in his *Handelsrechtliche Erörterungen* (Göttingen 1882) he rightly insisted upon the necessity of limiting his extensive subject. Goldschmidt rather unjustly accused Thöl of pursuing a "method of dogmatic isolation." Thöl recognized the essential elements of the theory of the bill of exchange now dominant. He regarded as fundamental the divorce of the bill of exchange from the transaction which underlay it, and perceived that the indebtedness represented by the instrument did not rest upon contract.

ERNST JACOBI

THOMAS, ALBERT ARISTIDE (1878-1932), French statesman, socialist leader and historian. Thomas was born at Champigny of a humble artisan family and was educated at the Lycée Michelet and the École Normale Supérieure, where he was influenced by contacts with Charles Andler, François Simiand, Hubert Bourgin and above all Lucien Herr. He traveled in Russia, the Mediterranean Orient and Germany. Thomas early gave evidence of two major interests: the theory of history and the problems of the working classes. His concern with the latter led him to seek in history for precedents and causes of socialism, syndicalism and co-operation, three forms of action and thought which were always associated in his mind. His most important scholarly works were the volume on the Second Empire for Jaurès' *Histoire socialiste* (vol. x, Paris 1907), a study of German

syndicalism (Paris 1903) and the *Histoire anecdotique du travail* (Paris 1913, 2nd ed. 1926).

After teaching for a while at the Collège Sévigné he joined Jaurès on the editorial staff of the *Humanité* in 1904. He was elected municipal councillor of Champigny and later mayor. In 1910 he was elected to the Chamber of Deputies, where he immediately became a leader of the left. With Jaurès he introduced socialist legislation, such as the law of 1911 providing for workmen's and peasants' pensions and the law of 1912 establishing miners' pensions.

Thomas's extraordinary talent for organization was revealed during and after the World War. In September, 1914, he was entrusted with the organization of the railroads, in May, 1915, he became undersecretary of state for munitions and at the close of 1916 he was made minister of munitions. After the fall of the czarist government he was sent to Russia, where he worked with the Kerensky government and supervised production at the Putilov works in the attempt to maintain effective collaboration of the new republic with the Entente.

After the formation of the International Labor Office Thomas served as its director from November, 1919. He continued until his death to work with prodigious energy for its organization and the extension of its influence and for the elaboration of international labor law. It was chiefly through his efforts that the International Labor Office at Geneva became the center for the study and discussion of the problems of labor and for the integration of these studies in reports and texts made available to all nations. Thomas himself prepared encyclopaedic annual reports, traveled extensively and earned for himself the title of labor diplomatist.

THOMASIIUS, CHRISTIAN (1655-1728), German jurist and political philosopher. Thomasius, the son of a university professor, was born in Leipzig and studied law and philosophy there and at Frankfurt on the Oder. He was deeply impressed by the works of Grotius and Pufendorf, and as a young docent he followed their teaching. His first revolutionary act was to announce a course of lectures in the German language; he attacked the unworldly and unpractical character of the Latin instruction at the universities. His fiery temperament and his

critical approach early involved him in conflicts with the orthodox theologians and his conservative colleagues. As a result of their persecution he was forced to leave Leipzig in 1690; he then went to Halle, where he taught at the newly founded university until his death. Here through cycles of encyclopaedic lectures he carried into effect his improved method of instruction and wrote his famous dissertations against belief in sorcery, punishment of heresy and the use of torture. He thereby became one of the modern heralds of a more humane legal procedure. In the field of jurisprudence he continued independently of Pufendorf the doctrine of natural law. His chief aim was to discriminate carefully between morality and law, claiming that only the latter possessed compulsory character. He classified all social duties into three groups: *justum*, *honestum* and *decorum*. By *decorum* he meant all duties of manners, he is respectable who behaves toward others as he desires them to act toward himself. *Honestum* is the essence of all moral duties; he who acts toward others as they would act toward themselves lives a moral life. Thomasiaus drew a sharp distinction, however, between the *justum* and the main body of natural law: he who refrains from doing to others what they do not do to him is a just man. Adherence to these three principles insures the individual a happy social existence. The philosophy of Thomasiaus may thus be characterized as a hedonistic rationalism. Through the establishment of popular scientific journals Thomasiaus spread these ideas throughout Germany and to a lesser extent throughout Europe. In the religious field he also exerted a revitalizing influence in turning the unworldly Pietism of his friend A. H. Francke into a more practical and rational form of Christianity. Joyous, active and versatile, strong and full of life, Thomasiaus was a typical representative of the baroque period, free of all mediaeval conceptions. He was the most significant representative of the individualistic, bourgeois rationalism of the eighteenth century, the creator of the view of life of the enlightened German bourgeoisie and thus the leader of the German movement of Enlightenment.

THOMPSON, WILLIAM (1783-1833), Irish socialist and economist. Thompson was an Irish landowner who became a disciple first of Bentham and later of Robert Owen. His principal work, *An Inquiry into the Principles of the Distribution of Wealth Most Conducive to Human Happiness* (London 1824; new ed. by William Pare, 1850), illustrates the development of his thought from utilitarianism to Owenite socialism. In *Labor Rewarded* (London 1827) Thompson, setting out from the dogma that labor is the sole creator of value, developed the case for Owenite socialism on this basis in contrast to Thomas Hodgskin's semi-anarchist advocacy of non-capitalist individual production. *Practical Directions for the Speedy and Economical Establishment of Communities* (London 1830) was published when the rapid and large scale growth of Owenite cooperation and trade unionism was just beginning. Thompson was also a keen feminist, and his *An Appeal of One-Half the Human Race* (London 1825) is a powerful plea for sex equality. He was an active member of the London Cooperative Society and a frequent contributor to the *Co-operative Magazine* of 1830.

The *Principles of the Distribution of Wealth* is by far his most important book. In it he argues, against Bentham, that the removal of the toll levied on the worker by the property owner will not decrease but greatly increase the incentive to labor by adding to the laborer's reward. The wealth of a community, he contends, must be judged not by its total amount, but by its distribution so as to achieve the maximum of happiness; and this can be secured only by the adoption of the cooperative, or socialist, principle. Like the other anticapitalist economists of the early nineteenth century, Thompson regards capital as unproductive, in the sense that it can only transfer but cannot create value. The la-

borer must emancipate himself from capitalist exploitation by forming trade unions and cooperative societies, which will serve both as part protection against exploitation and as training grounds for corporate self-government, enabling him to advance to the further stage of replacing capitalism by self-governing communities collectively owning all the resources of production. Thompson like Hodgskin is thus an important forerunner of Marx in formulating the theory of surplus value and capitalist exploitation; and his book is easily the best of the early socialist writings in this field.

THONISSEN, JEAN JOSEPH (1816-91), Belgian jurist and statesman. Thonissen received the degree of doctor of law from the University of Liège in 1838 and took a postgraduate course at Paris. Subsequently he practised law in Hasselt and held various government positions. The publication of his *La constitution belge annotée* (Hasselt 1846, 3rd ed. Brussels 1879) and of the first volume of *Complément de code pénal* (3 vols., Hasselt 1846-52) led in 1848 to his appointment as professor of criminal law at the Catholic University of Louvain.

Thonissen became one of the most authoritative representatives in Belgium of the classical school of penal law, upholding the traditional conception of crime and punishment. Capital punishment he opposed not as illegitimate but as unnecessary, and the polemic launched by his *De la prétendue nécessité de la peine de mort* (Louvain 1862, 3rd ed. 1864) resulted in the virtual if not legal abolition of the death penalty in Belgium. Thonissen was the author of a number of juridical studies, many of which were published in the *Mémoires* of the Académie Royale de Belgique. His outstanding achievements were his studies in legal history, in which he set out to trace the evolution of penal law from antiquity to modern times. In this field he published *Études sur l'histoire du droit criminel des peuples anciens* (2 vols., Brussels 1869), *Le droit pénal de*

la république athénienne (Brussels 1875) and *L'organisation judiciaire, le droit pénal et la procédure pénale de la loi salique* (Brussels 1882). These labors were interrupted, however, in 1884 when he resigned his chair at the university to become minister of the interior and of education in Beernaert's cabinet, a post which he held until 1887.

From 1863 Thonissen was a member of the Chamber of Representatives and was affiliated with the conservative Catholic party. During his political career he played a prominent part in the elaboration of many important laws, including the law on preventive detention, the law on competence in civil and commercial affairs, the law on liberation and conditional condemnation and the law of 1878, modifying the preliminary section of the Code of Penal Procedure. From 1874 to 1876 he was reporter of the new Code of Civil Procedure. In 1877 a commission was set up to prepare the reform of the Code of Penal Procedure and Thonissen was appointed its reporter. He submitted twenty-five extremely interesting reports on its debates, which were published as *Travaux préparatoires du Code de procédure pénale* (2 vols., Brussels 1885).

Thonissen was interested also in political and economic theory. *Le socialisme depuis l'antiquité, jusqu'à la constitution française du 14 janvier 1852* (2 vols., Louvain 1852), which combined two earlier works and was inspired by the events of 1848, revealed his antipathy to the theories of the socialists. It purported to be a history of socialistic ideas and movements, pointing out fallacies in doctrine and concluding that attempts to realize a communistic system brought devastation and anarchy. To offset socialist influence Thonissen demanded a program of social amelioration to be realized by the promotion of thrift, cooperation and professional training. Religious and moral education, he held, should be stressed in order that a revival of Christian morality and charity might be effected.

FERNAND COLLIN

Consult Lamy, T. J., "Notice sur la vie et les travaux de Jean-Joseph Thonissen" in Académie Royale des Sciences, des Lettres et des Beaux-Arts de Belgique, *Annuaire*, vol. LVIII (1892) 377-477, Terhinden, Charles, in Académie Royale des Sciences, des Lettres et des Beaux-Arts de Belgique, *Biographie nationale*, vol. xxv (1930-32) 113-19.

THOREAU, HENRY DAVID (1817-62), American philosopher. Thoreau when just out of Harvard came under the powerful sway of Emerson's mind and did his formative thinking as a

member of the Concord group of transcendentalists. Eventually, however, he liberated himself from Emerson's influence, and at no time was he taken in by the excesses of transcendentalism. Thoreau's criticism of American society sprang from the rebellion of the pioneer spirit against the crudity and materialism of the pioneer in an industrial age. He denounced the factory system because it meant the exploitation of others; he rejected the cult of success and the Puritan creed of persistent work because it meant the exploitation of oneself. His economics anticipated Ruskin's by defining the cost of a thing as the amount of life that has to be exchanged for it; his aesthetics anticipated William Morris' by declaring that no beauty can exist in commodities that does not flow from a creativeness in the lives of those who fashion them. He recounts in *Walden* (Boston 1854) his two-year experiment in living in a hut in the woods according to his own economy of wants and satisfactions. Finding that the economic system was making unreasonable demands on him, he entered upon a conscientious withdrawal of efficiency. Similarly he sabotaged the government by refusing to pay taxes, and he spent a night in the village jail as an exultant political prisoner. His essay "Resistance to Civil Government" (in *Aesthetic Papers*, ed. by E. P. Peabody, Boston 1849, ch. x; new ed. as *On the Duty of Civil Disobedience*, New Haven 1928), a sharp statement of the duty of resistance to governmental authority when it is unjustly exercised, has become the foundation of the Indian civil disobedience movement. Thoreau's three speeches on John Brown (1850-60) extol the insurrectionary attempt at Harper's Ferry and denounce the shortsighted coercion of the government that martyred him. As a social critic Thoreau was uncompromising: his thought was tighter than Emerson's, less optimistic, less given to the resolution of opposites. But his individualism may easily be overemphasized, just as his absorption with nature has been overemphasized. Both must be seen as part of a rebellion against the oversocialized New England town and against the factory system which saw nature only as so much raw material to be subdued to the uses of profit. He was not so limited as to believe that the individual could by his own action stem the heedless onrush of American life, but as a transcendentalist he believed that a sharp moral protest is ultimately irresistible. While he regarded individual development as the only aim of society and the individual's moral sense as the only test and ultimately the only

safeguard of institutions, he did not envisage the individual as the necessary cadre of society. "To act collectively is according to the spirit of our institutions," he wrote in *Walden*, and he continued with a plea for the extension of the social services of the community. Nor did he reject altogether the machine as an instrument of production: his emphasis was rather on its cultural consequences in his own day. It was one of his characteristic paradoxes that the man who could solemnly call his fellow townsmen together to read them a protest against the imprisonment of John Brown or the return of a fugitive slave could also profess an unconcern with most of the burning political issues of the day and insist that his business was not to change the world but to solve the problem of living in it.

THOU, JACQUES AUGUSTE DE (Thuanus) (1553-1617), French historian and statesman. Under Henry III, de Thou became successively master of requests, chief justice and counselor of state and under Henry IV was particularly active in the sphere of ecclesiastical politics. His voluminous *Historiae sui temporis* (5 vols., Geneva 1604-09) was conceived as a universal history of his time, beginning with the year 1543; unfinished at his death, it was continued and annotated by N. Rigault and P. Dupuy (new ed. 5 vols., Geneva 1620; best known French translation by Abbé Prévost and others, 16 vols., London 1734; English translation by B. Wilson, 2 vols., London 1729). Rigault and Dupuy were possibly also the editors of the *Commentarium de vita sua* (tr. into French from Latin ms. by I. G. Le Petit, Rotterdam 1711;

republished in Michaud, J. F., and Ponjoulat, J. J. F., *Nouvelle collection des mémoires pour servir à l'histoire de France*, 1st ser., vol. xi, Paris 1836).

De Thou's history is important chiefly for the sections relating to France and has provided the foundation for the history of the religious wars of that country. Based upon a painstaking study of all the French and Italian historians, upon the reports of eye witnesses and upon the regular correspondence maintained by de Thou with authors in divers foreign countries, it reveals enormous erudition and few factual errors. The author's humanistic background is apparent in the oratorical style and in the manner in which he sometimes transmutes his documents into harangues worthy of the ancient forums. His great tolerance and remarkable impartiality in the treatment of religious questions won him the praise of d'Aubigné and the reputation of being pro-Huguenot; in reality his point of view was that of the *politiques*—of the royalists of the *parlements*—whose opportunistic principles he helped to establish as a member of the commission which prepared the Edict of Nantes and supervised its execution. Also obvious in the work is de Thou's adherence to extreme Gallicanism. As a statesman-historian he may be compared with Guicciardini and Machiavelli, although his lack of a unifying philosophy and his assumption of divine determinism in history rendered him distinctly inferior to his Italian contemporaries. His work was highly esteemed by Bossuet.

THRANE, MARCUS MOELLER (1817-90), Norwegian-American labor leader. Thrane was the founder of the organized labor movement in Norway. An unemployed schoolmaster, he became a radical journalist in 1848 and in December of that year set out to form working men's associations, at first in the cities of Drammen and Christiania and subsequently in other cities and in country districts. In the course of a year and a half he was able to organize a national union with over 270 associations and more than 20,000 members, embracing poor peasants as well as factory workers and journeymen. Through travels in Germany and France

and through wide reading Thrane had acquired a knowledge of European socialism; in his speeches he drew freely upon the works of Weitling and Cabot, and from Louis Blanc he took over the idea of industrial cooperatives under state auspices and with state aid. But the program he formulated for his organization did not limit itself to cooperation; it was intimately bound up with the social and political situation and needs of the Norwegian workers. The chief demands were universal suffrage and legislation in favor of independence for poor peasants. The program was discussed and pressed forward by national congresses called by Thrane in 1850 and 1851. But this daring enterprise, up to that date unexampled in the history of the country, induced the government to turn against the movement. Thrane and about two hundred of his closest associates were arrested and indicted for revolutionary propaganda and after four years of custody were at last convicted, Thrane being sentenced to another four years of imprisonment. During that time the movement dwindled away, and in 1863 Thrane emigrated to the United States. Most of the time he lived in Chicago, where he took an active part in establishing sections of the First International; from 1869 to 1884 he edited and published socialist magazines in Dano-Norwegian.

THRIFT. Although it originally connotes saving, the term thrift has a tendency both in technical economic and in popular discussions to become identified with economic rationality in general, with the "wise" and "efficient" use and disposal of all resources, time, labor and material things as well as money. In harmony, however, with its original connotation the emphasis tends to be put on the long as against the short run point of view. The thrifty person is he who resists the temptation to satisfy momentary whims, but husbands his resources for the satisfaction of his "true" needs and desires.

But the ultimate ends of concrete economic activities are never given on economic terms alone. Hence it is not surprising that there should be a variety of different interpretations of what thrift really means. For at the basis of every doctrine of what is economical and rational

must lie some view of the chief end of man. Two main tendencies may be distinguished. All doctrines of thrift go beyond the immediate interests of an "eat, drink, and be merry, for tomorrow we die" philosophy and most go beyond a rational distribution of the resources of an individual over his probable expectancy of life. But there is a whole class of doctrines which preach thrift as a means of attaining and maintaining, generally for a family over a period of generations, a standard of consumption that is fixed mainly in terms of non-economic considerations. Thrift being thought of as a means, there is inherent in this type of thought a limit to its practise—when the end is attained there is no further need for the means. In the modern world this type is perhaps best exemplified by the thrift of the French lower middle class; a significant index is retirement and cessation of earning when enough has been laid by.

The second type is characterized by the absence of such a limit. It elevates thrift into an end in itself, a virtue, good for its own sake. It then becomes an ethical obligation to devote one's whole power to the largest possible accumulation without any clear conception of what the means are to be used for. The pure type is relatively rare but none the less important. There is almost always some rationalization of why inordinate thrift should be practised, if only the assumption that the more wealth one has the better off one is. Perhaps the most important connecting link in the concrete shading off of the two attitudes is the role of wealth as a mark of social prestige, not merely in the Veblenian sense of conspicuous consumption but also through mere possession and accumulation: above all the objective not only of individual but of family social advancement over a series of generations. "Getting ahead in the world" is perhaps the most ubiquitous motive given for the practise of thrift.

A further classification of doctrines of thrift cutting across the others should be made. The primary connotation of the term lays its emphasis on the allocation of given resources. Just as the "means" concept of thrift noted above tends to be associated with a general traditionalism in standards of consumption, this type is associated with traditionalism in the means of earning a living and, more generally, of the productive processes as a whole. The principal problem of allocation of course is that of time, but the term thrift is often used to cover the avoidance of waste in general.

On the other hand, by something of a twist in the meaning the emphasis may be placed not on the thrifty use of given resources but rather on the continual increase of one's resources—on enterprise and initiative in earning and production. This interpretation occurs particularly when it appears desirable to retain the pleasant overtones of the term thrift and at the same time to avoid the connotation of niggardliness often connected with it. It is clear that this type along with the valuation of thrift as an end in itself is generally associated with a breaking through of traditionalism, often in both production and consumption. It is in fact an attitude very likely to appear with a weakening of the sentiment for unlimited thrift.

Historically attitudes toward thrift have varied greatly in different cultures and on the part of different classes within them. Hostility to thrift in almost any form tends to spring from two main sources, the *carpe diem* attitude and an attitude of indifference either to the good things of this world as such or to the thrifty ways of acquiring or safeguarding them. The attitude of *carpe diem* tends to become widespread above all in the well to do classes in relatively opulent and highly individualized and secularized periods. The Hellenistic age in Greece, the late republic and early empire in Rome, Renaissance Italy and eighteenth century France are examples. On a smaller scale and with less duration the same thing tends to happen in the reaction following a period of tense crisis, as in the "cocktail" era of the decade after the World War.

Of the attitude of indifference one of the main types is that arising from religious motives. The "take no thought for the morrow" of the Christian Gospels is primarily an expression of the sense of the utter unimportance of worldly things in comparison with the religious life. In more extreme forms this indifference may develop into active hostility with an ascetic prohibition of all worldly possessions, as in monasticism. The other type of indifference which does not affect worldly goods as such but thrift as a means to them is to be found above all in the attitude of aristocracies, which have almost universally looked down upon peaceful economic production and saving as beneath their dignity. The main exception in this group is that of commercial aristocracies. Above all a military aristocracy, which has booty as a source of acquisition, cannot but disdain the meanness of thrift. But even apart from resources obtained through war an aristocracy will almost always have a source of

income from the labor and thrift of others.

By far the most common form of thrift historically has been the means type, and it has very generally been associated with traditionalism in both production and consumption. It exemplifies the kind of economic rationalism Aristotle had in mind in his discussions of the "management of a household." It is not incompatible even with aristocratic ways of life so long as it is limited to the thrifty management of the estates of nobles or the properties of monarchs as well as of the small tradesman, the artisan or the peasant. The principle is very generally the same.

The valuation of unlimited thrift as a virtue for its own sake is far less common and has appeared on a large scale only in the modern western bourgeois class. It is one of the most important aspects of the peculiar cultural constellation which has produced modern industrialism. Before its crystallization into a system of more or less automatic social pressures it is difficult to account for it except as a product of the religious motivations of ascetic Protestantism, especially Calvinism. For from purely religious motives these movements enjoyed a rational participation in the affairs of this world, including disinterested devotion to economic production as a calling, combined with great frugality in consumption as the only means of avoiding the cardinal sin of self-indulgence.

The influences affecting thrift may be divided into two great classes, those operating on people's motives relatively independently of external conditions, and the conditions themselves, relatively independently of specific motives. Pure rational calculation of advantage and hence the rate of interest as a factor can account for a certain amount of thrift—the tendency to adapt uneven income over a lifetime to the uneven needs of the individual. But the great bulk of thrift must be explained differently. Everything which transcends the lifetime and personal interests of a single individual must be motivated by ultimate values. The most potent force here is religion but, as has been pointed out, its influence is by no means simple. The only attitude which no major religion sanctions is the *carpe diem* type of thriftlessness. But aside from that, according to the specific character of the religious attitude involved, everything else is possible. Within the Christian tradition alone there is the indifference of the Gospels; the ascetic hostility of monasticism and the mendicant orders; the traditional means thrift of lay

Catholicism, which is still typical of countries like France with a predominantly Catholic background; and, finally, the "worldly ascetic" sanction of unlimited accumulation in some branches of Protestantism.

We may call attention to three important conditions for the development of thrift. One is the extent to which the individual is identified with groups in which his own interest is merged with that of the larger whole, above all the family. In general a strongly integrated family organization will be favorable to thrift of the traditional means type. The Chinese, for instance, practise an extraordinary frugality. Breakdown of family solidarity and individualization, on the other hand, will tend to be unfavorable to thrift, unless other positive influences, like the Protestant worldly asceticism, are present to counteract it.

A second important influence is what may be called the "security of careers," the extent to which the individual may look forward with reasonable certainty to a settled course of the development of his life and may expect in the relatively distant future to enjoy the fruits of present thrift for himself and his family. Not only is this a matter of settled conditions but also of the existence of tangible uses for savings which are close to the interests and sentiments of the individual. The conditions of the modern industrial laboring class are highly unfavorable to thrift in this respect as compared to those of an owner-peasant class, a skilled independent artisan class or an independent small business class. Those of the early phases of economic individualism which had the combination of relatively settled conditions, wide diffusion and personal control and operation of productive property and a relatively open opportunity for substantial but gradual rise in social status were much more favorable than the later phases of large scale industry, a propertyless laboring class and concentration of industrial control.

