Ritual therefore is prescribed formal behavior for occasions not given over to technological routine. It is ordinarily discussed as an aspect of religion and has even been considered the origin of religion, but it is by no means a phenomenon peculiar to religion. The occasions which are ritualistically elaborated are usually solemn and are often therefore religious; but many secular occasions are similarly elaborated. The formal traditional procedures of the council of elders in Samoa, built upon the theme of gracious hospitality and homage to chiefs, or that of affinal exchange—a lifelong exchange of goods governed by arbitrary traditional forms between the family of the husband and the family of the wife—in the Admiralty Islands are examples of elaborate ritualisms which are thoroughly secular. The contention of Durkheim and many others that religion arises from ritualism as such must be challenged, for the most extreme ritualistic formalism does not convert the council of elders or affinal exchange into an aspect even of the already existing religious complexes. Durkheim's theoretical position is untenable once it is recognized that ritual may surround any field of behavior and of itself does not give birth to religion any more than it gives birth to art or to social organization.

The view that art had its origin in ritual was set forth especially by Jane Harrison, who was impressed by the early and significant development of ritual behavior in Greek life, a development underlying Greek art, and who generalized this fact into a theory of the origin of art. Her theory that art arose out of religious ritual ignores the vast field of non-representative and geometric art and the whole field of secular art and, when it is rephrased to refer only to the rise of a religious art out of a religious ritual, throws little light on the origin of art. Even this specific relationship between art and ritual is lacking in many cases.

The most valuable part of Jane Harrison's discussion is that which reiterates the primacy of ritual in relation to other culture traits that grow up around it in different civilizations. Religious art preserves many ritualistic acts, and its themes may be intelligible only in the light of such acts. On the basis of Semitic studies W. Robertson Smith pointed out that ritual likewise underlies myth and that a comprehen-

sion of Hebrew ritual is essential to an understanding of Hebrew mythology.

The rite is similarly more stable and more fundamental than the rationalizations that universally accompany it. As soon as it receives traditional form the ritual itself becomes a standard of reference; "from it proceed the random whys, and to it return the indeterminate therefores." These whys and therefores include the symbols that are employed and the purposes for which the rite is performed. Ceremonial symbolism is fluid rather than fixed, and varieties of meanings are attached in different cultures to the same ceremonial. The rite of the Last Supper is a universal Christian ceremony, but the symbolism of the Protestant and the Catholic rite is differently interpreted. The symbolism of the primitive dance which whirls nearer and nearer to the altar and finally tramples and destroys the altar itself may be carried out to the last detail to indicate the identification of the ecstatic with the gods. In Mexican tribes of the Nayarit plateau the dancer at the culmination of the dance is beside himself and falls unconscious and foaming at the mouth upon the trampled altar. This dance form is by no means limited, however, to the regions where this symbolism applies. Among the Pueblos, for instance, the final dance upon the altar is as formal as the final round of a Morris dance and there is no idea of reaching an ecstatic height as symbolized by the dancer's daring to profane the sacred altar. In the rituals that have been studied most thoroughly the instability of the associated symbolism is as striking as the stability of seemingly arbitrary ritual acts. In the sun dance of the Plains Indians the act of scouting for the center pole of the lodge and dragging it to the camp in triumph like the body of an enemy is the most constant feature of a widely distributed ceremony; the purposes for which it is performed and even the symbolism of its drastic torture rites are extremely varied. Even such a transparent symbolism as death and rebirth, which Frazer has made the subject of investigation, is sometimes associated and at other times has no connection with a given rite. It may arise locally and as a late development in a ritual otherwise organized on other themes, and it is therefore methodologically unsound to argue that the origin of the ceremony is to be sought in the theme of rebirth.

Comparative study of ritual makes clear that a large number of themes have served in different cultures as the basis of the ritual complex. In

most civilizations certain dominant themes are repetitiously elaborated in ritual after ritual. Thus the melodramatic ritual of the Aztecs carried out the theme that life can be maintained only through death and portrayed it through the repeated sacrifice of victims at the hands of the priests. These victims were often given the honors of deity before the sacrifice, and later their flesh was divided among the people and their flayed skins were worn to clothe the living. The elaborate rituals of the Todas treat the milk of certain dairies with extreme punctilio, for it is believed that as the milk issues from the sacred cattle it is of an impossible sanctity and has to be rid of its dangerous quality and brought down to the level where it can be handled by human beings. On the other hand, Australian religious ceremonial symbolically presents the theme of the perpetuation of the food supply by totemic groups identified with the animals and plants for which they are responsible; this theme is elaborated by sex symbolism and by various mimetic performances which represent the life history of the plant or animal.

The beliefs and ideals of different civilizations are often formulated in their general ritual more explicitly than in other cultural traits, and this fact gives to the study of ritual a significance that has as yet scarcely been touched upon. Comparative studies of these intensively developed themes of ritual in various cultures can be of great importance in social psychology. They can make use of an explicit body of poetry and song and behavior which throws light on the basic attitudes of different cultures. Such inquiries have a more significant aim than the usual studies of ritual devoted to illustrating the widespread occurrence of similar formal traditional modes of behavior, such as divination or sacramental eating.

BLOOD ACCUSATION

RIVADAVIA, BERNARDINO (1780-1845), Argentinian statesman Like the other *criollo* leaders of the movement for Argentinian independence, Rivadavia imbibed the doctrines of Rousseau and admired the American and French revolutions. He voted in favor of the revolution of 1810 and distinguished himself as secretary and subsequently as a member of the first triumvirate (1811-12). From 1814 to 1820 he served on a diplomatic mission in Europe; during this period he made a careful study of French and English philosophy and institutions, devoting particular attention to the theories of Bentham. He was chief minister under Governor Rodríguez of Buenos Aires province from 1820 to 1824. He democratized the government and at the same time sought to consolidate its powers over the other provinces. Among his many reforms were the establishment of a statistical bureau, general archives, numerous schools and libraries, a department of engineering in the government, premiums for literary achievement, the Sociedad de Beneficencia (a sort of early relief organization), the home for foundlings and the University of Buenos Aires. He also introduced the Lancaster system of pedagogy. He modeled the university after the better European universities, imported professors from Europe and sent Argentinian youths to study abroad. After a brief period as minister to England during the presidency of Las Heras he returned to Buenos Aires in 1826 and was elected president of the republic as a Unitarian, or centralist. He continued his reforms and attempted especially to establish a system of emphyteusis with periodical revision of rates as the exclusive policy regarding public lands; but he was opposed by the Federalists, who desired a weak central government and were antagonistic to agrarian reforms. He went into voluntary exile in 1827, hoping to prevent civil strife, and again studied the social sciences

in Europe. Returning in 1834, he was formally expelled by the Rosas government, and the rest of his life was spent in exile. Many of his reforms failed to survive the Rosas dictatorship. His most enduring influence rests upon his cultural innovations and his campaign for Europeanization.

RIVERS, WILLIAM HALSE RIVERS (1864-1922), English psychologist and anthropologist. Rivers was appointed university lecturer in physiological and experimental psychology at Cambridge in 1897 and in 1907 lecturer in the physiology of the senses, a position which he held until shortly before his death. On the Cambridge expedition to Torres Straits he made his important researches which revealed that there were no significant sensory differences between the Melanesian natives and a group of white college students. He then became absorbed in a series of investigations dealing with the social organization and relationship systems of the natives, in which he introduced the genealogical method which has since been widely adopted as a valuable means of collecting data and of controlling the conflicting statements of informants. Rivers proceeded to apply this new tool in an ambitious study of the Todas of southern India; his elaborate description of their highly complex ceremonial organization has become a classic. Upon his return from the Todas he reopened, with characteristic zest and mental alertness, the entire subject of the meaning of relationship systems and terminologies. Without endorsing the thesis of Lewis H. Morgan in its entirety, he supported the latter's contention that kinship terms were causally related to forms of social organization in general and forms of marriage in particular; he held also that social systems and terminologies together with underlying ideas about kinship represented the most stable elements in a culture and could

therefore be utilized for purposes of historic reconstruction.

In 1908 Rivers joined the staff of the Percy Sladen Trust Expedition to Melanesia, which led to his major work, *History of Melanesian Society*. His conception of diffusion as a lever for evolution and the principles that useful arts may disappear and that small numbers of immigrants could under favorable circumstances work great cultural transformations are admirable as heuristic tools, but he applied them uncritically and failed to support them adequately by the safeguards of historic evidence. Although too good a psychologist to endorse the mechanical diffusionism of Graebner, he became an enthusiastic protagonist of G. Elliot Smith's theory of the Egyptian origin of human civilization.

While engrossed in anthropological studies, Rivers continued his work in psychology. During the World War he did clinical work in war neuroses. He rejected in part Freud's theory of dreams and substituted a theory of conflict for the theory of wish fulfillment. In his systematic treatise on the concept of the unconscious he attempted with indifferent success to prove that there was a biological foundation for the unconscious psyche. At the time of his death he was becoming increasingly interested in the psychology of politics.

RIVIER, ALPHONSE-PIERRE-OCTAVE (1835-98), Swiss jurist. Rivier studied in Switzerland and in Germany under Keller,

Rudorff and Heffter and taught Roman and French law at the University of Berne. In 1867 he replaced the eminent Romanist, Charles Maynz, at the Université Libre in Brussels. He served also as Swiss consul general for Belgium and the Congo Free State and became a member of the Conseil Supérieur of the latter state. Rivier participated in international conferences at Berlin and Brussels and was one of the arbitrators in the dispute between France and Great Britain concerning the Newfoundland fisheries. Shortly before his death he was chosen sole arbitrator in the Russian-British Behring fisheries dispute. He was editor in chief of the *Revue de droit international et de législation comparée* from 1878 to 1888 and president of the Institute of International Law from 1888 to 1891.

Rivier, who was a prolific author and contributed to many legal periodicals, first achieved a respected position as a Romanist, his most significant works in Roman law are *Introduction historique au droit romain* (Brussels 1872, 2nd ed. 1881), *Traité élémentaire des successions à cause de mort, en droit romain* (Brussels 1878) and *Précis du droit de famille romain* (Paris 1891). Although he never completely abandoned this field of study, it was in international law that he acquired his greatest renown. Rivier was above all a man of his own time, and while he did not despise historical study he felt that in international law there was more vital constructive work to be done. Beginning in 1864 he published writings on international legal questions. The *Programme d'un cours de droit des gens pour servir à l'étude privée et aux leçons universitaires* (Brussels 1889) and the *Lehrbuch des Völkerrechts* (Handbibliothek des öffentlichen Rechts, vol IV, Stuttgart 1889, 2nd ed. 1899) contained methodical, rational plans of study and condemned the traditional division of international law into the law of peace and of war. Rivier wrote for the first volume of von Holtzendorff's *Handbuch des Völkerrechts* an outline history of the literature on systems and theories of international law since Grotius (Berlin 1885, p. 393-523).

Rivier's concept of international law was determined by his general training and especially by his knowledge of Roman law. It was based on respect for individual liberty and the sovereignty of the state, tempered, however, by the idea of solidarity, essential in his work. Solidarity among fellow citizens is developed in the state; solidarity among nations will be realized in its turn in a superior, international form of social

organization which will guarantee state sovereignty and the freedom of the individual. The *Principes du droit des gens* (2 vols., Paris 1896), Rivier's chief work, is inspired by these principles. Stressing those rules of law which are universally respected, he emphasized the existence of what he termed "the juridical conscience of the society of nations" and showed that international law, so often ridiculed, is a system of positive law founded on facts and principles recognized by the states. To assign to international law the passive role of recording and classifying international facts was, Rivier believed, to degrade its standing as a science.

ROADS

ANCIENT, MEDIAEVAL AND EARLY MODERN.

Roads are means of overland communication; they include paths and highways but exclude streets, which run within the limits of cities, towns and villages. The first roads were probably the beaten paths leading to food and water, where animal trails led through the underbrush and to the water holes. Many followed the ridges where forest growth was lightest and drainage was good, where winds cleared away the leaves or snow and signal fires could be seen. Movements of population did much to create pathways through the wilderness, which in turn stimulated migrations. The localization of scarce and desirable goods, such as the yellow amber of the Baltic or the infrequent deposits of tin and copper in Spain, Cyprus and elsewhere in the Near East, led to definite long distance land routes through Europe before 2000 B.C., extending from the Danish peninsula down the Elbe and through central Europe to the Rhone or to Italy. Commerce was the most important factor in the development of routes by the Carthaginians.

The construction of roads developed with the rise of urban civilization. Herodotus tells of a causeway built for hauling blocks for the Great Pyramid. Similar tracks were built at the palace of Knossos in Crete, at Cyrene and elsewhere. In the Assyrian Empire roadways were maintained for messengers and the transportation of produce for the imperial household. Nebuchadnezzar built a sacred route for his favorite god

Marduk; it consisted of a foundation of bricks covered with asphalt and surfaced with limestone and red breccia. From ancient times through the Middle Ages sacred routes were maintained for criminals fleeing to sanctuaries.

The rise of empires, with their needs for administrative and military supervision, were the most effective stimuli for the building of ancient highways. Three great roadways radiated forth from Babylon. The extension of the Persian Empire from the capital city Susa through the Tigris-Euphrates basin and the Nile valley required improved highways for the chariot riding messengers carrying the letters of the king. Troops marched to enforce the king's law, and inspectors followed to report how his will had been carried out. The ancient royal road led from Ephesus to Sardis and thence through the Cilician Gates and across the Euphrates to Susa, a journey of more than 1500 miles. On this road were 111 resting places, relay posts and garrisons. There was a similar development of highways in ancient India and China.

The administrative and military genius of the Romans is revealed most impressively in their highways. Military leaders followed their conquests with extensive road building. From the administrative center at Rome the great highways extended to the farthest frontiers like spokes of a giant wheel, through Gaul to Holland and Britain; from Genoa to Marseille and into the rich Spanish province; along the Appian Way, the most celebrated of Roman roads, begun in the third century B.C., and through southern Sicily; from Carthage westward to Mauretania and Numidia and southward to Byzantium to join the caravan trail to Alexandria and the ports of the Red Sea. An eastern road led to Thessalonica and Byzantium, across Asia Minor to Tarsus and Antioch and through Palestine to Egypt. The *Itineraries of Antoninus*, probably compiled in the third century A.D., enumerated 372 roads in the empire with a total of over 52,000 miles.

Roman roads have never been surpassed from the standpoint of solidity of construction. Many still remain in actual use or as foundations for new roads. To build a surfaced highway two parallel ditches were first dug and the cleared course was firmly packed. Next came a layer of stones on which the *rudus*, or concrete, was laid. On top of this was spread the bedding, or *nucleus*, of fine cement, which grasped the pavement, or *dorsum* of flat stones, cambered to shed

the rain. The highway, thus raised above the land surface, was strengthened by a stone edging and frequent curbstones. Where a solid foundation was already present, some of the preliminary steps were unnecessary. Less important roads were of gravel or merely of leveled earth. The pavement was usually from 8 to 16 feet wide and remarkably straight. A considerable amount of forced labor was used to build and maintain the roads. Garrisons of soldiers policed the highways. Along the routes were numerous milestones, resting places and posting houses where horses and vehicles could be obtained. Senators and others wishing to gain favor used their private wealth for the extension and improvement of the highways, but increasingly the populations living near the roads were expected to maintain them. Even the forwarding of state messengers and the conveyance of state officials were maintained by frequent requisitions from the surrounding territories.

On the highways messengers rode night and day on state business. Officials went on horseback or drove in heavy carriages. Troops marched on the pavement with their wagonloads of *impedimenta* and supplies creaking behind. Peddlers, with their long lines of heavily laden donkeys, moved by the side of the road. Chariots were small, with about a three-foot track, but most of the carts and wagons were wider, the parallels of deep worn ruts measuring 4 feet, 8 inches, or roughly the present standard gauge. In the towns it was usual to walk the narrow streets or to ride in litters, wheeled traffic often being restricted to special streets and certain hours of the day.

Merchants in Alexandria, Lyons, Treves, Arelate or Narbo, great commercial centers, collected supplies for Rome and other cities. Even before Roman times the freighters of Egypt, organized into guilds, had been required to haul public goods, and the Romans continued the practise. Elsewhere draft animals, carts and supplies were requisitioned, often without payment. The security of travel, the low customs duties and the good roads were particularly encouraging for commerce. Roman citizens received their silks from the Syrian, Greek, Jewish, Arabian or other intermediaries, who went as far as Merv or Samarkand in Turkestan, to India through the Khyber Pass, or to Kandahar in Afghanistan and over the royal road across north India to the Ganges. The Chinese traders brought their silks on the paved steps and roadway of the Long Road through Sianfu, the

ancient capital of China. Over hard packed camel trails caravans brought African ivory, Arabian gums and spices, and pearls, cotton and silk from India. Gaul sent lead, tin, cattle, corn or horses; its pottery, in imitation of the Arrentine ware, even invaded the Italian market. From Spain came minerals and agricultural produce. The bulk of the trade around the Mediterranean moved by road to and from navigable water, but there was more through traffic by pack animals than conventional history would suggest.

After the decline of Roman control in the west the construction of roads virtually ceased and many of the older roads fell into a state of disrepair. In addition, without effective police protection from garrisons, journeys were hazardous. Merchants traveled in groups for protection, and lone peddlers often went as pilgrims. On approaching strangers the traveler prepared for fight. Frequently he left the main road, particularly where it was fringed with forests or bushes which might conceal outlaws. Moreover there were troublesome and onerous tolls (*passage, portage, charriage, péage*), and special taxes on wines and other goods. If any merchandise fell from the pack or cart the lord claimed it (*Grundruhrrecht*). Long distance trade was reduced to a minimum, and feudal warfare still further hampered easy communications. Maintenance of highways depended upon chance or the good will and piety of those to whom the adjoining lands belonged.

Outside of western Europe the state of the highways and traffic was somewhat better. In the Byzantine Empire the traditional Roman scheme of frontier defense was continued. Caravan trade with the East flourished. The new imperial power at Bagdad gave the Moslem world good roadways, equipped with hostleries and relays for traders and pilgrims as well as for official couriers. In India and China this period was marked by great activity in the construction of highways.

Although Charlemagne built military roads and instructed the monasteries to maintain the highways, little was done to preserve the pavement of Roman construction. The old highways were expensive to build and required constant maintenance. Without care the cemented slabs sank unevenly, as they did in the narrow Chinese roads; peasants sometimes removed rock or clay from the very center of the road. After the tenth century draft animals came into more general use. The ancient world knew nothing of the

modern type of harness or horseshoes and did not use the tandem hitch. Except for yokes of oxen, full advantage of animal power could not be taken. By the twelfth century there was widespread use of the heavily padded horse collar, fitted to the shoulders and with the traces attached to the whiffletree instead of the wagon. Nailed iron horseshoes were used. To get away from the stone surface of the old roads as well as to avoid tolls and thieves many travelers left the Roman highways to create new even if very poor dirt or gravel roads. For comfort women as well as men rode horseback, although horse litters and sometimes elaborate wagons also were used. Pack animals generally carried merchandise over long distances; sturdy carts, their broad felloes studded with nails, were widely employed for local traffic. By the twelfth century conditions were improving. The Truce of God restrained the more rapacious nobles. The increase of commercial life and the profits to be obtained from the fairs and markets resulted in measures for increased safety. At the close of the thirteenth century Rudolph of Hapsburg made nobles responsible for robberies in their territories. In north Italy, where the roads had remained good, roadside dwellers were required to go to the assistance of attacked travelers. Commercial centers contracted with lords for the protection of those going to the fairs.

There was also great progress in the maintenance of roads. In 1285 an English statute required that highways connecting towns should be cleared of woods and bushes for 200 feet on either side of the road. Lords moving to their scattered fiefs required the vassals to repair the roads through and between the estates. Religious orders maintained the routes and bridges and offered shelter to the many travelers.

With the rise of strong national governments there was a recrudescence of central rather than local control of roads, marked by the development of systems of postal couriers and the improvement of highways to meet the needs of growing commerce. These developments were strengthened by the rise of the absolute monarchies. In England an act of 1555 required each parish to maintain the roads within its area. Under two appointed surveyors every man was required to work four days in the year or to provide a substitute. Those who owned horses or ox teams had to send them with "one wain or cart." With the dissolution of the monasteries and the increased commerce, the condition of the highways became worse. After 1564, however, public

carriages took people over the roads, and the Dutch fashion of riding in coaches spread even to the country. In 1669 the Flying Coach brought passengers from Oxford to London in a day; but the danger of highwaymen, the deep rutted or miry roads, the frequent detours, made conditions of travel most arduous. Turnpikes, or toll roads, first appearing at London in 1346, spread to the principal thoroughfares of England in the seventeenth century, although there was no immediate improvement in road surfaces. As early as 1737 Robert Phillips recommended to the Royal Society an improved roadway of gravel laid on a well drained foundation, but little was done until the latter part of the century. Only a small proportion of the roads were turnpikes; and until 1835 statute labor, grudgingly given and directed by unskilled parish appointees, was the chief means of road maintenance.

France, largely because of the greater importance of its land traffic and the greater degree of centralization, achieved the best roads among the great nations of Europe. The Roman system had fallen into desuetude, and winding dirt tracks cared for, or rather neglected, by the adjoining proprietors were frequently so covered with bush that travel was almost impossible. Richelieu made out budgets for bridges and roads, regulated the *corvée*, or compulsory labor service, on the roads and improved the postal system. Colbert, in his struggle for a national economy, instituted the most extensive reforms. He developed the royal roads from Paris, made plans for highways and bridges and compelled the provinces to construct and maintain the roads. Turgot, also concerned with extensive road systems, abolished the *corvée*, although it was reintroduced after his fall in 1776. He employed Pierre Trésaguet, who in 1764 built highways on a set foundation of solid stone blocks, raised at the center to parallel the road surface of broken stone. But late in the eighteenth century travelers still complained of the hazardous and expensive journeys. Elsewhere there was little attention to road building; as a "means of increasing the national occupation" it was advocated by the German cameralists. Off the main thoroughfares the roads were extremely bad, particularly in wet weather.

When the European nations began to expand overseas, they often found satisfactory road systems. In India routes of beaten earth for pilgrims, traders, armies and elephant caravans supplemented the great river routes. In Peru

over 4000 miles of Inca highways zigzagged to altitudes of 15,000 feet or crossed over deep abysses and rivers. Many of these roads were paved. Tunnels, retaining walls or causeways were constructed at the most difficult places. Over these highways the llamas carried ores and produce and relays of runners bore messages and lighter goods. The first routes in New France were by water. In the eighteenth century a road from Quebec to Montreal was built along the north shore of the St. Lawrence with branches westward. Each person was required to build and maintain the section bordering on his property. In the other American colonies the early routes were uniformly bad. In the highlands the settlers followed the Indian trails widened for pack animals. Each town was usually required to construct a road to the next town; but road building meant simply clearing fallen timber, chopping stumps and blazing or notching trees. In swampy spots logs were thrown down to form corduroy roads, and wooden bridges or barges were maintained where rivers could not be forded. Bladdock and Blake had built military roads to the west over which settlers and traders could haul their supplies in heavy wagons or on pack horses.

Oversea expansion was accompanied by increasing commercial and industrial activity in the more progressive nations of Europe. These developments, particularly in their expression in the industrial revolution, led directly to the modern era.

NORMAN LEON GOLD
MELVIN M. KNIGHT

MODERN. The modern highway had its beginning in the economic and social changes wrought by the industrial revolution. Because of the growth of trade and a consequent increase in the requirements for better transportation facilities, governments were compelled to develop a better system of highways and highway surfaces to accommodate the vehicles used in the transportation of goods and persons. Highway construction and improvement expressed the progress of industrialization, both in the demand for roads and in the adoption of more efficient construction methods. The highway mileage of the world today is a fairly accurate index of the rise of industrialization (Table 1), although it is far from infallible, as is indicated in a comparison of the British and Japanese figures.

Although France surpassed England in the scope and quality of its roads up to the indus-

trial revolution, the situation was thereafter reversed by England's rapid economic progress. English roads were incredibly bad on the eve of the industrial revolution. Little attention had been paid to the art of road building and maintenance. Engineers believed such work was not within their calling. In repairing roads it was the custom to spread stones obtained from a nearby quarry over the road in a more or less haphazard manner and to leave them to be crushed into position by the wheels of passing vehicles. Roads were often mere tracks, unusable in bad weather. The first great improvement came toward the close of the eighteenth century in the work of Thomas Telford, who emphasized two objectives in road building: to make the road as level as possible and to give it a surface capable of bearing without injury the heaviest weights likely to pass over it. Telford's method of construction consisted of building the road surface in two layers. The bottom layer was made out of stones, about seven inches in depth, set by hand with their broadest ends downward. The space between these stones was filled with smaller stones packed by hand so as to produce a firm but even surface. On this lower layer was laid a second course, about seven inches in depth, of hard broken stone. On top of this was placed a binding of gravel, about an inch thick.

A somewhat different and improved method of construction, later known as macadam surfacing, was developed during the early 1800's by John McAdam. He laid great stress on making the surface of the road waterproof: in the older roads the clay became water logged and consequently was unable to sustain the weight of the traffic during the wet winter months. McAdam's method consisted of laying down an improved surface of granite and other hard stones and flints, which were broken into small angular pieces, welded together into a compact mass by pressure and the use of water and mud. Modern macadamized roads consist of a lower layer of broken stone, well rolled with a layer of broken granite and consolidated with sand, gravel and stone chips. This type of road was considered the highest type of surfacing until the appearance of rigid pavements. In 1930 the world mileage of macadam roads was 664,321, of which 99,426 miles, or 15 percent, were in the United States.

The construction and maintenance of roads in eighteenth century England was largely in the hands of local authorities, who depended on compulsory labor. The principle of maintaining important roads through the collection of tolls came into being quite early, but very few turnpike acts were passed up to 1760. From then on to 1774 Parliament passed hundreds of acts creating turnpikes. A turnpike trust was created with jurisdiction over a certain stretch of road and with authority to borrow money on the security of the tolls, which were to furnish the funds for the maintenance of the road and repayment of the loan. The trust was created for a limited period, usually about twenty years, and if the loan was not repaid in that time it had to be renewed. Invariably the debt on the road was not cleared and the need for toll collecting still remained. The tolls collected yielded barely enough to maintain the road in satisfactory condition, and in relatively few instances were they sufficient to pay interest on the loan. After 1830 competition of the railroads created a desperate situation for the toll roads. In 1838 there were in England and Wales 1116 turnpike trusts controlling 22,000 miles of roads; their borrowings amounted to over £9,000,000, and in addition there was £1,000,000 of unpaid interest. In their frantic attempts to meet increased expenses the trustees not only sought authority to collect higher tolls but of their own accord erected additional tollgates to the maximum allowed. Although the fundamental principle on which

the turnpike system was based was that of transferring the cost from the parishes to the users of the road, the parishes were obliged to meet the deficiencies and to keep up repairs, while their citizens had to pay toll. Furthermore the bondholders had the right of foreclosure, under which many of them seized the roads and appropriated all the collections to their own use, leaving all the expense of maintenance to the parishes. The oppressive burden of paying excessive tolls and taxes to maintain the roads produced great discontent, and riots occurred in many sections. An inquiry resulting from these disturbances showed that a real and serious grievance existed, and steps were taken to relieve the distressing situation. Parliament made appropriations to help in maintaining the roads and authorized local borrowings to pay off the debts of the trust, so that by the end of 1896 the last turnpike had vanished from British soil. The abolition of turnpikes in effect meant a reversion to the old principle of local liability for road maintenance, except that the charges were borne by the taxpayers as a body and not by the landowners alone. Meanwhile in the midst of all these difficulties there was steady progress in the mileage and quality of British roads.

The status of roads in the early years of the United States is revealed by a classification of the general ideas or principles underlying legislation on the subject: there were laws dealing with single roads, legislation for separate counties, general legislation for the state and the legalization of the turnpike system. The first three classes were largely restricted to the latter part of the eighteenth century; turnpike legislation was most prevalent in the first half of the nineteenth century. There was no highway construction in the modern sense. Roads were largely the result of chance and evolved from paths and trails which were gradually widened for vehicle use. Each community shouldered its own responsibility and solved the problem of land transportation as best it could. Compulsory labor, as in England, was the means by which road repairs were made.

As civilization pushed toward the west across the mountain ranges the need for roads became imperative. At the same time there was a rapid increase in the use of wheeled vehicles and a growing demand for more adequate postal services. Travel between important centers of population developed on a considerable scale. As the back country was settled, freight traffic by means

6 wagons assumed great proportions. This new situation, connected with the demand for roads which would sustain wagon traffic at all seasons of the year, led state legislatures to seek means and methods to improve the roads. At the close of the eighteenth century the condition of all the roads in the newly formed states was deplorable. The system of compulsory labor by which the roads were theoretically kept in repair had in many instances failed, and the tax plan for road repairs was not much more effective. Labor supply was insufficient, and there were no adequate revenues for permanent improvements or skilled overseers who understood the principle of road construction. Settlers in western Pennsylvania and New York, in petitioning their respective legislatures for highway improvements, stressed the fact that increasing use was made of their local roads, which formed a connection with the country across the mountains, by through traffic which contributed nothing to their maintenance. Stage lines, professional wagoners and groups of immigrants moving westward constituted the major portion of the traffic. The roads had been built originally by the local people and were maintained by them, and they regarded it as unjust that a highway connecting important centers of population and commerce should be maintained at the expense of the local communities.

The general movement for improved internal communication and the growing feeling that the users of the more important thoroughfares should contribute to the costs of construction and maintenance in proportion to their use led, as in England, to the development of the turnpike system. The first American turnpike company was organized in 1792 in Pennsylvania following prolonged agitation for the improvement of the roads leading from Philadelphia westward to Lancaster, 62 miles distant. The project was completed two years later; the paving was stone overlaid with gravel. Construction costs amounted to \$465,000, an average of \$7500 per mile. The American turnpike companies, unlike the turnpike trusts of England, were joint stock companies, the forerunners of the corporation type of business organization. In the state of New York in 1821 there were about 4000 miles of turnpike roads capitalized at \$11,000,000. By 1832 there were in Pennsylvania about 2400 miles of turnpikes in operation. Subsequently the abandonments exceeded new construction. This condition was prevalent in practically all of the eastern states with a fairly large

toll road mileage. During the 1830's canals and railroads demonstrated so conclusively their superiority over turnpikes that both public and private capital was diverted to new means of communication, particularly railroads. New turnpike projects were built almost exclusively as feeders to the newly constructed canals and railroads.

In order to obtain the required capital state legislatures were compelled to grant liberal concessions to the corporations desiring to build turnpike roads. It was the policy from the beginning to grant such companies exclusive franchises for a definite period of years, in some instances in perpetuity, and to award them also virtual monopoly of the particular routes they occupied. Legislatures conferred the right of eminent domain, which made it possible for the companies to select the most advantageous routes. The rates of tolls and various other details of management were specified in letters of incorporation. From a financial point of view the turnpikes were not successful. Even the best of them paid only limited returns. As business enterprises they were poorly organized and managed. The funds obtained through the sale of stock were in many instances inadequate to cover the costs of construction. This resulted in the creation of debts and forced the companies generally to divert current revenues derived from toll collection to pay interest charges and to forego adequate maintenance. Another prevalent cause of failure was the building of roads in sparsely settled regions in anticipation of traffic rather than for needs already existing, which was also the case later in the construction and bankruptcy of many railroads. Although the turnpikes were unprofitable as an investment, they rendered great service in speeding up traffic and in reducing the hazards of travel. Before the present era of road construction the vast majority of the turnpikes had been abandoned by their operators and control had been acquired by towns and counties.

From 1840 to 1860 there was considerable enthusiasm in isolated cases for the construction of plank roads. Before this movement was ended by the panic of 1857, New York had chartered 352 such companies, Pennsylvania 315, New Jersey 25 and Maryland 13. Not all of the contemplated projects were completed, but in these four states alone approximately \$10,000,000 was expended in the building of plank roads. They were constructed by toll road companies and were designed to serve as branch lines to other

forms of transportation rather than as routes for through traffic. They were the smoothest roads built prior to the hard surfaced road or the rigid pavement type. The weakness lay in the material used, for the planks constituting the road surface soon wore out and the cost of maintaining a usable surface was excessive.

While the states were chartering turnpike companies and in some cases even investing public funds in them, the federal government was urged to provide a highway between the seaboard and the region beyond the Alleghenies. The project was approved in 1806 and construction was begun five years later. The road, which came to be known as the National Pike, or the Cumberland Road, was open for traffic as far as Wheeling in 1818. The average cost for the 130 miles from Cumberland to Wheeling was nearly \$13,000 per mile. From the very beginning the road carried a tremendous amount of traffic, and there were demands for its extension. Congress in successive acts provided for continuation westward as far as Jefferson City, Missouri; but the road was never completed beyond Springfield, Ohio, although some work was done as far as Vandalia, Illinois. Despite opposition on the ground that construction of the road was not within the constitutional power of Congress, that body came to accept the view that the construction and maintenance of a highway of this character could be regarded as one of its "implied powers" under the constitution. Such a road fitted into the scheme for a national system of internal improvement and also possessed considerable value from a military point of view. The total appropriations for the road, covering the period from 1806 to 1844, when Congress made its last contribution, amounted to \$6,824,000. Funds from the sale of public lands in Ohio, of which 2 percent was earmarked for construction of the road, were wholly inadequate to meet the expenditure: by 1840 there had been credited to the fund only \$972,978, or about one seventh of the sum actually expended on the road. The large additional funds required and the controversies over location of the various sections were among the reasons which led Congress to abandon the National Pike in 1856. Of still greater importance was the rapid development of the railroad, which was proving its superiority for long distance traffic. In the subsequent development of the central and western states the United States army constructed many local roads and highways which were of considerable value to settlers.

In the prerailroad era the stagecoach was the chief means of travel between important commercial centers. The rapid development of commerce after the revolution led to considerable urban growth and augmented travel for business reasons. Regular stagecoach routes developed on a large scale. The stagecoach made its stops at taverns, whose number increased greatly. Ownership of taverns and stagecoaches was frequently combined. High profits in the operation of stagecoaches invited competition and resulted in disastrous rate wars. The triumph of the railroad abolished both the stagecoach and the tavern and marked the end of one of the most colorful aspects of early American life.

From 1850 to about 1890 little was accomplished in the way of highway construction or improvement in the United States. Because of the development of railroads and waterways there was no demand for through highway routes. The public generally failed to appreciate the social, commercial and economic value of improved local roads. Farmers, upon whom would fall the burden of constructing and maintaining high type roads, at first opposed them through fear of increased taxation. The system of payment of road taxes in labor was wasteful and inefficient. The country road tax was for the most part paid in labor but bridge taxes, usually levied on all taxable property in the rural districts, were paid in money. Road supervisors, responsible for maintenance, were elected regardless of their fitness for the work. There was a dearth of practical knowledge of the engineering aspects of road construction and maintenance, since almost no progress had been made in that direction since the days of Telford and McAdam. But as the situation grew relatively worse, the public, particularly the farmers, who were developing a keen sense of their economic and social disqualifications, began to appreciate the necessity of more and improved roads.

The modern "good roads" movement may be said to have been started by the first state road convention, held in 1883 in Iowa City. The deplorable road conditions in that state were discussed fully. People living in the rural sections realized that they needed better roads leading from the farms to the market centers and that means and methods would have to be devised to bring about an improvement. Resolutions were adopted which caused the legislature to pass an act the next year providing that county boards might levy a tax to create a county road fund, that township trustees might consolidate

the several road districts of their township into one highway district, that the township highway tax might be paid in money and that highway construction work might be let by contract to the "lowest responsible bidder." Throughout the whole act the word "may" was used instead of "shall" because many of the rural districts were still violently opposed to such a change in policy. This measure, although optional in character, served as an entering wedge for development along sound lines. In the following years similar legislation was enacted by many states which began to take active interest in road improvements.

Another great influence in the revival of interest in good roads during the 1890's was the bicycle. Men and women of all stations in life were riding bicycles, in cities, villages and rural districts. The League of American Wheelmen, organized in 1880, began an active campaign for better roads. It published a magazine, *Good Roads*, which had wide circulation and which through its articles and pictures stressed the value of improved rural roads. Newspapers throughout the country reprinted these articles and others which dwelt on the benefits of good roads and the methods of building and maintaining them. As a result of these campaigns the states again turned their attention to the utility of highways and to the problems associated with their construction and maintenance. A national road conference, the first of its kind, was held in 1894, with representatives from eleven states. Resolutions were passed calling on the state legislatures to create temporary highway commissions to consider legislation and methods of road improvements. It was also recommended in these resolutions that each state should set up a limited system of state roads or establish a system of state aid as the first step toward a comprehensive system of road improvement. As a result states began to create agencies, which at first confined their activities to investigation and the giving of free advice to counties on highway problems. New Jersey, by its act of 1891, was the first to provide state aid for the construction of surfaced roads through financial assistance to the counties. Most of the other states enacted laws which obligated the state to shoulder a part of the cost burden incurred in the construction of high type road surfaces by the counties or other municipal units. After the adoption of the state aid principle the several states soon came to realize that the problem of constructing and maintaining a connected sys-

tem of main roads could be solved only if the state assumed full control and financial responsibility. Massachusetts was the first state to accept this principle. Perhaps the most fatal defect of the state aid system as a means of developing connected main roads was that the counties could not be depended upon to maintain the roads after completion.

This trend toward state control of road construction and maintenance was strengthened by the growing use of the automobile, which gradually fostered a vigorous popular demand for improved and interconnected highway systems. Between 1921 and 1929, when the automobile really became a mass mode of travel in the United States, the total road mileage rose only from 2,941,000 to 3,024,000; but the mileage of surfaced roads, including macadam, asphalt and concrete, increased from 387,760 to 662,435.

At about the time that the policy of state aid was being urged the federal government began to interest itself again in the problem of rural road improvement. In 1893 a small Office of Road Inquiry was created in the Department of Agriculture, with an annual appropriation of \$10,000, to study the existing highway situation and report upon the best methods of road construction and maintenance. As the years went by the appropriation was increased to enable the government to publish and distribute information regarding the best methods and practices of road building and maintenance. Laboratories were set up to test road building materials. Later the Office of Road Inquiry was expanded into the Bureau of Public Roads, which, with increasing appropriations, promoted road improvements through demonstrations in various sections of the country. The local communities furnished the material and labor, and the bureau sent its engineers and experts to design and superintend the construction of "object lesson" roads. By 1916 the government was expending about \$300,000 a year on this type of educational and research work.

Nevertheless, the United States remained relatively backward in road construction and maintenance. In 1904 only \$79,623,000 was spent for this purpose. Progress thereafter was more rapid, expenditures in 1914 amounting to \$240,263,000. Growing demands for a unified national policy of road building led the federal government to act. The passage of the Federal Aid Act of 1916 provided for the resumption of active federal participation in road construction in every state of the union. Within the limits of

the appropriations the act authorized the secretary of agriculture to participate in the improvement of post roads up to 50 percent of the improvement, provided that the aid granted to a particular project did not exceed \$10,000 per mile. In 1919 the maximum limit was raised to \$20,000 per mile, but in 1922 it was reduced again to \$15,000 per mile. For 1917 the total appropriation was \$5,000,000. One of the most important and far reaching provisions of the law was the requirement that states desiring to receive federal aid would first have to create a state highway department which could cooperate with the federal government and assume responsibility for the immediate supervision of construction. This legislation accelerated the tendency toward state control, which experience had already proved to be the wisest course. An amendment in 1921 authorized the secretary of agriculture, in cooperation with the state highway departments, to designate a system of main interstate and intercounty highways, limited in each state to 7 percent of the state's total mileage. This system of roads is known as the Federal Aid system. It was further stipulated in the amendment that the roads must be maintained in satisfactory condition by the state highway departments and that if a state should fail to do this the federal government must maintain the road and charge the cost against the state's appropriation fund. Although the initial appropriation for federal aid was small, the several states were eager to cooperate to such an extent that substantial increases in the federal appropriations were demanded. By 1933 Congress had appropriated \$1,240,000,000 for rural road construction purposes. The annual appropriations were apportioned among the states in accordance with a formula prescribed by the original act of 1916: one third on the basis of area, one third on the basis of population, one third on the basis of rural road mileage.

In 1930 there were approximately 3,024,000 miles of roads in the United States. All roads by virtue of the traffic they carry belong to one of four classes, which may be called interstate roads, state roads, county roads and local roads. The more important of the first two classes are included in the Federal Aid highway system, which forms a connected system and has at present a total length of 200,013 miles. The federal government in 1931 had expended Federal Aid funds on 88,713 miles of the system. The roads thus officially designated comprise in the main all the roads referred to above as

interstate roads and a portion of the state roads and reach directly nearly every city with 5000 or more inhabitants; they are so chosen that if a zone 10 miles wide were marked off on each side, it would include the homes of 90 percent of the population. Those roads which constitute the state highway systems are sometimes called state roads and include all the roads of the Federal Aid highway system. All roads other than those included in the Federal Aid highway system or in one of the state highway systems are county or local roads, which comprise 90 percent of the total.

The several types of roads may be divided into three classes and rated as high, intermediate and low. The high types, with a total mileage of 91,463, are bituminous concrete, Portland cement concrete and vitrified brick; the surfaces of these roads are of the rigid pavement type and have been used as rural road surfacings only since the advent of heavy motor traffic. The intermediate types are bituminous macadam, water bound macadam and gravel, with a mileage of 514,441. In the days of horse drawn vehicles such surfacings were considered as the highest type. The low types are sand clay and graded and drained earth. The choice as between the several types within a group remains largely a matter of availability of material and relative cost under particular circumstances. These types of road bear a large and increasing portion of traffic. In addition there are 2,315,597 miles of earth roads, wholly unsurfaced, constituting 77 percent of the total mileage.

The building and maintenance of roads has in recent years accounted for a considerable part of total construction in the United States. Disbursements rose from \$240,263,000 in 1914 to \$1,718,000,000 in 1929. For the five-year period 1925-29 disbursements amounted to \$7,415,000,000. Disbursements rose to \$1,991,000,000 in 1930, although they declined in the subsequent years of crisis. Of the total in 1930, 16 percent went for debt services; the balance was spent on construction and maintenance (Table II). Although state highway departments are responsible for only 10 percent of rural road mileage, they disbursed 57 percent of the total outlays.

In 1930 approximately 43 percent of the total income for purposes of road construction and maintenance was derived from motor vehicle fees and gasoline taxes paid by users of the roads (Table III). The gasoline tax is in reality a species of toll charge and represents a reversion to

TABLE II
EXPENDITURES FOR HIGHWAYS AND ROADS BY STATE AND LOCAL AUTHORITIES, UNITED STATES, 1930

| PURPOSE OF EXPENDITURE | STATES | LOCAL AUTHORITIES | TOTAL |
|---|---------------|-------------------|-----------------|
| Construction and right of way | \$713,117,045 | \$206,594,546 | \$1,009,711,591 |
| Maintenance | 191,683,479 | 284,228,960 | 475,912,437 |
| Miscellaneous expenses | 2,227,459 | 37,066,817 | 39,293,276 |

TABLE III
SOURCE OF INCOME FOR ROAD CONSTRUCTION AND MAINTENANCE, UNITED STATES, 1930

| SOURCES OF INCOME | STATES | LOCAL AUTHORITIES | TOTAL |
|-------------------------------------|---------------|-------------------|---------------|
| State tax levied for state highways | \$11,181,693 | | \$11,181,693 |
| Appropriations for state highways | 32,136,298 | | 32,136,298 |
| Motor vehicle fees | 289,801,738 | \$54,911,122 | 344,712,860 |
| Gasoline tax receipts | 411,109,446 | 107,110,709 | 518,220,155 |
| Miscellaneous | 17,083,821 | 33,338,076 | 50,421,897 |
| Bonds and notes | 222,288,308 | 94,684,481 | 316,972,789 |
| Federal aid | 92,462,836 | | 92,462,836 |
| Transfers from local authorities | 60,609,297 | | 60,609,297 |
| Transfers from the state | | 33,701,795 | 33,701,795 |
| Local road tax levy | | 398,437,337 | 398,437,988 |
| Appropriations from general fund | | 96,195,337 | 96,195,337 |
| Total | 1,136,673,437 | 818,379,508 | 1,955,052,945 |

Source: Compiled from United States, Bureau of Foreign and Domestic Commerce, *Statistical Abstract* (1932) p. 350, and Department of Agriculture, *Yearbook of Agriculture* (1932) p. 934. The figures for state transfers, proceeds of the local road tax levy and appropriations from general fund obtained from the unpublished tabulations of the United States Bureau of Public Roads

the old turnpike principle of compelling highway users to pay for improvements. About 16 percent of the year's income was supplied from borrowings. Most of the remainder was raised from taxes. There has been considerable agitation in favor of a special tax on buses and motor trucks because of their use of public highways for business purposes and because of the extra wear and tear they cause.

The amount of service which the highways render in carrying traffic of all kinds cannot definitely be determined. During 1929 and 1930 a comprehensive survey of traffic conditions and road uses was made in eleven of the western states of the United States, including the Pacific coast states. It was shown that the annual use of the Federal Aid highway system was approximately 8,400,000,000 vehicle miles, that approximately 57 percent of all passenger cars travel

less than 140 miles per day and that 4 percent travel 400 miles or more per day. In a survey of traffic conditions in Michigan in 1930 it was indicated that the average density of traffic on the roads comprising the state highway system was 1144 vehicles per day, on the county roads 190 vehicles per day and on the township roads 22 vehicles per day. This general distribution of traffic is noted in surveys in other states of a more or less similar character. In Michigan for the year 1930-31 the highway expenditures on city streets amounted to 0.78 cents per vehicle mile, on state highways 1.05 cents, on county roads 2.37 cents and on township roads 1.29 cents.

Road building in the United States in recent years has not spread into new or undeveloped territories. The emphasis has been on extensions and improvements, on better planning and on

more efficient cooperation among local authorities. There is still much room for development, although progress has been considerable. Inspectors and supervisors are better trained. Since 1922 there has been a small but significant growth of road construction under the supervision of regional planning bodies. The higher type of concrete road is increasing; and there is more careful planning, stimulated by advancing research, of types of surfacing and subsurfacing in relation to the amount and nature of traffic.

In the more industrialized nations, particularly in the United States, road building is highly mechanized. The mechanical equipment includes plows and scrapers for loosening the earth preparatory to building, sprinklers to moisten earth and stone, rollers to pack the roads, graders to loosen earth and dump it and crushing and grinding machines to break stone and prepare concrete. Equipment has been greatly improved in recent years: for example, the power shovel, using electric or gasoline motors, is far more efficient than the old type and can be converted into a crane or drag line. Other improvements involve better preparation of materials and laying of road. The result has been a great increase in productivity. In the United States the daily output per worker rose from 4.7 lineal feet of road surfacing in 1919 to 17.7 lineal feet in 1928; despite the increase in road building there was practically no rise in the number of workers employed. From 1923 to 1929 the hourly wage of common labor engaged in road building was practically stationary, rising from 38 to 39 cents; hourly wages in 1929 ranged from 26 cents in the east south central states to 53 cents in the Pacific states. Although the trade unions have long opposed the custom, convict labor is still employed in road building by many states, particularly in the form of convict chain gangs in the southern states; the abuses of the contract system are notorious.

Road building developments in the industrialized nations of Europe have in general been similar to those in the United States. Military roads have played a tremendous role in European road building programs. Other important influences have been the attempts to stimulate domestic agriculture, the advent of the automobile and the increase in tourist travel. The colonial nations of Europe have developed road construction on a large scale in their colonies, in which military and commercial motives have been of about equal importance. Usually native forced labor is employed, often under conditions

of extreme cruelty. France in north Africa has been especially active in the construction of roads, as has the United States in the Philippines. These colonial roads are as a rule of high quality because of the importance of motor traffic.

Highways and highway transportation have attained ever greater significance during the last two decades. Improved highways and the use of the motor vehicle have wrought vast changes in the economic and social conditions prevailing in rural and urban areas. Recent developments have increased the economic importance of road building. In the United States the federal government, as part of its program to stimulate industrial revival, appropriated in 1933 the sum of \$3,300,000,000 for a program of public works, which includes many projects for the construction of new primary highways. In other countries, particularly in Italy and Germany, road building is being consciously developed to "make work" for the unemployed.

ROBERTSON, JOHN MACKINNON (1856-1933), British rationalist and politician. Robertson was born on the isle of Arran, on the west coast of Scotland, and left school at the age of thirteen. He entered newspaper work in 1878 and was for a time associated with Charles Bradlaugh on the latter's paper, the *National*

Reformer. Active as an author and lecturer, he stood for Parliament and was member for Tyneside, Northumberland, from 1906 to 1918. In politics Robertson was for long classified by the British Museum authorities as a socialist; yet in his later years he became increasingly distrustful of socialism, mainly because of his overriding concern for individual rights and liberties, which, he felt, might be menaced in the course of the establishment of a socialist regime. As undersecretary of the Board of Trade (1911-15) in Asquith's Liberal government he was known chiefly for his uncompromising advocacy of free trade views, but he specifically discountenanced the extremer laissez faire doctrines of English liberalism. Robertson was active for many years in rationalist circles and during the latter part of his life was the recognized leader of the rationalist movement in Great Britain. He was widely respected both within and outside the rationalist movement, to which his death was an irreparable loss. In his extensive writings on sociology Robertson's chief concern (see his *Celt and Teuton*, London 1897) was to combat the fashionable contemporary interpretation of the events of national history and the traits of national character in terms of innate racial differences. His view was that while differences of individual character are correlated with differences in the physical make up of the total organism, differences in national character are deducible from political or social circumstances rather than from bodily or racial variations.

Robertson's interest, however, lay less in philosophy and in the abstract sciences than in what might be termed—the word was his own—the "humanistic" implications of science; that is to say, in the effects of natural law upon the events of human history and the lives of human beings. Thus he was a professed materialist, not in the sense of endorsing T. H. Huxley's conception of man as a conscious automaton, which he explicitly disavowed, but in his disposition to interpret the evolution and development of human ideas and beliefs—for example, the movement from Catholicism to Protestantism at the time of the Reformation—in terms of underlying economic causes.

Robertson was perhaps best known for his works on comparative mythology, which were made the basis of a sustained criticism of the Christian religion. In *Christianity and Mythology* (London 1900, 2nd ed. 1910) he startled his contemporaries by denying not only the divinity but the historicity of Christ. In its sequel, *Pagan*

Christis (London 1903, 2nd ed. 1911), he distinguished as a phenomenon that arises in the history of religion the appearance of mediator gods between man and the cosmic process. These gods are at the same time victims and their existence is multiplied in the hosts of human victims actually sacrificed who are supposed to represent them. Jesus Christ, he held, was a god-victim of this order, a composite myth, combining and concentrating in his own person all the historical victims of the Jews. Inevitably such a view aroused opposition. But its uncompromising character at least did not lay Robertson open to the charge, justly brought against many contemporary critics, of moralizing religion by reading into the utterances of Jehovah and Jesus Christ the refinements of nineteenth century humanism.

ROBERTSON, WILLIAM (1721-93), Scottish ecclesiastic and historian. The high esteem in which Robertson was held by his contemporaries, both at home and abroad, was shown by his appointment as historiographer royal of Scotland in 1763 and by the honors showered upon him by the academies of Madrid, Padua and St. Petersburg; his popularity as a historian is evidenced by the unprecedented profits that accrued from the sale of his books.

Critically considered, Robertson like Hume and Gibbon was a product of the eighteenth century Enlightenment and a disciple of the new school of historiography, of which Voltaire was the pioneer. In his pragmatism, historical skepticism, distrust of "enthusiasm" and hero worship, and his contempt for the "mere antiquary" he displays the characteristic bias of his age. As a writer he lacks the brilliance of

Voltaire, the philosophic depth of Hume and the extensive learning of Gibbon; but he is more accurate than Hume and Voltaire and the sobriety and purity of his style contrast strongly with the meretriciousness of Gibbon. He keeps close to his authorities, strives painfully after correctness of fact and on the whole achieves a praiseworthy objectivity in the presentation of history. His introduction to his *History of the Reign of the Emperor Charles the Fifth* remained for a long time a model analysis of the developing structure of mediaeval civilization.

In some respects Robertson differed from the other historians of his school. He believed in the "dignity of history"—by which he meant that history should not only be written in a dignified manner but should concern itself solely with dignified subjects. His books are never overburdened with circumstantial detail, nor is the march of the narrative interrupted by learned disquisitions that ought to be relegated to an appendix. He was also fairly conscious of the importance of climatic, geographic and economic factors in the interpretation of history, although it is evident that he did not rationalize his position satisfactorily in these matters.

ROBERTY, EUGÈNE DE (1843-1915), Russian-French sociologist. De Roberty, who was born in Podolia, studied at the German universities and St. Petersburg. He taught at the Collège Libre des Sciences Sociales at Paris, at the Université Libre de Bruxelles, and after 1909 he was professor at the psychoneurological institute in St. Petersburg. In 1906 he proposed the abolition of the privileges of the nobility at the Assembly of the Nobility of Tver, in which province he resided and was later murdered.

De Roberty may be classed as an independent disciple of Auguste Comte, whose doctrine he completed and corrected by referring to explain the evolution of society solely through the evolution of philosophy (*La philosophie du siècle*;

criticisme, positivisme, évolutionisme, Paris 1891; 2nd ed. 1892). He could claim legitimately in the preface of *Sociologie de l'action* (Paris 1908) to have initiated discussion on a number of themes subsequently developed by sociology, such as the essential relation between the social and the mental and the necessity of completing physiological explanations of human behavior with sociological explanations.

He believed that ethics, in so far as it develops from a normative to an explicative science, can be nothing else than a sociology of action and thus can be only the application of a theory of social knowledge; every sociology is therefore at bottom a knowledge of knowledge, a gnosiology. Forms of conduct are essentially a translation of the progress of thought—first analytical and hypothetical, then synthetic and finally symbolic. Moreover the interaction of one consciousness upon another explains the formation of a superorganic world. De Roberty thought that through this theory, which binds together the intellectual and the social, he had found a satisfactory compromise between the materialist school, with its view of psychology as a simple chapter of biology, and the idealist school, which would make of psychology an abstract science. It also enabled him to react against the various pragmatist tendencies, whose origin he traced not only to Kant and his primacy of practical reason and to Nietzsche and his exaltation of the will but also to Comte's theories of subjective synthesis and the supremacy of the moral fact and to Marx' view of the domination of the economic fact. By leaning upon sociology and insisting upon the importance of the collective ideas manifested by social practises he sought to limit the excess of pragmatism in sociology.

ROBESPIERRE, MAXIMILIAN (1758-94), French statesman. Robespierre's early maladjustment due to a poverty stricken youth and an

unprepossessing complexion explains his retiring, taciturn nature and throws light upon his efforts to find consolation in faith in the Supreme Being and in the disinterested loyalty to principles which won him the epithet "incorruptible." He was a fairly well known provincial lawyer at his birthplace, Arras, when he was elected deputy to the Estates General. In the Constituent Assembly he championed democracy and universal suffrage against the moderates; during the Legislative Assembly he evinced his practical political insight by his vain denunciation of the Girondin war policy. Member of the Commune from August 10, 1792, and deputy from Paris in the National Convention, he participated with Marat and Danton in the bitter conflicts between Mountain and Gironde, favoring the death penalty for the king and taking part in the revolution of May 31, 1793.

After July 27, 1793, when Robespierre entered the second Committee of Public Safety, his activity is merged with that of the revolutionary government. His steadfastness and shrewdness in defending the policy of this government before the Convention soon made him its ostensible head. But while he undoubtedly exercised great influence in the committee, he was not its president nor had he appointed its members; all its measures, including the arrest of Hébert and Danton, the establishment of the cult of the Supreme Being and the law of 22 Prairial, were decided upon collectively. After Thermidor his former colleagues imputed to him the entire responsibility for their policies, but his dictatorship is a legend. Nor did he succeed in subordinating the Committee of General Security to the Committee of Public Safety, an objective which he pursued for the broader purpose of unifying the government and perhaps also of limiting the Terror. At any rate it was the extreme terrorists who assured Robespierre's downfall.

It is far from simple to discern Robespierre's personal preferences through the maze of responsibilities which he assumed. The cult of the Supreme Being was undeniably his work. No one displayed a more fervent attachment to the notion that the man in public life must symbolize "virtue"—patriotism and civic devotion. His social ideal was a republic of small independent producers and he perceived that it could never be realized except by state intervention: it was his friend Saint-Just who defended the decrees of Ventôse, the most extreme form of social democracy instituted by the Mountain. In the

major aspects of Robespierre's political and social outlook it is possible to perceive the tremendous influence exercised upon him since early youth by Rousseauism. His execution on the tenth of Thermidor, 1794, signified the termination of the revolutionary government and of the democratic republic. Thereafter his memory became the object of antithetical cults, the anti-Robespierist myth being fostered not only by conservatives but by orthodox liberals and by such socialists as Blanqui, while the Babouvists and their successors prior to 1848 venerated him as a precursor of proletarian revolution. In the modern scientific historiography of the revolution the problem of interpretation was given particular emphasis by the controversy between Aulard and Mathiez, the latter of whom saw in him a realistic statesman alive to the primary importance of the social problem and dedicated to the cause of the sans-culottes under the inspiration not of the idea of the class struggle, but of justice.

RODBERTUS, JOHANN KARL (1805-75), German social theorist and economist. Rodbertus was the grandson of Johann August Schlettwein, the leading German physiocrat, and the son of a professor of Roman law. As a liberal landowner he sat as a left center member of the Prussian National Assembly in 1848 and urged constitutional reform and national unity. The political movement influenced him profoundly and deepened his interest in the social question, which Rodbertus believed was concerned essen-

tially with the condition and status of the working class in modern society. While the eighteenth century, with its humanitarian theory of personal freedom, established the formal legal equality of the workers, the economic system of free competition condemned them to a bare minimum existence. It was necessary to effect a better distribution of the products which machine industry turned out in increasingly larger amounts; this was to be achieved by the substitution of "state direction" for natural liberty and free competition. Rodbertus regarded positive social reform by the state as the best safeguard against deflection of the reform movement into anarchistic channels. His socialism, which in contrast to that of Marx repudiated the class struggle, was to be realized in the concrete, historically developed state, meaning in fact the Prussian monarchy. It was the essential function of the monarchy, the living bond between "Prussianism and socialism," to abolish economic and social antagonisms. Rodbertus was in no sense a republican; by democracy he understood a liberal monarchy ruling for the public welfare. Particularly in his attitude toward trade unions and cooperatives he was much less liberal than Bismarck and much more an intellectual descendant of Frederick the Great. He was the German or at least the Prussian type of radical Tory.

The socio-philosophical basis of Rodbertus' ideas is an a priori, metaphysical collectivism, which, like every consistent doctrine of a similar kind, was in final analysis theologically orientated. But God can at times be sublimated rationally through the state, biologically through society and culturally or politically through the nation. This conception, like the opposite individualistic-atomistic view, is based on the philosophy of natural right, although in Rodbertus' particular interpretation natural right applied not to the individual but to mankind in its development and striving toward perfection. Society is not an aggregate of separate economic parts or individuals but an independent organism. The state is not to serve the well being of the separate parts or individuals; the latter are to serve the spiritual, moral and economic well being of the state. The essence of this type of thought is a consistent anti-individualism. Only the will and realization of the whole, not those of the parts and individuals or their groupings, have creative force and assure cultural continuity

Poverty and cyclical crises Rodbertus con-

sidered the two main evils of contemporary society. They have a single cause: an unjust distribution which deprives the workers of the full product of their labor. All commodities are economically only the product of labor; they cost nothing but labor. The workers therefore have a natural right to the whole product or the whole value of the product. The intermediate workers, those who perform socially useful service other than manual labor, can receive their remuneration only in a derivative or secondary distribution, not in the "original distribution of goods." The workers, however, receive in wages only a part of their product, the rest accrues to the owners of land and capital as rent, which is all income obtained by other means than personal labor. Rent owes its existence to the economic fact that labor produces more than it receives for its perpetuation and to the legal fact that institutional arrangements (private ownership of land and capital, exercising the same compulsion that slavery did in earlier systems) deprive the workers of part of the product of their labor. The rise in the productivity of labor redounds not to the benefit of the workers but to the benefit of the recipients of rent, as the workers receive only a subsistent wage ("iron law" of wages). Unlike Bastiat, Carey and others, Rodbertus believed that labor's share in the product is constantly diminishing, not increasing. Poverty, overproduction and crises necessarily arise from the fact that the purchasing power of the working masses is constantly limited because they are deprived of an important and increasing part of the product of industry, which accrues not to the workers but to the recipients of rent, so few in number that they cannot consume their share of the goods produced. This theory is similar to Sismondi's interpretation of crises and bears some resemblance to that developed by Marx.

Rent, which under primitive conditions is a single entity, Rodbertus differentiates into ground rent and capital rent, which have their origin in the social division of labor. The former accrues to the owner of raw materials, the landowner; the latter to the owner of the capital with which the raw materials are transformed into finished products. The division of rent into its separate forms is determined by the labor costs in the two branches of production; that is, by the relation of the value of the raw material to the value added to the raw material by the labor of manufacture (increment of the value product). According to this theory the amount of capital

has no causal influence upon the rent obtainable. A simultaneous rise in both forms of rent or a rise in one without a corresponding decrease in the other can take place only at the expense of wages. An increase or decrease in productivity raises or lowers ground rent; but the profit of capital is not affected, because profits are calculated on a larger or smaller capital, while ground rent is based on a constant area of land. There is no material value in the agricultural capital, which draws ground rent. Despite its penetration the Rodbertian theory of rent is erroneous, as it is based on a number of false or unproved premises. It is not true, for example, that the value of raw materials or of finished products is determined by the amount of labor embodied in them. Nor is it true that agricultural capital has no material value or that no costs are attached to the share of wealth it represents.

Despite his conception of rent as a form of exploitation Rodbertus ascribed an important social role to capital income and landed property and did not urge their immediate abolition. He pleaded for a compromise between the existing order and the demands of socialism. The prices of labor and commodities should not be left to free competition; anarchy is to be displaced by state regulation of prices and a comprehensive system of taxation as a means of checking inequalities in the distribution of wealth. This would stop the downward trend of labor's share and eliminate poverty and crises. Rational, just wages are such as neither endanger production nor condemn the workers to a minimum existence. Rodbertus opposed the maximum working day on the ground that it would not abolish the limitations upon the workers' share of the national income or prevent the consequent crises. Like Robert Owen, he proposed that all prices, including wages, be fixed in terms of a labor currency to be issued by the state, with an equal exchange value for products of equal labor time. Prices and wages should be revised periodically by the state, by reason of changes in the productivity of labor and for the purpose of increasing labor's share in production. Rent must be limited to a fixed amount, so that it will not only fall relatively to the increase in productivity but tend gradually to disappear in an absolute sense. In the field of agrarian reform Rodbertus condemned the domination of landed property by money capital and suggested the transformation of mortgage debt into a form of yearly rent which would set the landowner free. His basic conception was that land should not

be treated as a form of investment for money capital, but must be considered by its very nature as a perpetual source of rent. This Rodbertian principle had a considerable influence on inheritance rights, the system of holding land in perpetuity against payment of a fixed rental and other agrarian institutions.

Although Rodbertus was essentially a social reformer, he made some important contributions to the economic history of antiquity (agrarian development in the Roman Empire, the Roman system of taxation and the value of money): his study of the *oikos*, considered as an independent, self-sufficient economic form under which production was carried on by specialized slave labor, was particularly suggestive. His work in the history of the Roman Empire contributed to his conclusion that the new social order would be established by a modern form of Caesarism, which would insure social peace, centralized state power and unqualified acceptance of that power by the working class. There is nothing more conservative, he said, than reform which reconciles classes and strengthens the state power. Rodbertus had some influence upon state socialism in pre-war Germany, and many of his ideas may be discerned in contemporary National Socialism.

RODÓ, JOSÉ ENRIQUE (1872-1917), Uruguayan philosopher and literary critic. Rodó was professor of literature at the University of

Montevideo from 1898 to 1901 and was also active in journalism and politics.

He first attained fame by a short work, *Ariel* (Montevideo 1900, new ed. Barcelona 1925; tr. by F. J. Stimson, Boston 1922), in which he urged the youth of Latin America to dedicate itself to creating an ideal civilization. Social progress, he believed, consists of the sum total of the progress of the individuals in society; individual advancement in turn depends upon the fullest spiritual and moral development, to which modern materialism constitutes a serious threat. The ideal social order would be a democracy in which the forces of Christianity and Hellenism were coordinated; it would assure equality of opportunity but would also encourage the growth of an intellectual and moral aristocracy with a definite position in the democratic system. Rodó urged the South American countries not to imitate the United States but to realize their own genius, based upon their Spanish cultural heritage. The United States, he held, had made tremendous material strides but was characterized by an equalitarian mediocrity. Although *Ariel* was Rodó's most popular book, *Motivos de Proteo* (Montevideo 1909, 6th ed. Barcelona 1930; tr. by A. Flores, New York 1928) is more fundamental. Without definite arrangement it develops the thoughts of the author as they occur to him, upon the central theme that "self-renewal is life." His thesis concerning vocations, however, becomes obscured in the mass of categories into which he analyzes the subject.

Although Rodó became the most powerful intellectual influence in Latin America, in recent years his philosophy has been severely criticized as being merely eclectic and containing nothing original or creative. *Ariel* is considered only a rationalization of a contemporary situation, the apparent inability of Spanish America to attain the material development of North America. Its gospel, so negative in character, is questionable; the cultivation of the beautiful cannot be a norm of life in countries such as those of South America, which are backward culturally and in immediate need of economic and social advancement. There are no advocates of the "ferociously equalitarian" democracy which Rodó opposed, and he failed to realize that no country in Spanish America could compare culturally with the United States, which had made important contributions to science, art and philosophy.

Rodó's essays on Montalvo, Bolívar and Juan María Gutiérrez and his literary criticisms,

especially of Rubén Darío, show penetration and judgment, although they lack the profundity and scope of his philosophic writings. These essays are contained in the first edition of *El mirador de Próspero* (2 vols., Montevideo 1913; 3rd ed. Barcelona 1928).

ROGERS, JAMES EDWIN THOROLD (1823-90), English economic historian. Rogers was educated at King's College, London, and at Magdalen Hall, Oxford. He was ordained and held curacies in and near Oxford, but having abandoned his High Church position he divested himself of orders under the terms of the Clerical Disabilities Relief Act of 1870. Although by training he was a classical scholar, his interest was directed increasingly to the study of political economy. He was professor of statistics and economics at King's College, London, and at Oxford. He was also active in politics and served in Parliament for several years. Rogers was a firm free trader, a supporter of the cooperative movement and a follower of Gladstone on the Irish home rule issue.

Rogers was a man of great industry and strong opinions. While the many controversies in which he took a vigorous part are now forgotten, the *History of Agriculture and Prices in England (1259-1793)* (7 vols., Oxford 1866-1902), which he compiled so assiduously from a vast collection of original sources, remains as his permanent achievement. Even his severest critics express admiration of his scholarly labors in extracting prices from such sources as the bailiff's accounts of the property held by the colleges of Oxford and Cambridge and the great monastic corporations of the Middle Ages. It is the interpretation of these figures, particularly in his more popular works—*Six Centuries of Work and Wages* (2 vols., London 1884; 11th ed., 1 vol., 1912) and *The Economic Interpreta-*

tion of History (London 1888)—which is open to question and correction. His contention that money payments in the Middle Ages were made by weight and not by tale has been proved untenable. His assumption that employment was regular led him to identify wages rates with earnings and thus to exaggerate the purchasing power of wages. The "golden ages" for the agricultural laborer, which Rogers detected in the fifteenth century and in the early eighteenth, probably arise out of this confusion. His prejudices often led him to ignore important parts of the evidence. It is generally admitted that he seriously antedated commutation and put forward a reason for the Peasants' Revolt of 1381 by alleging that the landlords provoked it by going back on their bargains and again demanding the performance of actual services at a time when the Black Death had given labor a scarcity value. He also regarded the Statute of Artificers (1562), with its provision for the assessment of wages by the justices of the peace, as definitely devised and subsequently operated to degrade and impoverish the English laborers. Similarly he misconceived the nature of the confiscation of guild property in the reign of Edward VI, representing the loss of money held by the guilds in trust for religious purposes as the destruction of the guilds themselves. These views, popularized both by his own writings and by those of his disciple Henry de B. Gibbins, were naturally acceptable in political disputation. But they served to disguise the real value of his contribution to the elucidation of English economic history. How admirably Rogers could present his conclusions when his temper was not aroused by the detection of the tyranny of landlords or of the governments they dominated is demonstrated in his *First Nine Years of the Bank of England* (Oxford 1887).