Thirdly, in so far as the prestige of wealth is a powerful social force, it makes a great difference to thrift if the standard is primarily one of scale of consumption, the aspect which Veblen brought out, or one of the possession and control of wealth, as farms and factories. The latter type may favor thrift while the other favors extravagance. Recently there has been a shift from the latter to the former, which is largely explained by the increasing intangibility of the sources of income.

The classical economists of the early nineteenth century laid enormous emphasis on indi-

vidual thrift as the corner stone of the stability of laissez faire capitalism. In their invectives against the demoralizing poor law they failed to see that the very conditions which had made possible the freedom and mobility they prized so highly were also largely responsible for the thriftlessness they deplored. The gospel of thrift as preached by them and their successors was not sufficient to counteract the influence of these conditions. In fact the very vehemence with which the gospel has been preached may be regarded as an index of the failure of thrift to be a natural result of the social situation of recent times.

The modern economic order has created two important substitutes for individual thrift as a source of capital accumulation. One is the accumulation of corporate surpluses and their direct reinvestment in industry. The other is the operation of the banking mechanism to extend credit to business enterprise and through the resulting inflation, as it were, to tax the rest of the community. But it is highly questionable how far these mechanisms can take the place of individual thrift.

Individualistic ascetic Protestantism was one of the prime agencies in destroying the framework of solidarities which largely lay behind the practise of thrift of the means type. It supplied for a time a far more powerful motive of accumulation but one which rested on a highly precarious basis. Widespread secularization has already rendered it largely ineffective, while there seems to be little sign of a revival of the family and small property conditions which might restore the previous situation.

THUCYDIDES (c. 460-c. 399 B.C.), Athenian historian. Thucydides' work marks an original and significant development in classical historiography. Herodotus, building upon foundations laid by Ionian logographers (story tellers), had established history as an independent branch of literature—an "inquiry" which, while it reflected the insatiable curiosity of the Greek enlightenment, still revealed close affiliations with poetry and theology. With Thucydides history lost the character of a prose poem, becoming the diligent and meticulous search for truth according to a rigorous formula. This involved, on the one hand, a fresh ideal of chronological exactitude and the critical investigation of fact, on the other, an explicit repudiation of the mythical as a valid hypothesis for interpretation. History thus ceased to be diffuse and episodic, and in default of natural explanations it no longer invoked metaphysical conceptions, such as nemesis or cyclical evolution. On the basis of relevant material facts the historian undertook a cautious reconstruction of the genesis and growth of Hellenic polity which culminated in Athenian imperialism as the background for a vivid and penetrating account of the Peloponnesian War.

In thus creating "scientific" historiography Thucydides reflected in general the influence of his birth and upbringing in Periclean Athens, the "school of Hellas." Specifically his inspiration depended upon Hippocratic positivism. This movement, which like Democritean science rejected transcendental causes, nevertheless asserted the priority of life to the atom, thus escaping the physical and ethical materialism of the atomists and suggesting a dynamic rather than a mechanical account of behavior in terms of organism and environment. From this standpoint Thucydides offered a prognosis of the conflict between Athens and Sparta and of the consequent disintegration of Greek society, characteristic of which is a constant use of the complementary *ergon* and *logos*, material fact and its reflection in thought. This permitted an illuminating psychological analysis of individuals and groups as they responded to various typical situations, especially in the conventional dialogues which (although excluded by modern standards of objectivity) facilitated interpretation. Particular events thus acquired universal significance, yielding those inductions upon

which depended the value of Thucydides' work as a "possession forever"; and history, no longer mere entertainment, revealed those general principles which appeared to govern human affairs. To this study authority was added by the circumstances of Thucydides' life: his kinship with the empire builders Multiades and Cimon, his experience as eye witness and victim of the plague at Athens, his service as general and, above all, his twenty years' exile. This provided Thucydides with the opportunity of association with the members of the Peloponnesian League as well as leisure for study and composition.

THUNEN, JOHANN HEINRICH VON (1783-1850), German economist. Thünen's fund of theoretical and practical knowledge in the field of agriculture was superior to that of any other economist of his time. An experienced farmer, he established a model of agrarian economy on his estate in Mecklenburg, an independent thinker, he steeped himself in contemporary scientific lore by studying under Albrecht Thaer and by absorbing the works of Adam Smith. His major publication, *Der isolierte Staat in Beziehung auf Landwirtschaft und Nationalökonomie* (3 vols., Hamburg and Rostock 1826-63; 3rd ed. by H. Schumacher, Berlin 1875), which at first attracted little attention, is today recognized as a fundamental and pioneering economic study concerning the location of agriculture.

Thünen sets out by assuming that a great city lies in the center of a fertile plain unwatered either by a navigable river or by a canal; the soil is uniformly good and arable; far from the city the plain ends in an impenetrable wilderness. Under such conditions the prices of the products at the point of consumption and the transportation costs from the point of production determine the territorial distribution of

agricultural production, so that, as the distance from the market increases, the farmer will produce commodities which relative to their value involve ever lower transportation cost and will in general resort to increasingly extensive methods of production. Thus each consumption center will be encircled in a series of concentric belts in the following pattern: truck and dairy farming, forest economy, orchards, grains under crop rotation, three-field economy and, finally, cattle raising and hunting. Upon the same assumption ground rent can be viewed as a differential rent, resulting from the advantages of location. Thünen was aware, however, that differential rent also results from differences in soil quality. Nor did he overlook the existence of absolute rent, which he traced partly to the intensification of land cultivation with simultaneous decrease of wages and partly to the fact that capital put into well planned improvements yields an annual return in addition to the interest charges. Thünen was also the first to perceive and analyze the phenomenon of "negative rent," which arises whenever the yield derived from a plot of land does not cover the interest charges on the capital invested in the land and which because of its fixed form cannot readily be withdrawn and diverted to more remunerative channels.

Thünen's theory of location of agriculture not only has general theoretical validity but is capable of verification in reference to past as well as present development. Historically the development sketched in the isolated state corresponds to actual agricultural development within particular countries. In modern times the general acceleration of transportation methods and the sharp decrease in transportation charges, on the one hand, and the growth of large centers of consumption, on the other, have given a most complex cast to the simple picture of Thünen's concentric belts. But regardless of whether the grain belt closely encircles a metropolis or includes all Europe or extends as far as America from European industrial centers, the connection pointed out by Thünen between distance from the market, transportation charges and the locus of production must remain valid so long as agriculture continues to produce for the market instead of for its own use.

In the second part of his work Thünen studies the problem of natural wages and their relation to the rate of interest and to rent. The solution he offers in the formula $\sqrt{a \cdot p}$, wherein a represents the value of the commodities necessary

for the maintenance of the worker and *p* the value of his product, was shown as erroneous by Knapp, Brentano, Knies and others. Nevertheless, Thünen must be credited with having recognized at an early date that "the source of the evil is in the separation of the worker from his product" and that the way of defending or glorifying existing wages gives no solution of the social or even of the economic problem. At variance with the optimism of the classical school, he held that social measures, such as profit sharing, must be utilized to transform existing conditions into those which he regarded as "natural," or just.

TIELE, CORNELIS PETRUS (1830-1902), Dutch historian of religions. Tiele was educated at the Remonstrants' Seminary at Amsterdam and became a pastor and later professor in the same institution, which was moved to Leyden in 1873. In 1877 a chair in the history of religion, later including also the philosophy of religion, was established for him at the University of Leyden, where he passed the remainder of his life. Among his contemporaries Tiele acquired an international reputation as the foremost authority on comparative religion. He probably exerted more influence in England, where he lectured several times, than has any other foreign student of this subject.

With Max Muller and Albert Reville, both personal friends of his, Tiele was the founder of the modern school of the history of religions. Before his time practically all students of com-

parative religion approached the subject with a pronounced a priori philosophical bias and without any conception of the organic and hence historical nature of religion. Except in the case of the Old Testament, where others preceded him, Tiele was the first to apply the evolutionary method to the study of the ancient oriental religious sources. He emphasized also the fundamental importance of basing all research in comparative religion on the original sources. It is true that he was himself a linguistic autodidact, and although he had mastered the most important ancient languages, including Sanskrit, Avestan and Assyrian, he lacked the necessary training to handle sources with the skill shown, for instance, by Eduard Meyer. On the other hand, he distinguished himself by sound judgment and moderation. A certain philosophical weakness prevented him from making innovations in the philosophy of religion; nor was he in full sympathy with the new anthropological school of Tylor and Robertson Smith, although he utilized results of their researches.

TILAK, BAL GANGADHAR (1856-1920), Indian nationalist, educator and journalist. A Chitpavan Brahman, Tilak graduated from Deccan College in 1876 and subsequently studied law. He took a leading part in founding national secondary schools under Indian direction and helped to establish Fergusson College, where he taught jurisprudence until 1890. In 1880 he had begun publication of two weeklies, *Kesari* in Marathi and *Mahratta* in English. Ten years later he became editor in chief and owner of these organs, which served as his instruments in arousing India to a fierce and semireligious nationalism and in fostering and protecting

orthodox Hindu customs against western influences.

In 1890 Tilak entered the arena of all Indian politics, opposing the Age of Consent Bill, which sought to restrict child marriages. By 1905, the first period of Indian unrest, he had emerged as the great leader of the new nationalism, which revolted against the westernized liberal movement of the second half of the nineteenth century to which the founders of the Indian National Congress had adhered. Tilak brought to the youth of India, previously educated in the tenets of social reform and western enlightenment, a new and more militant gospel. India's first task, he held, was to secure national freedom and to renew the people's faith in their own great past. From the admiration of alien ways they must turn to a deeper understanding of their own history, ancient wisdom and traditions; for only from these could reform, if it was necessary, evolve as a gradual process in organic growth. Isolated social reforms Tilak regarded as superficial panaceas. Under his guidance the younger generation enthusiastically and romantically turned to India's past for inspiration. This revaluation of standards led to a rapprochement of the educated intelligentsia with the orthodox masses, whom Tilak succeeded in drawing into the orbit of the nationalist movement and in whom he tried to instil a spirit of independence and resistance. He glorified and attempted to revive the martial past by instituting Sivaji festivals and gymnastic clubs. Himself an intellectual rather than an emotional type, Tilak reached the masses by his exemplary personal life, by his orthodoxy and by the popular symbolism of the Sivaji cult. Released in 1914 after six years' imprisonment, he organized the home rule group, whose principles triumphed in the national congress of 1916. Not only was he the father of popular Indian nationalism but he also taught the movement the technique of agitation. In a certain sense Gandhi continued what Tilak had begun.

Tilak was a notable scholar. *The Orion; or, Researches into the Antiquity of the Vedas* (Bombay 1893) and *The Arctic Home in the Vedas* (Poona 1903) present his theory of the origin of the Indian Aryans.

TIME SERIES A time series is a number of quantitative measurements arranged in chronological sequence. Such series may be distinguished by the object of measurement, by the time unit employed in the sequence and by the way in which the period covered is delimited.

Since time is a most general frame of reference, measurements of all types may be presented as time series, with specific designation of space and period covered. But it is the basic aim of science to establish such relations among measurable phenomena as would hold over a wide area of time and space. The first step in this direction lies in experimental control of the measurable phenomena which makes it unnecessary for observations to be identified by historical dates. Thus, for example, when gaseous pressure is measured, the fact that the measurement is taken on February 13, 14, 15, . . . successively ceases to be of importance, provided that the experiment has been so controlled as to make it possible to ascertain the timing of the factors conditioning the observations. In the resulting measurements the chronological sequence is preserved; and thus the array of figures still constitutes a time series. But instead of a historical, or uncontrolled, time series it becomes a controlled one, the sequence being in time units elapsed from the moment when the conditioning factors began to operate. In the next step of scientific analysis the chronological sequence itself is likely to be eliminated. With increasing control over factors conditioning his observations the scientist is able to express the variations in the measurements as a function of some independent variable (of which time may be one). Thereby a series which originally described an event confined to specific time and place is transformed into an instance of a broadly valid relation binding two or more variables.

In the natural sciences, thanks to possibilities of experimental control, this translation of the raw material of experience into generally valid relations has gone much further than in the social sciences. With regard to the establishment of widely valid relations among factors time series play the same role in both groups of scientific disciplines. But the possibilities of ex-

perimental control of social phenomena are extremely limited. It is therefore much more difficult to pass from a historical to a controlled sequence. And while time series analysis is essentially a body of methods of interpreting a historical series as a congeries of changes, each due primarily to a specific group of factors—so that it is presented as a controlled sequence—the resulting generalizations are never so inclusive as to free the investigator from reference to limited historical periods and spatial areas or to relieve him of the obligation of describing fully the basic raw materials, i.e. the historical time series. Moreover there is marked human interest in time sequences relating to social phenomena. Man has a much keener interest in the history of his own kind than in that of other parts of the universe with which he does not identify himself. Historical time series have therefore remained and are likely to remain of greater immediate importance in the social than in the natural sciences. And so long as the social phenomena elude experimental control, analysis of historical time series with a view to establishing general relations will offer problems and necessitate tools significantly different from those relevant to sciences which can control the observed phenomena.

Of the vast number of time series available to the social scientist a considerable portion represent the by-product of administrative activity rather than measurements undertaken to gauge a precisely defined phenomenon; and many others may be deficient because of the vast extent of the area covered and lack of control over the phenomena observed. Consequently the first task in analyzing any time series, especially one covering a long historical period, is to ascertain what precisely has been measured. Faced with a row of figures labeled "pig iron production in the United States, 1890-1925," an analyst would do well to ascertain what exactly was meant by "production"; how complete was the coverage of the series as compared with the country wide total; how much of a bias there may have been in the reporting; and how great were the qualitative changes in pig iron. With these questions answered, the series may be evaluated as a description of the institutional category which it purports to measure. But the significance of the measurement from the point of view of analytical categories still remains ambiguous. This ambiguity can be dispelled only after the series has been interpreted as the product of a certain segregable group of factors, i.e.

when it has been presented as a controlled sequence.

The numerous tools of statistical analysis used in interpreting historical time series fall into two large groups: one dealing with the spatial aspects of the series, the other dealing with their temporal aspects. Both groups of methods may be used separately or jointly in the transformation of the historical series preparatory to its final translation into a functional relation, invariant over wide stretches of time and space.

Spatial analysis of time series is needed in so far as the area of reference of the historical records may not correspond to the functionally defined object of measurement. For instance, in order to establish the generalization sought for, the investigator may have to deal not with pig iron production but with the output of all producers' goods; or he may find it necessary to segregate merchant pig iron production. Two statistical problems may thus be involved: the combination of several time series into a more inclusive aggregate by the use of index numbers (qv); and the analysis of a single series into constituent parts, each associated with different independent variables, by means of correlation (qv).

The treatment of historical series in their temporal aspect may best be understood in the light of three assumptions: first, that each historical time series reflects, throughout the period covered, the combined effects of a number of factors, second, that these factors may be segregated into significantly different groups, identifiable on the basis of available knowledge and distinguishable by the pattern of changes which they produce; third, that while the various groups of forces which account for the different patterns of temporal changes are interrelated, the decomposition of historical series into these patterns is important for the study of the various groups of forces and their interrelations and is preparatory to the establishment of generally valid relations in the sphere of social phenomena. The first assumption is self-evident. The second and third will be expounded below in terms of time series analysis current in the social sciences.

The obvious grouping of temporal changes is one which distinguishes lasting from transient changes. This distinction appears in the most rudimentary attempts at time series analysis. When the object of interest is the "broad picture" of a protracted period, say a century, the natural tendency is to convert an annual series

into a decennial series and then to simplify the picture still further by rounding out the decennial averages. These crude transformations of the time and quantity units will cancel any changes confined within a period of ten years and remove a small part even of the decennial changes.

A more precise formulation of these two groups of movements in time would distinguish cumulative, irreversible changes on the one hand and cancelable, reversible changes on the other. The cumulative, irreversible changes are designated secular movements or trends. The cancelable, reversible changes are represented by cyclical movements of various types, distinguished by the period and regularity of the swing; cyclical fluctuations of two to fifteen years in length; seasonal variations of an annual period; and what may be called cycles of highly irregular and on the whole brief duration, the residual changes. The main problem of analysis in connection with these various types of temporal change is so to define them as to ground them firmly in the already existing knowledge of social phenomena; and to discover a mathematical expression for them which would provide a basis for the statistical procedure of describing the particular group of changes present in any given historical time series.

There is a certain group of social forces which produce changes cumulating over a long period. The growth of a nation's population, the increase in its fixed capital, the accumulation of its skill in technical arts, all these are expressions of forces whose effects cumulate over a period exceeding one or two generations. The changes thus produced are irreversible in direction; or, in mathematical language, they are movements whose first differences do not change in sign. Such a description of this basic attribute is, however, too restrictive. In the course of a very long period of time the factors accounting for secular movements are bound to produce a change in the direction of the cumulation: population and wealth cannot grow indefinitely. The statistical investigator may therefore relax the definition and apply the irreversibility of secular movements to the first differences rather than to the original line (thus making the second differences constant in sign). A further loosening of the definition, with a consequent increase in the number of turning points in the line of secular movements, does not appear advisable. For a short period this will tend to confuse secular and

cyclical changes; and for a long period the presence of many turning points will raise the general question as to the homogeneity of the secular forces at play.

Taken by itself the criterion of irreversibility does not provide a firm basis for the quantitative description of secular movements. It does not enable the analyst to distinguish short breaks in the influence of secular factors, which might appear as undulations that still leave the second differences constant in sign, from cyclical changes. Therefore the criterion of smoothness is added. Smoothness may be attained by minimizing the sum of the squares of the differences, the restrictiveness of this condition being the greater the lower the order of the differences considered. The prevalent practise of measuring smoothness by the sum of the squares of third differences renders the second degree potential series an ideal limit; a higher order of differences would permit the line of secular movements to undulate rather markedly. In this form, however, the condition of smoothness is too rigid; in practise departures from the rule become necessary. Thus the sum of the squares of the third differences is minimized, but only as one of the criteria of the choice of the line. Also a break in the smoothness of the line may be allowed if the investigator recognizes the existence of significantly different periods with substantial changes from one to the other in the congeries of secular factors. Finally, there may be a definite reluctance on the part of the investigator to present the description of secular movements as continuous beyond each segregable cyclical period; in that case the trend is described by a zigzag line.

Although cumulative changes are defined for purposes of statistical description by rigid mathematical attributes, a choice still remains among a number of available descriptive procedures. The choice is facilitated by the assumption of further qualifications which refer either to the nature of the changes produced by secular factors or to the character of the cyclical swings of various duration. As a result two broad groups of methods of describing secular movements may be distinguished. The restrictive methods, based on assumptions concerning secular movements themselves—mathematical curve fitting, first differences, the use of one time series as the line of secular trend of another series; and the inclusive methods, based upon assumptions concerning cyclical oscillations—all empirical types of moving averages. The only other method

frequently employed, that of free hand description, rests upon vague assumptions concerning some characteristics of both secular and cyclical elements.

Obviously the inclusive and the restrictive approaches to secular change will result in different descriptions, of which that based upon the restrictive definition may be regarded as a component of the congeries of movements covered by the wider definition. If the use of the two types of definitions is prompted by formal considerations only, the components resulting from restrictive definitions will represent merely approximations toward a more complete description. But if this procedure is suggested by a distinction between forces determining the various parts of the total secular change, the segregation of the two constituents of secular movements becomes important. Thus in a recent study on *Secular Movements in Production and Prices* (by Simon Kuznets, Boston 1930) an attempt was made to show that primary secular changes, whose description was based on restrictive assumptions concerning the nature of production trends, in various industries and various countries during the nineteenth and twentieth centuries had distinct features in common; and that secondary secular movements, i. e. that part of the total secular movement which was not described in the primary secular changes, were largely associated with secondary secular movements in prices.

In the case of cyclical fluctuations appreciably over one year in duration there is little difficulty in suggesting forces to which they may be attributed. Fluctuations in rainfall and crop yields, the unequal distribution of wealth and income with resultant oversaving and underconsumption, the complex relations between producers' and consumers' goods, the general element of uncertainty in the economic system and the resulting tendency on the part of the business community to alternations of pessimism and optimism, the peculiarity of the monetary and banking mechanism, each and all may be suggested as factors at play. None of these theories, however, yields a definition precise enough for purposes of quantitative description. They take the cyclical phenomenon for granted, its definition, if there is one, being implicit in the explanation itself. Such an implicit definition is never exact, even in hypotheses which trace cycles in social phenomena to periodic fluctuations in natural phenomena for the connection between

the resulting and the generating cycles is never so simple as to enable the investigator to endow the former with the rigid attributes of the latter.

The attributes of cyclical fluctuations as defined in time series analysis are as follows: reversible character of the movements; rough recurrence, within the broad limits of two to fifteen years, of the reversal in movement; rough equivalence, in respect of magnitude of the change, of the rising and declining phases of the movement. The first attribute is the basic distinction discussed above between secular movements and all types of cyclical oscillation. The second serves to distinguish cyclical fluctuations proper from seasonal variations and secular movements (in so far as a reversal in movement may occur in the latter). The last attribute, which relates to groups of several cycles rather than to each cyclical swing, serves to prevent a confusion of single phases of cyclical swings with short, irregular changes. Because the attributes cannot be defined more precisely, the segregation of cyclical fluctuations from irregular oscillations is not yet assured. If, for instance, it could be assumed that there is a strict recurrence of reversal in movement every four or five years, this attribute in itself would be sufficient to distinguish cyclical from irregular oscillations. At present the separation of cyclical and irregular changes can be made only by adding to the three specifically cyclical attributes a fourth—smoothness—which in this instance serves the same purpose as in the description of secular movements.

Here too the various descriptive procedures fall into two groups, according to whether they use a restrictive or an inclusive definition. In general restrictive definitions are employed not to describe exhaustively the specific cyclical swings in their historical occurrence but rather to decompose them into elements of possible importance from the analytical viewpoint. The additional qualifications of a restrictive definition are usually the strict periodicity of recurrence and the strict equivalence of phases of rise and decline. As a result cyclical fluctuations are represented, with the help of Fourier and periodogram analysis, as periodic symmetrical swings. Since historical time series do not exhibit a rigid recurrence of the cyclical swings, the latter can rarely be described by a single periodic series; they have to be presented as a compound of several periodic swings varying in period and in phase. Another type of restrictive definition is that involved in W. C. Mitchell's method of

studying the behavior of historical series within the dates of rise and fall shown by a country's business system in general.

An inclusive description of cyclical fluctuations cannot be achieved easily without recourse to empirical smoothing. This is usually applied to the deviations of the historical series from the line of secular movements and has for its purpose the elimination of seasonal variations (unless these have already been eliminated through a separate description) and of shorter, irregular disturbances. Such empirical smoothing can employ no hard and fast criteria, unless these are provided by the demarcation of specific cyclical swings in the original series and the selection of a moving average whose weight diagram assures a smooth line closely fitting the cycles as marked off. This procedure, however, does not dispense with arbitrary elements, which are involved in ascertaining the specific cycles in the original series. Moreover the demarcation of specific cycles makes possible the use of another method of isolating cyclical from irregular changes, that of averaging the various attributes of the cyclical fluctuations (duration, amplitude, relationship of phases) and thereby canceling the irregular changes; but in following this procedure the investigator runs into the difficulty of attempting to abstract at the same time from the irregularities of the cyclical element itself.