ROHDE, ERWIN (1845-98), German classical philologist. During his student days in Leipzig Rohde entered into a close friendship with Friedrich Nietzsche and later he became an intimate friend of Richard Wagner. With them he dreamed of a regeneration of the German spirit through an art similar to Greek art. But although Rohde was wont to express his reflections on philosophic and aesthetic matters in aphorisms, his life work was of a strictly philo-

logical character. Of Rohde's philological writings the largest and most remarkable is his *Der griechische Roman und seine Vorläufer* (Leipzig 1876, 3rd ed. 1914) His fame, however, is due to his scholarly work entitled *Psyche* (2 vols., Freiburg 1. Br. 1890-94, 10th ed. Tübingen 1925; tr. from 8th ed. by W. B. Hillis, London 1925), dealing with the cult of the souls and the belief in immortality among the Greeks. It is the Dionysiac aspect of the Greek religion which is emphasized; the legalism, protected by Apollo, recedes into the background. In this ecstatic kind of religion, in which the human soul entered into communion with the divine, Rohde found the origin of the belief in immortality. Despite his erroneous view that this belief originated in the cult of Dionysus, Rohde's work was epoch making and has had a lasting influence. Rohde was not an anthropologist but he had a clear understanding of the importance of primitive religion and folklore in any explanation of the phenomena of Greek religion. He considered the humanized and rationalized Homeric religion to be a side branch of the Greek, while the older and more crude beliefs still remained dominant in the mother country. This view has since been corroborated repeatedly.

ROLAND DE LA PLATIÈRE, MARIE JEANNE (1754-93). French *philosophe* and revolutionary. Reading everything, the precocious child early abandoned the Catholic creed to become a disciple of Rousseau. She withdrew into the bookish, ideal world of the *philosophes*, where others could see her as she saw herself, drinking the hemlock with Socrates, returning with Regulus to Carthage. In 1780 under pressure of realities she managed to marry J. M. Roland de la Platière, inspector of manufactures at Amiens, an austere *philosophe* superior in birth if inferior in worth to herself. Thus provided with a career she became the efficient goodwife, managing her house, aiding her husband in his work, actively furthering his advancement in a worldly way. Upon the mature woman, still cherishing the ideal world but resigned to making the best of the existing one, the revolution, quite unforeseen, had the effect of a revelation. Here and now the promised land of her youthful dream lay before her. No longer need she envy the ancient republics, since an even "purer day" had dawned. The typical *philosophe* and practical goodwife was trans-

formed into the militant *politique*. Nothing now concerned her but the sacred revolution, which even from the provinces she could see was being betrayed by timid and corrupt men. In Paris (1791), deprived of a settled income by the abolition of the inspectorships, she did much through her friends Lanthenas, Bosc and Brissot to advance the political fortunes of Roland. After his appointment to the ministry in 1792 her apartment was frequented by the Girondist leaders, whom she attracted by her charm and helped to orient by the dogmatic clarity of her ideas. Judging men by the "purity" of their principles and the "loyalty" of their conduct, identifying opposition to the Girondists with crimes against liberty, the impassioned lover of mankind helped to destroy the party she served by the embittered rectitude of her animosities against men. Her brief adventure in political revolution ended with her arrest on June 1, 1793. Sitting helpless in prison under the shadow of the guillotine, watching the Jacobins "betray" the sacred revolution, she recalled "the death of Socrates, the exile of Aristides," understood that heaven had destined her to be "a witness to crimes similar to those of which they were the victims, and to participate in the glory of a persecution of the same kind" (*Mémoires* II: 104). In this mood she wrote her famous *Appel à l'impartiale postérité* (Paris 1795; English translation, 2 vols., 2nd ed. London 1796), transcribing her "existence elsewhere" (*Mémoires* II: 2), projecting it into history, where her expiation, for which her whole life now seemed a miraculous preparation, could be regarded as an event of universal significance which posterity would record in humanity's great book of martyrdoms. Thus fortified Madame Roland on November 8, 1793, mounted the scaffold with unflinching courage and died, as she had lived, in a world of semblance less ignoble if perhaps less real than the world of "perishing occasions."

ROMAGNOSI, GIOVANNI DOMENICO (1761-1835), Italian jurist, criminologist and sociologist. After serving as civil magistrate and lawyer at Trent Romagnosi taught law at the universities of Parma, Pavia and Milan. He was imprisoned twice by the Austrians because of his liberal principles. Romagnosi achieved lasting fame with his *Genesi del diritto penale* (Pavia 1791, new ed. Milan 1857), to which he made important additions in 1825. One of the founders of modern criminology, he was concerned particularly with the more constant causes of crime. Indirect prevention, he held, was the great task of society, punishment being merely a counteragent. In addition to important work in mathematics, geology and physics (in 1820, before Oersted, he conducted experiments in electromagnetism) Romagnosi formulated independently of Kant the doctrine which, superseding sensationalism, stressed the potentialities of human consciousness. Intensely interested in the practical application of ideas he worked out what he called a "civil," or social, philosophy, closely related to sociology but founded on philosophical premises and directed toward the "art" of civilization. He was one of the first to understand the importance of statistics; economics he defined as the doctrine of "the social order of wealth." While he advocated the distribution of wealth among the greatest number, as a liberal in economic matters he favored a government which would interfere least with a society performing "the greatest function." In the field of jurisprudence (*Introduzione allo studio del diritto pubblico universale*, 2 vols., Parma 1805; and *Assunto primo della scienza del diritto naturale*, Milan 1820) he held that natural law is not absolute and immutable, but flexible and changeable, responding to varying conditions of social existence.

ROMAN LAW in the strict sense is the law of the Roman state from its inception (754 B C) to the death of Justinian I (565 A D). While it may be considered to embrace also post-Justinianian, or Byzantine, law—the law of the Eastern Roman Empire from the time of Justinian until the capture of Constantinople by the Turks in 1453—inasmuch as it represents the direct evolution of the older legal system, this branch is omitted from the present discussion because of its minor import as regards western European civilization. It is entirely erroneous to designate as Roman law the mediæval renaissance of the older law in Italy and its subsequent reception throughout western Europe, nor is it correct to include the present national continental legal systems (see CIVIL LAW).

The Roman political state took successively the form of a kingdom, a republic, a principate, or limited monarchy; and a dominate, or absolute empire. Although to some extent Roman legal development was affected by the various political structures, it is preferable to divide it into three successive periods, marked by two significant social and economic crises. The first led to a change from an agricultural militaristic culture to one of a mercantile nature following the Hannibalic wars, and the second resulted in a defensive alignment of Hellenistic east and Latin west against the inroads of the less civilized peoples of the north. The legal periods so delimited may be designated as those of ancient law (754-200 B C), classical law (146 B C-235 A D) and Roman-Hellenistic, or post-classical, law (305-565 A D).

The question of the authenticity of the traditional accounts of legal history must continually be kept in mind in any treatment of the earliest period of Roman law. Writers of the late republic and early principate referred to enactments of the kings, *leges regiae*; but it is hardly likely that these were actually statutes approved by a popular assembly, even though there existed also a tradition of a compilation of these *leges*, the so-called *jus papirianum*. They probably represented, however, genuine sacred tradition.

The history of the sources of the Roman law really begins with the Twelve Tables (450-449 B C.). These represented a great victory of the

plebs in its struggle with the patricians, a struggle that was to continue for a number of centuries. The plebs had already secured the appointment of the tribune, a purely plebeian magistrate. The reduction of the law to written form was a second victory of the plebs, which hoped through this means to insure respect for its rights.

Although two modern scholars, Pais and Lambert, deny the credibility of the traditional accounts, the former relegating the Twelve Tables to the time of Gnaeus Flavius, and the latter holding the Twelve Tables to be a purely private compilation of the jurist Sextus Aelius Paetus (c. 190 B.C.), the traditional view is commonly accepted. The Twelve Tables, which represent in great part the written codification of existing customary law, were a decisive step in Roman legal development. Although they may contain some traces of Greek law, little credence is to be given to the story of an embassy to Greece preceding their enactment. The field of private and public law covered by their provisions, as far as they can be reconstructed from later references, is quite extensive. The individual legal institutions portrayed, however, are exceedingly formalistic in nature and retain this character for a number of centuries.

The prime source of early Roman law was the *lex*, a statutory enactment which was proposed by a magistrate and voted upon by one of a number of popular assemblies (*comitiae*). The enactment (*plebiscitum*) of the assembly of the plebs (*conclium plebis*) was only made the equivalent of a *lex*, and thus applicable to both patricians and plebs, by means of a *Lex hortensia* of 287 B.C. Besides the famous *Lex duodecim tabularum* (Law of the Twelve Tables), the significant *leges* were in the main of a public law nature, often reflecting further victories of the plebs; such are the *leges liciniae sextiae* (367 B.C.) providing among other things for the admission of plebeians to the consulate; the *Lex Publilia Philonis* (339 B.C.), creating plebeian censors and providing for senatorial approval of popular legislation before rather than after the vote of the people; and the *Lex ogulnia* (c. 300 B.C.) permitting plebeians to be augurs and pontiffs, priestly officials. A few statutes were of import in private law situations, such as the *Lex poeetelia papiria* (326 B.C.) mitigating the severities of debt servitude, or *nexum*, and the very important *Lex aquilia* (c. 286 B.C.), which settled the law of damage to property upon a new basis.

Further sources of law were "the mere un-

written interpretation of the learned" (Pomponius, *Dig.* 1.2.2.12) and the *legis actiones*, or procedural remedies. The college of the pontiffs, a patrician body supreme in religious matters, represented at the same time the "learned" and the custodians of the *legis actiones*, and the significance of this body in the development of early Roman law by means of the *interpretatio* of statutes and the gradual extension of procedural forms of actions cannot be over emphasized. There seems, however, to be a definite connection between the *Lex ogulnia* noted above and the partial destruction of the juridical monopoly of the pontiffs by reason of the publication of the *legis actiones* on the part of Gnaeus Flavius (c. 300 B.C.), the second step in the process of making the law common property, a process which had begun with the Twelve Tables and which ended with Tiberius Coruncanius (c. 250 B.C.), who made known to all the secrets of "interpreting" the law and thus brought about the replacement of pontifical by lay jurists.

The classical period of Roman law was foreshadowed by the creation of the office of *praetor peregrinus*, chief judicial magistrate for foreigners, in 247 B.C. The *praetor urbanus*, or Roman praetor, had then been in existence for some time. The Roman people were discovering that they had to provide legal protection for the increasing numbers of foreign merchants and travelers within their realm. The remedies of the ancient *jus civile*, the law peculiar to the Romans themselves and made up of *leges*, *interpretatio* and *legis actiones*, would not suffice, for these foreigners possessed their own legal institutions, often at variance with the more formal Roman types. In fact, the later jurists came to recognize a body of law known as the *jus gentium* (*q.v.*) which was considered common to the peoples of the eastern Mediterranean world, whether or not a particular part of it had its counterpart in the Roman *jus civile*. As the result of modern research the existence of any such formulated body of law is doubted, just as skepticism is expressed as to the practical significance of the more tenuous *jus naturale*. The former is recognized as the font from which the Romans drew legal elements foreign to their ancient system, and the latter as a theoretical concept enabling them to formulate a superficial legal philosophy. In a few instances, for example, in the consensual contracts, elements of the *jus gentium* became part of the *jus civile*. A greater number of foreign and, in this respect, newer

commercial ideas were introduced by the praetor through his edict and thus came to be known as the *jus honorarium*, the law of the praetorian office. The praetor would, at the beginning of his term, specify what legal principles he would recognize during his office. But the greater part of the existing legal material was transferred from the edict of one praetor to that of his successor by means of the *Edictum translativum*, and thus the novel principles occasioned by the expanding legal activity of the Romans gradually became incorporated into the corpus of Roman law. It was not until the time of Hadrian (c. 125 A.D.) that the edict was formulated in final form, the so-called *Edictum perpetuum*, and ceased to be a structure of vital importance in the development of legal ideas.

The praetor, as chief judicial magistrate, played an equally significant role in the development of civil procedure. The Roman trial until the close of the classical epoch was divided into two successive stages: the first up to joinder of issue by the parties under the control of a judicial magistrate; and the second, through judgment, before a private person acting as arbiter, the *judex*. Naturally enough it was the praetor who often officiated in the first half, even to some extent in the old *legis actio* procedure. By a *Lex aebutia* of unknown date (200-150 B.C.) there was established, as an elective mode of procedure, the so-called formulary procedure, designed to handle litigation under the *jus civile* as well as under the newer law. By means of fiction or action upon the case (*actio in factum*) the praetor was enabled to give relief in controversies arising from novel legal situations. The advantages of the formulary system had been so appreciated by the time of Augustus that the *leges juliae judiciariae* were passed, transferring practically all civil litigation to the praetor's court with its formulary procedure. In addition the praetor was accorded the use of special, summary process, of great import in the rapid development of the law.

The enormous advance in private law during the first half of the classical period is paralleled by the striking changes introduced into the criminal law during the dictatorship of Sulla (82-79 B.C.). A whole system of *leges corneliae* instituted regular criminal courts, *quaestiones perpetuae*, clearly defined the particular crimes within the jurisdiction of each and fixed the penalties to be adjudged. Thus there was substituted for the older uncertain pronouncement by a magistrate with possible appeal to the

popular assembly in capital cases an accusatorial procedure which remained practically unchanged during the empire. Because of the continual intervention of the magistrate or emperor in criminal cases, however, the law as a whole was rather neglected by the jurists and never attained the degree of perfection of the civil law.

The establishment of the principate by Augustus had little repercussion in the field of private law. On the other hand, it was natural that such constitutional changes as did occur were reflected in the domain of public law. The emperor became the font of legislation; and even though Augustus utilized the popular assembly and its enactments, such as the *Lex julia et papia poppaea*, to bring about social and demographic reforms, his immediate successors favored the politically controlled utterances of the Senate, *senatus consulta*. Because of its control of public finance and foreign affairs the Senate, from the practical point of view, had been supreme in dictating policies during the republic but had not engaged in true legislative activity. There early developed, however, a third type of legislation in the principate which soon eclipsed both *leges* and *senatus consulta*—the imperial constitutions. These were wont to be classed as *edicta*, *decreta*, *rescripta* and *mandata*, and all were characterized as utterances of the emperor or of his imperial service. Despite the fact that there was no constitutional basis for attributing legislative power to the emperor, the constitutions were recognized by the jurists as having the force of law.

Edicta were true legislative enactments, in the main concerning novel matters and generally broad in scope. *Decreta* were the judgments delivered by the emperor in cases of first instance or on appeal. *Rescripta* were answers to petitions of litigants or magistrates involving disputed points of law; they thus were decisions of the emperor, or rather of the imperial offices *ab epistulis* (handling petitions from magistrates) or *a libellis* (handling petitions from private persons), upon questions of law but not upon questions of fact. *Mandata* were orders issued to provincial governors for their guidance in provincial affairs. Except for *mandata* and *rescripta* specifically delimited, constitutions apparently were valid until repealed.

The Roman law was developed into a great legal system in the classical epoch. This was primarily the work of the jurist, the constant adviser of the praetor and of the emperor. From the time of Tiberius Coruncanius until the close

of the classical period there was an ever increasing number of legal scholars who engaged in juristic activities of a varied nature. They acted as the legal advisers of the judicial magistrates, the praetor and his successor, the *praefectus urbi*, the *judex* or *arbiter*, they directed the conduct of lawsuits, advising the practising attorneys, the so-called *oratores*, from whom the classical jurist is sharply to be differentiated; they were also called upon by private individuals to draft legal documents, such as contracts and wills, as well as the contractual joinder of issue (*formula*) in the ordinary civil trial; these three lines of activity were characterized respectively as *respondere*, *agere* and *lucere*.

Moreover, since the jurists argued hypothetical or actual cases and general legal problems publicly, they gathered about them auditors, who in course of time became students or even disciples of individual jurists; and thus the jurists correspond to modern professors of law. Shortly after the founding of the empire, perhaps even earlier, there grew up two distinct schools or sects of jurists, the Sabinians and Proculians; the names of these schools were not, however, derived from those of the founders:—in the case of the first school, Ateius Capito, and in the case of the second, Antistius Labeo. Although the extant sources reveal a great number of conflicting views between the schools, no definite criteria of disagreement can be posed; perhaps the differentiation was due to the fact that the particular teacher selected by an individual student was himself a disciple of the original Sabinian, and thus teacher, student and the latter's successors became Sabinians or Proculians as the case might be.

A further and quite significant activity of the jurists was the production of literary works. Systematic treatises on numerous phases of the law were written by republican jurists, but few of them are now extant. In the empire numerous elementary handbooks (*institutiones* or *enchiridia*), and commentaries on individual *leges* or *senatus consulta* were written. More important are the treatises on the *jus civile*, often systematically arranged on the basis of the early works of Q. Mucius (c. 100 B C) or Massurius Sabinus (c. 30 A D.) on the civil law and thus termed *libri ad Mucium* or *libri ad Sabinum*, as well as the treatises or commentaries on the edict of the praetor, *libri ad edictum*; in addition the jurists made collections of hypothetical or actual cases (*disputationes*, *quaestiones*, *responsa*) and annotated works of earlier jurists (*notae*).

The single most significant activity of the jurist was the *jus respondendi*, the later public right—limited to jurists patented by the emperor—of preparing the opinion for a particular case (*responsum*), which upon request of the litigant or the judge would be delivered as the judgment (*sententia*) of the latter. The lay jurists had taken over from the pontiffs the duty of *interpretatio*, the application of established rules of law to particular cases significant where a novel situation had arisen; and it was chiefly by means of the *responsa* that the legal principles envisaged by the jurists became part of the law. Precedent must have played a more important role in classical law than modern scholars are wont to believe, even though a definite formulation of it is almost entirely absent. Roman jurists were practical lawyers rather than legal philosophers. Their activities embraced a field today divided between the law professor, the practising attorney, the notary, the judge (for the later jurists often occupied the magisterial offices) and the legal scholar. The names and personalities of Labeo, Sabinus, Celsus, Julianus, Gaus, Papinian, Ulpian and Paul are the high lights of the Roman law.

Jolowicz has enumerated three general tendencies in the evolution of the classical law which occurred under the influence of juristic interpretation and the praetorian system. In the first place, there was a substantial diminution of the formalistic elements of the law. Although classes of property and formal means of transfer of the ancient *jus civile* continued to subsist, the praetorian law broadened the classes and introduced informal means of tradition. While the jurists still reckoned with the strict minutiae of legacies, there were developed at the same time the wholly informal *fideicommissa*. Accompanying the decline of formalism was a corresponding increase of flexibility in the application of legal principles. The Greek philosophical interpretative doctrine of *scriptum et voluntas*, writing versus intention, pervaded juristic thinking and was applied in such a way as to guarantee justice in the difficult individual case. The same result was accomplished by the flexibility of legal rules; there was a corresponding broadening of standards, of *bona fides* and *dolus*. In the second place, there was in classical law an increasing tendency toward abstract methods of thought. Classification according to remedies was to a certain extent replaced by classification according to rights. The classification of things was based on general characteristics; *res corporales* were distinguished

from *res incorporales*, and ownership was conceived as an absolute right. *Obligatio*, originally the concrete bond of one person to another, came to be conceived as a *res*, and thus an asset, from the creditor's point of view. In the third place, classical law was marked by an increased use of writing. The reception of a number of institutions of the *jus gentium* led to an extension of the number of dispositive instruments of the Roman law. In the *jus civile* only the literal contract and the mancipatory will were considered to be the expressed intention of the parties or the testator, and hence dispositive; all other writings were merely evidentiary in nature. In late classical times the document evidencing a stipulation became conclusive of the existence of the stipulation, while the Hellenistic *chirographum* and *syngraphe*, written acknowledgments of debt, became binding. The Hellenistic view was not accepted in entirety, however, for the peculiar *exceptio non numeratae pecuniae* was provided, by which the debtor could force the creditor to prove the existence of the loan by means other than the mere document itself.

The reorganized and altered absolute empire which dates from the reign of Diocletian (284-305), and which came into existence after great social and economic disturbances, presents an entirely new picture of both public and private law. The incursion of the state into what had formerly been private activities, namely, oversea commerce and organization of commercial guilds, as well as the new economic status of *colonus* (serf) was reflected, in the extant materials of post-classical times, by the less frequent discussion of private fields of law, such as commercial obligations, and the extended presentation of such subjects as ecclesiastical law, public offices, fiscal law and the status of the various newly arisen social classes. Even such an institution as the formulary procedure, the very backbone of the classical law, disappears and is replaced by magisterial procedures, which, beginning with the so-called *cognitio* procedure of late classical times and ending with libellary procedure of Justinianian times, converted the bipartite civil trial into one of a completely stereotyped public nature, destroying its effectiveness as a means of developing legal institutions.

The sources of law of the dominate take on a new aspect. *Leges*, *senatus consulta*, *decreta* and *mandata* fall into desuetude. The enactments of the emperor (*leges*) and the writings of the classical jurists (*jura*) occupy the chief positions. The

former correspond in the main to the *edicta* of the time of the principate and become the customary type of legislative activity. Such *rescripta* as are of a general character are to be identified with the *edicta* in the group termed *leges generales*, while those of a temporary nature may be considered unimportant as sources of legal doctrine. A middle ground between the *rescripta* and *leges generales* is occupied by the *sanctiones pragmaticae*, or *pragmatica*, restricted legislative enactments but often not to be distinguished from *leges generales*. In the formulation of all this legislation a major position was taken by the *consistorium*, council of the emperor, a development of the *consilium* of classical times, the advisory council of magistrate or *judex*.

The remarkable exaltation of the works of the classical jurists as legal sources has as its correlative the absence, or at least the obscurity, of contemporary juristic thinkers. Practising attorneys flourish, the law teaching profession becomes a highly organized one, and to it are perhaps to be assigned the scholastic development and some of the juridical writings of this epoch. But it is the great personalities of Papinian, Gaius, Ulpian, Paul, that share with the emperors the lawgiving attribute. Various imperial constitutions attempted to evaluate the writings of the jurists, the most famous is the so-called law of citations (*Cod. theod.* 1. 4. 3), which placed the writings of Gaius, Papinian, Paul, Ulpian and Modestinus on the highest plane and advised the judge, when the authorities were equally divided, to follow the rule laid down on the side upon which Papinian stood.

With the growing number of imperial enactments collections of them naturally were made for the guidance of judge and attorney; the so-called *Codex gregorianus* and *Codex hermogenianus* of the close of the third and of the first quarter of the fourth century were among the first of the private compilations. The emperor Theodosius II, however, ordered that the *edicta* and *leges generales* enacted since Constantine be collected into an official compilation, and that the commission appointed introduce such changes as were necessary to condense or supplement the constitutions for current use. The completed code, *Codex theodosianus*, was published in 428 and went into effect in 439. It was not until the early years of the sixth century that further official compilations were made; these were executed at the behest of the Germanic kings of the west and are known as the *Lex romana Visigothorum*, the *Edictum Theodorici* and the *Lex*

romana Burgundionum. Much less extensive than the *Codex theodosianus*, they contain excerpts from late classical and postclassical editions of juristic works as well as from the earlier codes, a complex of Roman law for the use of the Romans in the kingdoms ruled by Germanic overlords.

Juristic writing, as far as extant sources show, was far less frequent than in classical times. The political division of the empire into east and west is reflected in the works which have survived. In the east scholastic tendencies came decidedly to the fore and even writings upon the Roman law had a Hellenistic flavor. Most important are the so-called *Scholia sinaitica* to Ulpian's *Libri ad Sabinum* and the various re-visions of the Syrian-Roman law books. The former is presumably derived from one of the eastern law schools which flourished in this epoch, Alexandria or Beirut, while the latter is a private compilation of Roman interspersed with Hellenistic law, presumably for the benefit of the clergy. In the west juristic writings consisted of private compilations of isolated fragments of classical jurists and imperial constitutions, such as the *Fragmenta vaticana*, the *Collatio legum mosaicarum et romanorum* and the *Consultatio veteris cuiusdam iuris consulti*.

Justinian almost immediately upon his accession set out to reestablish the Roman law over an empire which, through the able efforts of his military aids, more nearly approximated in extent that of the early principate than the realms of any of his immediate predecessors. Following in the footsteps of Theodosius, a new code was to be prepared, superseding all previous codes and containing within itself all enactments of previous emperors which were still valid. The commission appointed on February 13, 528, completed its work on April 7, 529. Almost immediately Justinian or more probably Tribonian, one of the commissioners, conceived the idea of the compilation of the *jura*, the writings of the classical jurists. By order of a constitution of December 15, 530, an extensive commission was appointed, consisting of imperial officials, law professors and prominent advocates, and a list of significant writings of the jurists was prepared (*Index florentinus*). The commission was given a free hand to select from this extensive index such extracts as it saw fit but was, however, required to reconcile inconsistencies and by means of omission, insertion or substitution to bring the old writings up to date. In the short space of three years the commission had com-

pleted its work and published the *Digesta*. To these were subsequently added the *Institutiones*, an introductory legal textbook, based on a similar work of Gaius, and the reedited *Codex* and the *Novellae*, representing the legislative activity of Justinian and his predecessors. Together the four parts of Justinian's compilation have become known as the *Corpus juris civilis* (*q. v.*).

It remained for present day students of Roman law to appreciate to the full the significance of Justinian's remarks upon revising the writings of the jurists. If the commissioners acted upon his order, and there is ample evidence that they did so act, then despite the fact that the name and work of a classical jurist are prefixed to each extract in the Digest, the language therein may not be that of the original. Eisele and Gradenwitz, in the 1830's, were the founders of what has become the most important twentieth century contribution to Roman law—the science and technique of interpolation. The aim is the reconstruction of the original classical text, for only then can the legal institutions of classical times, the apogee of Roman law, be defined exactly; and only then can the development of the law in the postclassical epoch be realized. The identification of some conjectured interpolations may, in the case of a few scholars, have exceeded the bounds of reason; but that there is a basis for much of this study cannot be denied. Definite criteria for the discovery of interpolations may be postulated. Direct comparison of Digest passages with other extant materials or with passages unchanged in the Digest itself, because of the hurried pace of the compilers, is one method. Historical anachronisms are often to be found. There may be illogical reasoning within an extract (*inelegantia juris*), the legislative nature of the compiler's work often impinging on the true juristic material and the methodological reconstruction of the works of the jurists leads to the discovery of matter inserted or omitted by the compilers. Most frequently used and yet most hazardous is the philological criterion. The grammar, style and language of the sixth century compilers were radically different from those of second and third century jurists. The jurists used a living tongue; the compilers unavoidably employed Grecisms. The style of the jurists was clear, simple, elegant, superior to that of contemporaries of the silver age of Latin literature. In the sixth century the style was inelegant, metaphorical, redundant with superlatives and full of abstractions. By these methods and others modern scholars dis-

cover interpolations, and today no one may discuss classical Roman law without taking them into account. It should be noted finally that some changes may be antecedent to the compilers, the so-called glosses, and that both interpolations and glosses exist in the *Codex Justinianus*.

Roman law in Justinian's time was a universal system. Consequently the distinction between *jus civile* and *jus gentium* had disappeared, in fact *jus civile* and *jus honorarium* had become one. There was therefore a still greater decrease in formalism and rigidity than in the classical law. The principle of *aequitas*, in the sense of abstract justice, came into prominence as contrasted with the classical identification of this term with the process of *interpretatio*; and the acceptance of such a principle was perhaps due to the influence of Christianity on the postclassical law, revealing itself in the protection of the weak against the strong, wife against husband, guardian against ward. Indeed an appreciable portion of the substantive law of persons and the family became infiltrated with Christian views of morality and ethics.

Another factor of importance is the increased use of writing as contrasted with classical times. Since as a result of the amalgamation of civil and praetorian law the classical categories of contracts had broken down, it became necessary to separate contracts arising from consent from those without consent. The categories "quasi contract" and "quasi delict" were invented, and the sphere of contract was greatly enlarged by means of the *actio praescriptis verbis*. Since intent (*animus*) was vital in contract, the subjective element became the prime factor in liability.

Whence do these novel characteristics derive? The expansion of the Roman state over the greater part of the civilized world was inevitably reflected in the Roman law. The subject peoples of the empire, particularly those of the East, were cultured races possessing very definite legal systems of their own. It was long assumed that the Roman law, as the law of the conquering race, simply superseded the native law. But, as Mitteis has shown, the Roman administration was forced to recognize the local law even after citizenship had been granted to all the peoples of the empire by a constitution of Caracalla in 212. Indeed the popular local law influenced as much as it was influenced by the Roman law.

This was true especially in the postclassical period. Collinet in a number of works has attempted to show the Hellenistic origin of post-

classical and Justinianian law. Certainly written instruments were well known in the popular law of the East, but Collinet has further shown a number of institutions which can definitely be traced back to the eastern provinces. The law schools, particularly that at Beirut, were influential in this respect, training and dispersing throughout the known world practitioners imbued with scholastic and neo-Platonic ideas of justice and well acquainted with the centuries old legal institutions of the native populations of Egypt, Syria and Asia Minor. Although the majority of present day scholars concede the widespread influence of the eastern popular law on Roman law, this view is entirely opposed by Riccobono, who recognizes but two periods of Roman law, that of the ancient epoch and that from the Punic Wars to Justinian. Such changes as occurred in the development of the universal system of Roman law were, he holds, internal: during the classical age they were due to the jurists; during the postclassical era to the practitioners and judges, particularly in Italy. Although Riccobono seems to go too far in ascribing all development in postclassical times to practise, nevertheless he has called attention to the fact that the West may also have contributed to the development of Roman law. Perhaps a compromise between the views of Collinet and Riccobono is possible: the law was neither Hellenistic nor the mechanical development of practise but a mixture of the two.

ROMANTICISM. Paradoxically, the term romantic, which traces back to the Latin *Roma*, was first used to designate a mood and temper of literary and artistic composition which by reason of the predominance of spontaneous and fanciful elements did not fit into the Roman tradition of aesthetic criticism. As a means of calling attention to the numerous traces of mediaeval popular romances (*romans*, *romanze*) which had persisted into the Renaissance, the orthodox Horatian and Aristotelian critics of Italy and France, and to a lesser degree of Germany, employed the terms *romanesco*, *romanesque* and *romanhaft* to designate those writings

which did not conform to classical canons. At the outset such terms were in the nature of a compromise, having neither the contemptuous associations of the more polemic epithets Gothic and barbarian nor the approbation implicit in classic: avoiding a four-square definition, they merely hunted at an atmosphere of sensitiveness. Around the middle of the seventeenth century, with the growing infiltration of continental criticism into England, the term romantic began to gain currency as a rough equivalent of "freely imaginative," "extraordinary" or "visionary" and by the time of the Augustans had established itself as a fairly familiar category. In the process, however, not a few peculiarly English associations had grown up around it; and when in the eighteenth century, as a phase of the more general spread of Anglo-Saxon ideas and institutions to the continent, the terms romantic and romanticism began to serve as points of reference in European critical thought, these English overtones were frequently audible.

By an extension of its aesthetic connotations romantic came in the course of the eighteenth century to designate a group of emotions and sentiments which, although neither peculiarly characteristic of modern man nor absent from Greek or even Latin literature, had at least been rigidly restrained by the canons of orthodox classicism: exalted fantasy, unrepressed passion, depth of feeling, whether canalized into enthusiasm or into melancholy, became the typical ingredients of the romantic temper. At the end of the century German authors and thinkers attempted to give the term scientific standing as the general characterization of modern and Christian culture as opposed to paganism. Although the refusal of Goethe to accept their thesis as to the superiority of the romantic fortified the monopoly of the term classic over permanent aesthetic and moral values, the term romantic came to be applied to the school of philosophy headed by Fichte and Schelling and in a broader sense to a large group of thinkers, who sought to carry its premises into every branch of culture, art and thought.

The expansion of the anticlassical movement from a mediaeval tendency, represented almost exclusively by popular literature and art, into a comprehensive vindication of modernism was conditioned by the spiritual revolutions of the sixteenth and seventeenth centuries. The Protestant reformers—Luther, with his substitution of justification by faith for good works, and Calvin, with his dogma of the predestined elect

—paved the way for the romantic doctrine of inspiration and for its more extreme variant, demonic frenzy. Transposed into the aesthetic sphere grace became genius; classical canons became the equivalent of good works, as powerless to produce a masterpiece as were good works to save the soul. The scientific innovations of the following age, by outmoding geocentric astronomy and Christian cosmogony, inspired a belief in the artistic infinite, beyond the compass of rhetorical rules, and in the idea of incessant evolution and revolution in cosmos and mind. As early as 1688 Dryden manifested his awareness of the relationship between astronomic conceptions and literary taste when he drew an analogy between "the under-plots or by-concernments" of the English drama as contrasted with the French neoclassic play, and the multiple motions of the planets. The English political revolution of the seventeenth century, apotheosizing the birthright of the individual to freedom, gave a somewhat more tangible impetus to the revolt against authority.

The ramifications and reverberations of these major contributions and of other contemporary developments reinforced the incipient trend toward romanticism. While the Protestant Reformation and systems of instruction broke the hold of the traditional poetic genres by popularizing the rhythmic prose of the Bible, the Catholic Counter-Reformation produced an analogous effect either by prescribing that the themes of art be found in Christian, that is, modern, sentiments and truths rather than in pagan myths or, as in the Jesuitical tendency, by striving to direct poetry and art into the innocuous channels of fanciful decoration, thus unconsciously furthering the free play of imagination. As a result of the diffusion of printing the older declamatory rhetoric with its emphasis on form tended increasingly to give way to a more realistic and at the same time more sentimental portrayal of life itself. The new middle class reading public, composed largely of women and remote from esoteric culture, turned to art and literature for a reflection of its daily struggles and economic and sentimental interests.

Universal Latin was replaced by the spoken language as the literary medium, and in the process local traditions and color as well as local vernacular passed into the fabric of literature. Once the native literary products in countries which had more or less successfully resisted the classical tradition were crowned by the achievements of Shakespeare, Calderón and Cervantes,

the authority of the neoclassical pattern was bound to dwindle. At the same time in learned circles growing familiarity with the Greek language and direct contact with Greek literature enabled scholars to differentiate between Greek and Roman and to uncover the romantic elements in Greek poetry: Homeric naturalness and primitiveness were thus set against Vergilian finish, the genius of the tragedy against the rhetoric of the orators. Similarly in architecture and sculpture the archaeological findings in Sicily and southern Italy, the rediscovery of Greece by travelers from the seventeenth century to the time of Chateaubriand and Lord Elgin and later the infiltration of archaic, oriental and primitive styles liberated the West from the conventional canons of proportion and balance, turning attention to the elements of color, fitness for the landscape and personal invention in the case of Greek building, and in sculpture to individual expression or exoticism. The development of baroque, the use of shadow by Leonardo and his followers, the sacrifice of form to color by the Venetian and Dutch painters, the bourgeois *Kleinmalerei*, the transmission of nature worship into landscape painting and English natural gardening, the enthusiasm for mediæval Gothic architecture, the emancipation of music from ecclesiastical conventions and from subservience to the prescriptions of the aristocracy, allowing Bach to appeal directly to aesthetic and religious fervor and Mozart to introduce vital contemporary problems into opera, the exploration of folklore by both musicians and poets: all these factors in their various ways furthered or expressed the cultural revolution.

In philosophy Locke and Berkeley broke a path that led away from Cartesian rationalism, and their successors without entirely abandoning Descartes' methods plunged more and more deeply into the exploration of the hidden life of nature and the spirit. Irrational and super-rational, mystic, occultist and magic currents of speculation arose. Philosophers and men of letters in constantly increasing numbers turned for inspiration to Spinoza's pantheistic system, which to most of them seemed to demonstrate the infinite reach of intuitive feeling but which eventuated in such divergent views as the enthusiastic preromantic optimism of the *Urfaust* and the self-indulgent romantic pessimism of Schopenhauer. Leibniz' contributions to the interpretation of the infinite likewise exerted a widespread influence. In religion a wave of unbridled

emotionalism and enthusiasm engendered a variety of new sects, exemplified particularly by English Methodism and German Pietism; Johann Hamann and Swedenborg typify the union of mystic fervor and theoretical aspiration. On a less exalted plane the antagonism that France aroused, especially in Germany, by reason of its political hegemony was transferred to French cultural predominance and therefore to the neoclassicism and rationalistic thinking of which Paris and Versailles were regarded as the strongholds. The cult of Teutonism, which had manifested itself sporadically since the time of the German humanists and which had gradually become directed against the French brand of classicism, was powerfully stimulated by the victorious wars of Frederick II and the rise of the Prussian state to a position of power. Lessing, a typical spokesman of Prussian pretensions, in his ambition to foster an indigenous Protestant literature exalted the free genius of the English theater above the French neoclassical drama and demanded an independent interpretation of Aristotle and Greek poetry.

Even in France, however, the general acceptance of Boileau's standards of *raison* and *bon sens* had failed to extinguish completely the revolutionary aesthetic taste which had lingered on since the Middle Ages and which was to serve as the subsoil of romanticism. The long literary skirmish between ancients and moderns—which in England took the form of the Battle of the Books—had clear romantic implications, particularly in its relativistic and environmentalist formulae. The *comédie larmoyante*, akin to the English sentimental novel, the exotic novel of the type of *Manon Lescaut*, the use of the grotesque in Voltaire's *Candide*, all point to the inroads of romantic influences. In Italy Gravina stressed the unreality of the abstract conventional literary type when measured against the complex variety of concrete life and personality, while Muratori analyzed the social and historical conditioning of literature. Emanating from the perception that literature and therefore literary standards must vary in different environments and ages, this latter concept, which had found a number of increasingly systematic exponents since the days of Erasmus, Huarte and Samuel Daniel, was of tremendous importance in discrediting the rigid and unalterable rules decreed by neoclassic authority. The Neapolitan scholar and philosopher Vico, although a Catholic and a conservative, presaged more clearly than any of his contemporaries the coming aesthetic cli-

mate. In isolation from the main currents of European thought he formulated the theory of the natural poetic genius of primitive peoples and emphasized the incompatibility of reason and fantasy. Even writers who continued to uphold classical measure showed a tendency to interpret perfection as the restrained expression of intuitive communion with the transcendent: thus both the Prometheanism of Shaftesbury and the apparently orthodox classicism of Winckelmann were strongly tinged with that neoplatonism which exerted so powerful an influence on the German romantics.

The first document signaling the fact that the new temper and outlook had ripened into a self-conscious movement was Lessing's *Laokoon* (1766), written in refutation of Winckelmann. Foreshadowing the Nietzschean dichotomy between the Dionysian and the Apollonian elements in the Greek mind, Lessing conceded the correctness of the neoclassical position in the plastic arts but insisted that the Greek epic and tragedy had been, as all true poetry must be, the free and creative expression of passion and action. But although it was Lessing who definitively established the aesthetic premises of literary romanticism, the real apostle of the romantic era was the Swiss born Calvinist Jean-Jacques Rousseau. Rousseau's heritage of Protestant enthusiasm and individualism coalesced with the sentiments impressed upon his memory by the scenic grandeur of a land where the worship of nature and the defense of fantasy and of the marvelous in poetry claimed in the same century such literary and aesthetic critics as Gessner, Haller, Bodmer and Breitinger. His confused theory, a thoroughly romantic compound of nervous intellectualism and lyric power, was to a large extent a reflection of the erratic yet demurgically creative temperament which made him the first clearly etched symbol of the romantic life. His main idea was the goodness of nature and the original virtue of the human heart. Convinced that the golden age was not a poetic fiction but a "state of nature" from which man had actually fallen, he attributed fear and wickedness to the misinterpretation of the *contrat social* and believed that happiness and salvation could be recaptured only by a return to natural freedom and innocence. Fusing such varied elements as the Arcadian and pastoral strains in classical and Italian art, the religious ethic of Christ's Sermon on the Mount and the new cult of primitivism, which was the offspring of natural philosophy and sciences and of the ideali-

zation of the "noble savage" in travel and fanciful literature, Rousseau's conceptions articulated scattered romantic tendencies into a dogma ready for popularization. If Rousseau might be called its Robespierre, the intellectual revolution had also its Danton in the person of Diderot, who with a more limited audience extolled sentimentalism and pleaded for the rebarbarization of poetry.

The first collective manifestation of the romantic movement appeared, however, in Germany, where in the early 1770's a group of youthful adherents of the cult of genius rallied to the slogan of *Sturm und Drang*. The most clearly discernible ingredients in the new doctrines were a vulgarized Spinozism, intuitionism and mysticism, the new humanism of Herder exalting originality and power wherever they might be found, the concept of Shakespearean "nature," Lessing's critical expressionism and religious free thought, hatred of the *Franzosen* (the pygmy French) and *Vernunftlei* (sterile and sophistical rationalism) and the vindication of childhood as preached by Rousseau and other pedagogists. The writers of the *Sturm und Drang* variously canalized their worship of insurgent energy and spontaneity into a deification of crime, as in Schiller's *Die Rauber*; of polygamy; of ecstatic insanity, as shown later in Holderlin; and of exalted self-destruction. Although young Goethe's *Werther*, whose hero commits suicide in protest against the social hierarchy and socially controlled love, most adequately typifies the *Sturm und Drang*, the Olympian detachment of the author already foreshadowed the subsequent reversion of both Goethe and Schiller to a modified form of classicism. In *Wilhelm Meister* Goethe formulated an ideal of social education far removed from the unbridled expressionism of the *Sturm und Drang*. But at this very moment romanticism proper in the persons of the Schlegels, Tieck, Novalis, Schleiermacher, Schelling and others gained its first firm foothold in Germany.

The variety of forms which romanticism assumed during the next few decades, both in Germany and abroad, may be accounted for in large part by the multiplicity of tendencies and attitudes which had gone into the making of the romantic *Weltanschauung*. When in the early nineteenth century the romantic movement began to spread to other European countries, most of the potential derivations inhering in the original philosophic and aesthetic nucleus had already manifested themselves in more or less

fully rounded form. Thus the seemingly bewildering contradictions which repeatedly crop up in the course of the spread of romanticism as an international movement are in the main reflections of the process of evolution which the philosophy had already undergone at the hands of the various schools of romantic thought in Germany. In the sphere of literature, for instance, romantic aesthetics in Germany ranged from the mystic proto-symbolism of Novalis, with its subordination of rational content to melopoeic phonetics, to Uhland's cult of the mediaeval ballad technique and to Ruckert's defense of involved metrical experimentation as a challenge to individualistic virtuosity. In the light of such disparities it is not surprising that outside Germany a romantic like Coleridge, in defending a finely wrought poetic diction, should find himself in fundamental disagreement with another romantic like Wordsworth, who traced the springs of true poetic diction to the half articulate peasants and shepherds of rural England; or that the romantic Parnassians, deploring the sentimentality and lack of form in the poetry of earlier French romantics, like Hugo and Lamartine, should have repudiated their spiritual sires. In music and painting as well as in literature this protean quality of romanticism was revealed under a multitude of disguises—the sentimental *Lieder* of Schubert, the Promethean sonatas of Beethoven, the grandiloquent motifs of Wagner, the restless fury of Delacroix, the calm balance of Ingres or the pale pseudo-primitivism of the pre-Raphaelites. For in spite of the multiplicity of forms which romanticism may assume in the aesthetic realm it is possible to detect beneath all of them a common characteristic feature: a sense of tension and stress and a spiritual drive toward creation and renovation, although the new may often have to be sought out along the path which stretches into the past.

The element of contradiction and opposition which is encountered in romantic philosophy and aesthetics is even more pronounced in the sphere of romantic political and social theory. Not only was there a wide variety of social and political doctrines as between different schools of romanticism, but the same individual might in the course of his intellectual development embrace a succession of apparently antipodal points of view. First in Germany and later in the other nations of Europe romanticism drew to itself representatives of many shades of political opinion: impressionable humanitarians like the

youthful Schiller and Fichte, who lamented with the revolutionary Rousseau the unfortunate plight of the common man born free but everywhere in chains; Olympian minded aesthetes like Tieck and the Friedrich Schlegel of the 1790's, who in the name of their sacred art repudiated all civic or political responsibilities and interests; irascible regionalists like Karl Ludwig von Haller, who in the tradition of Justus Möser sought escape from the bureaucratic centralization of the modern absolutistic state in a return to the self-sufficient patriarchal localism of the feudal economy; champions of totalitarian *étatisme* like Adam Müller, Friedrich von Gentz, von Arnim and the Schlegels, who, under the spell of Burke's and Schelling's organicism and Novalis' romanticization of the state, advocated the restoration of the integrated culture that they identified with the Holy Roman Empire in its prime; cosmopolitan humanitarians, who emphasized the international elements in Herder's system of thought; defiant nationalists like von Kleist, Arndt and the romantic patriots who rose with them against the tyranny of Napoleon; devout Protestants like the East Prussian Pietists; aggressive Catholics like Gorres, Baader and Brentano; and in the final stages of German romanticism the groups at Heidelberg, Berlin and Vienna which in more or less Hegelian terms assumed that the age old process of social change had at last come to a halt.

Since the same complex of broader political and social forces which had more than once changed the basic trend of German romanticism was operative with equal if not greater force in a number of the other European countries, similar shifts in the character of romanticism may be traced there. In the days of their youth, when "bliss was it . . . to be alive," Wordsworth and Coleridge like Fichte and Schiller had thrilled to the doctrines of Rousseau and the rights of man. But they were soon caught up in the widespread reaction against the democratic rationalism which was held responsible for the tragic excesses of 1793: the reaction which Germans like Haller, Adam Müller and the Schlegels had shared with Burke and which found repeated expression in the writings of émigrés, like Bonald and de Maistre, who gazed nostalgically at the departed days of iegntmacy.

Like romanticism itself the French Revolution was capable of a variety of interpretations, and in the half century which followed Thermidor various schools of political thought spoke

in its name—for the most part in romantic accents. Building upon the half articulate socialist program of the revolution, Saint-Simon, who in addition had been considerably influenced by the organismic theories of German romanticism, enunciated a new gospel of social integration and collective responsibility, which for a time caught the imagination of Victor Hugo and his fellow romantics during the stirring days of 1830 when idealists foresaw a new era of political and aesthetic freedom. These essentially romantic doctrines of collectivism and solidarity were perpetuated in a variety of quarters with a variety of modifications. Through the agency of Heine they reentered Germany, leavening the moribund reactionism of the romantic epigoni and forwarding both the Young Germany movement and socialism proper, which ranged from Marlo's and Rodbertus' reinvoation of the mediaeval guild system to Marx' scientific socialism with its typically romantic logical device of dialectic through opposition to reconciliation. With Mazzini the system of Saint-Simon underwent a still more striking modification, in the course of which a new philosophy of integrated nationalism was developed. Although Mazzini himself clung to the ideal of international solidarity, his doctrine of a homogeneous national population served, like the more immediately romantic and at the same time more individualistic nationalism of Byron, to engender and stimulate that nationalistic fervor so characteristic of nineteenth century Europe.

Although it is thus apparent that romanticism in France and Italy like its prototype in Germany was repeatedly conducive to a collectivistic outlook, it frequently manifested itself in a highly individualistic if not anarchistic guise. The lyrical Godwinism of a Shelley was paralleled by the bitter anarchism of a Stirner or a Bakunin; and once the first flush of Saint-Simonianism paled in France, the romantic Flaubert appeared with a gospel of the amorality and civic irresponsibility of the artist even more extreme than those of the early romantics in Germany. In fact during the century since Flaubert romanticism, with its emphasis on subjectivism and the sovereign rights of the individual genius, has been a powerful factor in undermining those authoritarian standards which are a prerequisite of collective solidarity in any form.

It is by a process of generalization from such anarchical and individualistic strains in romanticism that the most systematic and sustained attack upon it has been constructed. Just as in

the eighteenth century the conflict of preromanticism with neoclassicism often took the form of rivalry between the Germanic and French cultures, the most intransigent modern critics of romanticism, whether scholars and historians, like Seillière, Reynaud and Lasserre, or reactionary publicists, like the spokesmen of the Action Française, have been Frenchmen reflecting a persistent nationalistic antipathy to a typically German intellectual and artistic creed, which had received its official formulation during the period of open hostility between Germany and the Napoleonic empire. As stated by Madame de Stael, who principally through *De l'Allemagne* (Paris 1810) was the chief mediator between German romanticism and the Latin countries, the conflict resolved itself into the struggle of German spontaneity, sentimentality and piety against French conventionalism; that is, of the free nations against tyranny. To Seillière and kindred critics, on the other hand, romanticism appeared as a disintegrating force, reducible to solipsistic individualism and in its dangers more or less analogous to a barbarian invasion. For such a view they could find a certain amount of documentation in the history of literary romanticism in nineteenth century France, where the steady succession of ingeniously contrived cults of anarchism or irrationalism, from de Vigny's melancholy worship of the solitary poet martyr to the eloquent exoticism of the Parnasse, Baudelaire's imitation of Edgar Allan Poe and finally to the complete abnegation of logical content by the decadents and symbolists, is interwoven with the catalogue of hypersensitive or even degenerate personalities like Gérard de Nerval and maladjusted geniuses like Rimbaud. In America also under the stimulus of the French critics the nihilistic subjectivism in which literary and artistic romanticism culminated in the late nineteenth and the early twentieth century produced a vociferous reaction on the part of the humanistic group led by Irving Babbitt and Paul Elmer More.

On the whole, however, the United States like all Anglo-Saxon countries was little touched by the extreme varieties of continental romanticism. The empirical and flexible temper which had cushioned the impact of sentimentalism, mediaevalism, irrationalism and nature worship in early English preromanticism served also to restrain the effects of German romantic philosophy as imported and popularized by Coleridge and Carlyle. Thus guarded against its excesses, romanticism in England and America not infre-

quently helped to generate a constructive force, exemplified not only by the work of Coleridge, Carlyle and T. H. Green and his successors in stemming the tide of utilitarianism and imposing a new interpretation of English liberties but by the ethical socialism or enlightened humanitarianism of Kingsley, Ruskin, Morris, Emerson, Whitman and Thoreau. Italy also, at least during the nineteenth century, proved to be an uncongenial environment for the violent romanticism of the German type. The restrained romanticism of the Manzonian school, aiming to indoctrinate the masses with a moderate Catholic and patriotic fraternalism to the end that Italy might be delivered from oppression and allowed to take her rightful place in a family of free, peaceful and God fearing nations, had important consequences for the Risorgimento, as did various other elements of northern romanticism filtered through such proponents of Italian unity as Mazzini and Gioberti. But as a literary and artistic creed romanticism, in the mild form represented by Manzoni and his group, was unable to dissolve the prevailing loyalty to classical values. At the turn of the century, however, under the influence of a medley of factors, including de Sanctis' aesthetics, the disintegration of the neoclassic school and various foreign currents, there arose a new Italian school of romantics, which helped prepare the cultural foundations of Fascism. The Slavic nations, unlike Italy, were comparatively free from the classical tradition and, unlike the Anglo-Saxon countries, were emotionally receptive to the more intemperate forms of German and western romanticism. Poets like Pushkin and Mickiewicz came under the spell of Byronism and similar vogues, while Tolstoy revived Rousseauistic natural religion as Christian primitivism. More significant perhaps in their immediate repercussions were the restatement of the theory worked out by Lessing, Herder and Fichte regarding the primacy and divine mission of the German nation and the conversion of this theory into Slavophilism and a dogma of pan-Slavism or Russian nationalism.

By the end of the nineteenth century the literary and artistic potentialities of romanticism had been virtually exhausted; and in the intervening period the philosophic, social, political and even technically economic implications of the term have come to receive primary emphasis. At the end of the previous century Kant, drawing upon a store of personal wisdom somewhat akin to Goethe's, had achieved a balance be-

tween radical subjective criticism and the requirements of a stable intellectual, moral and aesthetic order. But within a short time absolute idealism had overrun all obstacles. The Fichtean deification of the *Ich* led to the deification either of the German nation, as in Fichte's system, or of the Prussian state, as in Hegel's. Similarly Schopenhauer's Will eventuated in a Will to Power and, as the final step in this process, Nietzsche substituted Dionysian frenzy for Lessing's passion and the beautiful savage, or superman, for Rousseau's good savage. While in the following decades the original formulations of German writers in the literary and aesthetic field proper were far less significant than during the foregoing generations, and while some of the most prominent German poets and theorists were under the direct spell of French postromanticism, the creative contribution of Germany to political and social life continued to spread.

Marxian socialism, with its reliance on the romantic technique of dialectic, and nationalism, with its romanticized version of the earlier conceptions of the chosen people, both these movements, although mutually antagonistic in their aims, are comparable in so far as they both inherit in varying degrees the substance of the pre-romantic age and belong in the bulk of their mature conformation primarily to German romanticism. Socialism first arose upon the pre-romantic conception of the bourgeoisie and of its class struggle against privileged groups, upon the supposition of a common ownership of land and tools in primitive society and upon the Rousseauian but more specifically Herderian idea of the equality of men. Nationalism is a deduction from "nature," a worship of the natural development of mankind as it is revealed in the concreteness of its group formations, a superindividual extension of the cult of individual genius. According to the formula of the Italian nationalist Gioberti, who shows unmistakable traces of German influence, "the inward autonomy of a nation is a function of the spontaneity of its character."

The consciousness of national genius leads inevitably to claims of superiority. German pre-romanticism, notably in the person of Klopstock, had delineated the image of the primitive German—valiant, truthful, pure, indomitable, blond—a fantastic idealization derived chiefly from the half political, half lyrical tract of Tacitus. Then after Fichte's Germanism and Schopenhauer's Aryanism came the Frenchman Go-

bineau with his theory as to the inequality of races and the superiority of the German, and Wagner, whose struggle against Jewish and Latin music, combined with his overpowering expression of mediaevalism and barbaric heroism, condensed and popularized the atmosphere of German nationalism. Similarly the Gaulois, the Saxon, the Roman, the Slav and all the other racial abstractions underwent the same process of sentimentalization.

The critique of the humanitarian and utopian side of pre-romanticism had started, from premises not less romantic, as early as about 1760 with Möser's pessimistic objections to Rousseau. The idea, substantially new to western civilization, of war not as an evil or a necessary evil but as a creative element had been advanced explicitly since the *Sturm und Drang* and had found a degree of acknowledgment even at certain stages of Kant's thought and of Goethe's poetry. The military epic of the French Revolution and the myth of Napoleon increased the strength of this idea. The hero of Carlyle and the representative man of Emerson contributed to this development, however unintentionally. Tendentious interpretations of Darwinism, of natural selection and of the struggle for existence gave to the theory of national conflict the imprint of objective scientific authority. Shortly after Nietzsche had invested this theory with emotional values Sorel announced the formulae of general strike and of violence, mixing the seeds of radical revolution and of reactionary involution. The Italians Mosca and Pareto elaborated the Machiavellian, aristocratic, pessimistic, implicitly heroic theory of the élite. In Germany during the romanticism of the Holy Alliance there had been outlined, notably by Adam Müller, a particular theory of the national state, according to which it constitutes an eternal alliance of past and future generations. To Müller the proper economic foundation of the national state was represented by the mediaeval structure of the functional groups or guilds; thus arose the mediaevalistic ideal of the corporate state. Certain currents of socialism, such as the organicist socialism of Marlo and Robertus and, more popularly, syndicalism, converged toward conceptions more or less similar; the cult of mediaevalism sponsored by the followers of Ruskin, by the aesthetes and the neo-Catholics added the charm of lyrical and picturesque appeal. In Germany before the World War Othmar Spann, inspired chiefly by Adam Müller, built a complete theory of organ-

istic society and romantic economics. Toward the close of the war the radical revolutionary outbreak in an orthodox Marxian direction swept Russia. Shortly afterward Italy, under the spell of the romantic and German interpretations of its own traditions and impelled by the Italian neoromantics, made the first attempt toward a romantic synthesis, which should include both socialism (or corporatism) and, to a greater degree, nationalism; this synthesis moreover was designed to include the Nietzschean ideal of individual Titanism, which in this case found expression in the cult of Caesar. This large experiment was called Fascism. The same movement, reverting to its German sources and finding there a more or less different support in the romantic myth of Aryanism and *Kaiserreich*, assumed the name of National Socialism.

Midway between the Rousseauian and Herderian hate of the actual state and the Hegelian deification of it Kant, characteristically, touched the correct balance when he said that "Utopias are sweet dreams, but to strive with all power towards them is the duty of the citizen and of the chief of state." In Kant as well as in the universalism of Goethe are still to be found the most authoritative signposts on the road to the real synthesis and rehabilitation of romanticism. For romanticism cannot be reduced to an idea of decadence or, as in the formula of Seilhères and others, to an idea of decadent individualism. Romanticism, properly understood, is the critical consciousness in modern man of a strong feeling of the contrast between infinite and finite, movement and stability, creation and standard. Hence arises the Protean and harassing multiplicity of its phenomenal appearances: ranging from anarchic individualism to herd collectivism, from brutal vulgarity to vicious aestheticism, from reactionary idolatry to wild destruction. Equidistant from both extremes stands the constructive energy of romanticism, that is, of modern mind in its self-knowledge and purpose. The essential romantic conquests have not lost, and indeed do not seem bound ever to lose, their permanent validity: in natural sciences and philosophy the idea of evolution; in social life the will to progress; in the aesthetic field, where the romantic consciousness first manifested itself, the passionate discovery, or at least decisive rediscovery, that art and poetry are not ornaments extraneous to life but a deeply spiritual faculty synonymous with life itself. The clearest minds of today are quickly outgrowing the crude contrast of romantic and

classic and may soon erase the derogatory connotations which at the outset surrounded—and which of late have tended, as a consequence of the recent reactionary tide, to surround again—the word romantic. The present age is in search of a superior synthesis that may comprise and reconcile infinite and finite in astrophysics, motion and matter in physics, anthropomorphism and pantheism, immortality and death in religion, instinct or subconscious and repression in psychology, individualism and socialism, freedom and organization in politics. Such is the trend in romanticism, whether literary and artistic or universally spiritual, toward something that is neither imitative repetition nor lawless and aimless wandering. The driving force is romantic, the goal is classic: the result is, or aims to be, classic, the creative act is romantic.

ROMILLY, SIR SAMUEL (1757-1818), English lawyer and criminal law reformer. Romilly's untiring industry, sound legal scholarship and

powers of advocacy made him one of the leaders of the chancery bar. Visits to Paris during his early years brought him into contact with liberal continental thought and with leading Frenchmen of the period, including Diderot, d'Alembert, Rochefoucauld, Condorcet and the ill fated Malesherbes. In 1784 he formed a friendship with Mirabeau and later became intimate with Bentham and Lord Lansdowne, all of whom influenced materially his political and social beliefs. In a pamphlet published in 1790 Romilly predicted that the French Revolution would have a beneficial effect on English institutions.

Stimulated by the works of Rousseau, Beccaria and Bentham, Romilly early became interested in alleviating the rigors of the English criminal law, which at that time punished with death a large number of comparatively minor offenses. His penal philosophy was dominated by utilitarian ideals: punishment should be reasonable, adequate, proportioned to the gravity of the offense and certain of application; mild penalties put into effect were more efficacious than threats of severe penalties which were not carried out.

Romilly's advent into politics in 1806 as a member of the House of Commons and solicitor general in the ministry of "All the Talents" marked the beginning of his indefatigable labors in behalf of legislative reform of the penal code. The immediate results of his parliamentary efforts were not impressive; the forces resisting change were too strongly entrenched. He succeeded in abolishing the death penalty in cases of private stealing from the person but failed to secure the enactment of similar reforms in respect of shoplifting, stealing in dwelling houses and on navigable rivers. He substituted transportation for death in cases of stealing from bleaching grounds and repealed a statute making it a capital offense for soldiers or seamen to be found vagrant without passes. Because of his efforts the severities of the law of treason and attainder were mitigated. Romilly's career was brought to an untimely end by suicide, as a result of grief over the death of his wife. Although it was not rewarded with the success it deserved, Romilly's pioneer and courageous work demonstrated the futility and stupidity of the old barbarous punishments and made it possible for the succeeding generation to effect genuine liberalization.

PENDLETON HOWARD

Works. Besides numerous pamphlets and other works Romilly published: "*Thoughts on Executive Justice*"

(London 1786), *Observations on the Criminal Law of England, as It Relates to Capital Punishments, and on the Mode in Which It Is Administered* (London 1810, 3rd ed 1813); *Objections to the Project of Creating a Vice-Chancellor of England* (London 1813).

Consult *The Speeches of Sir Samuel Romilly in the House of Commons*, ed by William Peter, 2 vols (London 1820); *Memoirs of the Life of Sir Samuel Romilly, Written by Himself, with a Selection from His Correspondence*, ed by his sons, 3 vols. (London 1840), Collins, William J., in Huguenot Society of London, *Proceedings*, vol. viii (1905-08) 310-39, Philipson, Coleman, *Three Criminal Law Reformers: Beccaria, Bentham, Romilly* (London 1923).

RONCALI, ANGELO (1845-1917), Italian writer on public finance. After obtaining his doctorate in law at Padua Roncali began teaching languages at the age of twenty-two. He subsequently became professor of public finance at the university and the Scuola Superiore di Studi Commerciali di Genoa and was for many years director of the latter school. Roncali devoted himself to the study of theoretical questions of tax policy and commercial legislation. His three works *Morale nei sistemi finanziari* (Bologna 1887), *Teoria dello stato in rapporto colla finanza* (Bologna 1890) and *Corso elementare di scienza finanziaria* (Parma 1887) are of particular importance in the history of fiscal doctrine in Italy.

Roncali opposed decisively the contemporary current of economic thought in Italy which by ignoring the state failed to comprehend the phenomena of public finance, considering it simply an appendix to political economy. He emphasized the ethical, political element in public finance rather than the economic. He compared the duty of paying taxes to that of military service. Roncali stressed the need of applying the historical method to political phenomena in order to derive therefrom the laws of public finance, which is closely related to politics generally and to administration in particular. He determined to break away from the vogue of those ideas of narrow individualism which are openly contradictory to the basic principles of a strong and vital state; as a result the idea of anti-individualism runs through all his works. Roncali must be considered one of the characteristic precursors of the political trend in the science of public finance which has acquired particular importance in Italy since about the beginning of the World War, and which, in the restoration of the state as the subject of fiscal activity and in its criticism of the economic school of public finance, developed

ideas whose germs at least are to be found in Roncali's works.

BENVENUTO GRIZIOTTI

Other economic works: La imposta personale sul reddito nelle moderne riforme tributarie (Genoa 1892), *Sunto di politica commerciale* (Florence 1916)

Consult Griziotti, B., in *Giornale degli economisti*, 3rd ser., vol. lv (1917) 29-30, and *Primi lineamenti delle dottrine finanziarie in Italia nell'ultimo cinquantennio* (Padua 1930).

ROOSEVELT, THEODORE (1858-1919), president of the United States. Sometimes condemned by his contemporaries as a radical, Roosevelt was basically conservative in his political philosophy. Behind his actions was a desire to preserve the existing economic and social organization, but he thought this could be done only through moderate change. Although as a young man he had believed in laissez faire, Roosevelt gradually came to advocate a larger measure of control by the federal government. This was to apply to business and to social conditions; it was also to mean an increasing participation by the United States in international relations as befitted the country's growing economic strength. Roosevelt did not accept fully, particularly as president, the traditional American doctrine that the executive, legislative and judicial branches occupied equally important places in the governmental scheme; the nation, he thought, required a dominant chief executive.

Born into the mercantile middle class which had built up New York City, Roosevelt was left with an adequate competence on his father's death. He was educated at Harvard College, abandoned an original plan to study law and went into politics because he "intended to be one of the governing class." His training for public affairs followed the customary American pattern. Joining the Republican party and becoming in effect a party stalwart, he climbed the ladder of political preferment and from 1882 to 1909 was never out of public life except for a single interval. He was a member of the New York assembly for three terms (1882-84); in 1886 he campaigned unsuccessfully for the New York mayoralty; during 1889-95 he was a member of the federal Civil Service Commission; from 1895 to 1897 he was head of New York City's police board; from 1897 until the outbreak of the war with Spain he was assistant secretary of the navy. Throughout his early public career Roosevelt evinced, with one or two exceptions, the utmost regularity in his allegiance to party chiefs and principles and beyond

an interest in civil service reform, for which he had crusaded, advocated no new departures in government. He was elected governor of New York in 1898 on the strength of his war record, and two years later was nominated and elected to the vice presidency of the United States. On September 14, 1901, he became president following the assassination of McKinley.

As president Roosevelt based his corporation policies—they had been first developed in 1899 when he had forced the New York legislature to pass a corporation franchise tax—on disagreement with the prevailing assumption that control of the government by large business interests was necessarily beneficent. But he was never the foe of corporations and never actually a "trust buster." His greatest achievement was in persuading large corporate and banking groups that strict government supervision was inevitable unless they mended their ways. His viewpoint was moral rather than economic, and most of the specific measures he recommended, such as his railroad legislation, were compromises with the more radical positions held by La Follette, Bryan and others. He was a vigorous advocate of the conservation of natural resources and, believing that the United States would shortly be threatened by a food shortage, he supported his departments of Agriculture and Interior in ambitious farm expansion and irrigation projects.

Greatly influenced by Alfred T. Mahan's writings, Roosevelt was an oversea expansionist from the start. In 1886 he talked about possible war with Mexico; in 1894 he demanded the annexation of Hawaii. As the war with Spain approached, his public utterances reflected with great accuracy the viewpoint of those Americans who believed that any war was a good war. When it was over, Roosevelt energetically supported the acquisition of the Philippines. The same desire to see the United States play a major and aggressive role in world affairs was basic to his demand for the building of an isthman canal by the United States; it influenced his action in encouraging the revolt of the Panamanians against Colombia; and it was behind his continuous agitation for a big navy. His imperialistic leanings were particularly apparent in his attitude toward South and Central America; and the so-called Roosevelt corollary to the Monroe Doctrine enunciated in 1904, which held that the United States could intervene in the countries of the western hemisphere if they did not keep order and pay their obliga-

tions, antagonized Latin Americans. In his foreign policy Roosevelt was inclined to distrust Europe, particularly Germany and its monarch William II. He brought the Russo-Japanese War to a close, because he believed that the Far East was a potential area of danger and that American safety lay in the maintenance of a balance of power between Russia and Japan. When the World War broke out Roosevelt approved of President Wilson's proclamation of neutrality; later he became ardently pro-ally and demanded participation by the United States. In May, 1910, he had urged a "league of peace" to prevent war, by force if necessary. His hatred of Wilson caused him, however, to oppose the League of Nations.

In 1912, on the ground that Taft had been unfaithful to the Rooseveltian principles, he forsook party regularity and organized the Progressive party. In the ensuing presidential campaign he moved farther toward radicalism than before or after. He called for greater control of business, easy amendment of the constitution, recall of judicial decisions, the direct primaries, woman suffrage, social insurance laws to protect workers against sickness, unemployment and old age, farm relief and social welfare legislation for women and children. These were the tenets of the New Nationalism, whose coming he had heralded in 1910. With his defeat in the election Roosevelt abandoned the Progressive party and it passed out of existence.

HENRY F. PRINGLE

ROSAS, JUAN MANUEL DE (1793-1877), dictator of Argentina. Rosas came of a distinguished creole family in Buenos Aires, where he received his limited education. For about twenty years he ranches successfully to the south of the capital and became noted for his progressive methods. During internal struggles he won fame as commander of federalist troops and in 1829 was elected governor and captain general of Buenos Aires province. In 1835 he was again made governor of Buenos Aires, this

time with dictatorial powers. From then until 1852 he was complete master of the country. Members of the Unitarian opposition, which included most of the cultured element of the country, were exiled, imprisoned or murdered. Bold and aggressive in foreign policy, Rosas tried forcibly to extend his political control to Paraguay and Uruguay, made war against the Bolivian-Peruvian confederation and quarreled with France and England over his relations with Uruguay. In February, 1852, however, he was defeated by an army composed of Brazilians, Uruguayans and Argentines from the provinces of Entre Rios and Corrientes and led by his former lieutenant Urquiza. He fled to England, where he spent the remainder of his life.

Rosas has been known chiefly as a brutal despot. Recent writers, however, have emphasized his genuine contributions to Argentinian development. He broke the power of the provincial *caudillos*, made the rural masses more self-assertive, carried out an energetic foreign policy and fought vigorously against opposition at home, thus unquestionably helping to create sufficient national solidarity to make real political federation possible in Argentina.

Miall as *Latin America* (London 1913) p. 140—46.

ROSCHER, WILHELM GEORG FRIEDRICH (1817—94), German economist. Descended from a venerable family of officials and judges Roscher typified German economic thought as it grew out of administrative and historical problems. He is commonly linked with Knies and Bruno Hildebrand as founder of the "older historical school" of German economics, but the peculiar method of his economic research ought rather to be traced to the historical training he received in Göttingen under Dahlmann, Gervinus and K. O. Müller and later in Berlin under Bockh, Karl Ritter and Ranke. His *Grundriss*, which led to his promotion in 1843 from *Privatdozent* to professor extraordinary at Göttingen, laid the foundations for what was to be his famous *System der Volkswirtschaft* after he had become full professor at Göttingen in 1844 and at Leipzig in 1848. In rather marked distinction to Knies, who was at

once more opposed to the "naturalistic" ways of western "classical" economics and more akin to their theoretical and practical aims, Roscher had absorbed the "objectivist" spirit of Ranke, conceiving of economic development as a great "physiological" phenomenon and believing that practical conflicts could be solved by a closer, especially a statistical, knowledge of facts. This did not, however, prevent him from making original contributions to economic theory, such as the paper in which he opened up the important subject of the location of industries. With the same alertness with which he took up the "social question," on which he continued to lecture even after his retirement, he presented an important theoretical guide to the new German colonial policy and to colonial questions in general. His history of economic doctrines in Germany shows him perhaps in the least advantageous light. Although his wise middle course between one-sided political and one-sided theoretical schools very often made him appear eclectic, Roscher will perhaps eventually be recognized as a forerunner of modern institutionalism, largely through the many American economists who were trained in his school.