It is curious that the technique of time series analysis, as it developed in the past, laid little emphasis on the precise description of cyclical fluctuations as distinct from the irregular elements. This is due partly to the fact that the definition of cyclical fluctuations is formally much less precise than that of the other elements; and partly to the reluctance so to delimit the description of cyclical fluctuations as to eliminate any element of change, unless it is definitely proved that this element is distinctly different from the cyclical fluctuations. Thus in the past secular and seasonal changes were described precisely in order that they might be eliminated from the original time series, leaving the measurable *quiesita*, that is, the cyclical swings, corrected only to the extent justified by the recognition of the separate groups of factors in operation. The present tendency, however, is toward a more direct study of cyclical fluctuations and their separation from the irregular disturbances of short duration. Moreover there is a definite prospect that cyclical fluctuations themselves may be broken down into several types. One obvious

conclusion of a precise description of cyclical swings is that their period and amplitude are distinct for different types of phenomena. In social phenomena at large a distinction between major cycles of over seven years and minor cycles averaging about four years seems to suggest itself. A grouping of cycle types associated with different types of secular movements is also indicated, especially in the field of prices. The extension of periodogram analysis, at present hampered by lack of reliable historical time series covering long periods, is likely to result in a segregation of characteristic cycle types for different historical epochs. Another development of considerable promise is the hypothesis that cyclical fluctuations are the product of cumulation of random changes in time. The practical application of this hypothesis might lead to the interpretation of various types of cyclical fluctuations as reflecting cumulative processes of varying periods and patterns of cumulation.

Seasonal variations are fluctuations recurrent within each calendar year. This is their distinguishing feature, although refinement of statistical procedure has suggested a relaxation of the rigidity of this attribute. Thus with the establishment of moving seasonal variations gradual shifts in pattern and amplitude of these annually recurrent cycles have been allowed; and as short term shifts in seasonal amplitude (departure of the seasonal swing from the annual average) are recognized, the element of recurrence may be confined to the pattern only (the relative standing at calendar units in the seasonal swing).

That seasonal variations can scarcely be defined as strictly recurrent swings follows also from a consideration of the factors making for seasonality in social phenomena. The essential generating factor, the succession of weather and growth (in plants and animals) seasons, is not strictly repetitive from year to year and may manifest some movements during the period under analysis. More important is the fact that seasonal variations in social phenomena reflect the adaptation of social processes to both natural and conventional seasonal factors; and the mechanism of this adaptation may undergo rapid, if gradual, transformation because of the changing technical proficiency of the social system. Another source of possible changes in seasonality occurs in the case of historical time series whose constituent parts respond differ-

ently to the influence of seasonal factors (for example, a series of total volume of transportation or of foreign trade); in such series the shift in the relative magnitudes of the components will result in changes of both the pattern and the amplitude of the seasonal swing.

The first task of the investigator, faced at the outset with a presumptive lack of constancy in seasonal swings, is to attempt an approximate isolation of the seasonal element in order to ascertain whether or not it is variable and perhaps to compute a constant seasonal index for each comparatively short period. This preliminary treatment, which consists in removing the non-seasonal element to the greatest possible extent, is usually accomplished by one of two methods. First is the substitution of relative first differences (link relatives) for the original series; this procedure eliminates a considerable part of the secular movement and some part of cyclical fluctuations, especially if the latter are marked by plateaus, but it also removes some part of the seasonal element and may tend to accentuate the short time residual disturbances. A second method is the transformation of the original series into arithmetic or logarithmic deviations from a moving average in which the weights of each of successive twelve months are equal. The average used may be a simple twelve-month moving average, the combination of two twelve-month averages taken a month apart or any other combination satisfying the above condition. This procedure eliminates almost all of the secular movement and a great part of the cyclical fluctuations and leaves intact the seasonal element and the irregular, brief changes.

The second stage in the measurement of seasonal variations is the search for the central values. Here the number of methods is determined by the variety of available averaging procedures: in the case of constant seasonal swings the choice lies between the arithmetic mean, geometric mean, median, modified median and the like; in the case of moving seasonal variations the secular movements in seasonality are described either by a mathematical function or by an empirical smooth line. The grounds for choosing a specific procedure, aside from practical considerations of time and liability to mechanical errors, are the same as those obtaining in the averaging of variables or in the description of secular movements.

In so far as the non-seasonal elements are not completely eliminated in the preliminary stage and in the averaging, a third stage becomes

necessary: the correction of the results obtained in the second stage for the remaining non-seasonal elements, usually the secular element. This is often accomplished by proceeding on the assumption that the secular element remaining in the seasonal averages can be represented by a straight line on a logarithmic or arithmetic scale.

A consideration of factors making for seasonality in social phenomena leads to the conclusion that there may be year to year variations in the seasonal element, which will be most marked in seasonal amplitude. For the extent to which social processes are allowed to reflect seasonal factors may vary with the cost of adaptation or resistance. A producer facing a seasonal demand for his output may prefer to run his plant at an even rate and store his products to supply the demand in the peak season, or he may choose to vary his production schedule and avoid accumulation of stock. The factors determining such decisions tend to move with the business cycle; the cyclical fluctuation in business conditions will therefore tend to produce changes in seasonal amplitude and to some extent in seasonal pattern of those series in which the adaptation is controllable by the human agent. These year to year variations can be measured by comparison of the seasonal change in each single year with the constant seasonal index characterizing the period as a whole; change in seasonal amplitude is measured by the coefficient of regression and change in seasonal pattern by the coefficient of correlation.

This brief summary of the numerous procedures for describing seasonal variations is significant also as an epitome of the methods that might have been used in the study of what are now called cyclical fluctuations, if they could be defined by an attribute of recurrence within a rigidly fixed time unit.

The residual changes in time series are, as their very name indicates, the most ambiguously defined element. They reflect any inadequacies which have found their way into the description of the positively defined constituents of a time series (secular movements, cyclical fluctuations and seasonal variations); and they comprise those irregular fluctuations which no definition could classify under the three types of movements listed above.

It is in regard to this second element of the residual changes that an interesting question arises. Obviously neither secular, cyclical nor seasonal changes can be interpreted as random

variations spread out in time, for significant correlation exists between the successive values in each of these three types of change. But is the analogy of dice throws or random drawings from an urn applicable to those short, irregular oscillations in time series which remain after a most complete description and elimination of the changes that are classifiable as secular, cyclical and seasonal?

In the absence of any knowledge as to the nature of forces which make for these "pure," irregular oscillations this analogy might have been plausible; although even then it would be treated as only one of many models or analogies potentially helpful in interpreting these irregular changes. But in series dealing with economic behavior some tentative knowledge of the forces at play is often available. Strikes, changes in the law, elections, technical and fashion innovations, all may be identified as responsible for some specific, irregular disturbances. There is little justification for discarding such knowledge by burying these specific irregular changes in the anonymity of a frequency distribution. Moreover in some economic phenomena, especially speculation, there is the suggestion of a negative correlation between the successive items of the residual changes, the departure upward tending to provoke a definite opposite reaction as the human agents come to realize the highly transient character of the change. Whatever the theoretical objections, practical considerations render it dangerous to treat residual changes as random in character and to apply to them statistical devices originating in the analysis of random universes. It is difficult to attain an exhaustive description and elimination of secular, cyclical and seasonal changes; and since the knowledge of significantly different components of time series changes rapidly, there is seldom the assurance that residual changes do not contain some non-random pattern of temporal change. Residual changes are best considered as an ambiguous combination of the remaining particles of secular, cyclical and seasonal elements with some "purely" irregular fluctuations; although the forces determining the latter cannot be identified, in economic series these fluctuations appear significantly different from elements entering into random frequency distributions.

Time series analysis is essential as a tool in the establishment of generally valid relations between controllable factors and in practical at-

tempts to overcome difficulties raised by intractability of nature. These aims are served in a direct and significant fashion if the segregation of the various types of temporal change is associated with the separation of the various groups of factors.

In so far as description of secular movements, cyclical fluctuations and seasonal variations implies an isolation of significantly different groups of factors at play, the procedure may be compared with that of a scientific experiment in which a group of factors is segregated with resulting control over the measurements. There can be little doubt that such experimental isolation of various groups of factors occurs in time series analysis. This does not mean that the control so exercised is as efficient as that in the natural science experiment or that the prospects of arriving at generally valid relations are encouraging. Such relations of universal validity may never be established, but the aim should be kept in mind in order to emphasize the inconclusive character of the procedures involved in time series analysis. The latter is important only for the bricks which it makes available for the more inclusive structure of the generalized knowledge of social phenomena. A single line of secular movements, a single index of seasonal variations, a description of cyclical fluctuations in one time series, these are of no general significance. Nor does the computation of many trend lines, seasonal indices and cyclical curves permit the formulation of generally valid relationships unless the purely statistical generalization has been buttressed by knowledge of social phenomena derived from other sources and hence expressed in a form in which the factors conditioning the relation are clearly delimited.

In view of these considerations some of the tendencies discernible in present day time series analysis must be regarded as unsound. Increasing refinement of statistical technique and accumulation of data available for application of this technique foster the inclination to segregate types of change not clearly reducible to any otherwise identifiable groups of forces and to accept the mere decomposition of time series into arbitrarily defined constituent parts as highly illuminating. Related to this tendency and reinforcing it is the unwarranted imputation of inferential possibilities to statistical concepts borrowed from frequency distribution theory, particularly in interpreting trend lines fitted by the method of least squares and in testing the goodness of description by probable error meas-

ures in general. Such inferences rooted in probability theory are rarely warranted when applied to measures involved in time series analysis; the probability technique is applicable only after time series analysis is completed. A third tendency, which must likewise meet with disapproval, is that of concentrating on one group of changes and treating the others as disturbing factors to be described, eliminated and forgotten. It is a matter of common sense observation that the forces determining secular movements, segregable though they may be from those influencing cyclical fluctuations, condition the latter; the same is true of the relation between cyclical fluctuations and seasonal variations. A proper analysis of time series should take cognizance of the correlation that may exist between the specific characteristics of each of the changes as they manifest themselves in the historical time series.

Time series analysis is of great practical value in a society sensitive to changes and attempting to eliminate some of them or to counteract their most undesirable effects. A measure of duration and amplitude of the various types of movements is a necessary prerequisite to any planned endeavor to iron out some of the disturbances which these movements represent. For unemployment insurance, for public works, for the regulation of the banking and credit system, for the control of foreign trade, the measurement of stresses and strains provided by intelligent analysis of significant time series forms the only basis of practical planning and action. Here too the value of the analysis will be correspondingly greater, the less the analyst confines himself to the formal, quantitative results of his description; the more closely his analysis is bound up with a complete recognition of the institutional framework of which the historical time series is a reflection; and the more intensively it utilizes the available knowledge of general relations of social factors.

TINDAL, MATTHEW (c. 1653-1733), English deist. Tindal, who was educated at Oxford and was a lawyer by profession, first attracted wide attention by his *Rights of the Christian Church* (London 1706, 3rd ed. 1707), a trenchant argument against the power of the clergy. The book provoked so much resentment in the High Church party that it was publicly burned, along with his *Defence* (London 1709), as a postlude to the Sacheverell case. Tindal's most important work, *Christianity as Old as the Creation* (published anonymously London 1730, 4th ed. 1733), the second volume of which was destroyed in manuscript by the bishop of London, marks the high point of the deistic attack on revelation and is generally regarded as the most convincing presentation of the deistic view that religion consists wholly in morality. Since God is a "Being infinitely happy," He "can require nothing of us, but what makes for our happiness." God's laws therefore are immutable, and

a revelation can merely duplicate the religion of nature, the precepts of which are written "on the hearts of men." This view naturally led Tindal to a critical treatment of the Bible as containing much that was inconsistent with true morality. He pointed out the absurdity of trying to reconcile the Old and the New Testament, attacked Biblical ignorance of natural science, questioned the evidential value of miracles, asked why the Jews should be God's "favorites" and inveighed against priestly accretions to the original, simple religion of nature. The "Bible" of deism provoked more than one hundred replies, including Conybeare's *Defence* (1732), William Law's *Case of Reason* (1731) and Butler's *Analogy of Religion* (1736). The great result of the controversy was to lead deism into skepticism. Tindal's chief work appeared in German and French during the century and was an important influence on the continent. Tindal furthermore published a number of vigorous pamphlets, including several in defense of freedom of the press as well as of the Whig anti-clerical party.

TIRPITZ, ALFRED VON (1849-1930), German grand admiral and statesman. Tirpitz may be considered as representative of imperialistic Germany in its struggle for world power. As secretary of state for the navy from 1897 to 1916 he laid the foundations of the strong German fleet of the times before the World War. In this he was backed by Kaiser Wilhelm II, whose general foreign policy he influenced; Tirpitz succeeded also in winning over the Reichstag to a vigorous naval policy. Most important, he was one of the first in German conservative circles to recognize the significance of public opinion and to mobilize it for his support. The German navy association, or Flottenverein, which was founded to circulate propaganda for a bigger navy, furnished to some extent the inspiration for the mass movements of the Right groups in post-war Germany.

Tirpitz' naval program concentrated on the formation of a battle fleet. This, he believed, could guarantee peace because England, Ger-

many's rival, would not risk a conflict with German sea power. At the beginning of the war, in accordance with his policy of battleship construction, he sought an immediate naval battle; but he did not achieve his aims. The submarine warfare originally entered upon against his will was abandoned, likewise in contravention of his wishes. This mode of naval warfare, which Germany was not equipped to carry out successfully, resulted only in slight gains and stirred up vigorous objections on the part of the neutral powers. Tirpitz' withdrawal from office followed in 1916.

In 1917 Tirpitz became head of the German *Vaterlandspartei* (Patriotic front), which agitated for a policy of annexations and in particular demanded German dominion over the Belgian coast. After the war he was a member of parliament on the German Nationalist party ticket and played an influential political role behind the scenes. Hindenburg's willingness to stand for the presidency was in great part due to the influence of Tirpitz. A man with an exceptional talent for organization, Tirpitz possessed a gift for politics which was rare among the German pre-war military caste. His clever parliamentary negotiations and his books testify to his special ability in the art of persuasion.

TISZA, ISTVÁN (1861-1918), Hungarian statesman. Stephen Tisza was the son of Kálmán Tisza. Although he was raised to the peerage by the king he remained like his father a typical exponent of the gentry. Twice prime minister and once president of the Lower House, he continued in all essential points the system of his father. But the safeguarding of the Dual Constitution and the strong development of the army came to be resented not only by the disinherited majority but by a growing group of the privileged Magyar classes themselves, who clamored violently for the independence of the Hungarian army and economic life. An increasing industrial proletariat supported by a group of intellectuals was demanding universal suffrage. Further, the agrarian problem with the enor-

mons emigration it involved was alarming the better elements of the population. At the same time Tisza with other spokesmen of the agrarian aristocrats set out to push the country into a customs war with Serbia, which became one of the chief causes of the World War. Finally, resistance of the national minorities became more conscious, and their younger intellectuals succeeded in establishing direct contact with Archduke Franz Ferdinand, who feared the policy of the Magyar oligarchy as a menace to the monarchy's survival. The pseudo-parliamentary system did not work because the opposition's more active elements began to use obstructionist tactics against Vienna's military claims. For Tisza there was no escape from this situation, for the forces of national chauvinism could be balanced only by the peasants, the proletariat, the radical intellectuals and the national minorities, and these were exactly the groups which he dreaded even more than the nationalists. Under these circumstances Tisza crushed the opposition by disregarding parliamentary rules (November, 1904), an action which led to tumultuous resistance, so great that he lost his majority, and Vienna was again compelled to experiment with open absolutism. After a short compromise between Vienna and the national opposition Tisza regained power, again suppressed opposition by armed force (June, 1912) and remained dictator of Hungary. The World War made his position even stronger; after a short period of hesitation he supported it passionately, and he seemed to be the only "strong man" of the ramshackle empire. When the war situation became worse, the new emperor Karl realized that Tisza's oligarchic policy made impossible the remodeling of the monarchy into a federation of its nationalities. He asked Tisza to introduce a universal suffrage law; but Tisza resigned, since the chief purpose of his entire policy was to maintain the rule of the nobility and the exclusive Magyar character of the country. As a colonel he went to the front; simultaneously he did all he could to hinder the new government's efforts to introduce universal suffrage. In September, 1918, the emperor sent him as *homo regius* to solve the South Slav question. Instead of peaceful negotiations, six weeks before the final collapse of the monarchy, Tisza "lashed his horseman's whip against the memorandum [of the Jugoslavs], which he termed a stupidity." When on October 17 he announced in parliament, "We have lost the war," he gave the first signal for the dissolution of the monarchy. Popular passion

was so aroused against him that on October 31, the first day of the revolution, he was killed by riotous soldiers.

TISZA, KÁLMÁN (1830-1902), Hungarian statesman. In the first period of his political career Tisza was an ardent advocate of Hungarian independence. He rejected the Dual Constitution created by Déak, and in 1868 he committed his party to the realization of a separate Magyar army, an independent diplomacy and a distinct financial system. His agitation made the position of the Déak party difficult. Later, however, he realized that against the overwhelming power of the dynasty there was no chance for success; and in 1875 he openly abandoned his principles and entered with his followers into the party of Déak, forming a union called the Liberal party. In the same year he became prime minister, founding a political system which remained virtually dominant in Hungary until the end of the monarchy. The liberal traditions of the Déak-Eotvös era were pushed more and more into the background, and the so-called Liberal party assumed a distinctly conservative and even reactionary aspect. Tisza's party could be called liberal only with regard to its policy toward Jews, who constituted the commercial and financial personnel of the system. When the antisemitic current ran high in 1882, Tisza's government suppressed the movement. Otherwise his system meant the satisfaction of four fundamental interests. The first consisted of maintenance of the Dual Constitution in accordance with the desires of the emperor and

leading Viennese circles. The second involved the safeguarding of the latifundist predominance, since under the rule of this "liberalism" as many entailed estates were created as under two centuries of feudalism. In the third place Tisza set out to protect the wealthier middle nobility, known as the "gentry," to whose Calvinist group he himself belonged. As the majority of the gentry were unable to adapt themselves to the new competitive economic system, many became bankrupt, refusing to enter industrial or commercial activities. The influential public positions were regarded as monopolies of the gentry. In the fourth place he established the national unity of the country by a policy of Magyarization and exclusion of national minorities from participation in power. The Tisza system put the liberal nationality law of Déak-Eotvos out of practise and fostered a spirit of Magyar jingoism. As the overwhelming majority of the inhabitants were its victims, the system could be maintained only by the most rigid party machine. In fact no opposition could ever compete with the governmental party at elections, because the Tisza system controlled the great majority of the constituencies through an antiquated electoral law, by administrative pressure, if necessary by open corruption and by the use of the army. The supporters of the system enjoyed all influential positions and public favors. As it excluded the cooperation of the nationalities it assumed in the international field a growingly anti-Slav tendency. Thus Hungary became a staunch supporter of the Austro-Hungarian-German Alliance. Yet Magyar nationalism itself became dissatisfied with the Dual Constitution, and after 1880 the fight for an independent Hungarian army and for an economic system became more vehement. Worned by these struggles in the year 1890 Tisza resigned the presidency of the council and retired into private life.

TITCHENER, EDWARD BRADFORD (1867-1927), American psychologist Titchener, who was considered by many as leader in the United States of the German mentalistic school of psychology, was an Oxford graduate and throughout his life a British subject. He studied the new experimental psychology at Leipsic under Wundt and came immediately afterward (1892) to Cornell University in America, where he spent the remainder of his life, devoting himself to the establishment of psychology as an experimental science and to the development of a systematic view of psychology as a science of conscious phenomena.

Titchener's championship of experimentalism in psychology led him to write the four volumes of his erudite *Experimental Psychology* (2 vols., New York 1901-05) as laboratory manuals. These books rendered feasible the offering of psychological laboratory courses in American universities and thus helped to establish the status of psychology as a science.

Titchener never regarded himself as a member of a recognized school of psychology, nevertheless, by his opposition to the dominant trends in American psychology and by his ability and seniority he became the leader of the conservative American minority, which held to the belief that consciousness is the sole or principal subject matter of psychology. Thus Titchener's unnamed school opposed the functionalism of James and Dewey with a "structuralism," the behaviorism of Watson with an "introspectionism," and animal psychology, psychoanalysis, the mental tests and applied psychology with disdain.

Originally (from 1896 to 1915) Titchener's doctrine of consciousness was that all mental phenomena are reducible to three kinds of sensory, elementary mental processes: sensation, image and feeling. Thus his systematic contributions consist chiefly in his establishment of feeling as an independent mental process, his reduction of attention to the sensory attribute of clearness and his combating of the new doctrine of imageless thought in favor of a sensory theory of thinking. Later he shifted his emphasis in descriptive analysis from the mental processes to their attributes, and still later he came to regard these attributes as general dimensions of consciousness. His view at the time of his death seems to have been that consciousness can be described with respect to the dimensions of quality, intensity, extensity, protensity (the temporal dimension) and attensity (the

dimension of clearness which varies with attention).

Titchener, who cultivated no formal school of psychology during his lifetime, left no school after his death. His views, however, have continued to provide a fulcrum for almost all that phase of American psychological thought which is directed against the behavioristic, the functionalistic and the practical trends that in general characterize American psychology. Recently Gestalt psychology, imported into America from Germany, has been replacing the Titchenerian concepts as the rallying ground for the mentalists.

TOBACCO. The inhaling of smoke from burning herbs had already been a part of medical practise in mediaeval Europe when explorers brought tobacco from America to the Old World to be smoked for pleasure. In the middle of the sixteenth century the custom of smoking tobacco spread through western Europe and later throughout the world. Wonderful curative properties were claimed for it, and in spite of opposition from both secular and church authorities the habits of smoking and snuff taking soon took firm root. During Elizabeth's reign smoking was practised at the court and in polite society and thus became popular and respectable in England. The efforts of James I and Charles I to discourage it were unavailing; their edicts against its cultivation on English soil, which were issued more to increase customs revenues than for the benefit of Virginia planters, were commonly ignored. Under Cromwell the attempt to suppress the growing of tobacco in England was only halfhearted. But the drastic decline in price, coupled with greater vigilance on the part of the later Stuarts, brought about the end of tobacco cultivation in England by the last decade of the seventeenth century. Imports of Spanish tobacco were virtually prohibited by high tariffs and the English market was devoted

almost exclusively to the colonial plantations. The prohibition in 1621 of colonial shipments to any country except England, and later Scotland, was persistently evaded.

Tobacco growing by English colonists had begun at Jamestown in 1612. Tobacco proved to be the colonies' only profitable export. Trade with Great Britain soon reached large proportions; exports increased from 20,000 pounds in 1618 to 500,000 pounds in 1627, to 7,000,000 pounds in 1663 and to 35,000,000 pounds annually by the end of the century. Rapid as was the growth of tobacco consumption in Europe, the flooding of the markets with leaf from Virginia and Maryland together with heavy import duties in England brought a speedy fall in price. From 55 cents a pound in 1618, the price dropped to 3 cents in 1664, even lower prices were recorded during the next hundred years. Legislation designed to fix prices and to restrict acreage met with little success. In spite of the low prices the planters of Virginia, Maryland and the Carolinas persisted in depending on tobacco for their export crop, although the kings and colonial governors sought to encourage more varied agriculture in these areas. Wars and severe depressions in England sometimes forced a measure of diversification, but with the first improvement in the market the areas planted to tobacco again increased. Although tobacco did not lend itself to cultivation in large tracts it was important to have enough forest land to allow for constant change from old fields to new ones, since tobacco rapidly exhausted the soil and abundant labor meant that new acres could be brought continually into use. Negro slavery had little to do with the early extension of tobacco culture in Virginia; there were three white servants to each Negro slave as late as 1671, and both were greatly outnumbered by freemen. During the eighteenth century, however, large planters in the south came to rely more and more upon slave labor in tobacco growing.