CARL BRINKMANN

Important works: Roscher's fundamental treatise is the *System der Volkswirtschaft*, which comprises 5 volumes as follows: *Grundlagen der Nationalökonomie* (Stuttgart 1854, 26th ed. by Robert Pohlmann, 1922), tr. from 13th ed. by J. J. Lalor as *Principles of Political Economy*, 2 vols. (New York 1878), *Nationalökonomik des Ackerbaues und der verwandten Urproduktionen* (Stuttgart 1859, 14th ed. by Heinrich Dade, 1912), *Nationalökonomik des Handels- und Gewerbfleisses* (Stuttgart 1881, 8th ed. by Wilhelm Stueda, 2 pts., 1913—17), *System der Finanzwissenschaft* (Stuttgart 1886, 5th ed. by Otto Gerlach, 1901), *System der Armenpflege und Armenpolitik* (Stuttgart 1894, 3rd ed. by C. J. Klumker, 1905) Other important works are: *Grundriss zu Vorlesungen über die Staatswirtschaft, nach geschichtlicher Methode* (Göttingen 1843), *Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkte* (Leipzig 1861, 3rd ed., 2 vols., 1878); *Kolonien, Kolonialpolitik und Auswanderung* (Leipzig 1856; 3rd ed. with Robert Jannasch, 1885), pt. II, ch. 1 tr. from 3rd ed. by E. H. Baldwin and E. G. Bourne as *The Spanish Colonial System* (New York 1904), *Geschichte der Nationalökonomik in Deutschland*, Akademie der Wissenschaften, Munich, *Geschichte der Wissenschaften in Deutschland*, Neuere Zeit, vol. XIV (Munich 1874); *Geistliche Gedanken eines Nationalökonomien* (Dresden 1895) For a bibliography of Roscher's works see K. Sächsische Akademie der Wissenschaften, Leipzig, Philologische-Historische Classe, *Berichte*, vol. XLVI (1894) 222—26.

ROSENWALD, JULIUS (1862-1932), American merchant and philanthropist. Rosenwald was born in Springfield, Illinois, the son of a Jewish shopkeeper. At the age of seventeen he went to New York to work in his uncle's wholesale clothing company. From 1885 to 1906 he headed a Chicago clothing firm bearing his name; meanwhile in 1896 he had assumed the post of vice president and treasurer of Sears, Roebuck and Company, pioneer mail order house, which had become indebted to his concern. By 1910, when Rosenwald became its president, the business of Sears, Roebuck and Company had grown to over \$60,000,000 a year, a figure more than quadrupled when Rosenwald became chairman of the board fifteen years later.

Rosenwald's policies in the handling of the company were largely responsible for the phenomenal growth of merchandising by mail. Building and leasing factories, which he equipped with labor saving devices, establishing his store's encyclopaedic catalogue as an institution in small town and farm homes and introducing the revolutionary money-back-if-not-satisfied plan, he reduced costs, reached an undeveloped market and quickly won its approval. As the automobile and hard roads opened up rural life, he met the change in buying habits with a national retail chain. Rosenwald was a firm believer in welfare capitalism; among other things he set up a profit sharing system for his workers and made generous use of bonuses and anniversary checks. When the stock market collapsed in 1929, he pledged \$5,825,000 to guarantee the brokerage accounts of those of his employees who had been trading in the company's stock.

Rosenwald's benefactions, which totaled between \$60,000,000 and \$70,000,000, set new standards in philanthropy in that he left the use of his donations to the institutions receiving them and stipulated that the principal as well as the income of the Julius Rosenwald Fund, incorporated in 1917 "for the well-being of mankind," should be expended within twenty-five years of his death. A friend of the Negro race, he also made possible the establishment of some 5300 schools in the south, which had a total enrolment of approximately 650,000 Negro pupils at the

time of his death. He was actively interested in Jewish philanthropies and was one of the most prominent supporters of Jewish colonization work in Soviet Russia. Without regard to race or creed he furthered enterprises in higher education, science, religion, social relations, city planning, scientific agriculture and library extension.

R., in Julius Rosenwald Fund, *Review for the Two-Year Period, 1931-33* (Chicago 1933) p. 1-14, Angell, Pauline K., in *American Jewish Year Book, 5693, 1932-33*, vol. xxxiv (Philadelphia 1932) p. 141-76, Washington, Booker T., "A Remarkable Triple Alliance" in *Outlook*, vol. cviii (1914) 485-92.

ROSMINI-SERBATI, ANTONIO (1797-1855), Italian philosopher. Rosmini, who came of a wealthy noble family, was born in the Italian Tyrol. He entered the priesthood in 1821 and in 1828 founded a new order, the Institute of the Brethren of Charity, whose functions were to include popular preaching, education and welfare work. He won great fame in learned Italian circles with his *Nuovo saggio sull'origine delle idee* (1830; English translation, 3 vols., London 1883-40), in which he strove to reconcile the subjective and phenomenal elements in knowledge with the objective and transcendental. His philosophic bent and his receptiveness to the liberal influences of the Risorgimento led him to take part in the neo-Guelphian movement not only as a philosopher but also as a statesman. In 1848 he was invited to Rome by the Sardinian government to discuss the question of Italian federation with the pope, and he succeeded in furthering the formation of a liberal ministry under Pellegrino Rossi in the papal state. After the assassination of Rossi and the unfortunate ending of the Guelphian utopia Rosmini lost favor with the exponents of clericalism. In addition to this unpopularity in politics he provoked a violent theological battle with his *Delle cinque piaghe della Santa Chiesa* (1848), in which he lamented the wide gulf between the educated class and the clergy, the inadequate education of the lower clergy, the aloofness of the bishops and the interference of the secular government in ecclesiastical appointments. The book was placed on the Index in 1849 together with Rosmini's *La costituzione seconda la giustizia sociale con un'appendice sull'unità d'Italia* (1848), in which he advocated a confederation of princes and peoples of Italy under the leadership of the pope, elective assemblies for the in-

dividual states, a general assembly for the confederation and a supreme political tribunal of judges elected by universal suffrage to insure equal justice for all citizens. He affirmed the necessity of distinguishing between secular and ecclesiastical power and of regulating their relations through the use of concordats.

After the condemnation of his writings Rosmini sought seclusion at Stresa on Lago Maggiore where he devoted himself to pure philosophical speculation. Before his death, however, his works were "dismissed" by decree. The use of the word dismissed later aroused further controversies, and in 1887 Pope Leo XIII confirmed the condemnation of the forty propositions contained in Rosmini's writings.

GUIDO DE RUGGIERO

Works: Opere, 14 vols. (Naples 1842-45), with a supplement, *Opere postume*, 5 vols. (Turin 1859-74).

ROSSI, GIOVANNI BATTISTA DE (1822-94), Italian archaeologist. After studying at the Collegio Romano and at the Sapienza, Rossi was appointed scriptor in the Vatican, a post which he retained until his death. He became a disciple of the Jesuit numismatist Padre Marchi, under whose influence he developed an interest in Christian archaeology. By the application of new methods Rossi revived this subject and gave it a tremendous impetus. Concentrating his researches in Roman territory he conceived the idea of reconstructing the topography of the catacombs by utilizing the ancient itineraries written for the use of the pilgrims of the seventh to the ninth century as indicated in early manuscripts. Aided by his brother, a distinguished geologist, he was able to determine the history and successive development of these subterranean cemeteries. His profound knowledge of primitive Christian literature was of vital assistance to him in his difficult research on early mediaeval inscriptions. Important discoveries, such as those of the suburban sanctuaries in the cemeteries of St. Callistus and Praetextatus, confirmed the excellence of his technical proce-

dures. In 1863 he founded the *Bollettino de archeologia cristiana*, which he published as sole contributor and editor until 1894.

PIERRE DE LABRIOLLE

Principal works: La Roma sotterranea cristiana, 3 vols. (Rome 1864-77), tr. by J. S. Northcote and W. R. Brownlow (new ed. London 1879; vol i, new ed. 1922), *Inscriptioes christianae urbis Romae septimo saeculo antiquiores*, 2 vols. (Rome 1857-88), *Inscriptioes urbis Romae latinae*, ed by Rossi, W Henzen and E. Bormann, *Corpus inscriptionum latinarum*, vol vi, pts 1-6 (Berlin 1876-94)

M., *Giovanni Battista de Rossi* (Rome 1892), Le Blant, E., in *Revue archéologique*, 3rd ser., vol xxv (1894) 145-51, Duchesne, L., in *Revue de Paris*, vol v (1894) 719-30; Müller, Nikolaus, in *Realenzyklopaedie für protestantische Theologie und Kirche*, ed by J. J. Herzog, vol. x (3rd ed. Leipsic 1901) p 799-802.

ROSSI, PELLEGRINO LUIGI EDOARDO (1787-1848), Italian economist, jurist and political figure. Rossi was a revolutionist in his early youth and minister under Murat in 1815. Fighting for Italian unification, he was exiled from Italy, became professor of law and of political economy at the Academy of Geneva in 1819, deputy from Geneva to the federal diet and reporter to the commission charged with the drafting of the new Swiss constitution in 1832. In 1833 he accepted Guizot's invitation to succeed J. B. Say as professor of political economy at the Collège de France; in the following year he became professor of constitutional law at the Sorbonne. Appointed to membership in the Institut de France, elevated to noble rank and to membership in the upper house of parliament, and subsequently French ambassador to the Holy See, Rossi was entrusted with the task of forming the cabinet of Pope Pius IX after the July revolution but died by the dagger of a revolutionary on November 15, 1848.

Politician, diplomat, publicist—even at times a poet—by turns revolutionary minister, legislator in a federalist and democratic republic and later in a unitary regime and finally reformist minister in the most autocratic of states, a man who belonged at various times to three different nationalities but remained an Italian at heart, Rossi offers a striking example of an international career in the nineteenth century, inspired by the ideas of the great revolution. In politics as in his scientific works Rossi followed the golden mean: he was a skilful diplomat, an ardent defender of reforms but an opponent of any sort of extremist innovation. Eclectic also in his writings and receptive to diverse scientific

theories, he rarely attained originality. In his juridical works as well as in his writings on political economy it was not so much the novelty of his theories as the art of evaluating those best known in his time which gave his works a didactic value quite considerable for the period. Continuing and commenting upon the authors of classical political economy, he was eclectic likewise in his method and may be considered as the precursor of the historical school. As a criminalist he considered moral responsibility as the basis of punishment but tempered its application by the admission of the principle of social utility.

ROSSLER, CONSTANTIN (1820-96), German publicist and politician. Rossler's long life spanned the emergence and triumph of Prussianism. As a publicist he played an influential role in the rise and subsequent glory of the Bismarckian empire. A young friend of Rossler, Hans Delbrück, who later became the well known historian, called him "the German scholar as professional politician."

Born at Merseburg of a family with a clerical tradition and destined for theology, Rossler soon turned to the study of philosophy and social science at Halle. He began to teach at Jena in 1848, but the revolution caused him to abandon his academic career for politics. As a member of the editorial staff of the Leipsic *Grenzboten* he worked with Gustav Freytag, the well known German writer, who was his intimate friend. After the collapse of the revolution he returned to Jena, where in 1857 he became professor of philosophy; in 1860 he finally abandoned academic life to become a free lance journalist. In 1877, however, he became director of the Literary Bureau, a sort of press agency of the Bismarckian government. Under Caprivi he was also counselor of legation in the foreign office, serving from 1892 to 1894.

The chief monument of Rössler's academic activity is his *Allgemeine Staatslehre* (System

der Staatslehre, vol. i, Leipsic 1857), the first part of a projected but unfinished system, which shows him to be a conscious follower of Hegel and as such a defender of the idealistic conception of history, as is indicated by his moralistic justification of the state as "the realization of the whole nature of man." All other bodies, including the church, are assigned their proper spheres by the state. Thus a theocracy is a contradiction *in adjecto*. This philosophy contains the germs of his later political aims: the creation of a German national church free from the pope and the formation of a powerful German state dominated by Prussia.

Prophetically Rossler saw in Bismarck the man who could build this state, and as early as 1862 he called for *eine Diktatur für einen Mann*. The articles, often anonymous, which he published constituted so powerful an advocacy of Bismarck's policy that many regarded them as Bismarck's own pronouncements or at any rate as inspired by him. The explanation, however, lies rather in an unusual concurrence of ideas, fortified by Rossler's peculiar need for a prop. Nevertheless, in the last years of his life Rossler opposed Bismarck as vigorously as he had once championed him when the latter abandoned the ill fated Kulturkampf, Rossler disagreed with him: he had fought for a strong evangelical mission and a resurgence of the church and he saw his hopes destroyed by Bismarck's shift in policy. It seemed to him that their mutual object—the Little Germany solution, a German empire without Austria and under Prussian Protestant leadership—had as a consequence become devoid of sense.

ROTHSCHILD FAMILY, international bankers. The first Rothschild of importance was Mayer Amschel (1743-1812), the son of a small trader in the ghetto of Frankfurt. Starting as a dealer in old coins, money changer and merchant he established connections with Landgrave Frederick II of Hesse-Cassel and his son William IX and occasionally arranged loans from the Hessian state treasury to needy states and princes. The disposal of English bills of ex-

change, representing part payment to the Hessian landgraves for the mercenary soldiers they hired out to England, was managed by Frankfort bankers; Mayer Amschel secured an increasingly larger share of the business and eventually dominated it. Partly by bribery of important state officials but mainly through his ability, he became indispensable to the landgrave in financial matters and in 1801 became the court agent. The enormous sums which William deposited at interest with him increased Mayer Amschel's credit and reputation and permitted a constantly greater participation in the flotation of loans, including foreign loans. The economic basis of Mayer Amschel's success was essentially the exploitation of feudal wealth through more modern forms of financing and investment.

While Napoleon's advance into Germany seriously limited the business activities of Mayer Amschel and his princely client, it marked the rise of Nathan Mayer Rothschild (1777-1836), the third and ablest son of the founder of the house of Rothschild. He settled in England as a young man, at first occupying himself with trade but gradually acquiring considerable financial interests. For ten years he was engaged in supplying England's subsidies to Napoleon's continental enemies, an enormous task in which his talent for financial manipulations in the grand manner found expression. His resources were greatly increased when William of Hesse, fleeing from Napoleon, entrusted to him part of his treasury (not all of it, despite a legend to the contrary started by the Rothschilds). In cooperation with his four brothers in various European capitals Nathan cannily and daringly manipulated all the technical financial means whereby foreign money might be obtained in exchange for English currency or credit; he understood perfectly how to offset all pressure on the rate of exchange for English money. According to Commissary General Herries, Nathan Rothschild's political chief, it was only with the Rothschild help that these financial operations essential to the defeat of Napoleon could be carried out successfully.

After the Napoleonic wars the house of Rothschild gained increasing prominence in the circles of international high finance. Nathan Rothschild held sway in London, where he dominated the stock exchange; the four brothers—in Frankfort, Paris, Vienna and Naples—were powerful in their countries. By means of an unshakable family unity, constant exchange of opinions before any important transaction and

a rapid and dependable news service by which they kept track of and exploited events the Rothschilds, dominated by Nathan, forged steadily on to supreme financial power. After the peace of 1815 London became more than ever the great market for the credit needs of the European states, and the Rothschilds devoted themselves to these credit transactions. At first, especially in London, they seem to have continued to engage in speculation in government bonds floated by other banking houses; but later they undertook large scale bond flotations of their own, the first a loan to Prussia in 1817. Then followed a series of loans to the governments of Austria, France, the German states, Belgium, Russia and the Kingdom of Naples. A loan to Brazil broadened the scope of the Rothschilds' international operations. London was considerably indebted to them for its undisputed position as the world's leading financial market. They enhanced the popularity of foreign loans in England by making interest payable in sterling coin, thereby avoiding fluctuations in exchange. At the same time the Rothschilds, especially Nathan, dealt extensively in stocks, but unlike modern investment bankers they avoided any considerable permanent connections with corporations. The brothers were equally entrenched in the continental capitals, acting as bankers for the governments, participating in intrigues and exploiting politics and wars for financial gains, particularly in France and Austria. They were Metternich's financial agents. By 1836, when Nathan Rothschild died, the family had surpassed the older banking houses, the Barings, the Hopes, the Goldsmids and others, as earlier they had eclipsed the Bethmanns, the Ruppells and Harmers in Frankfort; they were the world's financial leaders and among the wealthiest of men. This power was in some cases used to mitigate the political disadvantages of the Jews.

Thereafter the house of Rothschild, dominated by Lionel Nathan Rothschild (1808-79), virtually monopolized the flotation of large government loans and frequently affected political events decisively. Although at first skeptical, they early realized the importance of railways and took an active part in their promotion. They backed railways in England, the first railway in Austria, the largest railway in France, the great network of Belgian railways and were identified with railway financing in Brazil and the United States. They participated in the financing of the Crimean War, of the Papal States, of Italian

unity. The Rothschilds were displaced as the leading bankers in France by the organization of the *Crédit Mobilier* in 1852, which was aimed directly at them, but upon its collapse a few years later their power was restored and even increased. They acquired large commercial interests in the southern states of the United States and were consequently pro-Confederate; but this did not prevent them, in alliance with Jay Cooke, from taking part in the United States government financing of 1871. The Rothschilds were an important factor in the European export of capital to the United States and through their American representative August Belmont they participated in extensive financial transactions, including the Morgan loan to the Cleveland administration in 1895.

At the outbreak of the World War the Rothschild family was still financially powerful, immensely wealthy and socially important (the family had acquired nobility). But their strength was on the wane; the earlier supremacy was no longer theirs, partly because of changes in investment banking and partly because they were unable to adapt themselves to an age in which corporate financing was more important than governmental. Their family cooperation moreover was far less intensive. The French and English branches of the house of Rothschild profited greatly from the war, but the Austrian branch was almost ruined. The latter recouped its fortunes, however, through speculation in foreign exchange based on inside knowledge of the financial operation intended to bolster the French franc in 1924; in this venture the English and French Rothschilds participated with the house of Morgan.

In addition to the external historical factors which determined the financial success of the Rothschilds there was another factor, which Gentz, the great publicist of the Napoleonic period, designated as "the traders' instinct"—that native, unacquired, inimitable instinct which makes choice of the commercially sound a matter of course.

ROTTECK, KARL WENZESLAUS ROTDECKER VON (1775-1840), German politician and historian. Rotteck was born in Freiburg i. Br. His father was a professor of medicine raised to the nobility by Emperor Joseph II, and his mother was descended from an old titled family of French Lorraine. Rotteck was thus twice heir to the traditions of Hapsburg-Austrian Josephinism, and these were confirmed during his student years at his native University of Freiburg by the teaching of Johann Georg Jacobi. Appointed to a chair of history in this university as early as 1798, he laid the foundations of an immense popularity by his great *Allgemeine Geschichte* (9 vols., Freiburg i. Br. 1812-26; 25th ed., 11 vols., Brunswick 1866-67), which together with the later works of Schlosser, Gervinus and Haussler helped to train the German bourgeoisie to liberal and constitutional views of German history. Rotteck was indeed the chief political mentor of south Germany. Under the first constitution given to Baden by Grand Duke Karl Friedrich, his career became definitely political when he assumed a professorship of political science and natural law and when he represented his university in the first, or upper, chamber of the grand duchy. In 1831 he exchanged this mandate for that of a deputy in the second chamber. Here he fought for a radical abolition of feudal services and tithes, for freedom of the press and parliamentary responsibility of the executive, and to this end he took over the publication of the *Allgemeine politische Annalen* (vols. i-xi, Munich 1830-32) and with Welcker founded the newspaper *Freisinnige* (1831-32), both of which created a favorable name for German liberalism throughout the century. The *Staats-Lexikon* (15 vols., Leipzig 1834-43; 3rd ed., 14 vols., 1856-66), which he likewise founded with Welcker, was the first publication of its kind in Germany and may be said to have been the bible of the revolutionary movement culminating in 1848. Dismissed from his chair in 1832, Rotteck was at once elected mayor of Freiburg but was prevented by government veto from taking this office. Nevertheless, his enthusiastic adherents spread his fame over the country by a campaign for planting *Rotteckseichen* in every community. Rotteck's later books, chief of which was the *Lehrbuch des Vernunftrechts und der Staatswissenschaft* (4 vols., Stuttgart 1829-35; 2nd ed. 1847-48), did not even approach the success of his universal history, perhaps because of his rather uncritical condemnation of the British

aristocracy, a heritage of Napoleonic times. Characteristically Rotteck opposed the accession of Baden to the German Zollverein, toward which his government, led by Nebenius, showed a much deeper understanding.

Rottecks *gesammelte und nachgelassene Schriften mit Biographie und Briefwechsel*, ed. by H. von Rotteck, 5 vols. (Pforzheim 1841-43).

ROTTEN BOROUGHS. The corrupt borough constituencies characterizing the English parliamentary electorate before 1832 from which the term "rotten borough" is derived resulted from various causes. Apart from the universities the electoral units represented in the House of Commons were the counties and the corporate towns. The franchise in both was originally democratic, although in the boroughs there was no uniformity. The Tudors and Stuarts doubled the number of borough members, but thereafter and until 1832 English representation remained fixed at 80 county and 405 borough members, the only change being the transfer of Gram-pound's two seats to Yorkshire in 1821. The decay of once prosperous towns in the centuries following their enfranchisement accounts for the earliest of the rotten boroughs. This was a continuing factor, creating new Gattons and Old Sarums in each generation. Another crop of rotten boroughs resulted from the enfranchisement by the Tudors of mere villages in order to insure the crown's control of Parliament. The narrowing of the franchise by corporate action, royal charter or the decisions of parliamentary committees facilitated the subjection of borough elections to royal or private influence. Of the 203 English borough constituencies, 59 had a resident householder franchise; in 39 the vote was attached to certain parcels of land called burgages; in 43 the corporation, i.e. the mayor and council, had exclusive right of election; and in 62 the vote was vested in the freemen, but as the corporation admitted the freemen, it exercised a large measure of control.

Early in the sixteenth century when seats in the House of Commons began to be prized, the wooing of borough electorates by courtiers, lawyers and landowners began. The residence requirement for representatives was generally disregarded for over a century before its repeal in 1774. The payment of members, although never abolished by statute, disappeared as soon as candidates offered to serve unpaid. After the non-resident member came the patron, acquiring local property and influence and bestowing local favors in return for the right to nominate the borough members. The patron appears in embryo in Elizabeth's reign, but the heyday of the boroughmonger was the eighteenth century, when the greatest of them controlled half a dozen seats apiece and Sir James Lowther returned 9 members, known as Lowther's ninetins. The degree of the patron's control and the means of establishing it varied with the population and franchise of the particular borough. In small hamlets ownership of the bulk of the property gave the patron full control. Most "pocket boroughs" were of this type. In corporation boroughs the corporation might be packed with dependents. Where freemen voted, the corporation might be persuaded to restrict them to a manageable number or to create enough non-residents to swamp the resident vote. The larger the electorate the more recourse was had to treating, bribery or intimidation and the greater the expense of elections. Patronage was the government's chief reliance in winning elections, even church preferences being used for electoral purposes.

The evil increased rapidly during the eighteenth century in spite of the efforts of reformers. The reasons were threefold: expanding wealth, a phenomenal shift in population and the determination of the landed class to balance the unfair county representation by controlling the smaller boroughs. Grey stated in 1793 that 157 members were returned directly by 84 individuals, and that the majority of the House were chosen by considerably fewer than 15,000 electors. Croker reckoned that in 1827, 276 seats were controlled absolutely by patrons. Boroughs were bought, sold and inherited. The reformers' demands for disfranchisement were denounced by patrons as confiscation.

The evil effects of boroughmongering were manifold. A majority of the House were returned directly or indirectly by a couple of hundred patrons. Members so returned were seldom independent. Some patrons sold their seats out-

right but most bartered the votes of their members for places or peerages. By his manipulation of this corrupt regime George III threatened to restore to the crown the independence lost in 1688. Municipal life was contaminated by its connection with the corrupt electoral system. The electorate was so demoralized by bribery that the evil survived until the establishment of the ballot in 1872 and the passage of the Corrupt and Illegal Practices Prevention Act of 1883. Although the costliness and inefficiency of government services under the spoils system were notorious, most of the nineteenth century passed before the country was rid of that incubus. By means of the rotten boroughs the landed class was able to dominate Parliament and to dictate its legislation. The industrial towns of the north were unrepresented until 1832, and not until 1885 was the balance righted between land and industry. It required the three franchise acts of 1832, 1867 and 1884 to restore the democratic character of the franchise. Many rotten boroughs disappeared in 1832—56 lost their representation entirely while 31 were deprived of one member each—but some survived until 1867 and a few until 1885. Both in 1885 and in 1918 in the effort to equalize electoral districts the larger boroughs were divided into single member districts while many small boroughs lost their separate representation. The plural vote, which had favored the landed class, was abolished in 1918. Efforts to secure proportional representation failed in 1918 as in 1885; no provision was made for periodic reapportionment.

ROUGÉ, VICOMTE OLIVIER CHARLES EMMANUEL DE (1811-72), French Egyptologist. Educated at the Collège de Saint-

Achéul, Rougé was trained for a juristic career; but he applied himself to the study of Semitic languages as an avocation and in 1839 began the study of Egyptian, which had just been deciphered. In 1849 he was appointed curator of the Egyptian section of the Louvre and in 1860 he became professor of Egyptology in the Collège de France.

Rougé was, with the German Lepsius, the founder of the second phase of Egyptology, in which precise logical method replaced the brilliant conjectures and approximate interpretations characterizing the period of discovery and decipherment. Well trained in Semitic philology, he introduced sound linguistic method into the study of hieroglyphic and especially of hieratic texts. He was the first to classify correctly the then known monuments of the pyramid age. His treatment of Egyptian phonology and his defense of the Egyptian origin of the alphabet were of fundamental importance. Rougé also collected and published a great many Egyptian monuments and texts. Nearly all more recent French Egyptologists were his immediate pupils or studied under them.

ROUND, JOHN HORACE (1854-1928), British historian and genealogist. Round was one of the most prominent of the scholars who founded the modern study of Anglo-Norman history. Although he never held an academic appointment and had no ambition to found a school of history, his influence on younger workers has been great. He was a strict and every outspoken critic of inaccurate scholarship, and his own writing set a new standard of exactitude in

genealogical studies. Although most of his work bore a technical character, its results became well known through his relentless exposure of many famous but spurious pedigrees; and he may be said to have opened a new period in the study of family history in England. His strength lay not in any power of continuous historical writing, which he rarely attempted, but in the originality and precision of method with which he approached the investigation of individual problems. All his books are in reality collections of essays. The most important for general historical purposes are *Geoffrey de Mandeville* (London 1892), *Feudal England* (London 1895), *The Commune of London, and Other Studies* (London 1899), *Studies in Peerage and Family History* (London 1901), *The King's Serjeants and Officers of State* (London 1911) and *Family Origins, and Other Studies* (ed. by William Page, London 1930). In all these books the interest centers around questions of Anglo-Norman government and family history. They deal with an extremely varied range of subjects, among which may be mentioned the nature of the assessment underlying the *Domesday Book*, the early government of London, the household organization of the Anglo-Norman kings and the condition of England in the reign of Stephen. Probably Round's most important single contribution to historical knowledge was his demonstration that the system of knight service on which English feudalism rested was established by William I. Here Round was challenging the opinion held by many eminent historians that knight service was gradually developed on a basis supplied by the pre-Conquest distribution of landed estates; and his conclusions, which have not been seriously attacked, have proved of the first importance for the study of old English as well as of Anglo-Norman history. The definite results reached by Round would of themselves entitle him to a high place among English historians, but his greatest achievement lies in his establishment of the principle that the detail of Anglo-Norman topography and family history is the only sure foundation for the general history of England of that period.

ROUSSEAU, JEAN-JACQUES (1712-78), French social and political philosopher. When Rousseau came to Paris and as a student of

music gained entrée into the circle of Diderot, d'Alembert and other *philosophes*, the circumstances of his life had implanted in him a tendency to vacillate between respect for order and discipline and impatience with any form of restraint. His childhood and early youth, passed in the Calvinistic atmosphere of the Genevan theocracy, where the welfare and, on the whole, the happiness of the people had been promoted by an extremely rigid social organization, left a lasting impression on his thought. Many critics, emphasizing this aspect of Rousseau's heritage, have tried to explain the *Contrat social* as an expression of admiration for the political wisdom of Calvin. But with equal justification his Genevan background can be presented in terms of the psychological maladjustments resulting from his frail health, the absence of parental sympathy and his distaste for the duties of an engraver's apprentice. Aggravating his egotism and hypersensitive intractability, these influences made him from the age of sixteen a restless vagabond, whose travels were interspersed with periods of domestic service, protracted and sometimes idyllic sojourns with his patroness, Madame de Warens, and an interval of feverish self-instruction.

Although Rousseau had already contributed to the *Encyclopédie* several articles on music and a very important essay on political economy, he did not become a celebrity until the publication of the *Discours . . . sur . . . les sciences et les arts* (1750), containing the well known "paradox" that mankind deteriorates as civilization advances. In his subsequent *Discours sur l'origine . . . de l'inégalité parmi les hommes* (1755) he devoted considerable space to showing that the misery which has invariably accompanied the progress of civilization is absent in primitive life, but he pointed out also that primitive peoples are incapable of positive happiness. Despite the thousands of statements to the contrary he never recommended an actual return to the state of nature. He stressed once more the corrupting influence of civilization upon the masses in his *Lettre . . . sur le projet d'établir un théâtre . . .* (1758), which denounced Voltaire's project to establish a regular theater in Geneva. His three major works were written after his rupture with the *encyclopédistes*, vigorous advocates of the civilization which he scorned. The first of these writings, *La nouvelle Héloïse* (1761), was quite as responsible as his posthumously published *Confessions* (1782-89) for his reputation as the father of romanticism. Yet this novel was in fact

a vehement plea against surrender to passion or love marriage and a defense of social convention as more conducive to enduring happiness. *Émile* (1762), his revolutionary treatise on education, represented to a large extent a synthesis and continuation of Montaigne and Locke. The attack launched upon it by church and state centered, however, not about Rousseau's pedagogical theory but about the *religion naturelle* which he proposed to substitute for the dogma of revealed religion. Rousseau's best known work, *Contrat social* (1762), aroused comparatively little comment at the time in France. In Geneva, on the other hand, where the issue of the rights of the individual conscience against authority had flared up periodically since the Reformation and where the bourgeoisie was at the moment in conflict with the aristocratic government, Rousseau's advocacy of popular sovereignty met with a fervid response. The official condemnation of the book was defended by a member of the Magnifique Conseil in a pamphlet which evoked Rousseau's fiery *Lettres écrites de la Montagne* (1764). The controversy between Rousseau and Geneva, which became known as the *affaire J.-J. Rousseau*, was a faint adumbration of the French Revolution.

In his various political writings Rousseau was not primarily concerned with demonstrating anew the century old theory of popular sovereignty based on a social contract. The more profound problems which he faced were these: once the social contract has been accepted and every individual has completely alienated all his rights to the community as a whole, from what source will the newly constituted state derive its laws; and further what reason is there to expect that these laws will be observed? As regards the first question, Rousseau recognized that each state must perforce rely on wise lawgivers like Moses, Lycurgus and Solon to provide a code appropriate to its conditions—a task which for perfect realization would require the talents of omniscient deities. The second question involved this fundamental difficulty: since it was left to the free will of the citizen to accept or reject the laws, what guaranty has the state that he will observe them when they happen to conflict with his interest? Rousseau might have answered either that the people would obey spontaneously because they were the source of the laws and had voluntarily adopted them, or that some means of coercion would be necessary. In the article "Économie politique" for the *Encyclopédie* (vol. v, 1755) he indicated his awareness of a conflict

between the interests of the state and those of the individual, although he offered no more satisfactory solution than the suggestion that laws be made to enforce the laws. In a first draft of the *Contrat social* he explicitly criticized Diderot for his apparent conviction that the natural goodness of man assured the invariable observance of the laws. He then proceeded, it is true, to develop, in the doctrine of the *volonté générale*, his own conception of a force which would impel individuals to desire the common good, since they themselves would be beneficiaries. But, as Rousseau clearly realized, this was merely a theory and in view of human fallibility many, or in fact all, of the citizens might be unable to discern what was best; in other words, the *volonté de tous* might easily fail to coincide with the *volonté générale*. Hence the state must place its trust in the capacity of the lawgivers to make the best laws and in that of the magistrates to uphold them. Even Rome, which Rousseau regarded as the most perfect state ever constructed, was not entirely proof against lawlessness and disorder. In the end Rousseau decided that the only absolute guaranty reposed in the citizen's inner sense of obligation to obey the laws, and that such a sense could be derived only from religion. Thus in the final chapter of the *Contrat social* he advocated as essential to the absolute security of the state the exclusion of all who refused to subscribe to the seven dogmas of the *religion civile*. Apart from this creed, which centered chiefly about the belief in a God of justice and in an after life, Rousseau was an eloquent foe of intolerance.

In reviewing the much mooted question of Rousseau's relation to the revolution Vaughan came to the conclusion that Rousseau's influence was most clearly discernible in the brief period when his two professed disciples, Robespierre and Saint-Just, were in power and in the four constitutions promulgated between 1791 and 1799. In all probability he helped to inspire the Declaration of the Rights of Man. The idea of a civil religion and the strenuous defense of religious toleration as well as the doctrines of popular sovereignty and the separation of the legislative and executive powers seem to have gained momentum from his writings, but it is not possible to trace definitively the lineage of concepts which were current in greater or less degree among other forbears of the upheaval.

ROY, RAM MOHUN (1772-1833), Indian religious reformer and nationalist. Roy received the education customary to a Brahman and in addition learned Arabic and Persian. He traveled through India for a number of years and was in the employ of the British East India Company from 1804 to 1814.

Roy was the pioneer of the renaissance movement in India, the first Hindu to break through the barrier between the ancient East and the modern West. He advocated that India adopt European intellectual achievements in order to further its own development. His numerous activities had but one objective, to arouse India's spirit and to free it from the deadening stupor of mediaevalism. Through Roy's influence European thought and social standards began to penetrate, to a limited extent, the circles of the high caste Hindus. He created a vernacular press and together with John Hare established the Hindu College in Calcutta, the first educational institution in India to give instruction along western lines. He was active in social reform and was instrumental in the abolition of suttee, the sacred Hindu rite of immolating the living widow on the funeral pyre of her husband.

At an early age Roy had come into contact with Islam and Sufism and had become critical of the polytheism and idolatry of the Hindus. Later, when he had learned English, his religious convictions were further modified by British liberal and rational ideas. He became profoundly interested in religious reform and in 1828 with Dvarkanath Tagore he organized the Brahma Samaj, a religious society preaching a return to a purified and primitive Brahmanism combined with theism and humanitarian rationalism. Although the synthetic doctrines of the society appealed to only a very small group of high caste intellectuals, they pointed the way to many subsequent reform movements.

ROYAL COURT. Although the concept of courtesy (*Höflichkeit, courtoisie*) dates only from the Middle Ages, the cultural influence of the royal court goes back much farther. In the Old Kingdom (c. 2980–2475 B C) of ancient Egypt political and cultural life was concentrated in the court of pharaoh, who was regarded as a god around whom the important figures of the empire grouped themselves in strict hierarchical order. This rigid centralization was replaced toward the end of the Old Kingdom by a feudal system, but the courtly culture of the Middle and New Kingdoms never equaled that of the old.

Far less is known concerning the importance of the court in the other ancient oriental empires. Among the Babylonians the king seems to have been primarily a lawgiver, like Hammurabi; among the martial Assyrians he was above all a military leader, like Sargon II. Similar elements prevailed in the court culture of the Persian Empire, especially under Darius I. In all these cases the cultural influence of the courts was dependent far more than in Egypt upon the personality of the ruler. These ancient court cultures exerted some influence upon European courts through the Hebrew kingdom, which gave to modern kingdoms the idea of the "anointed of the Lord."

In Greek history the court was important only in the early period, as in Mycenae. Not until the rise of the Alexandrianism of the Ptolemaic empire did the entire intellectual culture of the eastern Mediterranean area again acquire a thoroughly courtly stamp. Ptolemy II attracted learned men from all over the world and founded the famous library at Alexandria, while his wife and sister Arsinoe was a patron of the poets. Mention should be made also in this period of the courts of the Seleucids in Antioch and of the Attalids in Pergamum.

Because of disputes over favorites and dynastic struggles this Hellenistic world soon became ripe for the attack by the Roman Republic, which was steadily becoming monarchical as a result of contact with the East. Even then the victorious Roman military leader was surrounded by his *cohors praetoria*, a group of friends suggesting almost a courtly retinue, while a few great men played the role of patrons of letters, as, for example, the younger Scipio toward Polybius. Caesar's attempt to bring this monarchical development to a logical conclusion was defeated by a final flicker of the republican spirit.

While Caesar's successor, Augustus, professed himself content with the principate, he was clever enough to utilize his republican magistracy and the assistance of his friend Maecenas to control the intellectual development as well. He encouraged Vergil and Horace and banished Ovid, whose frivolity appeared to him to endanger the work of his moral restoration. Under Augustus this relation was still essentially personal, but with the later emperors it steadily became institutionalized, although no clear relationship developed between intellectual and political life.

Only under the adopted emperors of the second century A. D. did there arise a type of enlightened monarch who, like Hadrian, encouraged the philosophers or, like Marcus Aurelius, was himself philosophically disposed. In the great politico-social crisis of the third century this entire culture, strongly colored by court influence, was threatened with extinction; it was saved, however, first by Diocletian's reforms and later by Constantine's capitulation to Christianity. In the late Roman Empire, which gave rise to that of Byzantium, there again developed a pronounced court culture leaning heavily on oriental forms. Ceremony was regulated to the minutest details, and everything connected with the emperor was considered holy (*sacer*).

In the Germanic military kingdoms of the period of the great migrations the tie with the ruler was originally based not on religious or institutional grounds but solely on a personal relation of trust. The court offices which slowly developed—marshal, seneschal and lord high steward—at first embodied only a relationship of personal service, which in the Germanic and unlike the ancient conception appeared honorable. Despite the attempts of certain important Germanic rulers, like the Vandal Gaiseric or the Ostrogoth Theodoric the Great, to develop an absolutist power, cultural life was never centralized in the royal court, for their centralized power did not endure. Outstanding personalities like Charlemagne were, it is true, able to influence intellectual life. But the church remained the characteristic center of such activity, which furthermore was determined far more by knightly influences than by royal courts, even after the renewal of the emperorship under Otto I. Although it is in this very period that the expression courtly behavior originated, this referred not to the emperorship or to the various royal courts but to the encouragement of cultural life by the local dynasts. Enlistment in the

service of a lady love, the lyrics of the troubadours and the songs of the minnesingers were first cultivated in the courts of southern France, which Babenberger and the landgrave of Thuringia attempted to emulate on German soil, as the Wartburg *Sangerkrieg* shows.

A pronounced court culture, in which the center of political power was at the same time the core of social and intellectual life, first appeared in the late Middle Ages, although in competition with the culture of the cities. The lead in this new development was taken by the papal Curia, which in the Renaissance was the foremost protector of artists and scholars. The significance, for the intellectual life of Italy, of Julius II and the Medici popes who followed him is generally known. The city-state of Florence, however, competed successfully with the Curia from the beginning. In Florence Cosimo de Medici and his son Lorenzo the Magnificent, paralleling the example of Augustus, retained the republican form but constructed a ceremonious principate and established a broad cultural patronage, which reached its height in its cultivation of Platonic philosophy. The greater and smaller dynasties of Italy emulated the Medici. Out of this atmosphere, in which the noblewomen played a decisive part, arose the ideal type of the courtier, a dilettante who is master of or at least conversant with all the arts and sciences.

At the same time, in the Burgundian kingdom of Philip the Good and Charles the Bold, there flourished a courtly culture which, despite its emphasis on knightly ideals, may be considered in many respects a Nordic counterpart of the Italian Renaissance. This minor renaissance acquired especial significance because the Burgundian court ceremonial entered Spain with Charles V and subsequently influenced Vienna and Paris. Under Philip II the Spanish court became a firmly established institution, virtually independent of the personality of the reigning monarch, whom it forced to conform to its requirements.

With the rise of European national states the cultural significance of the court in England and France increased, almost contemporaneously with that of Spain. The Reformation and the Counter-Reformation again raised the theological to intellectual supremacy and strengthened the church, so that only those states which were confessionally unified maintained their positions of power. Elizabethan England, whose cultural growth reached its highest point in Shakespeare,

stepped into the foreground on the Protestant side; while among the Catholic countries, even after the miscarriage of the universalistic plans of Charles V and his son Philip II, Spain remained the leading power, attaining with Cervantes, Calderón and Velásquez its highest intellectual development under Philip III and Philip IV. Germany receded far into the background, while France recovered with surprising rapidity from the effects of the religious civil war and under Henry IV was again able to play the role of a great power. Institutionally strengthened by Richelieu and Mazarin, the French monarchy successfully took up the struggle against Spain and with the Peace of the Pyrenees in 1659 France supplanted Spain as the leading power on the continent.

Under Louis XIV, the *roi soleil*, France attained intellectual supremacy as well, retaining this lead for almost a century. Out of the fusion of the idea of the anointed of the Lord and the Roman law concept of *princeps legibus solutus*, there arose a type of kingship which, while religious in origin, was basically worldly; this was to become the model for the entire European continent. Louis XIV acted this type of king for his princely compeers with such intensity and thoroughness that for the first and perhaps the only time in modern history the political and cultural tendencies of an age were inextricably intertwined. To Bossuet the king held the state together in the same way as God the universe. The "century of Louis XIV" was characterized by the fact that all human activities, political or intellectual, were subject to and stamped by the same norms of a thoroughly courtly culture. It is not accidental that naive fantasy identified this king with his most characteristic creation, the palace and gardens of Versailles. Nothing excited imitation so strongly as this establishment, where the sun king gathered about himself an aristocracy deprived of political rights and surrounded his person with a ceremonious cult whereby the rising and the retiring of his all Christian majesty became ceremonial acts of state. This cult of the king, which made obedience on the part of his subjects a religious duty, corresponds to the concept of the kingly power as Louis XIV himself formulated it in his memoirs. "The king represents the entire nation; . . . it is completely embodied in his person." The French poetry and above all the drama of this period reflect this monarchic-aristocratic world as expressed in differences in and quarrels over rank at Versailles.

Political activity was theoretically restricted to the king; all others were subjects who owed the ruler passive obedience. In practise even Louis XIV had to share his power with the nobility, who supplied his officers and diplomats. Never have wars been characterized by such absence of hate and slander of the enemy as in the seventeenth and eighteenth centuries. For the diplomats were merely courtiers, who continued against other nations the game they had learned at court—the fight for glory, for the prestige of their prince. This glory motive is fundamental in the foreign policy of absolutism. All the princes were concerned with it; their aim was to increase the inheritance of their fathers. Thus war appeared as an entirely natural form of political activity, and the diplomacy of the period served more as a preparation for war than as a preventive of it.

Louis XIV was never equaled by any of his imitators, primarily because none of the princes who set out to create Versailles palaces had behind him a state already consolidating itself along national lines. Furthermore the idea of kingship slowly disintegrated in the eighteenth century. The sun king had identified himself entirely with his state and had equated his interests with those of France. The enlightened despotism of the eighteenth century, as represented by Frederick the Great, Joseph II and Catherine II, distinguished between ruler and state and considered the monarch "the first servant of the state." There was still no thought of participation by the subjects in administration of the state; rather the principle applied was "all for the people, nothing by the people." But the monarchy was no longer a value in itself; at least in theory it had become an institution justified only through the benefits which it conferred on society as a whole. This represented a fundamental concession to bourgeois thought of the eighteenth century, which was inclined to gauge all political and social measures according to the standard of "the greatest happiness for the greatest number."

In this respect England was far ahead of the continent. The absolutism which the Tudors had established while cleverly maintaining the parliamentary forms had collapsed in the middle of the seventeenth century as a result of the unenlightened policy of the Stuarts. The Glorious Revolution of 1688 finally set up a parliamentary oligarchy, half aristocratic, half bourgeois, in which the Tory landed interests and the Whig moneyed interests struggled for su-

premacv, leaving the social position of the crown almost untouched but limiting its political power so severely that thenceforth the king "could do no wrong." Even under the house of Hanover the royal court remained the center of social life, and in this capacity it has continued down to the present to play a more important role than the continental courts. The price of this social prerogative was the renunciation of political activity, which came increasingly into the hands of the cabinet. The monarchs on the continent gradually became weary of their courtly ceremonial in the eighteenth century and began to free themselves from its bonds. The role which Louis XIV had played with ease became an uncomfortable burden for his great-grandson and successor, Louis XV. There gradually developed in France a public opinion which, in the absence of all legal forms, was voiced in the salons of Paris by the reigning philosophers. The literary monarchy of Voltaire entered the lists against the political monarchy of Louis XV; its peculiar strength consisted in the fact that it expressed what every man, that is, every French bourgeois, already knew. About the middle of the eighteenth century the process of divorcing intellectual from political life had everywhere been carried to completion. In western and central Europe the center of intellectual life had quite definitely shifted to the bourgeoisie, frequently in alliance with the liberal nobility, which alone represented the same ideas in the economically backward areas of eastern Europe.

In the great revolution of 1789 the bourgeoisie, conscious of having attained its intellectual majority, undertook to seize control in the political field as well and to fashion state and society after its own desires. The French idea was transferred to the other European countries with an adjustment based on the degree of development attained by their respective bourgeoisies. The role of the monarch as leader in intellectual and political life was now played out; all attempts at restoration at best led only to temporary and partial successes. The monarchs themselves gradually became bourgeois. Frederick William III of Prussia may perhaps be considered the first bourgeois king. He functioned almost like a minor official; concerned only with the welfare of his subjects, he sought unsuccessfully to remain aloof from all international conflicts. His conqueror, Napoleon, tried to reestablish in France a courtly atmosphere after the pattern of the *ancien régime* but his attempt was unsuccessful.

The Restoration period did not involve a return to the past. On the contrary, during this extrapolitical and relatively uneventful period the bourgeoisie everywhere strengthened its position. Even in the countries of more or less enlightened absolutism the decisive factor was no longer the hereditary nobility but the bureaucracy, which thought in bourgeois terms even where it was recruited from the nobility. The rulers were forced to make conscious or unconscious concessions to the spirit of the times and to behave as bourgeois. Characteristically the lead was taken by the lesser princes, such as Leopold, who ascended the Belgian throne about the same time that the French bourgeoisie gave themselves a king after their own hearts in the person of Louis Philippe. Another Coburger, the prince consort of the English queen Victoria, faced the delicate task of reeducating his pleasure loving young wife in bourgeois earnestness and respectability; he succeeded amazingly and thus helped to shape the Victorian era, which also established a high point in English intellectual life. A general democratization of society ensued and to an ever increasing extent rank was replaced by wealth, the bourgeois way of life gradually came to set the tone for all circles, including the court itself. The more the ruler adjusted himself to this development, the firmer was his hold upon his position; so that after the World War, except for Italy, where Fascism saved the monarchy, only England among all the great powers retained its monarchical form.

The period of courtly culture, which reached its zenith in the seventeenth century, was finally brought to a close by the World War. The court has retained a certain social prestige, to which the members of the upper classes in democratic countries readily succumb, and which advocates of an authoritarian democracy, like the Italian Fascists, know how to utilize for their own ends. The continued existence of monarchistic groups in republican countries does not obviate the fact of the decadence of the monarchic idea. For these groups of *bien pensants*, recruited from the upper classes, are numerically very weak. Even a monarchical restoration will not bring a return to the past. The time when the court was the center of the political, social and intellectual life of an epoch is definitively past.

ROYCE, JOSIAH (1855-1916), American metaphysician and social philosopher. Royce was born and educated in California and as a student came under the influence of a scientific mind with philosophical leanings—Joseph Le Conte, a pupil of Agassiz. At the same time his imagination was deepened by association with Sill, the poet, and by reading in Greek drama. His later philosophical development was molded by German idealism, especially by Kant, Hegel, the romanticists and Schopenhauer, and also by the logic of Charles Peirce and the voluntaristic psychology of William James.

In his thirty-four years as teacher at Harvard University Royce developed an original interpretation of idealism, based in large part on social experience and applying a new insight to social structure. Although generally regarded as an absolutist, Royce had a strongly empirical bent: his concern throughout was with "experience." Experience for him was not, however, a matter primarily of space and its contents, but rather of human emotion and purpose. What chiefly attracted him to the romanticists and to Hegel was their perception of the fact that human passion has its logic; that life requires a discovery of this logic, or inner principle, and an ordering of personal and social life in accord with it; this leads to recognition of the unity of all conscious life, whether that unity be called the Absolute, or God, or the ideal community.

It is characteristic of Royce that he was strongly individual: that he was always repelling and repelled by much of the spontaneous group life around him. He was keenly sensitive to the goods and evils of social motives, especially to the intangible loyalties and disloyalties which determine the fate of all societies. For him no community has any cohesion except the loyalty which its members entertain toward the "causes" which that community professes to cherish. Yet loyalty, as affecting a highly self-conscious and assertive individual, remained for him a quality having not only its mysteries but its dangers, and requiring intelligent criticism. Royce made it part of his work to bring this imponderable to light and to establish its metaphysical basis (*The Philosophy of Loyalty*, New York 1908; *The Hope of the Great Community*, New York 1916).

His greatest metaphysical work, *The World and the Individual* (2 vols., New York 1900-01), took its title from the effort to show, in contrast to Hegel, that the life of an absolute purpose

requires the moral independence of each individual. Royce not only rejected the common prejudice that one must choose between the unity and the variety of the world, between the total life and individual freedom, but insisted that neither could be had without the other. It is only in the development of the individual that the life of the whole can properly be expressed.

The psychological basis for this theory of the individual was prepared by Royce in an earlier work, *Studies of Good and Evil* (New York 1898), and developed in his *Outline of Psychology* (New York 1903). Instead of regarding the individual as a closed moral unit, out of whose assemblages societies are made, Royce held social consciousness to be a necessary condition of self-consciousness. Out of this naturally grew his later conception of the self as a community; a conception which in turn makes it possible to regard the community as a self and to interpret the universe in terms of an ideal community (*The Problem of Christianity*, 2 vols., New York 1913).

The World War brought to Royce an immediate demand for an application of his philosophy. This gave rise to his striking proposal for a form of international insurance (*War and Insurance*, New York 1914) and various addresses (collected in *The Hope of the Great Community*). His absolute idealism was not inconsistent with a fervent belief in the reality of evil and in the necessity of resolute rejection. His sociology had an ethical and religious motivation, guided by a profound grasp of scientific method and a wide mastery of relevant fact.

ROYER-COLLARD, PIERRE PAUL (1763-1845), French philosopher and statesman. Like most of his intellectual contemporaries Royer-Collard reacted vehemently against the Jacobin phase of the French Revolution. In an effort to undermine the eighteenth century rationalism of which he considered Jacobinism an outgrowth,

he appealed to the Scottish philosophy of common sense as refutation of the sensationalist epistemology of Condillac and his revolutionary disciples. A Jansenist by training and conviction, he felt that human reason alone was incapable of comprehending the unknowable and sought to reidentify philosophy and religion. As professor of philosophy and dean of the Sorbonne from 1811 to 1814 he exerted a deep influence not only on his colleague Guizot, but also on Victor Cousin and his fellow eclectics. With the restoration of Louis XVIII, Royer-Collard assumed more active responsibilities. In 1814 he was appointed director of government publishing and printing and in the following year president of the commission of public instruction. His election in 1815 as deputy from the Marne launched him upon a career as parliamentarian and political leader which was to last until 1845.

At the same time the violent antiliberal counteroffensive, which he witnessed at close range during the "White Terror" of 1815-16, materially altered the trend of his political and social thinking. His extreme anti-Jacobinism gave way to a realization that the French Revolution had been responsible for establishing certain civil and social liberties which must be diligently safeguarded against the forces of reaction. Proceeding from a set of more or less abstract principles, he developed a rather flexible working political philosophy and program, around which he rallied a group of likeminded parliamentarians known as the Doctrinaire (*q.v.*) party. In the course of the various shifts in party and governmental leadership during the reigns of Louis XVIII and Louis Philippe, Royer-Collard remained the most eloquent and profound spokesman of the liberal groups in their persistent opposition to the right. As counselor of state from 1815 to 1820 he was the moving spirit among the ministers who were engaged in setting up a new constitutional regime; and in 1830 as president of the Chamber he was largely instrumental in overthrowing the Bourbons. In the interest of public order he supported, although not actively, the monarchy of Louis Philippe and was outspoken in his opposition to the measures of September, 1835, against the liberty of the press.

Maintaining at all times a middle course between the rival theories of divine right of kings and popular sovereignty, he based the new constitutional charter on the principle of constitutional sovereignty. According to the generally accepted interpretation formulated by Royer-

Collard this sovereignty derived from the interaction of three equally balanced powers—the monarchical represented by the king, the aristocratic represented by the peers and the democratic represented by the elective chamber. Instead of being rigidly separated these powers should work together harmoniously. Such collaboration, if accompanied by an irremovable magistracy and by a free press, was an adequate guaranty of liberties. He regarded voting not as a natural right of the individual or even as a device for indirect representation, but as a specialized function to be entrusted to those groups of the population best qualified to perform it.

RUBBER is peculiarly a commodity of the modern industrial age. Not only has the great expansion in its use occurred within the last generation, but most of the uses to which it is now put were unknown fifty years ago. Rubber is notable both for the variety of its products, numbering more than 32,000 different articles, and for the overwhelming importance of a single one of them, tires, whose production absorbs more than three fourths of all crude and reclaimed rubber. It is one of the few important raw materials which all manufacturing countries must import. Crude rubber occupies an important place in the foreign trade of the United States, the principal importer and manufacturer. The American imports of crude rubber rose from an annual average of \$86,000,000 in 1911-15, or fourth place among all imports, to \$430,000,000 and \$506,000,000 in 1925-26, or first place among imports, chiefly because of a sharp rise in prices; by 1929 rubber imports had dropped to third place and by 1932 to sixth place, being exceeded in the latter year by imports of coffee, silk, sugar, newsprint and woodpulp. On the basis of value added by manufacture the rubber industry ranked fifteenth among the manufacturing industries of the United States in 1929 and thirteenth in 1931, as compared with twenty-

seventh in 1914. On the basis of total value of the product it ranked fourteenth in 1929 and seventeenth in 1931, as compared with twenty-ninth in 1914.

Rubber was among the strange articles that Columbus brought back to Europe from his second voyage of discovery. Even at this time natives of Central and South America had learned to use rubber in making waterproof garments and shoes, but for nearly 250 years rubber continued to be little more than a curiosity in other parts of the world. In 1770 Joseph Priestley gave rubber its popular name by mentioning that it could be used for "wiping from paper the marks of a black-lead-pencil," and it came into popular use for that purpose. A satisfactory waterproof cloth was developed by Macintosh and Hancock as early as 1820. From 1820 to 1837 numerous attempts were made to introduce waterproof rubber shoes and various other products made with rubber. Little success attended these efforts, chiefly because of inability to overcome the effect of changes in temperature upon rubber.

In 1839 Charles Goodyear, after years of disappointing experiments, devised a method of vulcanizing rubber by the application of heat to a mixture of rubber and sulphur. He was repeatedly involved in litigation over patents and royalties, and despite eventual court action in his favor he never realized a substantial return on his patents. Goodyear's discovery of a satisfactory means of vulcanizing rubber marked its emergence as an important commercial product. By 1856 a wide variety of rubber articles, including belting, hose, boats, balloons, gloves and other articles of apparel, tents, water bags, cushions and carriage tires were being offered to the public. From the Civil War to the beginning of the twentieth century the manufacture of rubber products grew slowly but steadily. New uses for rubber appeared from time to time but the most important products were boots and shoes, waterproof fabrics, tubing, carriage tires and mechanical goods. Toward the end of the period production of bicycle tires assumed substantial proportions.

It remained for the development of the automobile to revolutionize the rubber industry. The tremendous impetus which this gave to the demand for rubber tires led to the rise of the plantation rubber industry, transformed rubber manufacturing from small scale enterprises to giant industries and contributed to unsettling variations in the price of the crude product.

In Brazil, the main producer prior to 1912, the output rose from 31 tons in 1827 to 27,650 in 1900; only small amounts were produced elsewhere. In 1905, 99.7 percent of the total world supply, or 59,230 tons, was wild rubber. It rose to a maximum of 73,834 tons in 1912, declining to only 8210 tons in 1932. The proportion of wild rubber to total world supply of crude rubber was 55 percent in 1913, 7 percent in 1922 and just over 1 percent in 1932. For the ten years 1922-31, 72 percent of all wild rubber came from Brazil, 8 percent from elsewhere in South America and 20 percent from Africa.

At one time it was said that each ton of rubber cost a human life. In the early years of the twentieth century various western powers protested against the methods allegedly practised by the Belgian authorities to compel the natives of the Congo to provide them with rubber—such measures as holding women hostages for delivery of rubber by their husbands, cutting off hands when the quantity was insufficient and forcing natives to eat the rubber when the quality was unsatisfactory. Shortly before the World War the virtual enslavement of native rubber workers in the Putumayo region of Peru led to an international campaign of exposure. In the Congo, which, although termed a free state, was in reality a preserve of Leopold of the Belgians, two methods were used to secure rubber: direct forced labor and imposition of a tax on native villages of so many kilograms of rubber. Exports of crude rubber rose from \$30,000 in 1886 to \$9,000,000 in 1905. The extraction of rubber was combined with other enterprises, and non-Belgian capital, including the American Congo Company, participated in the activities. One concessionaire company in six years made net profits of over \$3,000,000 on a paid up capital of \$45,000. Yearly dividends exceeded original investment. The stocks of these companies soared to fabulous prices. With the expansion of plantation rubber, output of rubber in the Congo declined steadily, as did wild rubber in other regions, until now it is negligible.

Rubber is found in a large number of plants, including goldenrod and many varieties of milkweed, but only a few plants have figured as commercial sources of rubber. The earliest attempts to cultivate rubber made use of the *Ficus elastica* tree, but the only important source at the present time is the *Hevea brasiliensis*, a tree indigenous to the Amazon valley. In 1930-32 over 99 percent of the world's supply of crude rubber was obtained from *Hevea* trees com-

pared with less than 55 percent in 1910. Seeds of the *Hevea* brought from Brazil by Henry Wickham in 1876 were germinated in England and seedlings were transported from there to Ceylon and subsequently to British Malaya. Interest in the new plant developed slowly, but a coffee blight toward the close of the century made planters in the Middle East more willing to experiment with rubber. By 1904, 66,000 acres, chiefly in the hands of natives, were planted to rubber. Rubber growing received an impetus from the high prices prevailing before the World War and rising prices during the first years of the Stevenson Act again stimulated heavy planting. By 1927 the acreage planted to rubber in the Dutch East Indies exceeded the total planted in British Malaya. Rubber planting in Indo-China has also grown rapidly in recent years. The area planted to rubber in the Middle East totaled 1,140,000 acres in 1910 and 4,326,000 acres in 1920, in each case approximately half being situated in British Malaya. The total area in rubber at the beginning of 1932 was estimated at 7,955,000 acres, of which 38.5 percent was in British Malaya, 41 percent in the Dutch East Indies and over 6 percent in other non-British areas.

The plantation rubber industry falls into two categories, that controlled by natives and that controlled by plantation companies, or "estates." The native usually plants his rubber trees along with rice or some other crop, which he continues to cultivate. The capital investment is relatively slight, especially in the Dutch East Indies, where much free land is available to persons who settle and clear it. The work on the native holding is usually performed in spare time or by members of the family who would not otherwise be employed. Because of differences in organization and methods the native grower finds it easier than the estate plantation grower to shift from the production of rubber in response to continued low prices. Native production constituted approximately 45 percent of the total output of rubber in 1929.

Estate plantation rubber is usually in the hands of joint stock companies, whose holdings may vary from a few hundred to many thousand acres. The first rubber plantation company was formed in London in 1903. Companies are sometimes incorporated in the producing country, in which case part of the capital may be supplied locally; but it is more usual for them to be incorporated abroad, particularly in London. In the case of a company incorporated in

London the London office ordinarily has general charge of the affairs of the organization, but the estate itself is in the hands of a manager, who administers the plantation with the aid of a European and native staff. On the smaller estates the staff frequently consists entirely of natives. The rubber estates in Java generally use local labor. In British Malaya the estates depend principally upon labor imported from India, China and Java, the estates in Ceylon upon labor from India, and the estates in Sumatra upon labor from Java. Labor conditions are characteristic of those prevailing in plantation regions (see PLANTATION).

The rubber trees require considerable attention in the way of cultivation, prevention of disease and tapping. Latex, which is not the sap of the tree but a milky fluid contained in the bark, is obtained by narrow incisions in the bark. During the period of high prices trees were tapped once or even twice a day. With lower prices it has become customary to tap less frequently, but over a wider circumference of the tree. The trees are ordinarily rested for two months or more each year. After the latex has been gathered it is brought to the plantation warehouses and coagulated by acetic acid or some other chemical. The resulting rubber comes on the market as "crépe" rubber or, if it has gone through a smoking process, as "smoked sheet."

Some of the larger plantation estates engage in experiments to increase the yield of rubber trees, to reduce disease and in other ways to augment productive efficiency. The local planters' associations likewise pursue experimental work and in general seek to further the interests of growers. Experiments to improve yield, particularly by means of bud grafting and seed selection, have increased annual yield from the usual 300 or 400 pounds per acre to 1000 pounds or more, although the average yield even on the most progressive estates is still far below this figure.

The high prices of crude rubber before and during the World War were expressed in the high dividends of rubber companies. They were lower shortly after the war, when prices dropped, but rose sharply a few years later, when the Stevenson restriction scheme forced up prices. Stock prices and dividends declined precipitately with the failure of the restriction scheme and the fall in prices of crude rubber. Many synthetic rubber substances have been produced, particularly in Germany, but none has thus far become commercially important. The

government of the Soviet Union has reported the production of considerable quantities of rubber from a domestic shrub.

Trade in rubber is mainly through private contract. The chief markets in the producing countries are Singapore, Penang, Colombo, Surabaya and Batavia. Large quantities of plantation rubber and most of the rubber produced in Africa are marketed through London and other European markets. The principal markets for South American rubber are Pará and Manóas. Exchanges for forward dealing in rubber exist in New York, London, Hamburg, Paris and Amsterdam, but only the first two of these do a large amount of business. In addition to the local planters' organizations there are in England the Rubber Growers' Association, the Rubber Share Brokers' Association, the Rubber Trade Association of London and the India Rubber Manufacturers' Association, Ltd. The Rubber Growers' Association is of very great importance; it maintains relations with other rubber associations in England and other countries and with the planters' associations in the producing countries. For years it has fostered new uses for rubber, and it played a leading part in the enactment of the Stevenson plan to restrict production and raise prices. Somewhat similar organizations exist in Germany, the Netherlands and the United States. The Rubber Trade Association of New York includes dealers and importers; the Rubber Manufacturers' Association, Inc., formerly the Rubber Association of America, comprises manufacturers of rubber products; and the Rubber Reclaimers' Association is made up of reclaimers not allied with manufacturing companies.

For the five years 1910-14, 44.5 percent of the total output of crude rubber was consumed by the United States. Other leading consuming countries were Great Britain, Germany and France. During and after the war the United States forged far ahead and in 1924 absorbed nearly 76 percent of the total output. The relative importance of the United States declined after this date; in 1932, for the first time in many years, consumption by the United States fell to less than half the world total; namely, 47 percent (Table 1).

Crude rubber has always been subject to wide swings in price. These fluctuations are traceable primarily to certain peculiarities in the demand for and supply of rubber. In the first place, the demand for crude rubber is highly inelastic, principally because over three fourths of the

TABLE I
ESTIMATED WORLD ABSORPTION OF CRUDE RUBBER, 1926-32
(In long tons)

| COUNTRY | 1926 | 1927 | 1928 | 1929 | 1930 | 1931 | 1932 |
|-----------------|---------|---------|---------|---------|---------|---------|---------|
| United States | 366,000 | 377,000 | 440,000 | 472,000 | 376,000 | 350,000 | 330,000 |
| United Kingdom | 40,000 | 45,000 | 48,500 | 72,000 | 75,000 | 77,000 | 79,000 |

consumption arises from the automobile industry, in which rubber is a minor but absolutely essential element. In the second place, the supply of rubber also is inelastic. It is difficult to increase the quantity materially in a short period because of the necessary lapse of four to seven years between planting and harvesting. The organization of the plantation rubber industry with heavy fixed investment, with labor frequently recruited from a distance and with a large proportion of native producers, who may increase their output despite falling prices, also has contributed to the rigidity of supply so far as contraction is concerned.

The high price of crude rubber which prevailed prior to the World War encouraged heavy planting. Unlike most raw materials, crude rubber declined in price during and even after the war. Where the price had risen above three dollars a pound in 1910, it fell below 12 cents in 1921. The maturing of rubber trees, the improvement of roads, the post-war depression and the introduction of the longer wearing cord tire combined to hold prices at record low levels from 1920 to 1922. During this time various attempts were made to restrict production in order to restore prices. At the end of 1920 a large group of British, Dutch and Chinese growers undertook voluntarily to restrict output by 25 percent, but the results were disappointing. Despite failure to obtain the cooperation of the Dutch the British Parliament on November 1, 1922, enacted the Stevenson Rubber Restriction Act, named after the chairman of the committee which presented it, to restrict the supply of rubber. The act imposed a prohibitive

tax on rubber exported by any planter in excess of a certain percentage of his "standard production." This standard was based where possible on actual output during the year ended October 31, 1920. The proportion of export allowed, originally 60 percent, was to be raised or lowered in case the market price over quarterly periods was above or below certain pivotal levels.

The average price of crude rubber in New York in August, 1922, was 14 cents per pound; in December, the second month of restriction, it was 27½ cents. The averages for 1923 and 1924 were 30 cents and 26 cents respectively as compared with 16 cents in 1921 and 17 cents in 1922. Restriction undoubtedly played a part in this price recovery. But there were other contributing factors, including increasing business activity in the United States and a rapidly expanding demand for automobiles, economic recovery in Europe and the development of balloon tires. These influences became more pronounced in 1925, and in June and July of that year there was a runaway market with the price of rubber reaching \$1.23 per pound. This was due in part to uncertainty as to the way in which restriction would be administered. Despite the apparent success of the Stevenson Act in raising prices during the early years, its influence gradually weakened. Reduction in the export allowance to the limit set in the law failed to overcome the downward trend of prices in 1926-28. In the spring of 1928 it was announced that restriction would be abandoned at the end of the sixth year, October 31, 1928.

Both the rise of prices following the enactment of restriction and the drop after the an-

nouncement of its abandonment indicate that restriction played a substantial part in determining prices. The high prices stimulated production chiefly through heavier tapping in the unrestricted Dutch areas. Of greatest ultimate importance was the impetus to new planting in restricted and more particularly in unrestricted areas. Indignation against the Stevenson Act and especially against the high prices prevailing in 1925 and 1926 led to an active antirestriction campaign in the United States. This campaign, encouraged by the government, assumed large proportions and caused a certain amount of friction between the United States and Great Britain. Measures to economize the use of rubber were put into effect. The output of reclaimed rubber was increased from 54,000 tons in 1922 to 223,000 tons in 1928, although only part of this increase was due to restriction. Attempts were made to revive the production of guayule rubber, a Mexican industry which in 1909 represented an American investment of \$30,000,000 and supplied 20 percent of the rubber consumed in the United States, but which had declined and practically disappeared; these efforts were, however, unsuccessful because of the low prices which followed the breakdown of the Stevenson Act. Guayule rubber is now of importance only as a possible source of rubber in case of emergency.

The Stevenson restriction plan precipitated a movement among American rubber companies to own and control their own sources of supply. The most ambitious project was that of the Firestone interests in Liberia, which contemplated rubber production on a large scale. At the end of 1932 three American companies—United States, Firestone and Goodyear—were reported to own rubber plantations totaling approximately 150,000 acres and representing an investment of \$52,000,000 in Sumatra, British Malaya, the Philippines and Liberia, part of this investment dating from before the war. Another American company owns 18,000 acres of rubber plantations in Java. Several foreign companies, notably the Dunlop Rubber Company, Ltd., and Michelin et Cie, also have extensive plantations. The low prices of crude rubber in recent years have made plantations a liability rather than an asset to the companies owning them. Against this must be set the substantial profits on plantation account earned, particularly by the United States Rubber Company and the Dunlop company, before 1920 and during the early years of the Stevenson Act.

On the whole the planting operations undertaken in response to the slogan, "Americans should own their own rubber," have thus far proved a costly failure.

In retrospect it seems that the Stevenson Act was hardly justified by the circumstances. The rubber industry was probably no worse off than many other agricultural industries at the time, and it is likely that improvement in general business conditions would have cured most of the ills. It was a mistake to prolong restriction and to raise the pivotal price in 1926, since the effect in both instances was to encourage very heavy planting. Far from relieving overproduction, the ultimate effect of the Stevenson Act was greatly to aggravate it. Restriction was instituted with the average price of rubber at about 16 cents a pound. It was abandoned because it was found impossible to hold the price above 40 cents. But in 1932 the price fell to just over 2½ cents and for the entire year it averaged only 3½ cents a pound. It is probable that the losses from restriction outweighed the gains, and it appears that the producing countries, because of the aggravation of overproduction, were the chief losers. In 1921, 72.5 percent of all rubber produced in the Middle East came from British possessions and in 1922, 71.5 percent; largely as a result of restriction the proportion fell to 59 percent in 1924 and to 57 percent in 1927. After the abandonment of restriction production in British areas rose again to an average of 66 percent for 1929-32. In view of the greater increase in planting in non-British areas it is probable that the relative importance of the British areas will decline further.