In the Connecticut valley tobacco was grown during the seventeenth century, although it was of little importance as an export crop until after 1800. Southeastern Pennsylvania became an important center for the cultivation of cigar leaf early in the nineteenth century. With the settlement of Kentucky and Tennessee the area of tobacco growing was extended west of the Appalachians, and for many years Kentucky vied with Virginia for leadership in production of leaf. Tobacco planting began in Ohio, Missouri and Florida early in the nineteenth century.

Although less than 1 percent of the crop area of the United States is now devoted to tobacco culture, only five or six crops exceed tobacco as sources of gross income to farmers. Tobacco requires more intensive cultivation than any other widely grown farm crop. The area planted to tobacco by the average farmer is small—4 or 5 acres; yet for thousands of farmers in the upper south of the United States it is the main if not the only cash crop. In the piedmont and in Kentucky and Tennessee the characteristic grower of tobacco is the small owner-farmer or the farmer with one or two tenants; but along the Atlantic coastal plain the percentage of tenancy on farms is very high. 25.6 percent of the farms of Virginia are operated by tenants, 43.5 percent in North Carolina, 64.5 percent in South Carolina and 66.6 percent in Georgia. The proportion of tobacco farms operated by Negroes is likewise very high in these states. 25.7 percent in Virginia, 28.3 percent in North Carolina, 56.6 percent in South Carolina and 41.9 percent in Georgia. Dependence on merchant credit is here very common, with high rates of interest adding to costs of production which would be heavy even on a cash basis, since much fertilizer must be used on the land in this area. The prevailing method of marketing tobacco of the cigarette and export types is the auction, a means which seems to have fostered the concentration of power in the hands of the few great buyers—large American and British manufacturers and the European governmental corporations—who dominate the leaf market. Efforts to unite growers for purposes of cooperative marketing and production control have had only brief successes; outbreaks of violence, as in the Night Riders episode in 1905-06 in Kentucky, have sometimes marked these attempts. Cigar leaf is commonly sold at the grower's barn or contracted for by the buyer before the crop is harvested. Grown largely in the northern states, its culture presents few of the problems of tenancy and merchant credit which characterize the growing of cigarette and export types of tobacco. In 1933 as a part of its agricultural relief program the United States government undertook to secure the consent of tobacco growers to control acreage in exchange for a bonus to be paid out of the proceeds of the processing tax.

In the years just prior to the American Revolution exports to Great Britain had amounted to about £100,000,000 annually. The trade suffered during the wars with England and the Napoleonic wars, and exports did not again

reach this level until after 1840. A fairly steady increase in exports continued thereafter, but only after 1870 did they regularly exceed £200,000,000 a year and only after 1918, £400,000,000 annually. The reason for this retarded rate of growth of export trade lay in part in the increasing domestic manufactures of tobacco products.

As early as 1732 tobacco factories existed in Virginia, and snuff and smoking tobacco soon became relatively important manufactures in the colonies. During the 1790's about 80,000 pounds of snuff were manufactured annually. Manufactured tobacco was put in special packages with a trade label by a Baltimore firm as early as 1786. By 1810 cigar making had developed from a household to a shop industry in Connecticut, Kentucky and probably other parts of the country. New Orleans with 400 cigar makers in 1812 sold its product in cities as far north as Buffalo. During the second quarter of the century Essex county, Massachusetts, Philadelphia, Lynchburg and Richmond became important centers for cigar making. Between 1840 and 1860 the gross value of tobacco manufactures increased fivefold; at the latter date it exceeded \$30,000,000, cigars accounting for one third and manufactured tobacco for the remainder. A single factory in St. Louis employed 500 workers in the manufacture of plug and fine cut tobacco and in the preparation of leaf for export.

Prior to the Civil War, however, cigar making was not typically a large scale industry, nor was tobacco manufacture exclusively so. The typical cigar shop was the establishment of an owner-worker, who bought his leaf, made his cigars and sold them locally. A common type of tobacco factory, especially in the planting regions, was the farmer's barn, where hands would lay the cured tobacco on long tables, beat it with flails and rake it over screens, sacking that which passed through and reworking the remainder. Marketing was equally simple; the entrepreneur would load his bags into a wagon and journey through the surrounding country, selling or bartering his wares.

The Internal Revenue Law of 1862 imposed a tax upon cigars and required the bonding of the factories, a burden which the small shops found difficult to bear. The introduction of the mold in 1869 made division of labor in cigar making economical and increased somewhat the advantage of the larger over the smaller shops. During the decade that followed the cigar industry experienced tremendous growth through

tariff protection and the swing of fashion toward cigar smoking, and the factory system became firmly established. Meanwhile the manufacture of chewing and smoking tobacco and snuff had been shifted rapidly to the factories, stimulated by the development of machinery for cutting, pulverizing and sacking; by the discovery and development of a new and very popular type of leaf, the "bright southern"; and by the expansion of the market through national advertising and improved transportation. From an average of 30 workers per establishment in 1860 the number rose to 40 in 1870, 69 in 1880 and 79 in 1890. It declined to 59 in 1909 and 74 in 1921 and rose again to 92 in 1931.

After its appearance following the Civil War the manufacture of cigarettes rose from 1,750,000 in 1869 to over 400,000,000 in 1880 and over 1,000,000,000 in 1885. The cigarette machine, which finally became established in the early 1880's, turned out 100,000 a day (expert hand rollers could hardly exceed 2500) and reduced the cost of manufacture in one case from 96 to 8 cents a thousand. An extensive advertising campaign on the part of the large manufacturers promoted the product.

To obviate an increasing bitterness of competition the American Tobacco Company was formed in 1890 by the merging of 5 concerns under the leadership of James B. Duke, and during the two decades that followed the history of the tobacco industry was largely the history of this trust. At the time of its formation it had fully 90 percent of the total cigarette business of the country, and to insure its continued dominance it acquired exclusive control of the best cigarette making machine then in use. Adverse decisions on patent questions in 1895 took away this advantage, but a vigorous policy of purchasing competitors was adopted and by 1899 the American Tobacco Company was turning out 95 percent of the cigarettes produced in the United States.

Meanwhile in a strenuous and costly effort to obtain similar dominance in the field of plug manufacture the American Tobacco Company encountered the opposition of the Union Tobacco Company, formed by a group of rival capitalists who had acquired control of the most important independent manufacturers. The two combinations merged in 1899. Subsequent purchases by the trust brought its share of the output of the United States to 75 percent or more of all tobacco products with the exception of cigars. Since machinery for cigar making had

not yet been developed to a point where the large concern had a decisive advantage over the small one, the trust was never able to control more than one sixth of the total output of cigars. Its efforts in this direction were relaxed after 1905, the three preceding years having shown losses in cigar manufacture. In order to gain increased control of the retail market for tobacco products, especially cigars, the trust acquired the United Cigar Stores Company in 1901 and soon became the most important single distributor of tobacco products. In 1907 it reported (with its subsidiaries) 392 stores, with annual sales amounting to over \$12,000,000. By stimulating sales through premiums and by pushing the sale of trust products it initiated the developments which are making chain store systems the dominant factor in tobacco marketing and are diminishing the importance of the once familiar tobacco shop.

During the decade following its formation the trust established a substantial foreign business, especially in cigarettes, and manufacturing properties were acquired in several foreign countries. In 1901 a large English company, the Ogdens, Ltd, was purchased, and the trust locked horns with a powerful British combination, the Imperial Tobacco Company. A brief period of severe competition ensued, ending in 1902 with an agreement which reserved to each its home market and turned over to a jointly owned corporation, the British-American Tobacco Company, the foreign trade of both combinations.

As a result of the changes that took place in the corporate structure of the trust, some of which appear to have involved deliberate manipulation in the interests of an inside ring, a new American Tobacco Company was formed in October, 1904, in which 60 percent of the stock was held by seven men, two estates and one bank. In this excessively capitalized company was centralized the control of the numerous corporations which comprised the trust, with total assets of approximately \$200,000,000 and with earnings of 17 or 18 percent.

In 1911 the Supreme Court declared the corporation to be a combination in restraint of trade and ordered its dissolution. The plan arrived at provided for a division of the assets of the company among fourteen corporations, in such a way as to preclude the control of any one company in any of the chief branches of the industry and to prevent the twenty-nine individuals who were defendants in the suit from holding collectively a majority of the stock in

any of the new companies. Restrictions designed to prevent the continuance or revival of the practises which had been found objectionable in the trust were imposed upon the several companies and their stockholders. Since the latter had acquired so large a proportion of the total business in tobacco products, except cigars, it was inevitable that the successor companies should start with a tremendous advantage over the independent companies. They have since maintained this advantage. The four large companies which succeeded to the trust's business have handled nine tenths or more of the country's total cigarette business in the years since the dissolution of the trust, and their dominance in the production of chewing and smoking tobacco has been nearly as great. The four companies combined made a return on their net investment in excess of 10 percent during each of the years 1915-32 inclusive and the rate of return rose steadily until 1931, when it reached 16 percent. They have maintained and even advanced the prices of their products in spite of falling production costs. Their price policies have been strikingly uniform, particularly since the World War. The prestige of their leading brands has been maintained by enormous expenditures on advertising, which have made it exceedingly difficult for other companies with financial resources too limited to allow them the necessary advertising budget to offer serious competition. Charges have been made and partially sustained by evidence unearthed by the Federal Trade Commission in 1922, that the great tobacco companies practised collusion in the buying of leaf as well as in the sale of their products. The commission's recommendations for remedying the situation in the industry were not acted upon by the Department of Justice, because it was alleged that the practises complained of had been abandoned. However, it is vigorously contended by the tobacco farmers that such practises are still prevalent.

Cigar manufacturing was long a field in which the advantages of large scale production and extensive advertising were insufficient to bring any distinct trend toward centralization. But soon after the World War an automatic machine for making the complete cigar was perfected; within ten years the number of cigar factories had declined 50 percent, and large factories which each produced annually over 40,000,000 cigars had increased their combined share of the country's total output from one sixth to over one half. During the post-war decade the con-

sumption of cigars gradually declined; chewing tobacco lost in popularity and smoking tobacco barely held its own. Cigarette consumption, however, grew at a phenomenal rate; in 1930 over 123,000,000,000 cigarettes were manufactured, five times as many as in any pre-war year. Of the 780,000,000 pounds of leaf tobacco consumed in manufacturing in 1930, about 44 percent went into cigarettes, about 18 percent into cigars and 38 percent into manufactured tobacco, which includes smoking and chewing tobacco and snuff.

Labor in the American tobacco industry has been organized in two unions, both affiliated with the American Federation of Labor. The Tobacco Workers' International Union, organized in 1895 by a group of ten local trade unions which had been directly affiliated with the A. F. of L., claims jurisdiction over the workers in all branches of tobacco manufacturing except cigar making; the latter branch is claimed by the Cigar Makers' International Union, organized in 1864 after the failure of several attempts to bring scattered locals together. The former union, faced by one of the most powerful trusts of the time, was unable to make much headway for several decades. Trade agreements with independent companies were not difficult to win, as long as the union label carried goodwill value; but the plants of the trust and, after 1911, of the successor companies were closed to unionism. During the World War and for a year or two after its close, the union was active and enjoyed virtual recognition from one of the four great successor companies. Thereafter it subsided into its normal inactivity until the National Industrial Recovery Act of 1933 again enabled it to increase in membership and in functioning. The changing technology of the industry caused the Cigar Makers' Union to lose in members and influence after 1910. The union persistently refused to accept new developments, such as the suction table, the bunch roller and the scrap filler bunching machine, while there was still time, and relied too heavily upon the union label. The automatic cigar making machine, introduced in 1918, was opposed bitterly until 1927; its official acceptance by the union in that year came too late to save any considerable measure of control over the industry for the union. The largest manufacturers of cigars were as obdurate and as successful in opposing unionism prior to 1933 as were the great cigarette companies. The Cigar Makers' Union has furnished a number of leaders for the American

labor movement, Gompers and Strasser among them. There has been in certain centers, notably Boston, New York and Tampa, a tradition of vigorous labor action among cigar makers, based upon ardently fought struggles to improve wages, to oppose the tenement system of manufacturing and to maintain certain rights, such as that of hiring a reader who furnishes entertainment or instruction to his fellows as they work at their benches. The left wing Tobacco Workers' Industrial Union affiliated with the Trade Union Unity League has during the last few years organized locals in the various tobacco centers; in Tampa a permanent federal injunction was issued against it after its strike of cigar makers in December, 1931.

Average earnings of workers in tobacco manufacturing are among the lowest to be found in American industry. Brissenden has estimated that actual money earnings in cigar and cigarette factories in 1925 averaged \$978 for males and \$543 for females, a third lower than the estimated average earnings of workers in all manufacturing industries. Over one half of the employees in the industry are women and their proportion is steadily increasing. In the south large numbers of Negroes are employed. Employment of children in tobacco factories, which was quite general at the close of the nineteenth century, has greatly declined in recent years. The sensitive machines used in making and packing cigarettes and in making cigars are generally operated by young persons; the displacement of older workers by the introduction of these machines, particularly in the cigar industry, has caused a severe unemployment problem among this group. Productivity per worker, in terms of leaf used in manufacturing, increased at a rapid rate during the period 1919 to 1929 in all branches; a decline in average number of wage earners employed, from 157,000 in 1919 to 116,000 in 1929, was accompanied by a doubling of cigarette production and a decrease of only 8 or 10 percent in the manufacture of other products.

In Great Britain over half of the manufacture of tobacco products is in the hands of the great Imperial Tobacco Company, yet the competition of some 300 other producers seems to have been effective in preventing monopoly control. Although heavy import duties on leaf tobacco, which is imported very largely from the United States, make prices of finished products relatively high, consumption averages over 3 pounds per capita annually—approximately one half

that of the United States. British companies have a considerable oversea trade in manufactured tobacco, chiefly with the dominions and protectorates and China.

The tobacco industry is a government monopoly in at least 15 European countries and in Japan. The Netherlands has a monopoly of trade in tobacco leaf from the Dutch East Indies; Amsterdam and Rotterdam are important ports of transshipment to Germany, Belgium, England and the United States. There is also a substantial amount of manufacturing in the Netherlands as well as some exporting of finished products. The trade is little hampered by tariffs and trade regulations, as the government desires to maintain the greatest possible measure of freedom of movement for raw leaf and finished goods. Probably no other European country except Belgium has a greater per capita consumption of tobacco products—approximately 5 pounds annually.

In France the tobacco industry has been a government monopoly for over a century. Cultivation is strictly regulated as to both type and area planted, buying, manufacturing and selling are conducted wholly by the monopoly, which operates a score of factories in the chief growing and consuming centers. Since domestic production meets less than half of the country's requirements, much leaf is imported; the French monopoly is one of the most important buyers in the auction markets of southern United States and the chief buyer of Algerian tobacco. Consumption per capita is nearly 3 pounds annually.

The tobacco industry of Germany imports about 150,000,000 pounds or more of leaf annually, to supplement a domestic production of some 70,000,000 pounds. Most of the German imports are Java and Sumatra leaf, since the cigar is the favorite form of consumption, although the increasing demand for cigarettes has brought a rise in imports from the United States and the Balkans. Taxes are heavy on all tobacco products, yet consumption per capita is approximately 4 pounds annually.

The total world production of tobacco leaf is difficult to estimate because the amount grown in China is unknown; exclusive of China, world production of tobacco leaf is about 5,000,000,000 pounds, of which one third is grown in the United States. Slightly more than one half of the crop of the United States enters domestic consumption. Imports of tobacco to the United States equal in value a third of the exports of leaf (in weight, scarcely a sixth); they come

mainly from Greece, Cuba, Turkey and the Dutch East Indies, which countries grow a type of leaf not suited to the soil of the United States.

In the export trade of the United States no agricultural products exceed tobacco except cotton and in some years meats. Great Britain buys more than one half of the United States' exports, and the British dominions, especially Canada and Australia, are likewise important customers, as are China, France, Germany and the Netherlands. About 80 percent of the leaf exported from the United States is of two types, "flue-cured" leaf grown chiefly in Virginia, the Carolinas and Georgia and "dark-fired Kentucky and Tennessee" leaf, both of which are used chiefly in cigarettes and smoking mixtures. Two other types grown extensively in the United States are used almost wholly in domestic consumption; these are Burley, which is raised largely in central Kentucky, and cigar leaf, which is grown especially in the Connecticut valley, southeastern Pennsylvania, Wisconsin and Florida. The tobacco exports of the United States constitute almost one half of the international trade in tobacco leaf. Other important exporting areas are the Dutch East Indies, Greece, Turkey, Brazil and Cuba. Leaf of special excellence is produced in each of these lands and the culture and export of leaf are among the leading economic pursuits. On the east coast of Sumatra and in parts of Java a cigar wrapper leaf is grown whose paperlike thinness and even texture and color give it a high value. In western Cuba a district called the Vuelta Abajo yields the Havana leaf, unequalled for cigars. Attempts to grow this leaf elsewhere, especially in Florida and in the Bahia district of Brazil, have been only partially successful, although Brazil exports a large quantity of excellent leaf. In southern Macedonia and parts of Asia Minor the pipe tobacco known as Turkish is grown; this leaf is indispensable for the blended cigarettes now popular in the United States and elsewhere. World trade in tobacco is largely confined to leaf, a fact accentuated by post-war tendencies in tariff making and fiscal monopolies. Exports of manufactured tobacco by the United States have been of relatively small importance in late years; imports have seldom reached \$25,000,000 in value and have consisted chiefly of cigars from Cuba and the Philippines.

Taxes on tobacco consumption have been a favorite source of government revenue in almost all countries since the seventeenth century. Vulnerable to the charge of being a luxury and

characterized by extreme inelasticity of demand, tobacco is generally purchased by the consumer in small amounts; and various levies, although they may be high ad valorem, are accepted by the smoker with less protest than is encountered in most other forms of taxation. In the United States, for example, the federal excise on cigarettes—6 cents per package of 20—has at times amounted to more than 50 percent of the price paid by the consumer of popular brands; state taxes are also frequently imposed upon the federal tax. Of the total value of products reported by the tobacco industries of the United States in 1931, nearly two fifths (approximately \$442,000,000) is accounted for by the federal excise stamps which the manufacturer is required to affix to each package. Changes in rates of taxation seem to have had little effect upon the growth of consumption of tobacco products, although they are usually reflected promptly in prices. Even in years of severe economic crisis government revenues from tobacco taxes decline but little; consumers' demands shift somewhat from more expensive to less expensive forms of smoking, but aggregate consumption maintains a high degree of stability.

Countries which grow tobacco in small quantities commonly depend on customs duties, both on raw leaf and on finished products, as producers of revenue from tobacco; Great Britain's customs revenue from this source amounted to £63,298,000 in 1931-32. Countries which grow as well as import leaf, like the United States, generally employ both customs and excise levies; protection of domestic growers is usually the chief factor in the determination of the amount of the impost. Evidence is inconclusive as to whether tobacco excises yield higher returns in the countries of Europe and in Japan, where they take the form of a government monopoly price, than in those which allow private enterprise in tobacco manufacturing and depend on taxes for revenues..

TOCQUEVILLE, ALEXIS CHARLES HENRI MAURICE CLEREL DE (1805-59), French political theorist and statesman. De Tocqueville's active political career, during which he had served as deputy in the Louis Philippe government and minister of foreign affairs of the republic in 1849, was brought to an end by his intransigent opposition to the despotism of Napoleon III in the period following the coup d'état of 1852. During the remaining years of his life he lived in retirement, completely absorbed in historical work. The distinctive approach to political problems which is characteristic of all of de Tocqueville's mature writings was first systematically presented in his *De la démocratie en Amérique* (4 vols. in Paris 1835-40; tr. into English, 2 vols., new ed. New York 1898). These volumes, although occasioned by the travels which he made to the United States in 1831, primarily with a view to studying at first hand the penitentiary system, did not stop at a mere descriptive account of public institutions. Confronted with a functioning democratic system of government, de Tocqueville was led to speculate in more analytical terms as to the essential nature of democracy itself, its advantages and its dangers. The emergence of the democratic regime he interpreted as a historical necessity, resulting inevitably from the diffusion of the idea of equality, which acts as a leveler of individual differences and traditional privileges. In the United States this development had been particularly favored by the similarity of conditions obtaining among the original colonists and by their Puritan outlook; in France the preparatory process of leveling had been the work of the centralized monarchy and of the revolution, which had built upon the older administrative machinery. In this diffusion of the principle of equality de Tocqueville was not unprepared to recognize a certain positive value arising from a more rapid circulation of public life and from the collaboration of all the individual members in the government of the state. But his critical spirit led him to throw the greater emphasis on the negative elements of democratic equalitarianism, which taken together make for despotism, since the leveling of all individuals annihilates the historical barriers by means of which these individuals are able to

defend themselves against incursions of state power. The absence of a single despot under a democratic tyranny is little compensation, for collective and anonymous despotism is even more oppressive and stultifying, penetrating as it does into every cell of the social organism. The only remedy against this danger is the reawakening of the feeling of liberty. The exercise of popular sovereignty through elections is not sufficient, if liberty is to survive, safeguards must be erected in all spheres of individual and social activity. Although his own attempts during the Revolution of 1848 to carry over these libertarian principles into practise brought only disillusionment, de Tocqueville's writings supplied most of the ideological premises of the so-called liberal democrats, who while accepting democracy as an inevitable development nevertheless sought to hedge it about with guarantees of personal freedom. During his final years of retirement de Tocqueville developed in *L'ancien régime et la Révolution* (Paris 1856; tr. by Henry Reeve, 3rd ed. London 1888) the thesis that the French Revolution, far from being the cataclysmic overturn which had been pictured by romantic historians and political theorists, was merely the dénouement of a long historical movement which could be traced almost continuously from Louis XIV to Robespierre. This radically new conception of the revolution brought about a marked reorientation of French historiography.

GUIDO DE RUGGIFRO

Consult Eichthal, Eugène d', *Alexis de Tocqueville et la démocratie libérale* (Paris 1897), Janet, Paul, *La philosophie de la Révolution française* (Paris 1875), Michel, Henry, *L'idée de l'état* (Paris 1895) p. 318-26, Bryce, J., *The Predications of Hamilton and de Tocqueville*, Johns Hopkins University, Studies in Historical and Political Science, 5th ser., vol. ix (Baltimore 1887), Ruggiero, G. de, *Storia del liberalismo europeo* (Bari 1925), tr. by R. G. Collingwood (London 1927), Soltau, R., *French Political Thought in the Nineteenth Century* (London 1931) p. 50-61.

TOLAND, JOHN (1670-1722), initiator of English critical deism. Toland was born in Ireland of Catholic parentage but turned Protestant about 1685. He received his university training at Glasgow, Edinburgh and Leyden. His *Christianity not Mysterious* (London 1696, 2nd ed. 1696) came to much bolder conclusions than Locke's *Reasonableness of Christianity* (London 1695), of which it was an outgrowth. Without

denying the possibility of revelation Toland held "that there is nothing in the Gospel contrary to reason or above it." His iconoclastic treatment of the accretions that were "contrary to reason" led to persecution. When the work was frowned on in London, he retired to Ireland but promptly left when the Irish House of Commons burned the book publicly, forbade its sale and ordered the arrest and trial of the author.

In his *Life of John Milton* (London 1698) Toland offered the bold hypothesis that the Christian canonical books might have arisen as forgeries. He defended these conclusions in *Amyntor, or a Defence of Milton's Life* (London 1699), a volume that began English critical study of the canon. After visiting Hanover and Berlin Toland published *Letters to Serena* (London 1704), in which he discussed the origin and force of prejudices, the question of immortality and aspects of materialism. His *Dissertationes duae . . . et origines judaicae* (The Hague 1709) and the *Nazarenus* (London 1718, 2nd ed. 1718) continued the historical attack on early Jewish and Christian history. His last work, *Pantheisticon* (London 1720), was a parody of the English church service and liturgy.

Toland's political or semipolitical writings, such as his *Anglia libera* (London 1701) and the biographies of Milton, Sidney and Harrington which he published along with editions of their works, indicated the general tendency among the bearers of the English liberal tradition in the period following the Glorious Revolution to abandon republicanism and to seek reconciliation with monarchism. His chief significance, however, lies in his fearless initiation of critical deism. His *Christianity not Mysterious* elicited over fifty replies before 1760. Through Voltaire and Holbach, the latter of whom translated several of his works, he was well known on the continent. Toland was the first Englishman to be called a freethinker, and he coined the word "pantheist."

TOLEDO, FRANCISCO DE (1517-84), Spanish statesman. Of noble birth, Toledo had served Spain as a soldier and diplomat before his appointment as viceroy of Peru in 1569. He remained in Peru until 1581, spending the first five years of his administration in traveling about the country and acquainting himself with its conditions. He then issued a series of decrees to govern the viceroyalty in which he regimented the relation between the Indians and their new overlords; systematized the collection of public revenue; fixed the conditions under which mines, industry and agriculture should be carried on; organized the Indian *corvée* system; established codes governing judicial procedure, the sale of land and methods of transportation; set up sanitary and police regulations; and provided water supplies for the principal cities. Interested in spiritual matters as well, he issued instructions for the systematic Christianization of the natives, established the Inquisition in Lima, gave permanent form to the University of San Marcos and opened schools in the principal centers. So broad was the scope of his legislation that he is often referred to as the "Solon of Peru." The governmental regulations which he adopted, and which were known as the *Libro de tasas*, endured for the whole colonial period; and some of them are still in effect in slightly modified form.

Critical evaluation of Toledo's achievements must take into account the fact that he arrived in Peru just as the conquest was completed, but while the newly acquired lands were still in a state of confusion. The social machinery of the Inca Empire had been disrupted and no European system had as yet taken its place. The foundations of the colony, however, were already laid: the *encomienda* system had been established, municipal governments had been organized to some extent, while the agrarian communities which constituted the base of the Inca Empire still survived. It was essentially on these bases that Toledo organized Peruvian society. By strong, even ruthless methods he established the authority of his sovereign and the church. Assuming the crown's right to the resources and population of the conquered territories, he tolerated no opposition. In order to bring the Indians under full control he issued decrees which bound them to the rural estates of the Spaniards or gathered them into settlements under supervision of civil and religious officials. In his attempt to forestall a move to restore the Inca Empire he dispersed the descendants of the

Inca and beheaded the young pretender, Tupac Amaru, on a charge of treason.

Toledo has been condemned for accepting and trenching socially injurious institutions, but it is questionable whether he could have altered the system already established. Undoubtedly he welded the diverse institutions of the Peruvian colony into a solid unit, establishing the authority of the Spanish crown upon a lasting basis.

TOLERATION. See INTOLERANCE; RELIGIOUS FREEDOM.

TOLSTOY, LEV NIKOLAEVICH (1828-1910), Russian author, moralist and social critic. He was born into the aristocracy and until he reached fifty led the life that befitted a gentleman farmer who was also a man of letters. In his youth and middle years he wrote chiefly fiction, wherein may be discerned some of the dispositions and attitudes which were the roots of the ethical system he developed later. It is clear that from the first he was possessed by an exacting conscience, by an urge to find the meaning of existence and to lay down a rule of right conduct. Aside from his work as a novelist and the activities connected with his estate his great interest in these years was popular education. He was a disciple of Rousseau, but he outstripped his master in his aversion to any form of discipline. This libertarian and non-conformist was, however, then generally reckoned among the conservatives.

When he was completing *Anna Karenina*, in the 1870's, he experienced a spiritual crisis, the history of which is set down in his *Confession*. Thereupon he embraced a rationalist variety of evangelic Christianity, the cardinal principles of which were brotherly love and non-resistance to evil. He aimed primarily at the achievement of inner freedom and personal righteousness, but he also applied his ethical doctrine to the solution of social problems. He rejected the church, believing that it had corrupted Christ's teachings, and repudiated the state because, he held,

the taxes supporting it drove the peasant into industrial slavery and above all because it was maintained by force. Paradoxically enough this rigorous anarchist was an admirer of Henry George and advocated the single tax. He scorned the arts and the literature enjoyed by cultivated people as well as modern science and the products of technological advance, spurning a culture which was based on the exploitation of man by man. His ascetic streak led him to regard marriage as a compromise and to exalt celibacy along with other forms of renunciation and self-discipline, while his opposition to violence made him condemn alike patriotism, revolution, war, capital punishment and a diet requiring the existence of slaughterhouses. The one road to the good life for a propertied person was to surrender his possessions and with them the desires and appetites bred by an artificial civilization and to turn to manual labor and the simple rural routine that was the lot of the peasantry. For his own part he handed all that he owned over to his family, declared in 1891 that his later works were public property and for a while took up such trades as cobbling and masonry.

He set forth his views in numerous tracts, in private letters and also in the stories and plays he produced after his conversion. The authorities forbade the publication of most of these writings, but they dared not molest the author, although some of his followers, who were largely recruited from the intellectuals, were made to suffer for their opinions. Tolstoyan colonies, which with his distaste for organizations the master repudiated, had a brief existence in more than one country, including the United States. His teachings reached the masses also, affecting chiefly the dissenters and giving rise to a Tolstoyan sect in the southern provinces, the Caucasus and Siberia. If by his severe criticism of the social order Tolstoy helped the cause of revolution, he hindered it by his condemnation of violence. His "feudal socialism" was stigmatized by Lenin as "utopian" and "reactionary." It was only in the early years of the Soviet regime, when the government tolerated sectarians and exempted conscientious objectors from military service, that the Tolstoyans were rather active. At present some of the teachings of the man who in his lifetime was acknowledged "the conscience of Russia" are honored to a degree in Gandhi's India and by the pacifists of western countries.

TOMEK, VÁCLAV VLADIVOJ (1818–1905), Czech historian. Tomek studied law at Prague and became a tutor in the home of Palacký, the celebrated Czech historian, who recognized Tomek's ability for historical research and encouraged him to concentrate on this field. He served for a time as secretary to the patriotic publishing society Maticе Česká and from 1851 to 1888 was professor of Austrian history at Prague. He served also as president of the Historický Spolek (Historical Society) of Prague. In 1848 he took part in the nationalist activities in Bohemia as a member of the National Committee. With the victory of the reaction in 1849, however, he became convinced that the interests of the Czechs demanded a compromise with the Hapsburgs rather than a struggle against them. From 1860 he was active as a member of the right wing, the Old Czechs, and served as a member of the Bohemian Diet and the Reichsrat in Vienna.

Although Tomek lacked the perspective and philosophic approach of Palacký, his historical works are scientific and thorough and constitute a significant contribution to Czech history. The most outstanding of his earlier books is his history of the University of Prague, *Geschichte der Prager Universität* (Prague 1848), the result of original and painstaking research. The Czech edition covers the story of the university until 1436; the German version, which was more concise, carries it to 1848. But Tomek's chief work is the monumental *Dějepis města Prahy* (12 vols., Prague 1855–1901; vol. i tr. into German, 1857),

the history of Prague from its origins to 1609. It consists of a very detailed study of every aspect of the political and cultural history of the city and in effect of the entire Czech nation, since Prague was its constitutional and spiritual center. The treatment of the Hussite movement in its relation to national development is especially interesting. Tomek's topographical study of Prague, *Základy starého místopisu pražského* (4 vols., Prague 1865-72), is a companion piece to the larger work.

Tomek also wrote histories of Austria and Bohemia, which were intended to bring Czech national sentiment into harmony with the dynastic views of the Hapsburgs and with their Catholic sympathies. In these works he proved the falsity of the *Stammlandstheorie* of the Viennese historians, which linked the history of the Hapsburg monarchy too closely with the Alpine countries and overlooked the importance of the Bohemian crownlands in its development. Among Tomek's other works mention should be made of *Jan Žižka* (Prague 1879; tr. into German, 1882) and *Sněmy české obnoveného žrizení zemského Ferdinanda II* (Prague 1868), a study of the Bohemian diets in which he tried to support historically Czech demands for autonomy.

TOMMASEO, NICCOLÒ (1802-74), Italian publicist. Born in Dalmatia, Tommaseo was educated in Italy; after studying law in Florence he turned to journalism, contributing among other reviews to the *Antologia*, which Vieusieux had established in 1821 in order to stimulate national regeneration. His intellectual orientation was toward Italian cultural traditions and the political ideals of the Risorgimento. In 1849 he participated, first as minister of education and then as ambassador to Paris, in the provisional government of the Venetian Republic established by Manin.

Tommaseo's literary activity was extremely varied. He wrote poetry, novels and histories as well as studies in penology, education, politics and philology, achieving distinction in many of these fields but never attaining preeminence in

any single one. His writings, all of which are characterized by a strongly moralistic point of view, display keen psychological penetration. As a novelist he followed the model of the "historical novel" developed by the Manzonian school, although he introduced a more sensual quality. His historical writings include "Pensieri sulla storia di Firenze" (published in *Archivio storico italiano*, n. s., vol. xiii, 1861, p. 3-30) and *Storia civile nella letteratura* (Turin 1872), the latter an attempt to correlate political and literary history. Tommaseo's rigid moral prejudices tended, however, to warp his historical judgments.

More interesting are his political writings, animated as they are by warm patriotic sentiments. *Libri dell'Italia*, written in 1835 and published in the same year in Paris as *Opuscoli inediti di frate Girolamo Savonarola*, propounds the fundamental theses of the neo-Guelphian program—the federation of Italian principalities under the presidency of the pope—before they appeared in the more famous writings of Balbo and Gioberti. After the events of 1848-49 Tommaseo revised his political doctrine, and in *La pace e la confederazione italiana* (Turin 1859) and *Rome et le monde* (Capolago 1851; new ed. in Italian, Naples 1862) he supported a program of Italian unification under the leadership of the Savoy monarchy. In *Il supplizio di un Italiano a Corfù* (Florence 1855) and *Discorsi sulla pena di morte* (Florence 1865) he urged the abolition of capital punishment.

The ideas expressed in Tommaseo's leading pedagogical work, *Della educazione, desideri e saggi critici* (2 vols., Turin 1856; new ed. by G. D. Valle, 1916), were developed further in a number of monographs. He insisted that emphasis should be placed upon religious and aesthetic training in the education of children and was one of the first Italian writers to realize the social significance of female education. Tommaseo's *Dizionario dei sinonimi* (Milan 1830; rev. ed. by G. Rigutini, 1925), *Dizionario della lingua italiana* (in collaboration with B. Bellini, 8 vols., Turin 1861-79; new ed., 7 vols., 1924) and *Dizionario estetico* (2 vols., Milan 1852-53) were valuable contributions to the study of the Italian language.

TOOKE, THOMAS (1774-1858), English financier and business man. Tooke's first incursion into economic controversy was his composition in 1819 of the Merchants' Petition against protective tariffs, the first practical step in the conversion of Great Britain to free trade. The rest of his life was devoted largely to monetary and statistical problems, on which he not merely gave evidence before successive parliamentary and government commissions but also wrote a series of pamphlets and books, culminating in the famous *History of Prices . . . 1793-1856* (6 vols., London 1838-57), the last two volumes being written in collaboration with William Newmarch (*q.v.*).

The guiding principle of Tooke's monetary theory was the conviction that price fluctuations originate in changes in the supply of and demand for commodities, as caused in particular by wars, harvest variations and speculative optimism or pessimism. To monetary disturbances he was prepared at first to assign a significant if secondary influence; thus he held that the Bank of England was in part responsible for the rise in prices during the Napoleonic wars, although not for the slump which followed their termination. Later, however, he came to deny outright the power of banks to affect the quantity of money in circulation or through it the level of prices; and in consequence he vigorously opposed the restriction on note issues embodied in the Bank Charter Act of 1844. The strength of his case against this act lay not so much in the statistical investigations with which he sought to refute its principles as in his insistence upon the similarity in the monetary status of banknotes and of deposits payable on demand, which latter the act did not attempt to control. He did well also in emphasizing the inadequacy of any theory of price fluctuations which confines its attention to purely monetary factors. But in supposing that monetary stability would be insured so long as the banks confined their loans to customers of sound credit he undoubtedly underestimated the effect of too low discount rates in stimulating industry and raising prices.

LINDLEY M. FRASER

Chief works: *On the Currency in Connection with the Corn Trade*. (1st-2nd ed. London 1829); *Considerations on the State of the Currency* (1st-2nd ed.

London 1826); *An Inquiry into the Currency Principle* (1st-2nd ed. London 1844).

TOOMBS, ROBERT (1810-85), American statesman. As one of the leaders of southern policy Toombs exerted a decisive influence during the crisis of secession. Although he was riotous in college, he acquired somewhere a sound education in public finance, statecraft and high debate. In Georgia politics he was a conservative, a southern rights Whig. Reaching Congress in 1845 he became an outstanding defender of southern claims to territorial expansion. After the failure of his own project for the immediate admission of California, New Mexico and Utah as a single state under whatever constitution its people might adopt, he supported Clay's compromise. When the Whig party collapsed, he became a Democrat and shifted to the Senate in 1853. In the hope of settling the Kansas question he proposed a new registration of bona fide citizens and voters under federal supervision, and a prompt admission of the state under whatever constitution the delegates elected by them should adopt.

As a member of the committee of thirteen appointed by Vice President Breckenridge in 1861 to effect a compromise between northern and southern demands Toombs, in company with Jefferson Davis, proposed that nothing be considered as adopted unless ratified by a majority of the five Republican members and a majority of the eight other members. Under this rule all compromise proposals were rejected. Toombs then exhorted Georgia to secede. At Montgomery he was well considered for the Confederate presidency, but partly by reason of a misunderstanding Davis was chosen. Toombs' services during the Civil War, whether as secretary of state, brigadier general or member of the Confederate Congress, brought him comparatively little power or prestige. Upon Lee's surrender he fled to Europe. Returning after two years he avoided the oath of allegiance and considered himself only a citizen of Georgia.

ULRICH B. PHILLIPS

Consult: Phillips, Ulrich B., *The Life of Robert Toombs* (New York 1913); Reed, J. C., *The Brothers' War* (Boston 1905) ch. xi; Stovall, P. A., *Robert Toombs* (New York 1892); Bradford, Gamaliel, *Confederate Portraits* (Boston 1914) ch. vii.

TOPINARD, PAUL (1830-1911), French anthropologist. Topinard, who was associated with Paul Broca, first as a disciple and later as a colleague, has an important place as one of the founders of French anthropology. After a youth spent in the United States he returned to France and studied medicine, but in 1871 he abandoned his medical practise for the study of anthropology. He exerted wide personal influence on the development of this science as secretary general of the Société d'Anthropologie de Paris between 1881 and 1886, as editor of the *Revue d'anthropologie*, as curator of the collections of the Société d'Anthropologie, as director of the anthropological laboratory at the École des Hautes Études and as professor at the École d'Anthropologie.

Topinard's research was concerned primarily with human races, their evolution and anatomical variations. He shared Broca's delight in the development of new techniques and methods and was responsible for numerous technical improvements in physical anthropology. Influenced by the dominant scientific discussion of his time, he devoted a large share of his labors to the problems of evolution. In the controversy between the polygenists and the monogenists he sided with the former, favoring the transformism of Lamarck as the mechanism of evolution.

Topinard's interest was not exclusively given over to anatomy; he devoted considerable attention to man as a social and intellectual animal. He did not rule out the possibility of psychological correlates of race but preferred to wait for their scientific demonstration before accepting them. As was consistent with his earlier studies and his great erudition in physical anthropology, he approached sociology by way of anatomy and emphasized the biological roots of the social structure. He held that society consists of ordered aggregations of individual organisms each acting in accordance with his physical nature; that within each ego are the potentialities of development from an egocentric to a socio-centric orientation. The conflict which inevitably arises in the individual between these two points of view may be resolved only by insistence on the observance of a code for the social animal.

TORRENS, ROBERT (1780-1864), English economist. Torrens shares with Ricardo and Malthus the honor of having founded the classical school of political economy. He was one of the first writers to adopt the tripartite division of factors of production into land, labor and capital. He enunciated the principle of diminishing returns in agriculture, although he did not lose sight of the possibility that increasing returns might arise from the extension of the division of labor. He elaborated the "standard of life" theory of wages in almost the same form in which it was later expounded by Ricardo. His theory of profits, as a surplus over costs or as the difference between market and "natural" price, was superior to that of Ricardo in that it recognized the possibility that during times of technical progress profits might rise without an accompanying drop in wages; he denied moreover that mechanical improvements could harm the working classes as a whole. In international trade he laid primary stress upon the advantage to be gained if each country were to specialize in type of production for which it was best suited rather than upon Ricardo's problem of trade between two countries one of which has an "absolute" advantage in both the commodities exchanged.

Torrens' theoretical doctrines led him to important practical conclusions. On the principles of diminishing returns and the territorial division of labor he based his vigorous opposition to the corn laws, although he did not commit himself to the support of free trade in general. Torrens was moreover an active supporter of the "currency theory" of banknotes and he is said to have been the first to suggest in the formulation of the Bank Charter Act of 1844 that the issue department of the Bank of England should be separated from the banking department.

H., *David Ricardo* (Baltimore 1910); Seligman, E. R. A., in his *Essays in Economics* (New York 1925) p. 70-77; Seligman, E. R. A., and Hollander, J. H., "Ricardo and Torrens" in *Economic Journal*, vol. xxi (1911) 448-68.

TORT. While there is no general agreement as to the exact meaning of tort, it may be said, without any attempt at rigorous definition, that tortious liability arises from a breach of duty fixed primarily by the law, that such duty is toward persons generally and that its breach is redressible by an action for unliquidated damages. It is to be distinguished from liability in contract, where the duty is fixed primarily by the contracting parties themselves and is toward a particular person; and from criminal liability, which is redressible by public punishment and which is not avoidable by any act of the offending party, whereas compromise of the sanctions for tortious liability is always possible.

It must be emphasized, however, that although these distinctions are fairly workable for literary and instructional purposes, they are misleading unless the history of the law is borne in mind. The same facts may, and frequently do, constitute a tort, a breach of contract and a crime or any combination of these. Moreover historically breach of contract was remedied by the action of *assumpsit*, which was tortious in character; and, although forms of action have been abolished, there is still an ill defined borderland between tort, contract and quasi-contract. Again, in origin tort and crime were not separated; and even when some sort of distinction between them began to be perceived, they remained a viscous intermixture. At the present day they are not readily distinguishable in the case of many wrongs which are petty offenses.

Another historical survival is the relation of the law of tort to the law of property. Many torts are wrongs to property, real or personal; namely, trespass to land or goods, interference with easements, infringement of copyright or trademark. Hence these topics are apt to be treated twice over in treatises on tort and on property law. The explanation is twofold. In the first place, several of the remedies for torts to property were once so much cheaper, quicker and less technical than the remedies for the recovery of property that they were applied by fictions to the latter purpose, and thus some of the law of tort became incorporated in the law of property. Secondly, from beginning to end there has never been any agreement in English law as to whether right or duty is the plinth upon which the law should be based. In the law of property the literary tendency is to make "right" the basis of exposition; in the law of tort the tendency is in favor of "duty." If either of these tendencies had been a dogma, then a great deal

of the law of tort would have been descriptive of breaches of right in the law of property, or else much of the law of property would have appeared in the law of tort as the rights corresponding to the breaches of duty there described. In fact neither plan has been consistently adopted, partly for the historical reason stated, partly because the development of English law has never favored scientific arrangement. The result is that no one can say of topics like infringement of easements whether they are more germane to the law of property than to the law of tort.

Criticism has been directed against the distinction between tort and contract upon the ground that while liability in the former is fixed primarily by law, in the latter it is the result of the parties' own acts. It has been argued that in many contracts the parties find themselves committed to obligations of an onerous character which are fixed by law and of which they had either no knowledge or a very partial knowledge when they entered into them; this is notably so with innkeepers, common carriers and sellers and buyers of real or personal property. But this criticism does not touch the point that a person need not enter into any contract unless he wishes to do so, and in that sense he and not the law primarily determines his liability, whatever secondary and compulsory obligations may be imposed upon him by the law when once he has made the contract.

It is also true that while the remedy in tort is an action for unliquidated damages, this is by no means the only or indeed the primary remedy. Others are self-help, injunction and actions for the specific recovery of property. All these are, however, subject to restrictions which do not apply to the action for damages, which may therefore be taken as one of the tests of tortious liability. Injunctions were the only notable contribution of equity to the law of tort. Breaches of trust have been styled "equitable torts," but the better view is that the whole law of trusts is a separate branch of the law within the peculiar jurisdiction of equity.

The historical evolution of tort is to be found in the development of forms of action rather than in any theory of scientific liability. The parent of tort is the writ of trespass which became common in the latter part of the thirteenth century. It applied to direct and immediate injury to the person or to property. Its scope was greatly widened by the invention toward the close of the fourteenth century of the writ of trespass upon the case, which extended to in

direct and consequential injuries and which more than any other procedural device has been responsible for enlarging the law of tort. The writ of deceit was known very early in English law but was limited to swindling a court of justice in one way or another until 1789, when it was expanded by judicial legislation into the action for the modern tort which covers deception generally. For wrongful distraint of chattels there was the writ of replevin, which was important in the Middle Ages but not capable of much development. Appropriation of the goods of another, as distinct from trespass to them, was remedied by the writ of trover invented about the middle of the fifteenth century. This proceeded upon a fiction that the defendant had found goods casually lost by the plaintiff, and the tort corresponding to the remedy came to be known as conversion. Trover was greatly superior to the older remedy for detention of goods, detinue, in which it was possible for the defendant to reduce the proceedings to a farce by compurgation.

One of the most striking developments of the action of trespass upon the case was the action of *assumpsit*. Where a man had undertaken (*assumpsit*) a duty he was held liable if he performed it badly; for example, if a farrier pricked a horse's hoof in shoeing it. The next step was to hold him liable if he undertook to do something and did nothing. This extension of *assumpsit* from misfeasance to non-feasance made it possible to use what was really an action in tort for the redress of breach of any contract in which there had been an undertaking. *Assumpsit* is the foundation of almost the whole of the modern law of contract. At the same time it has made distinction between liability in tort and in contract difficult; and it has also blurred the lines between both these categories on the one hand and quasi-contract on the other, for by *indebitatus assumpsit* the writ of *assumpsit* was adapted to claims which were in the nature of debts and hence really quasi-contractual.