The manufacture of rubber products is concentrated in countries which are not producers

TABLE II
MANUFACTURE OF RUBBER PRODUCTS, UNITED STATES,
1914-31

| | VALUE OF OUTPUT (in \$1000) | VALUE ADDED BY MANUFACTURING (in \$1000) | NUMBER OF WAGE EARNERS | WAGES (in \$1000) | AVERAGE YEARLY WAGE |

of crude rubber, by far the most important of these being the United States. Rubber manufactures of all varieties in the United States have made great progress since 1914 (Table 11). The industry's proportion of value added to output by manufacturing is somewhat higher than the average for manufacturing as a whole. Rubber manufacture, particularly in the making of tires, is an industry with large fixed capital and overhead costs. The machinery and apparatus used are heavy and complex, and chemical processes are of the utmost importance. The manufacture of rubber goods direct from latex, eliminating the step of preparing crude rubber in bulk form, is increasing. This process, since its invention in 1921 for use in paper making, has been applied to many other purposes, including canning and the manufacture of textiles, adhesives and hose; this use of latex is said to produce a cheaper, stronger and more durable article than milled rubber reduced to liquid form by mastication and dissolution.

Technological progress and the increasing productivity of labor have resulted in considerable displacement of labor. While physical output rose substantially, the number of wage earners declined from 158,549 in 1919 to 149,148 in 1929; there was, however, a slight increase in average yearly money wages and a somewhat larger increase in real wages. The increase in the productivity of labor was especially notable in the manufacture of tires and tubes. By 1931 the man hour output of pneumatic tires had increased 34 percent over 1929, 86 percent over 1926, 172 percent over 1922 and 581 percent over 1914, accompanied by an improvement in quality which multiplied the average life of a tire fully five times. For many years the growth in automobile output and the consequent increase in number of tires were sufficient to offset the effect on unemployment of the increased man hour productivity and the greater life of tires. The maximum of man hours worked was not reached until 1928, and the total for 1929 was only slightly less. By 1931, however, the decline in demand for tires in combination with the other factors mentioned brought about a great reduction in man hours worked. In 1931 an output greater in number of tires by 668 percent and in weight by 856 percent was produced with only 40 percent more man hours than in 1914. Average yearly earnings rose from \$1469 in 1923 to \$1526 in 1929, above the average for the rubber industry as a whole; but in 1931 they dropped to \$1290, while the per-

centage of earnings per worker to average "value added by manufacture" fell from 37 percent in 1921 to 28 percent in 1931. Unionism is non-existent in the rubber industry; the union of rubber workers, affiliated with the American Federation of Labor, which in 1903 claimed 1000 members, has disintegrated. Some of the large tire companies have experimented with employee representation.

Aside from tires and tubes the most important products made from rubber are footwear; waterproof fabrics; mechanical rubber goods, such as belting, hose and machinery parts; and sundries, such as medical supplies, toys and tire repair materials (Table 11). While the United States leads in the production of most lines of rubber goods, the United Kingdom holds first place in the manufacture of waterproof clothing and golf balls.

Large and small scale production exist side by side in the rubber industry. The manufacture of rubber fabrics, toys, mechanical goods and the enormous variety of rubber goods in general is frequently carried on by small independent concerns. The manufacture of tires, on the contrary, is in the hands of a few large companies; while approximately 370 tire companies have been in existence in the United States, it is estimated that as a result of failures, mergers and shifts into other lines only 28 distinct tire companies were in operation in 1930. The concentration of production is even greater than these figures indicate. The 4 largest companies, Goodyear, United States, Goodrich and Firestone, produce approximately 70 percent of all rubber tires sold in the United States; these companies in addition manufacture a large proportion of other rubber goods. These conditions are generally true of the industry in other major producing countries; concentration in Germany is probably as marked as in the United States. The existence of great excess capacity has resulted in bitter competition, particularly among tire manufacturers, who in recent years have been selling through company distributing chains and through mail order houses and service stations. Prices and profits for the industry as a whole have been adversely affected. During business depression the large companies in general suffer more than the smaller companies. This is partly because the large companies have greater overhead costs and supply a large proportion of the original equipment for automobiles, this business falling off greatly during depressions, while the smaller companies have

less overhead and carry smaller inventories and so are less affected by declining prices. Various attempts have been made to regulate competition by establishing trade associations which would serve to fix prices and to prevent discrimination and price cutting; so far these attempts have been without success. In Germany, Czechoslovakia and Poland sales cartels have been formed by rubber manufacturers; dealers also have formed sales cartels, in which foreign producers, especially American, British and French, figure conspicuously.

Profits in the tire industry have depended chiefly upon demand from the automobile industry and the movement of crude rubber prices. A large part of the demand for tires is for use as original equipment on automobiles. This demand is almost entirely independent of the level of tire prices, but it reflects general business conditions closely. The high prices of crude rubber during 1925 did not injure the tire manufacturers; indeed, because of the stimulus given to buying by the upward movement of prices and because of the appreciation of inventories, they were responsible for one of the most profitable years in the history of the industry. With the fall in the price of crude rubber, the companies which owned their own plantations suffered severe declines in profits.

Some of the larger tire companies maintain extensive operations overseas in the form of agencies for purchasing raw materials, distributing organizations for the sale of finished products, branch factories and rubber plantations. Various French and British companies have established branch factories in the United States and elsewhere and American companies

have established branches in South America, Canada, Australia, England and on the continent. The experience with American branch factories abroad appears on the whole to have been fairly successful.

The reclaiming of rubber constitutes an important part of the rubber industry, particularly in the United States. The fact that reclaimed rubber contains valuable chemicals and is already partially processed renders it preferable to crude rubber for many uses. The proportion of reclaimed rubber used varies considerably with the different branches of the industry. Over the three years 1929-31, reclaimed rubber used in the manufacture of tires and tubes amounted to 30 percent of the crude rubber, 119 percent in rubberized fabrics, 147 percent in heels and soles and 233 percent in mechanical rubber goods (Table IV). Its importance increases.

TABLE IV

CONSUMPTION OF CRUDE AND RECLAIMED RUBBER, UNITED STATES, 1920-32

| YEAR | CRUDE RUBBER (in 1000 long tons) | RECLAIMED RUBBER (in 1000 long tons) | PERCENTAGE RATIO OF RECLAIMED TO CRUDE RUBBER | PRICE OF CRUDE RUBBER per pound |
|------|----------------------------------|--------------------------------------|---|---------------------------------|

Rubber manufacture requires large amounts of chemicals, the most important being carbon black, zinc oxide and sulphur. These cost in 1929, according to the Census of Manufactures, \$13,135,000, \$9,149,000 and \$1,354,000 respectively. Among the important chemical elements are rubber accelerators, chemical compounds which increase the tensile strength of rubber, shorten the time of the curing process and reduce oxidation.

Exports of rubber goods are an important item in foreign trade and are concentrated in nine major producing countries (Table V). Variations in these totals are partially due to fluctuations in the price of crude rubber. From 1927

to 1932 international shipments of tires fell 41 percent and belting and hose 44 percent, whereas trade in rubber footwear rose by 56 percent. Rubber footwear constituted approximately 14 percent of all international trade in rubber goods in 1932 as compared with only 7 percent in 1927. In 1927 the United States and Canada led in the export of rubber footwear; in 1932 Japan and Czechoslovakia held first and second place respectively. Foreign trade in rubber goods has been profoundly influenced by tariff increases and the establishment of foreign branch factories, and a greater local production has resulted. Since 1914 conditions in foreign trade have been extremely unstable, even for as rapidly growing an industry as rubber.

Rubber has played a turbulent role in international economy. During the period when it was derived chiefly from wild plants its history was characterized by the worst features of imperialistic policy, a sorry record of exploitation of natives not only by whites but by natives as well. The plantation industry was introduced into colonial possessions which had already reached a fairly advanced stage of development, and the conduct of the industry seems on the whole to have been enlightened and humane in comparison with conditions of wild rubber production. But with the recent expansion of rubber growing in Africa allegations of exploitation of natives have again arisen. The production of rubber has been intimately bound up with the export of capital and with imperialism.

Wide swings in prices have characterized the rubber industry, and the price of crude rubber, at least since the introduction of the automobile, has borne little relation to the cost of production and has had pronounced economic effects on the economy and social life of the producing

countries. The concentration of rubber production lent itself to restriction, but the aftermath was disastrous, a result due more to increased planting in the producing countries than to any measures initiated by consumers of rubber. The concentration of production in a small area in the Middle East and the inelastic nature of supply and demand are conditions which still favor attempts at artificial control on the part of producers. Reclaimed and synthetic rubber are potentially more important factors than in the past and constitute the chief defense in the hands of consuming countries.

The striking vicissitudes of the rubber industry in all its branches have been primarily the growing pains of a new industry—the dislocations attendant upon the development of a new technique. It is likely that as time goes on and the automobile, rubber growing and rubber manufacturing industries attain maturity, a degree of stability approaching that in other great industries will be realized.

RUBIN, MARCUS (1854-1923), Danish statistician and economic historian. Rubín studied at the University of Copenhagen and upon graduation was entrusted with the organization and direction of the municipal statistical office in Copenhagen. In 1895 he took charge of the state statistical office, reorganized its work and succeeded in bringing Danish official statistics to a high standard of efficiency. In 1902 he was appointed head of the Department of Customs and Taxation and in 1913 he was elected director of the Danish National Bank, a position he held for the remainder of his life.

Rubin was a voluminous writer and his interests covered a wide range of statistical, economic and social problems. In the realm of statistics he was concerned chiefly with vital statistics and cooperated with Harald Westergaard in the preparation of *Landbefolkningens Dødelighed i Fyens Stift* (Copenhagen 1886), a detailed study of the mortality of the population in rural Denmark, and *Aegteskabsstatistik paa Grundlag af den sociale Lagdeling* (Copenhagen 1890; tr. into German as *Statistik der Ehen*, Jena 1890), an analysis of marriage and fertility rates of the various social classes. The latter work attracted international attention and stimulated further research in this direction. Rubín's chief claim to distinction, however, rests upon his work as a

historian. His 1807-14 *Studier til Københavns og Danmarks Historie* (Copenhagen 1892), presenting a detailed account of this critical period in Danish history, and *Frederik VI's Tid fra Kielfreden til Kongens Dod* (Copenhagen 1895), which carried the story of Denmark to the death of Frederick VI in 1838, are still indispensable sources for the student of Danish history of that period.

HARALD WESTERGAARD

Works. For a full list of Rubín's writings see *National-økonomisk Tidsskrift*, vol. xxxii (1924) 174-91.

RUFFIN, EDMUND (1794-1865), American agriculturist and advocate of southern secession. A native of Virginia, Ruffin at the age of nineteen assumed the direction of the family plantation located on the James River. Here he experimented with marl on depleted soils and developed the hypothesis that lands once fertile but reduced by cultivation had become "acid" and thereby had lost their power to retain fertilizers. He advocated the use of calcareous materials to correct this condition, and the planting of legumes, the application of organic manures and the use of underground drains to restore fertility. His successful operation first of the family farm and then, after 1843, of another "seating" of more than 1500 acres of choice land located on the Pamunkey River proved the practical value of his advice. Ruffin's ideas were given wide circulation through the publication of *An Essay on Calcareous Manures* (Petersburg, Va. 1832; 5th ed. Richmond 1852) and through the pages of the *Farmers' Register*, an agricultural periodical which he edited and published from 1833 to 1842. He is generally credited with having begun the agricultural revival which brought new prosperity to the tidewater South in the decades before the Civil War. In 1842-43 Ruffin published a periodical called the *Bank Reformer*, in which he opposed the wide use of unsecured banknotes in Virginia. He demanded the withdrawal of the state from direct participation in banking and urged the immediate resumption of specie payments. He held that un-sound banking was a direct burden on agriculture, the dominating interest in southern society.

Ruffin early championed southern rights. His defense of slavery included the usual appeal to nature and history; but he went further in that he insisted that all forms of society tended to exploit their laboring classes and also that it was impossible to avoid a peasantry in any rural order which did not rest on the enslavement of

an inferior race. He justified secession as a constitutional right on the grounds of oppression of a minority by a sectional majority. In *Anticipations of the Future* (Richmond 1860) he developed the theses that secession was possible without war and that the common interests of trade would ultimately bring the northwestern states into union with the South. He was an advocate of direct commercial intercourse between southern ports and Europe, favored the conquest of Central America and was sympathetic toward the reopening of the slave trade. Ruffin called upon his fellow southerners to develop a sectional literature and system of education as essential elements in a "superior civilization."

RUFFINI, FRANCESCO (1863-1934), Italian jurist, historian and statesman. Ruffini was born at Lessolo in Piedmont. He studied for a time at Leipsic with the distinguished ecclesiastical jurist Emil Friedberg, and played a leading part in introducing into Italy the scientific study of ecclesiastical law, a subject which he taught for short periods at the universities of Pavia and Genoa and for thirty years at the University of Turin. Among his studies in ecclesiastical jurisprudence are a useful Italian edition of Friedberg's treatise on ecclesiastical law (*Trattato del diritto ecclesiastico cattolico ed evangelico*, Turin 1893), a treatise on Italian ecclesiastical law (*Corso di diritto ecclesiastico italiano*, Turin 1924) and a learned monograph on the *Actio spoli* (Turin 1889). His best known work in this field is *La libertà religiosa* (Turin 1901; tr., with an epilogue by Ruffini, by J. P. Heyes with preface by J. B. Bury, London 1912), which contains the most complete treatment to be found of the historical development of the idea of religious liberty. After sketching the earlier theories of religious toleration in western Europe Ruffini analyzed at considerable length the liberalizing role played by Socinian doctrines during the Reformation and post-Reformation periods and

emphasized the basic differences between the systems of separatism and jurisdictionalism in the regulation of religious liberty by the modern state. After an illuminating study, "Le origini elvetiche della formula del conte di Cavour: 'Libera chiesa in libero stato'" (in *Festschrift Emil Friedberg*, Leipsic 1908, p. 199-220), he produced two invaluable volumes on the youth of Cavour, in which he made use of numerous unedited letters (*La giovinezza del conte di Cavour*, 2 vols., Turin 1912). This was followed by *Camillo di Cavour e Melanie Waldor* (Turin 1914), which for the first time made known Cavour's relations with the French novelist Melanie Waldor. From these studies there emerged a new and intimate picture of the youthful Cavour and the development of his ideas. Ruffini's last important work consisted of two scholarly volumes on the religious experience of Manzoni and his relations with Jansenism (*La vita religiosa di Alessandro Manzoni*, 2 vols., Bari 1931).

Ruffini was made a senator in 1914 and served as minister of public instruction in the Boselli war ministry (1916-17). As is shown by his public activity and his essays and speeches on Cavour, Mazzini and Victor Emmanuel II, he was animated by the liberal and democratic traditions of the Italian Risorgimento. He was one of the earliest Italian enthusiasts of President Wilson and was a firm believer in the League of Nations, on whose Committee for Intellectual Cooperation he served for a time. In the troubled post-war years in Italy (1919-20) besides exerting a powerful moderating influence against the excesses of the extremists, which at Turin and other important centers were more successfully combated by liberals like Ruffini than by the Fascists, he advocated a number of constitutional reforms. With resolute courage he spoke in the Senate on behalf of the liberal opposition to Fascism. His speeches and writings against Fascism exemplify the constructive and vital elements of the liberal tradition of the Risorgimento. In 1931 he refused to take the oath of allegiance to the Fascist regime which the Fascist government demanded of university professors and as a consequence was dismissed from his post at the University of Turin.

GAUDENCE MEGARO

RUGE, ARNOLD (1802-80), German publicist and social philosopher. Ruge was the outstanding figure of the young Hegelian move-

ment. As editor of the *Hallische Jahrbücher für deutsche Wissenschaft und Kunst* and later of the *Deutsche Jahrbücher für Wissenschaft und Kunst* he succeeded in creating the only movement of cultural criticism, outside of Young Germany, sufficiently powerful to be singled out for special persecution by federal and local authorities. He started out on his intellectual career as a left Hegelian who sought to formulate demands for liberal reforms in the language of Hegelian logic and a freely interpreted Protestantism. At first he and his collaborators concentrated their fire upon reactionary cultural tendencies which were perpetuating the feudal ideology in law, literature and religion. The very skill and effectiveness, however, with which they demolished the historical school of Savigny and Leo, the religious fundamentalism of Hengstenberg and Baader and the romantic traditions inspired by Schelling, Schlegel and their circle gave rise to an extremely hostile reaction on the part of the authorities, which was strengthened when Ruge fell under the influence of Bruno Bauer and especially of Ludwig Feuerbach. Nevertheless, it was only when Ruge dropped his terminological camouflage and openly declared for a republican government, trial by jury, abolition of censorship and other political rights enjoyed by the bourgeoisie in England and France that he was compelled to leave Germany.

Despite his short period of collaboration with Karl Marx in editing the *Deutsch-französische Jahrbücher* Arnold Ruge remained, until his final period of apostasy when he placed his pen at the service of Bismarck, a liberal political democrat who believed that all social problems could be settled by representative institutions which expressed and functioned in accordance with the "spirit of reason." In this sense he never transcended the fundamental presuppositions of Hegel's *Rechtsphilosophie*. None the less Ruge was far in advance of the political consciousness of the German bourgeoisie, whose interest he defended so vigorously. Having no personal contacts with the manual workers and peasants in Germany and only a bowing acquaintance with the industrial and commercial forces developing in Europe, he attempted to derive specific proposals of political and social reform from abstract ethical principles rather than from concrete historical situations. The result was that his specific social program, aiming as it did only at reforms within the structure of the existing economic order and state, did not rally any working class elements behind it; while his abstract the-

ory, with its sweeping negations of all feudal hangovers and its apotheosis of the violent bourgeois revolutions in England and France, frightened off the timid and wavering German middle classes, who hoped that Germany would grow peacefully into a full blown political democracy on the model of the United States.

RULE OF LAW, also frequently called "the supremacy of law," is a characteristic doctrine of the common law that the judiciary, in ordinary legal proceedings, may pronounce upon the legal validity of the acts of the king's ministers and servants and hence, in the United States, upon the validity of administrative, executive and legislative action with reference to the constitution and, in the case of administrative and executive action, the statutes governing such action. Along with the doctrine of judicial precedent and trial by jury it is one of the three distinctive institutions of the Anglo-American legal system. Historically it comes from a fundamental notion of Germanic law of which the feudal idea of the relation of king and subject and the reciprocal rights and duties involved in that relation is an example. It became definitely established in the common law as a result of the contests between the courts and the crown in the sixteenth and seventeenth centuries.

While the Roman law books told the men of the Middle Ages that the will of the sovereign had the force of law, the Germanic polity of the time assumed a fundamental law above and beyond mere will and conceived that those who exercised authority were to be held accountable if they failed to conform their action to that law. Thus in the Saxon law it is laid down that if a

creditor appeals to the count for justice and the latter, for no sufficient reason, fails to act, he shall answer for it. But if the count acts and goes beyond enforcement of what is due, he shall answer for that. In thirteenth century England the judiciary became distinct from the administration and strong central courts grew up, purporting to administer the common custom of the whole realm. The judges thought of a system of law and order reflecting "the law and order of the universe" and hence assumed that, in the words attributed to Bracton, the king, although not under any man, ruled under God and the law. The formulations in the Magna Carta and its reissuings of the feudal duties of the king toward his tenants in chief furnished the basis for development of a legal doctrine of the duties and responsibilities of those who exercised powers of government. In the reign of Edward III in 1338 the court held that a collector of the king's taxes could not distrain cattle for non-payment without a warrant; in another case (1339-40) the Court of King's Bench fined a sheriff for refusing to execute a writ by reason of a letter from the king under his private seal. It told the sheriff he could not justify refusal to execute a writ of the king's court by showing a private letter from the king, thus in effect distinguishing between the act of the king as such and the private action of Edward Plantagenet. While in each case the decision turned on form, there was here a step toward requiring the crown and its agents to act within the legal limits of their authority. As the doctrine became established, if the king purported to act beyond the legally appointed bounds of his authority, the acts were of no legal effect. If his agents acted beyond those limits, not only were their illegal acts of no effect, but they became personally liable in an ordinary action at law to any one damaged thereby. When Fortescue wrote, in the fifteenth century, it could be said that the rule of an English king was not the personal rule of Edward or Henry. It was, as Fortescue put it, political; it was government within bounds established by law.

During the Middle Ages the growth of the common law had held down the strong administration developed after the Conquest. But there was a revival of administration under the Tudors and Stuarts and in reaction from this a revival with further development of the doctrine which the seventeenth century lawyers found in the great thirteenth century treatise of Bracton and in a succession of cases between the reign

of Henry IV and that of Elizabeth. In these cases the crown had sought to grant profitable monopolies to private persons or companies; to provide for seizure of private property by letters patent, without opportunity for the owner to be heard and without adjudication; and to use the royal power of protecting social interests as means of providing revenue and enriching royal favorites. The courts held uniformly that monopolies could be created only by Parliament, that property could be forfeited only in accordance with the law of the land and so not by royal letters patent, and that the royal guardianship of public and social interests was to be exercised in accordance with principles of reason and within legally defined limits. Naturally this led to a contest between the common law courts and the crown which came to an end only with the Revolution of 1688. Coke, the protagonist in this contest, held to the idea of a fundamental law operating as a check both on the crown and on Parliament. The Revolution of 1688 settled for the British polity that Parliament was to be supreme; that there were to be no limits upon parliamentary supremacy. But in the United States both aspects of Coke's doctrine prevailed, and thus the American practise of judicial review of unconstitutional legislation derives in part from the mediaeval idea of supremacy of law.

In the formative period of American law Coke's *Second Institute*, in which is to be found the classical formulation of the doctrine, was almost a Bible. The doctrine was put in the very foundations of American polity and was developed by the courts in a pioneer, rural, agricultural society in which there was little need of administrative activity. In consequence in the United States in the nineteenth century a system of judicial interference with administration was carried to an extreme. A paralyzing of administration by legal proceedings became an everyday occurrence. Important measures of police or administration commonly encountered injunctions, which also came to be used as a means of keeping the peace. A practise grew up of private suits by taxpayers to prevent alleged waste of public funds and misuse of the proceeds of taxation. Some courts went so far as to enjoin the collection of taxes for defects in levying them. In one state the highest court directed a writ of mandamus to the speaker of the House of Representatives, directing him to carry out constitutional provisions as to canvass of election returns. It was taken to be funda-

mental that administration was to be held down to an inevitable minimum. In the zeal not to be bureau ridden the American people achieved the other extreme of being court ridden.

Coke's statement that the Court of King's Bench had jurisdiction to correct oppression of the subject or "any other manner of misgovernment" was accepted by American courts down to the latter part of the nineteenth century, although as early as 1880 some courts began to desist from extreme assertions of the doctrine. But with the change from a rural, agricultural society to an urban, industrial one a revival of administration and a reaction from the extreme development of the common law doctrine were inevitable. The demands of an expanding law of public utilities and the requirements of social legislation, which called for inspection, supervision and speedy enforcement, led to a rapid development of administrative tribunals and agencies, which is still in process. The common law review of determinations of administrative tribunals, treating procedural defects as jurisdictional by holding that there was want of power unless it was exercised in detail in the prescribed way, hampered for a time the efficiency of these new agencies. In consequence a strong tendency arose in the twentieth century to take away judicial review of administrative action wherever courts would hold it constitutional to do so, and in other cases to cut down such review to the unavoidable minimum. This trend was manifest especially in legislation for the regulation of public utilities in the first two decades after 1900. It has been increasingly common to seek to limit judicial review to legal questions of the scope of the authority of an administrative commission or tribunal and to make administrative determinations of fact conclusive. But the line between law and fact in such cases is not easily drawn, and it is by no means settled how far the courts will allow this tendency to go.

As far as England is concerned, the judicial scrutiny of the action of administrative officials continued in the last century as it had been defined in Coke's *Second Institute*. Accordingly Dicey (*Introduction to the Study of the Law of the Constitution*) could say in 1885 that the rule of law, as a characteristic of English law, meant, first, that no one could be made to suffer in body or goods "except for a distinct breach of law established in the ordinary legal manner before the ordinary courts of the land," contrasting such a regime with one in which persons

in authority exercise "wide, arbitrary or discretionary powers of constraint"; second, that every man is "subject to the ordinary law of the realm and amenable to the jurisdiction of the ordinary tribunals"; and, third, that the rights of individuals are secured by judicial decisions "determining the rights of private persons in particular cases brought before the courts." But when he came to write the introduction to the eighth edition of this work in 1915 Dicey was compelled to say: "The ancient veneration for the rule of law has in England suffered during the last thirty years a marked decline" (p. xxxviii). Although the doctrine was by no means carried as far in England as it was in nineteenth century America, the revival of administration began earlier in Great Britain and has gone further than in the United States. Legislation has given final judicial powers to administrative officials, has exempted them in many cases from common law liability for their actions and has greatly extended the area of non-reviewable administrative discretion. This changed attitude toward administration and administrative discretion and the tendency to rely upon bureaus rather than upon courts have been increasingly manifest since Dicey's last pronouncement and show no signs of abatement despite vigorous protests from some recent writers, notably Lord Hewart, the lord chief justice of England. Indeed they are inevitable in the economic order of today. The need of individualization, the call for speedy determinations, the demand for direction and guidance in advance of action, instead of leaving enterprises to guess at the way in which courses of action will be regarded judicially after the event, with such expert advice as they may be able to secure, can be met only by administrative methods and require a large measure of freedom of administrative determination and a wide discretion in administrative officials. It is significant that the highest judicial tribunal in Great Britain now holds that in an appeal from administrative action to an administrative reviewing tribunal what had been regarded as the most ordinary requirement of a judicial appeal does not obtain. The tribunal may act on a secret inspection by an inspector who makes a secret report which the appellant may not see, may not criticize or contradict and may not explain by independent evidence or extrinsic argument. The courts will not interfere as long as the administrative tribunal applies its ordinary procedure to all alike.

Because of the constitutional requirement of

due process of law American courts have not gone so far. Obviously the doctrine of the rule of law is going through a crisis analogous to that through which it passed in the seventeenth century. While it cannot maintain itself in the extreme form which it took on in the last century, it is too deeply rooted in the Anglo-American polity to be likely to disappear.

RUMELIN, GUSTAV (1815-88), German statistician. Rumelin served in the school system of Württemberg and in 1856 was appointed chief of the department of the Württemberg church and school system. In this capacity he was instrumental in enacting a comprehensive reform of the public schools and drafted a church law regulating the relations between the state and the Catholic church. The latter bill met with strong opposition and Rumelin was retired at his own request in 1861. In the same year he became director of the Württemberg statistical bureau and until 1871 he published a statistical study in almost every issue of the *Württembergische Jahrbücher für Statistik und Landeskunde*. He also taught statistics and philosophy at the University of Tübingen. In the article on statistics which he contributed to the *Handbuch der politischen Ökonomie* (vol. II, Tübingen 1882, p. 465-520) he conceived of statistics as a method of investigation applicable to the study of aggregates which not only endeavors to establish the quantitative scope of mass phenomena but also takes account of the variability of the individual cases composing the aggregate with respect to specific characteristics. This method,

independent of the method of induction, which takes the individual as the type, is of particular value to the social sciences, which in most instances deal with aggregates composed of individual cases of greater or lesser variability.

Rumelin also turned his attention to other problems of social theory in a number of essays included among those in *Reden und Aufsätze* (3 vols., Freiburg i. Br. 1875-94). In *Gesetze der Geschichte* (vol. II, p. 118-48) he denied the existence of strict causality in history, and in *Gesellschaft und Gesellschaftslehre* (vol. III, p. 248-77) he urged the study of society in terms of the psychological instincts (*Triebe*) at the basis of social organization. He rejected the rationalistic conception of the social contract and formulated a theory of the state along the lines of the Hegelian and the historical schools. Rumelin attained considerable importance as a population theorist; although he criticized some of Malthus' calculations, he defended ardently the latter's main conclusions and ascribed the large unemployment which existed in Germany during the crisis of 1876-78 to overpopulation.

RURAL EXODUS. *See* URBANIZATION.

RURAL INDUSTRIES. What has been called the "primary division of labor," that between agriculture and industry, can be understood in another sense from the traditional concept of "progress" involved in this division. The seasonal and "organic" character of agricultural production calls for other occupations and pursuits to fill the resulting periods of partial or total inactivity. The most natural of these supplementary occupations were originally and to a large extent will remain the transformation and finishing of agricultural raw materials by the agriculturist himself. In other words, the growing interdependence of economic activities in a market, or exchange, economy will never benefit the farmer to the same degree as the non-agricultural worker. The scale of rural industries embraces economic and social organizations as diverse as the artistically superior "house work" of Scandinavian, Slavic and Asiatic peasants and the employment of impoverished rural "home industrials" by merchanting, or commission

houses. It is important to ascertain to what extent industrial activities associated with agriculture are remnants of an old order and make-shifts of a new or, like the folk arts and, on another plane, the processing of products by modern agricultural cooperatives, a self-sufficient element in an economic and social equilibrium.

All the basic human wants were at first provided for within the closed household economy: not only food but the principal clothing and housing materials were prepared and finished in an unbroken process from production to consumption; and even metals, wherever they were easily accessible, were smelted and forged by the individual peasant. From this stage division of labor progressed along two distinct lines. The simpler and more primitive development was the specialization, within the rural households and village settlements, of those more complicated crafts partaking mostly of the character of "real capital" production, like smith's or carpenter's work. The result was and, as in India, still is a slowness in the development of a market and cash nexus on the basis of divided labor. The specialized craftsmen serve their agricultural neighbors and usually are paid a customary fee in kind through a system of mutual community obligations. The second line of division was the rise of towns both as centers of industrial production and as markets for rural raw and food materials. Of course, as in other such economic stages, this development was not a single, uniform and direct process. Theoretically there is a relation between increasing size of markets and increasing division of labor. But special circumstances determine to what extent the country and the town become interlaced in their productive services, as in the industrialization of milling or brewing, or how far the townsman's household imitates the farmer's in self-sufficiency by the processing of materials, as in baking and slaughtering, or even by small scale agriculture within town walls, such as that of the *Ackerburger* of mediaeval and occasionally of modern Germany.

The two lines of division of labor indicated are cut across by another, more social than economic in nature—the widespread stratification of the rural population into classes of landlords and tenants. The more numerous a landlord's tenantry and the more complete their dependence upon him, the greater were the possibilities of division of labor both for the needs of the lord himself and for outside markets. The "families"

of industrially skilled slaves in the ancient world and of dependent craftsmen in the mediaeval manors, whether secular or ecclesiastical, have since Adam Smith given rise to the much debated "curial" (*Hofrecht*) theory of the origin of craft guilds. Regardless of how far this theory may be correct, it undeniably hits upon the vast importance of the ancient and feudal estate, the *oikos* of Rodbertus' theoretical terminology, as regards the development not only of rural industries but of a class of rural entrepreneurs which contributed as much as the towns and in some cases probably more to promoting industry beyond the internal services of rural communities and at the same time beyond the handicraft stage, when entrepreneur and workman were identical. Characteristically the Russian law of serfdom (*krepostnoe pravo*) produced high degrees of craftsmanship both in the *obrok* system, under which the servile craftsman was allowed to work for the market subject to a fixed duty to be paid to his lord, and in the small scale rural industries, directed either by the lords or the peasants themselves (*kustari*). The Soviet Union, despite its large scale planned industrial development, continues to depend to a significant extent upon such rural industries.

Rural industries, whether conducted by small peasant proprietors or by great landlords, are capable of considerable growth both quantitatively and qualitatively. These two forms of rural industry were, however, soon overshadowed in modern Europe by the merchanting, or commission, system and by government mercantilism. The former emerged more or less slowly out of the older system of exclusive division of labor between rural production of foodstuffs and raw materials and urban handicrafts, as in the course of time these handicrafts came to be conducted on the one hand by the average guild masters, striving to limit production to a given demand, and on the other by the rising entrepreneurs, seeking to extend it for a stimulated demand or new markets. While the guild masters sought a sharp restriction or prohibition of additional rural production, the entrepreneurs attempted to promote it by providing materials, capital and marketing facilities. The battle for and against "country weaving" in England or "rural crafts" (*Landhandwerke*) in Germany during the decline of the urban craft guilds is illustrative of this contrast. The merchant employer of rural handicraftsmen appeared sometimes as an ally of the landlords and sometimes as an opponent, since he was a

competitor for the rural labor force. Already at that time there appeared certain phenomena which foreshadowed the modern debate concerning the social justification of rural industries. On the one side, the lower standard of living in the country and the part time nature of most rural industry created a resemblance to the sweated labor of the bulk of urban industrial homeworkers. On the other, the insufficient living gained from small or "dwarfed" holdings, whether due to feudal exactions or to dismemberment of property, made the entrepreneur seeking low paid rural labor often seem the savior of a decaying countryside, for even the smallest piece of land endows the rural homemaker with a modicum of independence not enjoyed by his urban competitor.

In the industrial planning of mercantilistic governments the promotion of rural industries has played a large part down to the present neomercantilist period. It was a natural corollary to the mercantilistic policy of engaging labor reserves wherever they could be found. With the reversal of the situation through the world wide unemployment consequent upon the World War governments have continued to look to the land for reserves for occupation and settlement instead of for reserves of labor. One of the chief concerns of earlier mercantilism, the provision of sufficient wool and flax for the rapidly expanding weaving and knitting industries, led not only to the deliberate revival of old rural industrial habits, such as the social evening meetings of wives and "spinsters" for the common exercise of the craft, but, as in eighteenth century Russia, to the foundation of new "spinning villages," especially for the new foreign material, cotton. In France Colbert's system of state regulation and supervision of the craft guilds sought, although with only partial success, to embrace also the rural industries.