During the period in which a procedural approach completely dominated English law this confusion of tort with contract was unobjectionable in practise and indeed occasionally helped the growth of the substantive law; alternative remedies were useful at a time when the selection of the right form of action was vital to the success of the plaintiff. But when the importance of forms of action disappeared in the nineteenth century, the implications of tort, contract and quasi-contract had some unfortunate results.

One was a tendency to hold that if there had been a contract between two persons, a third party injured by the breach of it could never sue in tort. Another was insistence on the idea that liability in quasi-contract is based on an implied contract, an idea which is frequently the most transparent fiction.

Isolation of the law of tort as an independent branch with its own scientific principles came very late in Anglo-American legal history. Indeed it was impossible prior to the abolition of forms of action in the nineteenth century. No book on the law of tort appeared before Francis Hilliard's, which was published at Boston, Massachusetts, in 1859; and the first to appear in England, apart from an insignificant work in 1720, was Charles Addison's *Wrongs and Their Remedies* (London 1860).

The foundation of liability in the modern law of tort has been a subject of controversy. According to one view there is a general principle that all unjustifiable harm inflicted by one person upon another is tortious. Another view holds that there is only a definite number of named torts—assault, battery, deceit and so forth—outside which no liability in tort exists. Considerable weight must be attached to the word unjustifiable in the first view. If the defendant can prove some justification recognized by the law for the injury which he has caused, the plaintiff has no case. Hence it does not follow for a moment that an injured person can expect success in an action for any and every harm which he has suffered. The courts may well deny him redress either because he has alleged that a particular tort, e.g. defamation, has been committed and has failed to establish its constituent elements; or because he demands compensation for a wrong which the courts consider it impolitic to remedy or which they prefer to leave to the legislature to deal with. But what they never have done and never will do is to deny a remedy simply because the claim is a novel one and the wrong alleged is incapable of being classified under any tort which has received a special name. They are naturally cautious in admitting the creation of new remedies; but the whole history of the law of tort has shown a steady expansion in the creation of new remedies or, what amounts to the same thing, new torts. This was so with the old action of trespass upon the case and has continued since forms of action have disappeared. The chief objection to the second view lies in this fact: its logical consequence is that the courts cannot create a new tort, which is

patently false. Its chief support is derived from some decisions in which the plaintiff failed to recover on the ground that the harm which he had suffered was *damnum absque injuria*; but these appear to be explicable by the fact that the injury sustained was justifiable by reason of one of the recognized legal excuses.

In the early law very little attention was paid to whether an injurious act was intentional or negligent; either way the doer was liable, and this was notably so in trespass. In fact liability for harm was often so stringent that it was imposed even where there was neither intention nor negligence on the part of the doer. It has been somewhat hastily inferred from this that liability was "absolute" or that "a man acted at his peril." This, however, is an overstatement, for throughout the history of the law inevitable accident, which often passed current under other less technical phrases, was generally reckoned a defense. At the present day liability in tort may exist not only for intentional or negligent wrongs but also in two chief classes of cases for wrongs in which neither intention nor personal negligence is discernible; these are, first, the vicarious responsibility of a master or a principal for the torts of his servants or agents committed in the course of their employment and, secondly, torts of strict liability. "Quasi-delict" has been suggested as the correct term for these two classes as well as for some other instances of what has been styled "responsibility without fault," but thus far the suggestion has not met with general acceptance.

Another mental element to be distinguished from intention and negligence is motive. For the last generation or more it has been settled that conduct otherwise lawful, e.g. fair business competition, does not become tortious merely because it is accompanied by an evil motive. Such evil motive has been infelicitously called "malice," as that term has occasionally been used to signify mere intention and not motive at all. Exceptionally malice in the sense of evil motive must be proved as an essential in some torts like malicious prosecution and malicious inducement of breach of contract. The law on this point is very unsatisfactory.

During the last century the law of tort has undergone a remarkable development. Although originally simply a particular mode of committing a tort, negligence in the earlier part of the nineteenth century acquired an additional aspect, becoming also an independent tort. Its expansion as such has been enormous. There can

be no negligence unless the law holds that there is a duty to take care in the first instance, and there has been a steady tendency on the part of the judges to extend the duty to take care to an increasing variety of human relations. The *laissez faire* attitude of the law has been replaced by a much greater regard for the safety and health of citizens, and this attitude has been forced upon the citizen in his private dealings with his fellow men. This has been proved not only in the wide scope given to the tort of negligence but also in the invention of new forms of strict liability. The starting point here was the famous decision in *Rylands v. Fletcher* [Law Reports, (1868) 3 House of Lords, 330], where it was laid down that if a person keeps upon his own land anything likely to do mischief if it escapes, he is *prima facie* answerable for all the damage which is the natural consequence of its escape. What this decision did was, first, to state as of general application a rule which had long been applicable to damage done by the escape of fire, filth or cattle; and, secondly, to make the liability more strict than that in negligence by imposing it on an occupier of land for the default of a person hired by him who was not his servant but "an independent contractor" or indeed for the default of anyone who was not a trespasser. Such was the origin of torts of strict liability, and they have been extended in several directions since 1868, although the degree of strictness has not always been the same as that in *Rylands v. Fletcher*. Examples are liability of the occupier of premises to visitors for defects in the premises; of the manufacturer of dangerous chattels to the ultimate user or consumer of them; of the person who engages in a dangerous process which injures his neighbor. Another striking change in the law has been the creation of liability on the part of an employer to his employee for any injury suffered in the course of his employment. Exactly the opposite rule had been laid down in a law court in 1837, when the vicious doctrine of "common employment" was invented; and it was not until sixty years later that any really adequate legislation was passed to reform the law. Now, by successive workmen's compensation acts, the doctrine has been well nigh abolished. Yet another reform, albeit a crabbed and partial one, was the English Fatal Accidents Act, 1846, which to some extent got rid of the common law rule that if a person were killed by a tortious injury, his relatives could recover nothing. Similar legislation has been enacted in the United States.

If any broad general tendency can be traced in the growth of the modern law of tort, it is the idea that human life and safety ought to be protected at least as adequately as the ownership or possession of property. Formerly it was often much less expensive in law for a man to inflict careless harm on his neighbor's person than on his neighbor's property. Various causes have been responsible for the change of attitude. Mechanical inventions have greatly increased the dangers to life, and at the same time the rather harsh individualism of some of the earlier Victorian judges has been replaced by a wider and more humane legal conception of the duty which a man owes to another. This is not to say that the legal conception squares with the ethical idea of duty. It must of necessity fall short of the latter in many respects; but even allowing for this inevitability, there is still room for improvement in the law of tort in several directions. For instance, it is very doubtful whether offensive invasion of personal privacy (e.g. the unauthorized use of a photograph for advertising purposes) which does not amount to defamation or to a private nuisance is tortious in English law. It is tortious, however, in many states of the United States, probably because the need for protection there is stronger on account of the unscrupulousness of some advertisers. Again, the law as to combination in trade disputes is unsatisfactory, not so much upon any ethical ground as by reason of the confusion and uncertainty which still beset it. Trade unions, it is true, have been put by Parliament in a position of general immunity from actions in tort; but union officials still remain personally liable for any wrongful act done on behalf of the union, and it is still a vexed question whether there is any such tort as conspiracy, i.e. whether it may be unlawful to do in combination something which is lawful if done by one person only. Yet again, in spite of the development of the tort of negligence the courts are perhaps unduly sluggish in holding a man responsible for his omissions as distinguished from his acts. But he who does nothing has always been freer from legal liability than he who does ill.

In the developed Roman law of Justinian's time the idea of tort appears under *obligationes ex delicto* and *quasi ex delicto*. Some nine named wrongs were included in the former category; but some of them, for instance, *injuria* (injury to the person) and *dolus* (deceit), had a very wide application. From the point of view of its subsequent history the most important Roman tort

was *damnum injuria* created by the *Lex aquilia*. The Aquilian action provided a general right of recovery for injuries to property arising from positive acts. It represented a new point of departure in Roman law. While intention was normally required for delictual liability, negligence sufficed as a basis for the Aquilian action. Again, while the Roman law of delict was dominated by penal conceptions, the Aquilian action was essentially compensatory.

The obligations *quasi ex delicto* in Roman law corresponded roughly to vicarious responsibility in tort. They included liability for damage caused by objects falling or thrown from a building and liability of carriers and innkeepers for theft or wilful damage by their employees. The expression *quasi ex delicto* is obviously the source (quite unhistorical) of the suggestion that vicarious liability in Anglo-American law be termed quasi-delict.

The Germanic law of delict was, like the Roman, dominated by penal ideas. The principle of strict liability, however, prevailed in the Germanic law. The former characteristic was abrogated by the development of a public law of crimes, while the latter was undermined by the reception of the Roman law. By virtue of its general and compensatory character as well as its recognition of liability for fault the Aquilian action became the basis of the modern European law of delict. It was necessary only to extend it to include injuries to persons as well as property and to omissions as well as positive acts.

While in substance the modern continental codes have attained at least much the same ends as the Anglo-American law of tort, they differ *toto caelo* from it in formal expression and method of development. They present superficially an appearance of extreme simplicity. The whole of the French law of tort is seemingly contained in only five articles of the *Code civil* (sects. 1382-86). The first of these lays down the general principle that "every act of any person which causes loss to another binds him by whose fault the loss occurs to make it good." The later German Civil Code is somewhat more detailed (arts. 823-53), but in both France and Germany jurisprudence (case law) and doctrine (professional literature) have created an entire body of interpretative law which makes the provisions of the codes by themselves nothing but vague direction posts as to what the law is.

In some respects the law of torts in various continental countries is more advanced than the Anglo-American. There has been applied a

doctrine of "abuse of rights," under which spiteful or malicious exercise by an individual of his private rights is reckoned as unlawful. Both German and Swiss civil codes, by expressly providing for liability for acts "against good morals," have provided the courts with a flexible principle for expanding the law of torts; in practice this principle is less flexible than might appear. Absence of liability in case of wrongful death has never prevailed in modern continental law.

TORTORY PARTY, GREAT BRITAIN. See PARTIES, POLITICAL, section on GREAT BRITAIN.

TOTEMISM. Among many primitive tribes divided into sibs (clans or gentes) the sib name is derived from an animal, plant or natural object; the sib mates display special attitudes toward these creatures or things, which in this connection are designated by anthropologists as totems. The institution which comprises the sibs, their totems and the attendant beliefs, customs and rituals is called totemism; whereas the sum total of totemic features in a particular tribe or tribal group is usually designated as a totemic complex. In North America totemism occurs in the northwest, in the eastern plains, in the woodlands, in the southeast and southwest and among some tribes of California; it is to be found among the Mexican Indians; in South America many Arawak and Ges speaking tribes have totemism, and probably not a few others; in Africa it is common in the vast territory between the Sahara and the desert of Kalahari and on the island of Madagascar; perhaps half of the more primitive tribes of India have totemism; in Australia it is universal except for some coastal tribes of the east, south and west; in Melanesia totemism exists in southeastern New Guinea, on the Solomon Islands and on the New Hebrides, on the islands of the Torres Straits

and in several other localities; it is found also in Fiji and among the more western Polynesians.

Totemic complexes vary greatly in their concrete composition; even the more typical totemic features fall short of universality. The sibs of the American northwest, for example, do not follow the common practise of deriving their names from their totems but are named after localities; in Africa also totems do not always function as sib eponyms. Among the Iroquois and the Zuni the totem is merely a sib name and no other relevant ideas or practises are in evidence, not even the tabu on the totem, the prohibition to kill or eat the eponymous creature, which together with the totemic name is among the most regular features of totemism. In Australia and Melanesia this tabu is most pronounced; in Africa it frequently is the central aspect of a totemic complex—the very word for the totem in several Bantu languages means “the forbidden thing.” In America, however, the totemic tabu is often but slightly developed or altogether absent. Totemic descent—whereby the totem is regarded as a remote ancestor—appears in a somewhat veiled form in Australia; it is marked and precise in Melanesia; in Africa it does not seem to occur; in America the Indians of the northwest coast believe that a member of an ancestral human group entered into a physical relationship with the crest animal, a notion related to the belief in totemic descent, in so far as both ideas emphasize the biological closeness of the totemic species and its human devotees. Exogamy of the totemic sib is very common and even typical in most totemic areas, yet among the Tlingit and Haida the exogamous social groups are really the phratries which also have crests like the clans comprised in the phratries, whereas the clans are exogamous not as clans but as parts of a phratry. In Australia also intermarriage within the totemic sib occurs only by way of exception among some of the central tribes, but here again the business of intermarriage is really attended to by phratries, classes or subclasses (non-totemic groupings within the phratry) and, in the last analysis, by groups of blood relatives. In Africa instances are common where the exogamous group is either wider than the totemic or constitutes a part of it; while among some tribes of the Atlantic coast, such as the Herero, Baviili, Tshi and others, two social groupings are observable, one into maternal sibs (clans) which are exogamous but non-totemic and another into paternal sibs (gentes) which are totemic but non-exogamous.

Animals are generally preferred as totems, and next to animals, birds; among some Melanesian tribes, however, only birds occur as totems, and in others all the totems are plants. On Tikopia Island, in Fiji and in southeastern New Guinea “linked totems” are common, each sib having more than one totem; for example, a bird, a fish, a snake and perhaps a plant. In a number of tribes in Oceania, Africa and North America there are “split totems”—the tongue or tail or the horns of an animal figure as the totem instead of a whole creature.

From the standpoint of the relative role played by the different features in a totemic complex there is further variability. Thus in central Australia the magical totemic *intichiuma* ceremonies performed for its totem by each of the totemic sibs with the aim and supposed result of multiplying the animals and birds which figure as totems stand in the center of the totemic situation. Among the Indians of the northwest coast the central feature is the totemic art, consisting of carved totem poles from which the myths and ceremonies take their character. Here the crest, that is the totemic carving, is the sacred thing from which spring the emotional values of the totemic complex; the animal or bird itself is of no importance, nor are there special customs or attitudes associated with it. In Africa the totem as the tabued thing often plays a correspondingly predominant role.

The features associated with totemism are not specifically or inherently totemic but represent widespread cultural traits which occur also outside of totemism. Animal and bird names are bestowed upon religious societies, particular individuals and manufactured objects (boats, shields, houses). Not all tabued creatures are totems—the cow, although not a totem, is tabu in India; the sacred bull, also not a totem, was tabu in Egypt; the snake was tabu in many times and places that knew no totemism. The animal tabu moreover is only one aspect of tabu: the connotation of the Polynesian tabu is not totemic, and the religion of the Eskimo, who has neither totems nor sibs, is tabu ridden. The magical multiplication ceremonies are totemic in central Australia, but perhaps nowhere else; the Malay tribes perform such ceremonies but not for totems. The bond between totemism and exogamy is equally casual. Dual divisions or phratries, whether or not these have animal names, are at least as frequently exogamous as are totemic sibs. Sibs moreover are as a rule exogamous, whether

totemic or not; exogamy in other instances attaches to local groups, and practically universal avoidance of incest between close blood relatives expresses itself in an exogamous interdict.

Wherever totemism is more than a system of sibs with animal names the attitudes toward the totems, whether entertained as ideas or practised as rites, are not of the matter of fact or secular variety. To this extent Durkheim was correct when he stressed the sacred character of the totemic realm. Nevertheless, totem worship in a stricter sense is exceedingly rare; Jevons, Gomme, Wundt and others have made much of totemism as a religion, but the religious aspect in totemism is in fact relatively slight. The totem is regarded as a friend, a protector, something of one's own kind; it is usually treated with respect, but it is not a god, nor does the imagination of the totemite endow it with powers greatly beyond the human. The fact that the totem is not an individual but a species or a class and that totems vary from sib to sib seems to preclude, or at least render unlikely, a religious attitude of great fervor. The totemic attitudes do not moreover, in any known instance, exhaust the religious orientation of a group: there is always also magic and animism in addition to and beyond totemism.

Psychological attitudes toward totems are always of a kind to reveal the totems as objects of enhanced emotional value. Although the totemic species may not be any more powerful or awesome than natural things and creatures generally, as viewed by primitives, yet it is extraordinary to its own totemites in so far as it is mated to them by bonds of psychic or even physical relationship. Its powers, such as they are, are at the totemites' disposal, and they in turn owe it regard and protection. As a religion, then, totemism is democratic; a mildly sacred realm of nature is drawn into a human social system on terms almost of equality. This peculiar form of socialized mysticism is characteristic of totemism, differentiating it from the more marked forms of the religious attitude as manifested in magic, in the various kinds of animism and in the worship of more or less anthropomorphic deities. There is a further elaboration of the process in so far as each totem is socialized in a sib; this fact both unites the sibs and contrasts them, thus enhancing the socialization of the totemic features in each sib. With this in view, totemism has been defined as a "specific socialization of emotional values";

Reinach has characterized it as a "hypertrophy of the social instinct" and Thurnwald as a sort of "self adoration of the human group." If the concrete content of a totemic complex is totemically indifferent, the peculiarity, if any, of the totemic combination may rest in the way the different features are distributed or put together.

When a totemic complex is examined from this angle, one finds it to be constituted in the following way. The different totemic features appear as sib characteristics. Each sib is fitted out with a set of totemic features. These sets are strictly comparable, as between sib and sib; but descriptively speaking, each set is different, in so far as each sib has a different totem, and the associated myths, customs, rituals, are therefore also different, descriptively. Just as names serve to differentiate or classify a group of sibs, so here sets of totemic features, including names, serve to classify and distinguish the sibs. What we find then is that a totemic complex comprises or is carried by a group of totemic sibs which are identical in form but different in specific content.

There is, however, a further difficulty. A tribal set of religious societies frequently presents a somewhat distracting similitude to a group of totemic sibs; many of the concrete features are often the same, and there is further the element of socialization as well as the formal homology and descriptive disparity of the societies. The difference lies in the fact that totemism is an adjunct of a social system, that in an overwhelming preponderance of cases it is associated with sib systems. When a tribe is totemic therefore all of its members—male and female—are totemites. A religious society, on the other hand, is constituted a social unit solely by the common functions or preoccupations of its members; a tribal set of religious societies does not comprise all the members of the tribe—it may not include any of the women, and at best it comprises most of the men and some of the women. A further distinction lies in the fact that only in exceptional instances do religious societies tend to be hereditary. As a religious society is prevalently a unisexual aggregate, there can be no question of exogamy here; in sibs, on the contrary, exogamy is a favorite trait, and as such it also becomes a faithful companion of totemism.

In the adhesion of totemism to sib systems may lie the deeper socio-psychological reason for the appearance and coalescence in totemism

of three features, which, totemism apart, represent wholly unrelated traits of culture: the formally identical but descriptively distinct sib characteristics, the drawing of a mildly sacred realm of nature into a social system, and exogamy. While not one of the three features is inherently totemic, all three are typical adjuncts of sib systems; and in this setting they combine into totemism with striking frequency.

Totemism, complex in its historical and psychological determinants, has not always developed in one way; on the contrary, the precise histories of the different totemic complexes have undoubtedly been extremely varied. The fact that the end products prove comparable may be ascribed to processes of convergence induced by the socio-psychological tendencies which cause totemism to flourish as an adjunct of sib systems.

In the days of evolutionary ideologies, theories of totemic origins were prolific and varied. Lang claimed that animal names came first, and Powell, in the United States, referred to totemism as the "naming" system of the Americas. Haddon and Somló and Pikler emphasized the original economic value of the creatures which later became totems and tabu. Schmidt, inspired by Melanesian data, spoke of "trade-totemism" as the root of the institution. Frazer first saw in totemism socialized "bush-souls," then a magical system of economic reciprocity, then an outgrowth of Australian notions about sexual conception. Hill-Tout, generalizing the customs of the Salish, envisaged totemism as a social "suiasism"—individual guardian spirits turned into sib totems. Finally, Freud traced totemism to a patrilocal act in the hoary antiquity of the "Cyclopean family" and deduced from it religion, society, morality and art. Most of these theories contain a grain of truth, in so far as a more or less prominent factor in totemism or a local totemic complex has been noted; but they are all hopelessly inadequate as attempts to explain the origin and development of totemism.

Totemism has not survived the decay of sib systems and hence is not found in historic times. Survivals of totemism may perhaps be perceived in the animal tabus of Arabia, in the half human, half animal gods of Egypt, in the heraldic emblems of Roman legions; in each case, however, historians have the difficult task of demonstrating the validity of these conjectures. But fragments of totemism have survived in another form which calls for no historic

continuity but mere analogy in social psychology. Men still like to romanticize about animals, ascribe to them qualities of reason or emotion peculiar to humans, or even superior to them. Animal names, slightly tinged with emotional overtones, are used to designate individuals, groups, societies, athletic teams and political parties. Mascots are cherished and in time of war are invested with a halo more than quasi-totemic. Sets of analogous social units—regiments, college classes, professional groups—are differentiated by pins, flags and gowns. All this is not totemism, but in these odds and ends of customs, notions and values there may be discerned bits of culture which, in a setting of sibs, might have coalesced and flourished as totemism.

TOURIST TRAFFIC. The word tourist became current early in the nineteenth century as a somewhat contemptuous synonym for traveler, but it is now used in the social sciences, without color, to describe any person whose movements fulfil two conditions: first, that absence from home is relatively short and, second, that money spent during absence is money derived from home and not earned in the places visited. Thus tourists may be sightseers, holiday makers, religious pilgrims, invalids in search of health, students—any travelers who, as distinct from emigrants or immigrants, intend to return home within, say, twelve months, and who, as distinct from migratory laborers, move in the capacity of consumers, not producers. Tourist traffic may be either internal, within any given country or district, or external, crossing political frontiers.

In the ancient Greek world tourist traffic seems to have been fairly common—rather too common, Plato thought (*Laws*, sect. 950)—and in the Roman Empire there is abundant evidence that formal tours were regularly undertaken by the well to do, for pleasure or instruction, to the Bay of Naples, Sicily, Greece, Asia Minor or Egypt; keeping largely to the beaten tracks and furnishing a considerable revenue to innkeepers and guides in the principal centers. In succeeding centuries many streams of tourists are visible—pilgrims to holy places, such as Jerusalem, Rome or Mecca, and students to centers of learning, such as Bologna, Paris or Oxford. Much of the traveling by mediaeval journeymen also should be regarded as tourist traffic in so far as it had only a slender connection with paid work. After the Renaissance new and important groups of tourists began to set out in search of antiquities and the arts and, somewhat later, of the beauties or the wonders of nature, so that in the eighteenth century the so-called grand tour came to be regarded, in Britain particularly, as a necessary part of education for anyone who

could afford it. In 1785 Gibbon was told that "upwards of forty thousand English, masters and servants, are now absent on the continent," although he himself regarded the number as incredible. With the vast improvements in transport by land and sea which took place during the nineteenth century and with rising incomes per head in many countries, touring became possible to increasing numbers of people, until the expenditure of tourists is now the livelihood of whole districts in many countries and an important element in international balances of payments.

On the social aspects of tourist traffic many different opinions are possible. Some thinkers, in antiquity no less than in modern times, have been ready to ascribe to travel the decay of manners which they charged against their own contemporaries. Others have agreed rather with Samuel Johnson that all travel has its advantages: "If the passenger visits better countries, he may learn to improve his own, and if fortune carries him to worse, he may learn to enjoy it." Others again have argued that travel is not advantageous merely, but is one of the most important elements in the life of society; H. T. Buckle, for example, put travel side by side with gunpowder and the "discoveries made by political economy" as the three chief agents which in modern times had lessened the love of war.

From the economic aspect modern tourist traffic is significant in that it indicates and to some extent itself occupies the large place belonging to services as distinct from goods in the economy of today. Physical goods, their production, distribution and consumption, were for long the familiar objects of economic analysis, while services remained comparatively neglected. In recent years, however, with increased mobility of persons and higher standards of living in many countries services have probably become a relatively larger part of total output, and they have certainly begun to receive more attention from theorists; not least the two groups of services in which tourists are principally concerned—transport and hotels. Moreover the short term movement of consumers is an important supplement and often an important alternative to the movement of goods and services. Many goods and services are traded by being moved physically to consumers; other goods and services which cannot be moved can be traded none the less if consumers will move to them. The effect of tourist traffic is thus to extend the possible range of trade and to increase its

possible volume. A snow clad range of mountains, a barren seacoast, a wilderness of heather, the objects of disgust to one generation—may become economic assets of first rate importance to the next. And with the caprices of fashion and the desire of tourists for change, a mere difference by itself may be valuable: country A may attract tourists from country B, simply because A is not B.

If the importance of tourist traffic is to be assessed, three principal questions must be considered: external movement, or the movement of tourists across national frontiers; internal movement, or the length of time which tourists, foreign or national, stay away from home; and tourist expenditure.

External movement may be recorded either at frontiers or, inside the country, at hotels and lodgings where tourists stay. Direct frontier records are generally used for sea traffic, as in the United States, the United Kingdom and New Zealand, and sometimes also for land traffic, as in Italy since 1930. The main condition for their effectiveness is that tourists should be classified, not by nationality but by their place of permanent residence. A German entering the United States is German by nationality, and if his residence is in Germany, he ranks as a foreign tourist, and his expenditure is an active or credit item in the balance of payments of the United States; but if his residence is in New York, he ranks as a United States tourist returning, and his expenditure abroad is classed as a passive or debit item. Hotel and lodging records, on the other hand, are generally characteristic of inland countries, such as Switzerland or Czechoslovakia, and of countries like Germany where tourists for the most part come and go overland. They have the advantage of giving the aggregate of tourist days (tourists times the number of days spent), upon which the fortunes of the tourist industry primarily depend, but they do not give the actual number of tourists. For most visitors probably shift their quarters at least once or twice in the course of a single visit to a country, and are registered afresh at each place; so that the total of recorded arrivals exceeds the total number of tourists by an unknown but probably large amount.

Length of stay may be estimated by several methods. Hotel and lodging records give the average length of stay in any one place, say four days. If the average length of stay in the whole country is to be arrived at, the four days must be multiplied by some estimate, probably precari-

ous, of the average number of moves from place to place. A "census method" uses the principles commonly employed, for example, in measuring the velocity of circulation of money or of goods in a warehouse. Let n be the number of tourists counted in the country on December 31; let m be the number counted on January 31 following; and let a be the number arriving in the course of January. Then, if p be the number departing, $p = n + a - m$. Granted that arrivals and departures are spread evenly over the month, the average size of this changing colony of tourists is $\frac{m+n}{2}$, and the average change in it is $\frac{a+p}{2}$ and thus the average length of stay is $\frac{m+n}{2}$ divided

by $\frac{a+p}{2}$, or simply $\frac{m+n}{a+p}$ (Bachi, R., "Sulla rilevazione statistica del movimento dei forestieri" in *Giornale degli economisti*, 3rd ser., vol. lxi, 1921, p. 277-89). This method may be used regularly if hotel and lodging records are available or occasionally, at decennial or other intervals, when the whole population is counted. A third system for estimating length of stay may be called the "in-and-out lag method." If tourist arrivals and departures move in pronounced curves, as they commonly do, with sharp peaks usually in the summer months, it may be possible to calculate an average date of arrival and an average date of departure for the period in question. The difference between these two average dates, the in-and-out lag, will be the average length of stay (Aitken, A. C., "Statistical Note on the Average Length of Stay" in Ogilvie, F. W., *The Tourist Movement*, p. 115-23). The questionnaire method has within recent years been used both by the United States and by Canada, and in several countries important results, responding reasonably well to tests of statistical sampling, have been reached in this way.

With regard to tourist expenditure there are three main elements to be considered: transport charges, maintenance charges and sundries. The last element can never be measured with any exactness from without, but the other two, transport and maintenance, often permit some sort of rough calculation. If we know the number of visitors who have come from certain countries and the average length of their stay, then we can estimate their minimum expenditures in reaching the country of their destination and in maintaining themselves during their stay.

If we know further the type of transportation and class of hotel used by these visitors, we can make estimates with greater accuracy. For purposes of international accounting transport receipts have then to be divided according to the national ownership of the means of transport; hotel receipts, on the other hand, unless some of the hotels are foreign owned, are a national credit simply. The third item, sundries, according to recent estimates, may possibly have amounted to as much as some 30 percent of total expenditures in certain countries.

Such calculations of expenditure, however, are poor things compared with information obtained from tourists themselves by questionnaire. The United States Department of Commerce pioneered in the application of this method to oversea tourists in 1927, and since then it has published in the annual compilations of the balance of international payments detailed estimates which are models of their kind. In 1929, for example, when tourist traffic was at its highest, tourists from the United States were estimated to have spent about \$296,000,000 in Canada, \$38,000,000 in Mexico and \$534,000,000 overseas. This total of \$868,000,000 tourist expenditure was by far the largest of the invisible debit items on current account; and, compared with credit items, it was more than four times as large as the amount collected from the rest of the world for war debts, interest and principal combined (\$212,000,000). There can be no doubt that these large sums disbursed by American tourists abroad in the years after 1918 materially helped to ease the debtor position in which the world stood to the United States as a result of the World War and its aftermath. In the volume on *Balances of Payments* issued annually by the League of Nations estimates of tourist expenditure and receipts have been published for about thirty countries: the three largest credit balances being those of France, Canada and Italy and by far the largest debit balance being that of the United States.

The international aspects of tourist traffic are now so widely regarded as important that there is hardly a government in the world which has not devoted public money in one way or another to the development of tourist facilities, with the special object of attracting foreign visitors. In some countries a government department has been set up for this purpose, like the Italian Ente Nazionale per le Industrie Turistiche (ENIT), established in 1919, the Soviet In-tourist or the French Office National du Tou-

risme, which in 1928 was put under the direct supervision of the Ministry of Public Works. In other countries semi-official or voluntary bodies, such as the Travel and Industrial Development Association of Great Britain and Ireland, the Swiss Tourist Bureau or the Yugoslav Putnik, have acted under government auspices and received grants from the central treasury or from local authorities. Among the methods used by these agencies to attract foreign visitors are advertising, including the publication of illustrated booklets, circulars and posters; the provision of a tourist information service; the arrangement of local fairs, expositions and festivals; and the reduction or abolition of visa charges. The regulation of tourist traffic, like the tariff, has been used also by some governments, notably Germany in 1933, as an instrument of policy.

The rapid acceleration during the years after the World War of transoceanic travel from America is apparent from figures contained in the annual reports of the commissioner general of immigration, 1918 to 1931 inclusive. In 1920, 137,601 citizens of the United States departed from Atlantic ports while in 1930 the number was 404,390. During the same decade departures from Pacific ports increased from 14,201 to 22,829. The economic depression beginning in 1929 has, however, resulted in a decrease in tourist traffic. Figures issued in 1931 indicate a slight reduction in the volume of travel not only from America to Europe but from the British Isles to Europe. This situation has been utilized by tourist agencies in most countries, both official and private, to promote travel at home or cruises in home owned ships. In the United States automobile travel has continued to mount since the World War and has been accompanied by a rapid development of tourist camps and other roadside lodgings for the accommodation of motorists. The importance of this automobile traffic is apparent in such states as California and Florida, where tourists often rank as a major source of income. In southern California, for example, the tourist industry, according to a recent unofficial estimate, is responsible for an annual income to the community of \$160,000,000 as compared with only \$132,000,000 from motion pictures and \$17,000,000 from oil.

TOURVILLE, HENRI DE (1842-1903), French sociologist. Tourville received a thorough training in history and attended courses at Paris at the *École des Chartes*, where he became

associated with a group of young liberal Catholics. In 1865 he entered the seminary at Issy and embarked on an ecclesiastical career, becoming vicar of the church of St. Augustine at Paris in 1873. Previously, however, he had made the acquaintance of Frédéric Le Play and had set out to devote himself to the study and teaching of the latter's doctrines of social science, which in France have stood opposed to the sociology of the positivists.

Tourville began by adopting Le Play's ideas, his theory of the classification of family types and his procedure for the study of family budgets, and from 1876 he concentrated upon organizing a regular course of instruction on the method and doctrine of Le Play. After his master's death, however, Tourville departed from the orthodox disciples who remained grouped about the review the *Réforme sociale*, in order to undertake the publication of a dissident organ, the *Science sociale*, with Paul de Rousiers, Edmond Demolins, Paul Bureau and Robert Pinot as its outstanding collaborators.

In Le Play's work Tourville distinguished the method from the conclusions. He criticized the method for being too narrow and artificial and for failing to take account of numerous aspects of social life; the classification, or nomenclature, of social facts which he formulated in 1883, and which served as a framework for the work of his disciples, was quite independent of the mathematical study of family budgets. Le Play's conclusions seemed to Tourville incomplete and hasty. He contended that even if the family were considered the social type of grouping, it should be studied not by itself but in terms of the factors which condition it. These factors are place, work, ownership, system of movable property, wages and savings. Furthermore the family ought to be studied not only with regard to its means of existence but also with regard to its organization, its various modes and phases of existence. Moreover the analysis of forms of private life includes the study of protective associations (commercial, intellectual and religious), of free associations (neighborhood and fraternal groupings) and of compulsory associations (communes, unions of communes, cities, sections, provinces and states). Such a survey should enumerate the different and successive points of view whereby a people might be studied in its relationship to a national territory, whether in its private or in its public life, and to this should be added the study of alien peoples, the effects of foreign developments and the history of the

particular people according to its rank in human development.

Tourville created a school of travel for research and then a school of social science. He participated in formulating the plans for the founding of the *École des Roches* subsequently established by Demolins.

TOUT, THOMAS FREDERICK (1855-1929), British historian. From 1890 until 1925 Tout was a professor in Owens College, Manchester, which became an independent university in 1900. During this period and largely as a result of his personality and devotion the Manchester school of history came to form one of the principal centers of historical inquiry in England. Tout was a great teacher and both directly and through his pupils he influenced the course of research in many different fields of mediaeval history. The distinctive and most important part of his own work was in the administrative history of England in the thirteenth and fourteenth centuries. The administrative as distinct from the constitutional history of the period had not attracted any of the great historians of the previous generation, and the treatment which it had received from other writers was antiquarian in character. Tout placed its importance beyond dispute in his two chief works, *The Place of the Reign of Edward 11 in English History* (Manchester 1914) and *Chapters in the Administrative History of Mediaeval England* (6 vols., Manchester 1920-33). Earlier historians had recognized the part played by the king's household in the government of England under the Norman and early Angevin kings. Tout showed that it remained of primary significance in the organization of the English state until the end of the fourteenth century, and that many constitutional crises resulted from the determination of successive kings to entrust the work of government, so far as possible, to officials over whom they had direct control. This view gave a new significance to the changes in the tenure of the household offices during this period; Tout investigated these in detail, devoting much research to the personal history of their holders. The details

which he collected were related throughout his work to the general history of England, and the chapters which he devoted to the contemporary course of events showed that he possessed unusual gifts as a writer of narrative.

TOWNSEND, JOSEPH (1739-1816), English clergyman and geologist. After receiving a master's degree at Cambridge in 1765 Townsend studied medicine in Edinburgh. Subsequently he took orders and became rector of Pewsey, Wiltshire. He was a friend of William Smith, "the father of English geology," and was himself known among contemporaries as a geologist. He arranged an elaborate collection of English fossils and published a work entitled *The Character of Moses Established for Veracity as an Historian* (2 vols., Bath 1813-15). His best known works, *A Dissertation on the Poor Laws* (London 1786, 3rd ed. 1817) and *A Journey through Spain in the Years 1786 and 1787* (3 vols., London 1791; 3rd ed. Bath 1814), give him significance in the annals of social philosophy. J. R. McCulloch averred that Townsend's ideas were "not so much a foreshadowing of Malthus' theory, as the theory itself. And only required to have been presented in a more detailed and systematic manner to have anticipated the *Essay on Population*." Malthus did not mention Townsend in the first (1798) edition of the *Essay on the Principle of Population*. In the second edition (1803) he expressed surprise that Townsend's ideas on population, with those of Franklin, Steuart and Arthur Young, had not excited public attention. Malthus moreover expressly omitted specific treatment of the population of Spain on the ground that he could add little to what had been so well done by Townsend. The *Dissertation* was a trenchant argument from the decidedly ruling class point of view of the time. The poor are a lower order of beings provided by God and nature for manual toil. In

general only hunger will spur them to work. Consequently the right to charity does not exist, and all public relief should be discontinued. The *Journey through Spain*, a curious medley on Spanish topography, mineralogy, soils, agriculture, population, industry, finance and manners, reflects Townsend's encyclopaedic interests. His importance, however, lies in the fact that he attacked the poor laws and anticipated most of the essentials and some of the details of the Malthusian theory.

TOWNSHEND, SECOND VISCOUNT CHARLES (1674-1738), British statesman and agriculturist. As secretary of state for foreign affairs under George I and George II Townshend exerted considerable influence upon English foreign policy. Following a number of increasingly serious disagreements with Walpole he retired from public life in 1730 and devoted himself to the development of his estates at Rainham in Norfolk. He was the first of the famous improving landlords of the eighteenth century. The popularity of his nickname, "Turnip Townshend," has led to the exaggeration of his importance as an innovator. He was not the first to grow turnips as a field crop, still less to introduce them into England. Turnips are "very advantageous, when sown in fields" says the *Dictionary Rusticum* of 1704. Turnips became a field crop "sixty years ago," wrote William Ellis in 1733 (*Chiltern and Vale Farming*, London 1733). Nor was he the first to use marl on light soil. This was probably an old Norfolk practise—the old pits were there—and was being followed in Somerset and Staffordshire in his day. Yet within fifty years of Townshend's death the farming of Norfolk had been revolutionized, mainly by his influence. Farmers are afraid of novelties and cannot take extravagant risks. Townshend incorporated the best of the new ideas and new crops into a system which they could safely adopt. Marl, turnips and clover were the foundation of his system. He learned from Tull the importance of

hoeing, but he did not adopt the drill. Norfolk turnips were sown broadcast. They were also plentifully manured. This made possible the four-course husbandry of wheat, turnips, barley, clover—eliminating the fallow—which spread widely in Norfolk and England, although in Norfolk a more elaborate six or seven-course rotation was often followed. Above all Townshend was a great example of the farming aristocrat and resident landlord to whose enterprise British agriculturist is greatly indebted.

E.), *English Farming Past and Present* (4th ed. London 1926) p. 173-75.

TOYNBEE, ARNOLD (1852-83), English economic historian and social reformer. Toynbee was the son of Joseph Toynbee, a famous aurist who took an active part in the movements for public health and town improvement. He was a tutor of Balliol College, Oxford, from 1878 to his death. In that short time he made himself a great force both in Oxford and outside. His lectures on industrial problems, afterwards collected as *Lectures on the Industrial Revolution of the Eighteenth Century in England* (London 1884; new ed. 1908), established industrial history as a subject for serious study at Oxford. Outside he helped trade unions, friendly societies, the cooperative movement, church reform and all efforts to improve town life. The importance of his short life was twofold. As a teacher he had a profound influence in the field of economics, for he was at once a humanist and an economist. He thus approached economic problems with a wide and catholic interest in the history of man and the significance of character. If he had lived longer he would probably have written an important book on economic history, for he had historical imagination, vast knowledge, a passion for accuracy and a rare sense for what was relevant and important in the mass of facts that he studied. As it was he prevented the writing of economic history from falling under the blight of a narrow specialism. His lectures at Oxford made a profound impression. He shook the ascendancy of a doctrine of *laissez faire*, which was apt to leave humanity out of account. After his death his friends, who included Jowett, T. H. Green and Lord Milner, established Toynbee Hall in the East End of London

as a social settlement where rich and poor might be brought together in a common interest in the better government of a squalid and neglected district. Men from the universities, inheriting Toynbee's sympathy, working in government offices or in the professions, went to live at Toynbee Hall, helping their neighbors by taking part in local government or in the social life of which Toynbee Hall, under the rule of Canon Barnett, with its music, its art, its lectures and libraries, was the center. Similar institutions are now common in London and the chief towns of England and Scotland.

TRADE AGREEMENTS or joint trade agreements are collective arrangements regulating wages, hours of labor and conditions of work for a stated period and are reached through collective bargaining between a trade union and an employer or association of employers. The scope of the agreement, that is, whether it is applicable to a given craft or to all crafts in an individual plant, in a particular locality or throughout the country, varies with the jurisdiction and bargaining power of the union and of the employers' association and the conditions of the industry. Historically the development has been from local agreements covering a single craft to those which, if not necessarily national in scope, are at least limited by the standards of the national or international unions. Functionally the trade agreement represents a system of joint voluntary regulation of labor conditions, the interpretation of its terms and the adjustment of grievances being provided for by a system of voluntary conciliation as a substitute for the methods of direct action.

The trade agreement appeared as a local manifestation in some crafts about the second half of the nineteenth century. In the United States the earliest recorded agreement with a national association was that of the Sons of Vulcan with the iron manufacturers in 1865. In England trade agreements on a wide scale came into being in the 1860's. In Germany the jour-

neymen printers had demanded a national scale of wages as early as 1848, but their first agreement was not made until 1873, after the industrial code of 1869 had granted the right of combination to workers and employers. Beginning about 1890 the system of trade agreements in these countries gradually spread to industries in which the workers showed some organizational strength. In Germany almost from the outset these agreements were, as their name *Tarifvertrag* signifies, mainly wage and hour schedules, except in the case of the journeymen printers. Here an elaborate system of governmental regulation caused the German trade unions and their socialist allies to attempt to effect improvements in working conditions through political activity. A similar situation prevailed in Australia and New Zealand with their systems of wage arbitration. In republican Germany after the World War the governmental role was strengthened by legislation giving the state the right to intervene to enforce collective trade agreements, which could be made binding on a whole trade, including the unorganized sectors and barring individual exceptions, at the request of one or both contracting parties through an order of the Ministry of Labor. In 1930 this power was so augmented that the government could compel the acceptance of an agreement by both groups, if it considered that public safety so required. While these agreements, affecting a majority of the industrial wage earners, were still restricted in the main to wage and hour schedules, a new semigovernmental institution, the industrial relations council (*q.v.*), was set up to pass on the many details of working conditions.

The development in England and in the United States, on the other hand, was almost entirely on a voluntary basis and never reached so large a proportion of workers, but where it was in force it represented a far more comprehensive scheme of regulation. This was true especially in the United States, where in many instances trade agreements regulated every detail of job conditions under varying situations and included provisions for an institutionalized machinery for interpretation and enforcement as well as for the adjudication of all disputes which might arise during the life of the agreement or at its termination.

The first significant national trade agreement, concluded in 1891 between the Iron Molders Union and the Stove Founders National Defense Association, stipulated a method of settling

industrial disputes without suspension of work and upon its renewal was extended to include the setting of a general rate of molders' wages each year as well as provisions determining the ratio of apprentices to journeymen and regulating the introduction of machinery. The success of this agreement led to attempts to make similar arrangements with the National Founders' Association in 1898 and with the National Metal Trades Union Association in 1900. These were of short duration, however, and in 1903 the iron molders' agreement was terminated because of a dispute over apprenticeship and use of machinery. An even more difficult problem confronting the trade agreement, especially in industries characterized by close corporate semi-monopolistic ownership, as in the case of the steel industry, was the capacity of the union to organize on a nation wide basis and thus to control wage conditions. It was this difficulty which led to the refusal in 1901 of the American Steel Hoop Company to negotiate a national agreement with the hitherto powerful Amalgamated Association of Iron and Steel Workers, and which culminated in an unsuccessful strike with disastrous results for the union.

A very significant development in this period was the joint agreement concluded in 1898 in the "central competitive field" of the bituminous coal industry, which has been characterized by wide variation in conditions of production. As early as 1886 the mine workers' union proposed a regional agreement in order to enforce "competitive equality" and to eliminate cut-throat competition in labor standards. But it was not until the victorious and widespread strike of 1897 that the operators of the four states in this area could be induced to act jointly. Since that time a number of similar agreements have been reached for other coal producing areas, the basic conditions of the central competitive field serving as the standard for adjustment. During and after the World War the bituminous coal agreements were negotiated on a national basis; no agreement was made in the outlying fields until negotiations had been completed in the central competitive field. The gradual encroachment of the non-union fields upon the markets of the union producers led to a breakdown of this system after a quarter of a century of operation; and the Jacksonville agreement of 1924, terminating in 1927, was the last widespread agreement in the bituminous fields prior to the inauguration of the National Industrial Recovery Act.

In the anthracite coal industry, on the other

hand, with its close corporate ownership and restricted area of production the mine workers' union for some time was forced to depend on governmental conciliation for its agreements. The first agreement was the result of an arbitration award by a governmental commission, after the strike of 1902, settlement of disputes being entrusted to "outside" conciliators. The agreement, although signed by officers of the national union, did not recognize their affiliation; this situation persisted until 1912, when an agreement was signed on behalf of a non-existent union, the "Anthracite Mine Workers' Organization." The system of conciliation now more nearly resembles that in the bituminous coal industry.

Other examples of trade agreement as a method of regulating working conditions in highly competitive industries are to be found in the men's clothing and in the women's garment industries. In the former the trade agreement appeared after a long and violent strike in Chicago in 1910; since that time it has been extended to other centers. While wage and even hour schedules may vary for districts, the national union participates in regional negotiations. Although the preferential rather than the closed shop prevails, the trade agreement and the machinery for adjudication cover a wide range of conditions, including piecework rates, production standards and introduction of machinery. In Chicago a unique feature of the agreement in the men's clothing trade is the provision, dating from about 1923, for an unemployment insurance fund based on the joint contributions of workers and employers and administered through a joint office. While this fund does not provide for long time unemployment, it represents an attempt to furnish unemployment relief through collective bargaining and without governmental intervention. Similar provisions for unemployment insurance funds have been included in the New York and Cleveland women's garment markets and in the New York dress industry, under agreement with the International Ladies' Garment Workers' Union, which also has trade agreements in other localities and in numerous branches of the women's garment industry. In New York the scope of joint regulation in the industry has been extended to the enforcement of sanitary conditions through a joint board of sanitary control, which for a period also was entrusted with the issuance of a label testifying to the production of garments under prescribed conditions.

A type of agreement which establishes permanent united action among workers organized separately in different crafts has been developed among the railroad shopmen. The desire of the crafts to enter into agreements expiring simultaneously led to the formation of system federations, then to the Railway Employees Department of the American Federation of Labor and ultimately to one agreement covering all shop employees on a particular railroad system instead of single agreements with each craft. In September, 1919, the United States Railroad Administration and the shopmen's unions concluded national agreements which embodied very liberal principles in regard to rules and job conditions. Upon the return of the railroads to private management in 1920 employers' pressure for the abolition of the national agreements led to the national shopmen's strike in 1922.

The extent and coverage of trade agreements in the United States cannot be ascertained from any published statistics. Roughly they can be said to have corresponded to the number of organized workers, although in some localities and crafts where the union considers its power sufficient there is no use for the written agreement. Undoubtedly the depression beginning in 1929 and the loss of union strength tended to retard the development, both in scope and in effectiveness.

Generally speaking, despite many differences in details the trade agreements of Great Britain resemble closely those of the United States. National agreements or standards have been gradually replacing local and district agreements, which, however, still obtain in the industries and services supplying a limited market. According to a study by the Board of Trade for 1910, there were 1696 agreements covering 2,400,000 workers, a number almost equivalent to the trade union membership of that year. In the building trade, where agreements were for the most part local, there were no fewer than 803, covering 200,000 workers; whereas in the mining and quarrying industries, where agreements are regional in scope, only 56 were recorded for 900,000 workers. Although provision for governmental minimum wage regulation exists in certain sweated industries and in agriculture, there may be supplementary collective agreements. The coverage of trade agreements in England has kept pace on the whole with trade union membership.

Most American and British trade union leaders have considered the trade agreement to be

the very essence of trade unionism. Violation of these agreements by "outlaw strikes" has been punished in many unions by suspension of charters or by expulsion.

Indeed the instrument of the trade agreement has been a powerful factor in the centralization of control in trade union organizations. While local autonomy may play some part in the negotiation of agreements and the setting of local standards, the necessity for national standards has minimized the importance of the local body. Moreover, although many unions provide for the selection of negotiators in a general representative convention, which may also pass on the scale, in others authority to make such agreements is vested in the officials. While this view is consonant with the conservative concept of the function of trade unionism, the syndicalists and other revolutionary unionists oppose the trade agreement as a manifestation of class collaboration and are at most willing to make only agreements of brief duration, which they do not consider binding. This explains in part the virtual non-existence of the trade agreement in pre-war France, dominated as it was by syndicalist unionism. In general American trade unions have looked with some suspicion on the use of the machinery of government to enforce agreements. Curiously enough, however, it was one of the more progressive of the American unions, the International Ladies' Garment Workers' Union, which when faced by an attempt of employers to annul a trade agreement secured an injunction which was later made permanent.

The trade agreement is now a common institution in most industrial countries. In France, Sweden, Denmark, Switzerland, Holland, Belgium and Czechoslovakia agreements covering a large proportion of the workers are voluntary but regulated; in Austria and in Norway they are regulated and in part obligatory. In Italy and the Soviet Union trade agreements are compulsory. In both countries trade agreements were practically unknown in the pre-war period. The advent of Fascism halted the post-war development of voluntary agreements and substituted instead a system of agreements regularized and virtually enforced by the government. Hitlerite Germany has left the regulation of labor conditions almost entirely in the hands of the employers.

In Soviet Russia collective agreements are arranged between the unions and the various industrial trusts and include unorganized workers as well. It is forbidden to violate the pro-

visions of the Labor Code in regard to wages, working conditions and hours of labor or to depart from the wages and hours of labor specified in the planned control figures. Another check is that wage increases may be dependent upon increases in productivity. Within these limits modifications may be suggested by the workers in general meetings. Adjustments of grievances or disputes may be referred first to the "conflict commission" and then to an arbitration board or to a three-party board. Workers and management constitute the former, and in the latter the third member is elected by the other two or chosen by the organ of labor at their request. The decisions of both are binding.

The establishment of a system of legally enforceable labor codes under the National Industrial Recovery Act has raised some question as to the possible effect of governmental wage and hour fixing and conciliation on the development of the joint trade agreement in the United States. The codes provide in most cases only for minimum standards of wages and hours; and although the act allows for collective bargaining above these minima, it is by no means clear that these provisions necessarily require joint agreement. In fact thus far only in those industries which had hitherto been characterized by a well worked out system of joint agreements has the inauguration of the National Recovery Administration resulted in the revival, through collective agreements, of predepression conditions, extending because of the effectiveness of the organizing campaign to an even larger working population. On the other hand, organized labor, where it is represented in the code authority set up in these industries, has not the same power in the machinery of enforcement and conciliation as it had under the previous system of two-party impartial boards or charmen; and in other code authorities labor, if not well organized, has secured no representation at all. Nor is the fact that these agreements and codes are enforceable at law regarded as an unqualified gain by those skeptics who see possible adverse effects in a system of regulation which makes the union part of the state apparatus and dependent upon governmental authority.

TRADE ASSOCIATIONS. The organization of producers in the same trade or industry is not a peculiarly modern development. It existed in one form or another in ancient Egypt and throughout classical antiquity and has been found in China as far back as records extend. Whether the Roman "corporations" were primarily professional groups interested in the development of the arts and the preservation of decent standards of living and of workmanship or were essentially capitalistic in character, designed to improve bargaining efficiency, it is impossible now to determine. To some extent the interpretation of the mediaeval craft guilds encounters similar difficulties. Their main purpose appears originally to have been social protection rather than self-help; but from what

were primarily police agencies with public responsibilities they developed more and more of the character of instruments for the exploitation of opportunities for gain, earning eventually a richly deserved opprobrium.

The distinction between the modern trade association and the mediaeval guild, in view of this functionally shifting character of the latter, may be based more definitely and concisely upon their structural peculiarities. The mediaeval organizations of persons in the same trade were composed of all those who made their livelihood by it—those who gave as well as those who took directions, although of course with varying powers and duties. On the other hand, the modern trade association is composed of and represents solely the interests of a special class in each industry: those who give directions, the enterprisers. It was the shift in the basis of control of production from skill to ownership accompanying the radical changes in width of the market and in technology during the seventeenth and eighteenth centuries which not only sharply differentiated the directors from the directed but opened up an almost impassable gulf between them. In these circumstances the more energetic, resourceful and versatile elements in every trade were alienated from the guilds by the advantages of independent pursuit of their own private interests regardless of any social responsibility toward either consumers or workers.

The trade associations, which are the modern counterpart of the guilds among the propertied enterprisers, as the trade unions are among the propertyless workmen, did not immediately take the place of the defunct guilds. It was only after about a century and a half, from 1700 to 1850, of freebooting competition, of unrestrained and largely unregulated rivalry in trade that the common interests of enterprisers were again recognized and organization was achieved. At the outset the revival of efforts toward associative action for mutual protection and advancement of enterpriser interests was characterized by tentative thrusts in many directions. Thus the difficulties of employment relations might lead to the establishment of an employers' association, sometimes for more effective resistance to the challenge of trade unionism, sometimes for the facilitation of collective bargaining. Again, the gamble involved in the granting of credit by commercially isolated manufacturers or wholesalers each intent upon extending his custom at all costs might finally persuade the improvident sellers on credit to organize them-

selves for exchanging credit information, standardizing credit terms and combating fraud. Or the expediency of securing legislative favors, perhaps by way of protection from foreign competition, or of winning judicial or administrative recognition for trade standards, usages and grades might prompt organization for these purposes.

Not infrequently these initial associations included several lines of trade. They might be organized upon a territorial basis, as was particularly true of the early British associations directed toward the prevention of credit abuses, although the localization of industry tended to make of them none the less trade associations in a narrower and more conventional sense. A similar regional jurisdiction is to be found in the chambers of commerce, which through the past century have played such a vital role in the commercial and industrial development of France as quasi-administrative organs for defining trade customs, settling trade disputes and protecting trade interests. The range of interests common to all members of such multitrade associations is too restricted, however, to afford the basis for any cohesive action with respect to the market.

If trade associations be defined then as voluntary organizations for mutual protection or advantage of proprietarily independent enterprisers producing or distributing similar goods or services, it is evident that the scope of their joint action is immaterial. Such trade associations are in the main a product of the last half of the nineteenth century; and it is curious how nearly simultaneous was the emergence of this type of organization in countries so widely different in historical background, stage of industrial development and nature of public policy as Great Britain, Germany, France, Italy and the United States. The clue is perhaps to be found in the changed situation of manufacturers and dealers consequent upon the rapid expansion of the railways; for with the removal of the geographic barriers which had afforded a measure of protection enterprisers were suddenly exposed to the rigors of a new and severe competition, which was only aggravated by the opportunity thus afforded for the expansion of each. The generic purpose of trade associations is in some way to allay the rigors of trade competition, in order to assure or increase profits. But there is more than one way to achieve such an end. The general direction taken is largely conditioned by the public policy within whose confines associations develop. Accordingly there has been in

some countries a predominant emphasis upon activities aimed primarily at the reduction of costs and in others upon activities designed to raise or maintain selling prices. In general there is a growing tendency to limit the term trade association to those organizations whose paramount interests lie in cost reduction as distinct from such organizations as pools, cartels, syndicates or *comptoirs*, which are structurally similar but functionally oriented toward price control. But this usage is by no means universal, and since in countries, like Germany, where public policy has long sanctioned cooperation among business rivals to control prices trade associations in this narrow sense are practically unknown, the discussion which follows will embrace all organizations falling within the structurally defined category.

The rapid industrialization of Germany in the latter half of the nineteenth century was accompanied and aided by a general policy of removal of legal bars to free contract and free enterprise. Germany took over from England with the machine technique a substantial measure of *laissez faire*. Nevertheless, it retained enough of the mercantilist tradition to countenance, indeed to encourage, collective regulatory measures for softening the harsh consequences of individualist economic action. The Prussian *fisc* not only encouraged general participation in cartel agreements but was itself an adherent of one of the first cartels formed, that in the potash industry in 1879. The movement thus started in the mining industries soon extended to manufactures and finally to distributive trade, becoming a characteristic feature of German industrial organization. In spite of recurrent difficulties various legal devices, like the *Zwangsyndikat* law of 1920 and notably the Cartel Decree of 1923, have been adopted for strengthening the hold of the associations upon their membership and fortifying their market control.

In Italy after unification and prior to the World War numerous trade associations had been established, but under the parliamentary regime they appear to have functioned principally in the sphere of cost reduction. They negotiated employment contracts with the trade unions, standardized products, grades and trade terms and exerted their collective influence upon legislation and administration. Under Fascism, however, the syndical organization of business has become in effect compulsory and in practise ubiquitous. Nor are the functions of the syn-

dicates confined to employment relations. They embrace in their jurisdiction control of output, interchange of technical formulae and process patents and in some cases direct control of prices, subject of course to the supervision and approval of the Ministry of Corporations. These Fascist syndicates of business enterprisers represent not a deviation from but the culmination of trade association development. They are the concrete embodiment of the philosophy of capitalistic syndicalism.

It has already been remarked that the early and extensive development of chambers of commerce in France represented an incipient trade association movement in the sense that localization of industry contributed to their specialization in the protection and promotion of particular lines of business. Their functions, largely determined by their constitution, were and are confined to the provision of market information, legal advice in such matters as customs regulations and factory legislation, a sort of police administration for the protection of trade standards and similar activities. Trade associations limited to single industries began to appear in the 1860's, the first on record being the *Comptoir des Salines de l'Est*. The most important, both on account of its size and power in its own field and on account of the example it set for other industries, was the *Comptoir de Longwy* (1876). This was the progenitor of the present *Comité des Forges*, which rules the metallurgical industries of France with an iron hand. But although the *comptoir* movement has spread to other so-called heavy industries, it has never attained the prevalence and pervasive influence of the parallel cartel movement in Germany. This may perhaps be accounted for partly in terms of the continuing vitality of the chambers of commerce; but probably an even more important factor is the resistance to standardization, regimentation and mass production which has characterized French industrial development.

In continental countries generally as well as in Scandinavia public policy appears to have admitted free enterprise and free contract in trade as more or less alien elements. For the governance of peoples habituated through centuries of experience to one form or another of collective autonomy or hierarchical discipline these doctrines were singularly inept and inadequate. The basic assumption behind the faith in the salutary character of free contract and free enterprise has always been that they would foster free competi-

tion. In view of the historical development of the continental economies it was indeed shortsighted if not fatuous to expect the removal of the bars to free enterprise to assure there the realization of free competition. The revolutionary tendencies in Europe today, in so far as they have economic origins, may be taken as the logical reaction to the evils of capitalistic exploitation. The inadequacy if not the absence of safeguards and limitations upon free enterprise (voluntary trade association) characterizing the public policy of European countries in the nineteenth and twentieth centuries accounts sufficiently for the callous indifference to social responsibilities so typical of the modern business man. In other circumstances the growth of an essentially professional outlook and fiduciary responsibility among the members of trade associations might not have been so meager as to be quite insignificant.

The justification of this view is found in the development of trade associations in Great Britain and in a lesser degree in the United States. *Laissez faire*, or more properly economic liberalism, was neither a sudden accretion to nor a change in the public policy of England; an indigenous growth, by the middle of the nineteenth century it had reached a certain maturity after three centuries of cultivation. The notions of self-dependence, self-assertion and self-responsibility were ingrained in the habits of thought of the English people. It was in these circumstances that trade cooperation developed in Great Britain, from its beginning in credit safeguarding and collective bargaining activities to the integral national trade associations constituting the units of the Federation of British Industries. These associations have more of the genuinely professional character than is to be found in their counterpart anywhere else. Their technical staffs are engaged in constant research, testing and standardizing of productive processes. Their trade missions are exploring new markets and studying the causes for the decline of old markets in all parts of the world. Their employment committees are scrutinizing union demands, enforcing the terms of joint agreements and surveying labor efficiency throughout the industry. Yet despite this training in co-operative action and the absence, even more than in some continental countries, of legal safeguards against price maintenance their activities have not frequently or generally been shifted away from cost reduction and trade expansion into that easy road to profits. The flurry of

"Birmingham alliances" around the turn of the century and the imitation of the continental salt cartels and *comptoirs* by the Salt Union and the subsequent North-Western Salt Company joint sales agency (1906) represent exceptions. In a few branches of industry also the American trusts have been copied, as, for example, in J. and P. Coats' sewing thread combine and the Mond's Imperial Chemical consolidation. In the main, however, freedom of enterprise in Great Britain has not received a practical interpretation as freedom to combine for the more effective exploitation of the consumer. And if price agreements are far from unknown among British trade associations, the privilege does not appear to have been so flagrantly abused as to give rise to vehement, widespread protest, as has generally been the case elsewhere.

That British public policy does not itself supply safeguards against the perversion of trade association activities may be made clear by brief reference to some of the leading cases involving the legal limits of joint action by competing traders. Upon the basis of earlier decisions, notably in *Wickens v. Evans* [(1829) 3 Y. & J. 318] and *Jones v. North* [(1875) L. R., 19 Eq. 426], it was held in *Mogul Steamship Co. v. McGregor* [(1892) A.C. 25] that a conference of shipping lines which endeavored to secure for its members all the traffic from certain ports by offering rebates to shippers who patronized these member lines exclusively as well as by deliberate rate cutting was not an actionable conspiracy. It had even been held in the case of *Jones v. North* that an agreement similarly eliminating competition within an association of competitive enterprises was an enforceable contract. Later, in an action based upon an Australian anticompetition statute [Attorney General for Australia *v. Adelaide Steamship Co.*, (1913) A.C. 781], the House of Lords held that even under the statutory prohibition there must be proof of evil effects of a trade combination to establish liability. Such a rule assures a wide discretion to trade competitors in regulating jointly their market policies, as was confirmed in a subsequent case involving the notorious English salt monopoly, *North Western Salt Co. v. Electrolytic Alkali Co.* [(1914) A.C. 461]. Furthermore the absence of any legislation in Great Britain regulating the sphere or policies of trade combination is significant of the degree to which British public policy relies upon freedom of contract and of enterprise to protect public interests.

In the United States trade associations have developed under a far more skeptical and restrictive public policy. The frontier tradition made competition almost an end in itself. Lacking the British trust in free enterprise, given freedom of contract, public policy has sought positively to enforce free competition. By common law rule the elimination of competition in the market by joint action of traders was unenforceable, and by statutory enactment (the Sherman Anti-Trust Act of 1890) it was made penalizable, without regard to the actual consequences of a particular agreement. In these circumstances the trade association movement which developed in the United States in the latter part of the nineteenth century took two chief directions. Association was usually either primarily social, designed to foster more friendly and congenial relationship among competitors, or of a clandestine character. The former type of trade association (represented by the New England Cotton Manufacturers' Association, 1865, Manufacturing Chemists' Association of the United States, 1872, National Jewelers Board of Trade, 1874, and American Bankers' Association, 1875) was legally innocuous but in an age of hard headed business ruthlessness economically ineffectual. Trade associations of the latter type were usually ephemeral, although they might operate for a time, as in the wire nail trade, very much to the benefit of the confederates. Not infrequently both types of association might coexist or flourish alternately in the same industry.

Gradually the realization of the perils of market manipulation led to a divorce of such activities from the recognized trade association. By the turn of the century most of the associations formed or forming had become more or less inoffensive social organizations of business men who came together once or twice a year for convivial banquets and an occasional appeal for higher tariff protection or for lower freight rates upon their products or for a better insurance rating upon their plants. The endeavor to extend the functions of these "legitimate" trade associations in order to make of them more effective agencies for serving the interests of their members, in particular for tempering the fury of their own competitive warfare, while at the same time avoiding the snares of the antitrust laws constitutes the essence of trade association history in the past quarter century.

The movement was given strong impetus by the enunciation of the "rule of reason" by the

Supreme Court in 1911 in the *Standard Oil case* (221 U.S. 1) and by the publication in 1912 of a book on *The New Competition* by A. J. Eddy. The judicial contribution represented an interpretation of the Sherman Anti-Trust Act which seemed to place great stress upon the requirement of proof of nefarious acts directed against outsiders to a combination and of "undue" cupidity manifested by the associates. The professional contribution (Eddy was an attorney for numerous trade associations) represented what was put forward as the discovery of a technique for "cooperative competition." This was commonly, although inaccurately, denominated the open price plan, whereunder the members instead of agreeing upon prices or output or market territory undertook simply to furnish detailed information concerning these and cognate aspects of their business operations and transactions to a common bureau which was to make them available to the entire group. The aim was to afford that full knowledge of the market predicated by economic theory, although it should be observed that there was no suggestion of proffering the assembled information to those on the buying side of the market.

Under the spell of hopefulness induced by these promising developments and also prompted by the need experienced during the World War for some instrument for mobilizing productive resources in each industry and for giving concerted expression to the views of the trade, there took place during the next few years an unprecedented activity in the organization of trade associations. In the seven years from 1913 to 1919 seventy-six representative trade associations were formed and many old organizations were revived by the discovery of new avenues of usefulness, which for the most part were quite legitimate just because the inflation of prices took the emphasis off the pressure to safeguard profits.

With the end of the war, however, the traditional American skepticism of business confederation for self-help reasserted itself. In the *American Column and Lumber Company case* in 1921 (257 U.S. 377) and again two years later in the *American Linseed Oil Company case* (262 U.S. 371) statistical services conducted on the open price model were condemned, although it is true that the adverse decisions may have been influenced by the fact that in these cases the services were accompanied by various practices, such as official interpretations of the data and penalties for failure to adhere to certain

rules or to posted prices. In contrast, however, with the marked constriction of the scope of the antitrust law prohibitions as applied to outright proprietary amalgamations, or corporate mergers, as in the United Shoe Machinery and the United States Steel cases [247 U.S. 32 (1918) and 251 U.S. 417 (1920)], under the accommodating terms of the doctrine of reasonableness, the tenor of these decisions was unmistakably antagonistic to the efforts of small, independent businesses to achieve through association the stability and security already won by big business. The conviction that the rule of reason had a different significance for trusts than it had for cartels was confirmed by the decision in the Trenton Potteries case in 1927 (273 U.S. 392), which condemned a comprehensive price agreement in the trade without stopping even to examine upon their merits pleas predicated upon economic necessity and business prudence. This evident discrimination rankled in the minds of the small scale business men and gave rise to a persistent movement for amendment if not outright abolition of the antitrust laws.

Before this movement reached substantial fruition in the National Industrial Recovery Act of 1933, however, a series of judicial decisions had gone far toward modifying the strict construction of the antitrust laws in reference to trade association activities. In 1923 a joint program for curtailment of output in the window glass industry was held not to constitute a violation of the law, because it was accomplished through the medium of a national trade agreement between the organized employees and the trade association of the manufacturers. And in 1925 the Supreme Court evinced a willingness to tolerate a much wider latitude of direct trade cooperation among business competitors in the cases of the Cement Manufacturers Protective Association (26 U.S. 588) and the Maple Flooring Manufacturers Association (268 U.S. 563). These decisions conceded to enterprisers in the same line of trade the privilege of interchanging full statistical information upon their current operations and past transactions. Furthermore they upheld the concerted adoption of uniform basing points, credit standards, cost formulae, turn-in advances and a detective system for checking upon compliance with the terms of association. Subsequently even greater leniency toward trade-wide cooperation for "stabilizing" the market was evinced in the validation of the crack-inventories pool in the oil industry [283 U.S. 163 (1931)]. Finally, in the

Appalachian Coals case [288 U.S. 344 (1933)], decided only a few months before the suspension of the antitrust laws under the Recovery Act, it was held that even the organization of a joint sales agency among the producers of about three quarters of the total supply of a product entering the market was not in violation of the antitrust laws in the absence of proof of the abuse of the price fixing power thus established.

Meanwhile there had been other indications than judicial decisions that the changing temper of public opinion in post-war America might be ready to tolerate an enlarged scope of trade association activity in the government of industry, such as was finally granted in the National Industrial Recovery Act of 1933. Around 1926 the Federal Trade Commission initiated a unique procedure known as the trade practice conference primarily as a method of securing recognized definition of trade terms, grades and standards. But under the unremitting pressure of trade associations this developed within a brief period into a device for controlling prices through definitions of "unfair" and "discriminatory" price policies. The eager response of trade associations to the opportunity to turn a species of cooperation upon an essentially professional plane into a means of exploiting consumers is significant. Again in 1931 the launching of the Swope plan for securing to trade associations a wider responsibility in the government of industry and the not unfavorable response elicited by the high pressure publicity campaign in its favor showed that the American public was amenable to suggestions looking toward some type of capitalistic syndicalism, suggestions which a generation earlier would certainly have encountered the most vehement hostility.

The passage of the National Industrial Recovery Act of 1933 marks a sharp break in the traditional economic policy of the United States. Although the act exhibits the greatest confusion of purposes, the first year of its application reveals beyond dispute its practical effect of abandoning trust in trade competition and giving over to the self-regulation of business men organized in trade associations the power and responsibility of administering industry. The supposition that this will be done in the public interest because the actions, policies and decisions of the code authorities set up by and representing solely these trade associations are subject to rescission or annulment by the president upon advice of the administrators of the act—

executives who are already charged with an oversight of some 450 codified industries—may well be left to further experience to demonstrate how far it is warranted. And if the act sanctions coercion of minorities of business men, in the sense that they are bound by the rules formulated by the majority in a trade whether or not they subscribe to the code or join the trade association, it may be speculated how much this will conduce to national economic planning. One thing only is certain as to the eventual consequences of this new public policy for the place of trade associations in American industrial organization. It assures that, so long as the experiments in this direction continue, the professional side or aspect of their functioning (cost reducing and custom expanding activities) will be more and more eclipsed by their market controlling functions. And this is unfortunate. For if genuine economic stability is the end to be sought, then genuine economic cooperation is plainly the means. Trade associations, representing as they do the special interests of business enterprisers, are scarcely qualified for the responsibilities of industrial control in a genuinely cooperative society whose chief concern is security of livelihood.