In the modern rural industries, even where artistic quality does not insure a market, however precarious, the factor of cheap wages plays by no means the exclusive or even predominant part sometimes ascribed to it. The other chief determinants of industrial location, raw materials and the tradition attaching to their processing, are in most cases ultimately of equal importance. The fact that the industrial age of coal and steam was everywhere preceded by the use of water and charcoal as power generators would alone explain why a great many of just those industries which required more than the man power of the old handicrafts arose outside

the towns, chiefly in mountainous districts. The use of textiles, hides, timber, metal ores, earthenware and sands (glassmaking) for all kinds and stages of manufacture points in the same direction. The persistence with which rural industries have clung to certain districts can be explained largely by the ease of transition from one of these forms or stages to the other. Thus after mining and metallurgy had become concentrated into large urban units the rural communities originally engaged in the small scale extraction and manufacture of these raw and semi-processed materials turned to the production of finished cutlery, as in Westphalia, or watches, as in the Black Forest, or medical instruments, as in Württemberg. Another course was the initiation of new rural industries (mostly of high "labor capacity"), sometimes without any apparent impetus from large commercial employers. The manufacture of violins from the timber of the Tyrolean valleys was a typical rural industry of late mediæval and early modern times. But the quite different demand of modern mass societies for cheap musical instruments was catered to equally well by the rural home industry of Saxony and Württemberg. A similar development has led from the old sculpturing and painting of the Catholic peasants to the modern rural manufacture of toys, dolls or artificial flowers. It is true that since the World War most of these industries, especially in Germany, have suffered heavily from the loss or restriction of their former wide export markets; but it is significant that their chief competitors in these markets, for example, the Japanese toy industry, appear to be organized on much the same model of small and often rural homework.

In a survey of the different and often contradictory aspects of modern rural industries it is important to realize that the greatest differences prevail not only between industries with a more or less "organic" relation to their rural surroundings, with regard to both labor and materials, but also between different mixtures of agricultural and industrial labor. From this standpoint the question generally emphasized by the literature on home industries—whether the laborer is legally a dependent employee or an independent small master—loses much of its relevance. It is possible that the type of modern factory laborer with an allotment of land or even a small holding will live on a higher social level than the small peasant handicraftsman who works on his own or in occasional dependence upon outside middlemen or capitalists. The

former type will probably increase considerably as a consequence of mass unemployment, which makes for shorter hours of work and for the resettlement of the land. Significant in this connection are the proposals in the United States to establish small factories in connection with the government's first attempts to resettle subsistence farming colonies under the provisions of the public works administration act of 1933. Nor should it be forgotten that the urban concentration of modern industrial life seems to be changing rapidly in the direction of a break up of overgrown centers and their replacement by a rural and semirural organization of settlements and workshops. The English garden city movement was only a dim and indirect forecast of this tendency. The same aim has been expressed and put into practice by certain American entrepreneurs, notably Henry Ford and Jackson Johnson of the International Shoe Company. The recent expansion and cheapening of facilities for the transportation of men, materials and power will probably promote the growth or at least retard the decay of rural industries, as in the case of small sized industries generally.

RURAL SOCIETY as compared with urban society is marked by a relative predominance of the agricultural occupations, by the closeness of the people to a natural as contrasted with a human environment, by the smallness of its communal aggregates, by a relatively sparse population, by greater social homogeneity, by less internal differentiation and stratification and by less territorial, occupational and vertical social mobility of the population. The individual in rural society as a rule has fewer contacts with others, he associates with people from a smaller geographic and social area, a greater proportion of his social contacts are face to face and his relationships with any particular individual tend to have a longer duration. The people of rural society live in systems of organization which tend to include a higher proportion of status as contrasted with contract relationships; they are bound to a greater extent by organic ties rather than by the cooperation made necessary by economic division of labor.

Rural society has been variously defined as comprising all persons residing in the open country or all persons connected directly with agricultural occupations or all persons residing in administrative units of less than a given size. In Europe local units having a population of fewer than 2000 persons are defined as rural; the United States census first regarded as rural towns and villages of fewer than 8000, including the open country; later all persons residing in the open country and in communities of fewer than 4000, subsequently of 2500, were classified as rural inhabitants. As a provincial city of 25,000 people, however, may be more akin to rural society than to urban, whereas a smaller aggregate may belong more to the urban world, it is preferable to define rural society typologically rather than statistically.

The distinguishing economic, social and political characteristics of rural society are derived from its relationship to the land, from which most of its inhabitants make their living. The diet and the living conditions of rural areas are closely related to their land products and therefore tend to be regional and to be affected pri-

marily by natural calamities, such as famines. Rural politico-social classes are those related to the control of land as contrasted with the greater orientation of the urban political social system about personal and movable property, material display and human groups. Vertical social mobility in rural society is connected with movements up and down the scale from landlessness to the position of a landlord. A conflict of classes may develop within the society on the basis of landownership: small landowners against large, tenants against landlords, hired laborers against owners of estates. Agrarian radicalism has historically been closely connected with land rights, as illustrated in the history of China and recently in the Mexican peasant movement following 1912, in the revolution in Russia, in the peasant movements in central Europe following the World War and in the farmers' holidays in the United States that resulted from the foreclosures of mortgages after the crisis which began in 1929. The importance of land rights is also shown by the nature of voting in rural societies where legislation is by popular referendum.

Oriental society has been historically more rural than has western society, with the exception of the period following the decline of Roman culture when Islam and China were probably more urban than was western society organized around Constantinople. Rural society declined in relative importance in the Mediterranean region between the time of the conquests of Alexander the Great and the reign of Constantine and also in modern times in Europe and in the United States. This decline has been reflected only numerically, in the proportion of people living under rural conditions, for the greater development of urban society as a rule enabled the rural population to increase and to have higher material standards than during the times in which rural society was relatively more predominant. The lines of distinction between rural and urban society are now less marked in Europe and in the Americas than in the Orient, because of the commercialization of agriculture and the more mobile populations of the former areas; a few kilometers from the oriental centers of urban society, such as Tokyo, Shanghai, Bangkok or Bombay, one still encounters a different world. Variations within rural society depend upon whether the region is a pioneer fringe, a settled community or an immediate urban hinterland. The pioneer fringes which existed in the United States between the sixteenth and nineteenth centuries or in northern

Europe in the Middle Ages varied considerably from the older settled regions or the market gardens, suburban estates and other types of rural society to be found around the large cities. The agricultural possibilities of the soil determine to some extent the character of the rural community. For instance, the rural society on the eastern plains of England has always differed considerably from that in the more hilly sections of Wales. The manorial system of England, as it developed after the invasions of the Romans and the other foreign groups in the Middle Ages, was considerably different from the more self-sufficing tribal and family economy to be found in the western part of the country.

The economic characteristics of a relatively isolated society develop around its regional self-sufficiency. The family tends to manufacture much of its own goods; what it does not make is generally produced by artisans who reside in the villages or in the nearest communities. Industry and agriculture are so little divided that it is extremely difficult to separate the occupations from each other, unless one considers the task alone and not the individuals. Even the local leaders, who carry on the functions of religion, medicine, art and government, participate in one way or another in the direct activities of agriculture. Extremes of conspicuous consumption or of pauperization do not often become as apparent as in urban society. Rural societies that are less isolated from the urban world have economies more closely approximating urban economy. Trading towns and villages which replace temporary and periodic marketing places of the peasants become the centers of rural social life. Banks and money economy increase; prices are quoted in units of currency based upon a standard measure, and credit begins to play a production rather than merely a consumption role. Peasants who formerly borrowed money from relatives largely in their own village borrow for economic purposes from money lenders at high interest rates. During the period of change from the pure rural society to the urbanized rural society much property passes into the hands of non-agriculturists, and the inevitable result is antagonism and conflict between the social classes. This antagonism is enhanced when the money lenders, who come from the urban society, are of a different race, such as in the case of the Sikh money lenders in India and the Chinese or Annamese traders among the peoples of Malay origin. As the society becomes an urbanized rural aggregate

commercial banking appears, and later rural banks tend to be absorbed by urban banks; technological changes influence agriculture and rural society suffers from the economic fluctuations of urban society. In rural regions where agriculture has become essentially capitalistic, as in some parts of the United States and in the plantation areas of the tropics, the class struggle assumes a form comparable to that of industrial societies.

Contact with urban life facilitated by improvement in transportation leads to the use of ready made garments and other urban commodities. Houses are not as frequently built and roofed with native materials as before; instead lumber and other building supplies are purchased from traders. Culture and language symbols become more national and less local; urban fads, fashions and styles permeate the rural society, economic division of labor increases and illiteracy tends to diminish. Educational, hygienic, technical or economic public services improve but rarely come to be as advanced or as numerous in rural societies as they are in corresponding urban societies.

Regional cultures arise out of the local environment, the inventions of the people and the selectivity of traits which rural society secures from the urban. It is difficult to determine how much of a specific rural culture is indigenous to the country and how much of it is selected from past generations of urban influence. Rural art is manifested in domestic articles, in religious images and in festivities such as folk songs, dances and games; in the more purely rural societies each village is often recognized by the type of cloth that is woven there, each region by the type of articles which it wears. In commercialized rural societies, however, these distinctive characteristics disappear as part of the standardization process which results from the general movement of cultural interchange between rural and urban communities. The migration to the cities of the younger generation and of many families has tended to break down the vitality of the social life of the rural communities. The economic crisis beginning in 1929 led to a decided movement, in the United States as in other parts of the world, from the cities back to the country; this return movement has tended further to efface the differences between rural and urban cultures.

The judgment of Siegfried, Demangeon and others that agglomerated village types of rural societies have a different kind of culture from

those with isolated farm homes is doubtful, for there is little difference between the cultures of the isolated families and the village families when both operate under the same conditions. Among the important factors in the increase of the isolated farm homes in western society are the amount of land available and the economic rationalization of agricultural economy. Whatever differences in culture are found may be ascribed to these factors rather than to the location of the home, because grouped villages tend to take on the same cultural changes as do isolated farms when the trend of rural society is toward commercialized culture.

RUSH, BENJAMIN (1745-1813), American physician and social reformer. After graduating from the College of New Jersey in 1760 Rush

studied medicine under Redman and at the University of Edinburgh, where he received his degree in 1768. In the following year he was appointed professor of chemistry at the College of Philadelphia. From 1789 he was professor of the theory and practise of medicine. He was one of the founders of Dickinson College and served also as treasurer of the United States Mint from 1797 to 1813.

Rush was among the most eminent intellectual figures of his day. A leader in the medical profession, he pointed the way to many modern ideas, although he subscribed to a number of the older theories. His preeminent contribution to medicine is his *Medical Inquiries and Observations upon Diseases of the Mind* (Philadelphia 1812), the first American work on insanity. It remained the only systematic study until 1883. Rush was aware of psychological as well as physiological factors in insanity. The insane were classified according to types and scientific treatments were advised. His *An Account of the Bilious Remitting Yellow Fever . . . in the Year 1793* (Philadelphia 1794) is considered one of the best histories of epidemics. It was through Rush's efforts that the first free dispensary in the United States was established.

Rush was active also in political affairs. He supported the American Revolution from its inception and was one of the signers of the Declaration of Independence. He advocated the national constitution of 1787 and helped to frame the Pennsylvania state constitution of 1790. He always supported national as opposed to sectional interests.

One of the outstanding proponents of scientific education, Rush believed that the success of a democratic government was dependent upon the preparation of its citizens for the task of governing. Accordingly in his "Address to the People of the United States" and in his "Plan of a Federal University" (both reprinted in American Historical Association, *Papers*, vol. iv, 1890, p. 169-72, 172-75) he urged a national system of education based upon state supported schools and culminating in a national university, a graduate school in which students would be trained for holding public office. The curriculum was to consist of modern languages, law, politics, history, agriculture and commercial sciences. Rush was in general opposed to the classical content of contemporary education, which he regarded as undemocratic, and in "An Inquiry into the Utility of a Knowledge of the Latin and Greek Languages" (reprinted in his *Essays*,

Literary, Moral and Philosophical, Philadelphia, 1798, p. 21-56) argued for a modern liberal curriculum. He suggested technical schools and higher standards of medical education and was the first to propose a veterinary science.

But Rush's interest in social reform went beyond education. He was influential among the early abolitionists and in the movement for penal reform, opposing the "savage" criminal code, especially the death penalty, and advancing reformatory measures. A believer in temperance, he advocated the control of spirituous liquors.

RUSKIN, JOHN (1819-1900), English essayist and social theorist. Ruskin was born in London of well to do middle class parents; he was left a large fortune, which he gradually dispersed in helping others and in pursuing his social and economic experiments. He began his literary career as a critic of art, and his first important work was the opening volume of *Modern Painters* (London 1843) written mainly for the purpose of defending Turner against his critics. But from the first Ruskin's conception of art involved a consideration of the relation of art to life. Assuming, in accordance with the orthodox romantic tradition, that the art of a people is the expression of its national character and that art should serve moral and social as well as purely aesthetic ends, his writings dealt largely with social, economic and moral principles. The quintessence of his artistic doctrine is given in the famous chapter on the nature of Gothic architecture which appeared in his *The Stones of Venice* (3 vols., London 1851-53) and was subsequently reprinted by William Morris at the Kelmscott Press. His growing interest in strictly economic and social questions is indicated in his *The Political Economy of Art* (London 1857) and still more strikingly in the series of books written in the 1860's which began with his famous diatribe on the classical economists, *Unto This Last* (London 1862). Committed to the doctrine that economics must be conceived in terms of human welfare, he denied that the mere exchange of goods apart from their production could rightfully "breed" in such a way as to yield interest.

His economic writings were fiercely attacked at the time of their first appearance, but they have exercised a wide influence on subsequent economic thought. During this period Ruskin also turned his attention to practical social reforms, helping Octavia Hill in her efforts to establish model lodging houses, starting his scheme for the provision of work for the unemployed in cleaning the streets and in similar activities and teaching art at F. D. Maurice's Working Men's College. In 1871 he took a further important step by beginning his extraordinary monthly miscellany, *Fors Clavigera* (8 vols., Orpington 1871-84), in which he appealed directly to the working class and bade men realize the dignity of productive labor and by ordering their lives after a simpler fashion escape from the false complexities of the modern economic system. In connection with this new appeal he launched in 1871 his Guild of St. George, endowing it with a tithe of his fortune. Through this body he endeavored to promote model farming, the revival of village industries and a reform of the educational system; and while most of his experiments led to no lasting result, he undoubtedly gave great stimulus to the movement for the revival of handicraft. In 1870 he had become professor of fine arts at Oxford University, and his lectures there attracted a large band of disciples. In his economic thought Ruskin was greatly influenced by his friend Thomas Carlyle, and he exerted a profound influence on William Morris and through him on the wider socialist movement. Politically Ruskin was opposed to parliamentary reform on the ground that reform must be individual rather than political. He called himself a Tory, but he was also prepared to accept the name of socialist. Above all he was a preacher declaiming, in terms reminiscent of an earlier generation of romantic mediaevalists, against the injustice and poverty of life which he found to be characteristic of industrialized society and endeavoring to inspire men by setting before them the ideals that he conceived to be embodied in the great art and architecture of the past.

RUSSELL, JOHN, FIRST EARL (1792-1878), British statesman. Russell inherited a name that was "a programme in itself," for his family had long been champions of liberty. A Whig from birth, he entered Parliament at twenty and remained there for no less than sixty-five years, from 1812 to 1861 in the House of Commons and after his elevation to an earldom in the House of Lords. He grew up to regard Great Britain as the champion and schoolmaster of Europe, and when in the name of Great Britain he hectored other powers he not infrequently offended foreign statesmen who had no special reverence for the Glorious Revolution of 1688. United Italy owed much to him. He first broke the concert of Europe by justifying rebellion on the principles of 1688 and then, moved by a private appeal, refused to join France in confining Garibaldi to Sicily. On the other hand, he must share in the responsibility for the outbreak of the Crimean War and for the Danish disaster of 1864.

From 1831, when his name stood for parliamentary reform, to 1866, when he ceased to be prime minister, Russell's personality was of immense importance to social progress at home. Apart from the measures he promoted his very existence helped to avert a revolution. He furthered justice to the Irish, municipal reform, popular education, colonial expansion, ecclesiastical reform, control of factories, cheaper postage, abolition of the corn laws—the redress of every privileged abuse. He was instrumental in founding the University of London, which embodied many of his ideas. But electoral reform through the widening of the parliamentary franchise remains the outstanding achievement of his long career: he changed a small and partial measure into a broad one based on principle and secured its passage into law. By extending the constitution to half a million property holders Great Britain, thanks to Russell, secured for many years immunity from continental revolutions.

RUSSIAN REVOLUTION. The term Russian Revolution is generally employed with reference to the process of radical change in the social organization, culture and mentality of the Russian people which began in 1917. This revolution has been shaped by the historical, social and psychological factors peculiar to Russia. Indeed it should be regarded not as an isolated historical phenomenon but as a stage in a process which has continued since the early eighteenth century. In the reign of Peter the Great an effort was made to Europeanize the political and economic life of the country, a radical attempt considering the structure of European society and the narrow scope of international interdependence two hundred years ago. In a Eurasian country weighted down by intellectual lethargy and by the ritualistic immobility of the Eastern church the structure of the state—the armed forces, the civil administration and the courts—was changed to conform to European standards, while trade and industry were artificially stimulated. A discordant element was thus introduced into Russian life, provoking a movement of deep unrest which was to grow in intensity with the passage of time. In the course of the following century western ideas spread to the aristocracy attached to the new court at St. Petersburg, while the gentry, the clergy and the masses remained relatively untouched. Consequently there developed a profound estrangement between state and society, between the government and the people. Peter I, whom the opponents of westernization held responsible for this break in historical continuity, was regarded as the Beast of the Apocalypse. Since the Petrine reforms were necessitated by military and financial exigencies, they resulted in complete subordination of the national life to the needs of the state, above all of its army. Fiscal requirements aggravated the burdens of serfdom, which in the reign of Catherine II approximated outright slavery. The peasantry became more and more

discontented, and Pugachov's rebellion (1773-74), which spread throughout southeastern Russia, assumed dangerous proportions, although lack of intelligent leadership doomed it to failure.

In its first stage the revolution in Russia extended only to the state apparatus and the aristocracy; in the second stage, which began with the insurrection of a group of army officers in December, 1825, the pivotal position was occupied by the intelligentsia, a product of the closer intellectual contact with western Europe after the Napoleonic wars. By the latter half of the reign of Alexander I the younger generation of the nobility and of the rising middle class had begun to study the idealistic philosophy of Germany and the writings of the early socialist thinkers of France. Recoiling from the degradation and pettiness of Russian public life they yearned for the freedom and intellectual integrity of the West. But they were helpless; the government responded with rigorous repression and the masses remained out of reach. Alienated from the masses and excluded from participation in public affairs, the Russian intelligentsia was left to its own devices, to engage in the everlasting quest for the meaning of "the Russian development, the Russian national idea." Thus there emerged the eternal student and the professional revolutionary, two characteristic Russian types. For the eighteenth century antagonism between the government and the people the cleavages between the state, the intelligentsia and the masses were now substituted.

The development of the Russian intelligentsia was conditioned by its isolation from business and public life and by its psychological make up. The members of this class, catholic in their interests and sympathies, cherished lofty ideals but remained entirely ignorant of the prosaic aspects of existence; they demanded all or nothing, scorned gradual, concrete achievement and were prone to fatalistic despair. The movement of the intelligentsia resembled nothing so much as a permanent discussion club, where ecstatic speeches about the magnificent future offered an escape from harsh reality. An outstanding manifestation of this utopianism was the unwarranted idealization of the masses, especially the peasants. This was common both to the westernists, who looked toward Europe for inspiration and guidance, and to the Slavophiles, who saw in the spiritual and social peculiarities of Russia a substitute, universally valid, for the decaying civilization of the West. The Slavo-

philes had no more contact with Russian reality than the westernists; their Russia was an apolitical community of love and freedom, a kingdom of God prepared by God's chosen people, the Russians.

Throughout the nineteenth century the rootless idealism of the intelligentsia was challenged only by the nihilists of the 1860's who professed extreme utilitarianism and submitted all matters to the acid test of reason. But the nihilist predisposition to a sober view of reality was soon overwhelmed by the longing of the intelligentsia to end its isolation, to bridge the gulf which separated it from the masses. The movement known as "going to the people" was particularly strong in the 1870's; it failed to attain any concrete results largely because of the distrust and inertia of the masses. In their desperation many of the intelligentsia then turned to terrorism, typically a weapon of the self-sacrificing idealistic individual; this form of struggle was of slight practical value, however, for terrorist organizations were undermined by harsh governmental repression and by the corruption inherent in large scale conspiratorial operations. Whether committed to terrorist action or choosing the slower processes of underground propaganda and education, the Russian intelligentsia persisted in idealizing the peasantry and its communal form of agrarian organization; the latter was viewed as the survival of an early agrarian communism, a bulwark against the infiltration of western capitalism and a basis for future socialist organization on the land. *Zemlya i volya* (Land and liberty), the slogan of the populists in the late 1870's, was the basis of the subsequent demand for socialization of the land and convocation of a constituent assembly. Such were the planks in the platform of the Socialist Revolutionary party, which dominated the political activity of the intelligentsia from its formal organization in the early years of the twentieth century until November, 1917.

The development of the Russian state during the nineteenth century failed to keep pace with the times. While the governments of Peter I and Catherine II were comparable in their efficiency to those of western Europe, the state under Nicholas I was still a centralized eighteenth century autocracy, lagging far behind the new states of western Europe which emerged after the French Revolution and the Napoleonic wars. The extent of this lag was revealed in the Crimean War. The backwardness of the largely patriarchal structure of Russia appeared in sharp

contrast to the new society of the West, rooted as it was in a dynamic economy and buttressed by a free public opinion. In order to raise the efficiency of the army and the civil administration and to increase the taxable capacity of the country serfdom was abolished in 1861. But like most post-Petrine reforms this measure was inadequate; it burdened the peasant with heavy annuities and it vested control of the land in the commune, thus hindering the adoption of a progressive agricultural technique. Peasant hostility to the state did not abate; the peasantry did not become prosperous, while the landed nobility decayed. Reforms touching upon every phase of public life were enacted in the decade following emancipation, but they were oriented upon a narrow view of the aims of the state and did not greatly improve the lot of the masses or enhance the initiative and self-reliance of the individual. The best intentioned reforms lost their effectiveness for lack of suitable persons to fill the new positions in the reorganized administration. After the "era of reforms" public life reached what was probably its lowest ebb; these were "gray days" dominated by a total absence of any sense of social purpose and creative labor. Literature became an indictment of society and of the intolerable hopelessness of middle class life, especially in the provinces.

While the peasantry distrusted the intelligentsia as an offspring of the hated landowning gentry, it listened to the teachings of dissident religious sects. Those sectarians whose social ideology was molded by a literal interpretation of the Gospel established in the outlying regions pioneer colonies, which developed into prosperous communistic settlements. Many more, obeying the letter of the Gospel, abandoned their families and worldly possessions and wandered as "holy tramps" over the immense steppes of Russia, spreading the anarchistic message of a struggle against the state and the church, the servants of the Antichrist, the two horns of the Apocalyptic Beast. In the face of these doctrines of spontaneous peasant origin, preached in a language which the peasant could easily understand, the official church, completely devoid of social vision, and its illiterate village priests could offer no impressive resistance. As in seventeenth century England, religious dissidence operated as a revolutionizing factor, giving voice and form to the discontent caused by ruthless exploitation and extreme poverty. The peasantry was transformed into a revolutionary class with great

potentialities if the proper leadership were forthcoming; in its absence peasant risings could easily be localized and suppressed, as were the numerous outbreaks in the second half of the nineteenth century.

The quarter century preceding 1905 was a period of rapid industrialization and urbanization in Russia. Industry made great advances with the aid of French, Belgian, British and German capital, and the upper middle class prospered at the expense of the exploited working masses. Yet basically the country remained backward. Neither its social structure nor the production of raw materials was correlated with a high rate of industrialization and urbanization. Agriculture, the major branch of production, continued to stagnate; a large proportion of the agricultural output, drained off by the semifeudal landowners and the state, was sold abroad to service government loans and foreign investments, while the countryside was devastated by recurring famines and the living standards of the urban masses were kept very low. The Manchurian War of 1904 revealed the inner weaknesses of Russia as mercilessly as the Crimean War had done half a century before. The state was doomed but was kept alive by the inertia and feebleness of the opposition. The only classes which supported the autocratic monarchy were the nobility and the upper clergy, both in an advanced stage of economic and spiritual decay. The czar's alliance with the nobility had completely estranged the peasant masses, and the policy of Russification pushed the numerous non-Russian nationalities settled within the empire into the camp of the opposition.

By 1905, when Russia entered upon the third stage of the revolution, there were four conflicting groups. On the right autocracy was supported by the landed nobility and the high clergy, which were represented after 1905 by several reactionary parties. The middle classes, interested in stimulating the capitalistic development of the country, aspired to a more or less liberal constitutional monarchy on the German or the English model. The upper bourgeoisie was organized in the Octobrist party with the czar's manifesto of October 17, 1905 (this and all subsequent dates follow the Julian calendar used in Russia until 1918), as its platform, while the great mass of merchants, manufacturers, liberal gentry and bourgeois professionals was mobilized under the banner of the Constitutional Democratic party (Kadets). The political

and economic demands of the peasantry and the majority of the intelligentsia, in so far as they could be formulated definitely, were embodied in the program of the Socialist Revolutionary party. At the extreme left there was the industrial proletariat, which by the end of the nineteenth century began to form a distinct class conscious of its differences from the peasantry and giving pronounced indications of industrial unrest. The views of this class were expressed by the Russian Marxists, who had been active in underground propaganda and organization since the early 1880's. In 1898 they formed the Social Democratic Labor party of Russia, which split in 1903 into a right wing (Menshevik) led by Martov and a left wing (Bolshevik) under Lenin. While the latter demanded a highly centralized party with a small membership of professional revolutionists, Martov favored a loosely organized mass party paralleling the western Social Democracies. The national minorities were represented by numerous political associations, some of which were affiliated with the liberal opposition; most of them, however, were bound by programmatic and personal ties to the revolutionary left.

The revolution of 1905, which followed upon a year of widespread agrarian and industrial unrest, began with the Bloody Sunday of January 9. A mass of unarmed workers, with the clergyman Gapon at their head, marched to the palace to present a petition to the czar and were fired upon by the troops in an act of wanton cruelty typical of the last phases of Russian autocracy. Peasant uprisings and workers' political strikes broke out throughout the country and sections of the army and navy appeared to be infected with the revolutionary virus. But the autocracy did not yield; in a spirit of doubtful wisdom it aroused the anarchic instincts of the masses against the intelligentsia, the cultured classes and the Jews, and a wave of pogroms swept over Russia. In May the first soviet, or council of workers' deputies, was organized in Ivanovo-Voznesensk, an important center of the textile industry, with a view to directing the city wide strike. Similar bodies were later formed in a number of other cities. Of these the most important was the St. Petersburg Soviet, in which Trotsky was the leading spirit; it was created in October and functioned for two months before its entire membership was arrested. In October a general strike paralyzed the country; and the government finally capitulated, promulgating the czar's

manifesto which promised civil liberties and conferred legislative authority upon the elective Duma conceived originally as a purely advisory assembly.

The October manifesto marked the peak of the 1905 revolution, after which the revolutionary tide receded. The armed insurrection of Moscow workers in December lasted for eight days but was drowned in blood by loyal troops; the middle classes hastened to make their peace with the government, and the latter gradually withdrew its concessions. The powers of the Duma were greatly curtailed; and Prime Minister Witte, who was ready to cooperate with the liberal bourgeoisie, was dismissed. Despite the restrictions upon suffrage to the Duma—it was neither equal nor direct—and despite the boycott of the elections to the First Duma by all the socialist groups, the overwhelming majority of both the First and the Second Duma stood in opposition to the government. In 1907 after the dissolution of the Second Duma, which like the first survived only for a few months, the electoral law was changed by the sole authority of the czar and in violation of the constitution (Fundamental Laws) which he had granted; the representation of the peasants, workers and non-Russian nationalities was sharply reduced.

The 1905 revolution culminated in "a constitutional monarchy under an autocratic czar," but this was not due to the strength of the regime. On the contrary, the latter evidenced all its characteristic weaknesses: stubborn adherence to entirely obsolete forms; tardy and unsuccessful halfway measures adopted under strong pressure to win support and to play one group of opponents against another only to betray both as soon as such a course seemed safe; selection of an incapable personnel for the execution of vital policies. But the enemies of autocracy were united only in their negative attitude to the government; the middle classes dreaded the specter of a social revolution, while the revolutionary movement itself was immature and weakened by the failure to cement an alliance between the peasantry and the urban proletariat.

Although apparently it had failed, the 1905 revolution was in effect a huge dress rehearsal of the outbreak which came a decade later. The experience of 1905-07 served as an inspiration to the masses of workers and peasants and the non-Russian nationalities; it aroused them from their lethargy and taught them lessons which could not easily be forgotten. It created in the

soviet a pattern for the future organization of the urban masses and demonstrated the necessity of collaboration between the city worker and the peasant. Furthermore it widened the gulf between the right and left wings in the revolutionary camp. The right persisted in its belief that the scope of the revolutionary transformation should be restricted to the establishment of a bourgeois democratic republic and blamed the failure of the 1905 revolution in part upon radical extremism which alarmed the middle classes. The left wing, on the other hand, confirmed in its distrust of the middle class, made the union of the proletariat with the land hungry peasantry a basic element of its ideology.

The postrevolutionary era was marked by severe political reaction. The government, under the premiership of Stolipin for the first five years, was supported by the strong right majorities of the Third Duma (1907-12) and the Fourth Duma (1912-17) in following a policy of repression and of aggressive nationalism both at home and abroad. Where it was not completely exterminated by main force, the revolutionary movement was infested with spies and corrupted by agents provocateurs in the pay of the secret police. The numerous non-Russian nationalities, relegated to an inferior rank, underwent a process of forced Russification which frustrated the cultural development and the economic advancement of these peoples. Russian foreign policy was calculated to provide a link between autocracy on the one hand and the bourgeoisie and conservative intelligentsia on the other. It was oriented upon amity with western nations, on whose capital markets government and industry depended for loans, and upon expansion in the east. In particular the annexation of Constantinople and the Straits was designed not merely to satisfy the craving for imperial aggrandizement but also to fulfil the old dream of regaining Byzantium, the source of ancient Russian culture and religion. The dumas sought to strengthen the army in order to avoid the humiliating defeats of the past, but, as later events proved, an autocratic and bureaucratic regime which retarded the material advancement and spiritual emancipation of the masses could not prepare the country for the rigors of modern warfare. The peasant and the worker were not imbued with the spirit of self-conscious modern nationalism which would make them willing to bear for long the terrible sacrifices demanded by war. The Russian masses and the subject nationalities were kept outside the orbit

of Russian nationalism. The social structure of Russia was top-heavy—a condition which explains the easy susceptibility of Russia to revolutionary upheavals.

The economic structure of Russia was likewise unintegrated and top-heavy. Unlike the western countries, Russia did not experience the comparatively slow transition from a handicraft economy through the factory system to full fledged industrialism. There was consequently little correlation between the base of the Russian economy, which comprised a rather primitive agriculture and peasant handicraft, and the modern industrial giants at the top, which had been built up with the aid of government subsidies and investments of foreign capital. Even considered by itself Russian industrialism was extremely unbalanced. Although railway construction was pushed forward, the transportation system was not sufficiently developed to overcome the separation of the natural reservoirs of fuel and of industrial raw materials. There was moreover a perennial shortage of skilled labor adaptable to modern industrial technique. It cannot be denied, however, that Russian industry had made great strides forward. Agriculture benefited from Stolipin's reforms of 1906, which favored the dissolution of land communes and provided for the abolition of the system of scattered and intermixed allotments. The economic freedom thus conferred upon the more prosperous peasant strengthened his position, but the bulk of the peasants appeared in contrast poorer than ever. Grain trade was improved, better credit facilities were provided and rural cooperation was growing quite rapidly; but many years were required to diffuse the beneficial effects of these developments through the vast mass of the peasantry.

However slow and uneven, the modernization of Russian economy and the relative prosperity which it enjoyed in the years 1908-14 served to lessen the inertia of the people and to make them more receptive to political and economic education. At the same time the masses became more easily accessible to the intelligentsia. Although some of the latter were driven in despair to the sensuality of *Sanin* or the mystical Slavophilism of *Vekhi*, many of those who persevered found a new outlet for their idealistic devotion to the people in the cooperative movement, in the trade unions tolerated by the government after 1906 and in the workers' sick benefit societies provided by the law of 1912. Thus, while the leaders of the 1905 revolution were in prison

or exile and revolutionary party organizations were destroyed or crippled, new revolutionary forces were slowly being trained in the country. In 1912 the excesses of the government in suppressing the strike in the Lena gold fields aroused widespread indignation. And from 1912 on there was an increasingly large number of strikes, involving in the first seven months of 1914 over a million workers; in these disputes political demands were often more important than purely economic issues.

The World War, which might have diverted growing internal tension into other channels, served only to reveal the corruption and inefficiency of the existing regime. The development of Russian industry and transportation was insufficient to meet the demand for highly mechanized equipment and for the swift movement of large contingents of troops and supplies. The court, isolated from contact with realities, failed to appreciate the gravity of the situation confronting the country. The ministers, selected by a court camarilla which regarded even the overwhelmingly reactionary Duma as a radical body, lacked energy and training for the tasks before them; indeed it was scarcely to be expected that they could develop such qualities when their tenure of office was dependent upon the whim of an autocrat surrounded by court intrigue. Some of them lacked simple honesty and would have been a dangerous burden even in times of peace. The cleavage between state and society, lessened in the years of peaceful prosperity and spanned in the outburst of national feeling which characterized the first months of the war, soon reappeared and grew ever deeper. The mass of the people were subjected to increasing hardships. In the army an incompetent and heartless corps of officers sacrificed millions of men and called for larger and larger supplies of human cannon fodder. The fields and factories were stripped of their trained workers, while the peasant soldiers, inadequately supplied with munitions, longed for home. By the winter of 1916 military defeats, growing economic chaos and the shortage of foodstuffs in important centers had produced a dangerous instability. The confidence of the upper classes in the high army command, the court and the ministry was definitely shaken; and the conviction became widespread that the fatherland was menaced more by internal foes than by the attacking armies.

Russian autocracy collapsed in February, 1917, and within a few months nothing re-

mained of the state built up by such strong and able monarchs as Ivan the Terrible and Peter the Great. The personality of Nicholas II, the decadence of the nobility and the weakness of the upper bourgeoisie played their part; but the fundamental cause of the crash was the fact that the Russian political and social system could withstand the pressure of modern civilization no more successfully than could the archaic Ottoman Empire. Russia had not experienced the process of national integration which molded the destinies of all European states after the French Revolution. The poverty and illiteracy of the people and the weakness of the bourgeoisie gave the Russian Revolution its chance. The mass of Russians were not allowed to share in shaping the destinies of their country and consequently did not develop that sense of responsibility for and loyalty to the whole which characterizes a modern nation. Russia typified not so much a modern nation state as a semicolonial country exploited by western capitalism with the aid of its own government and upper classes; its antimanagerial revolution was therefore bound to take on the color of an anti-imperialist rebellion. But the revolution led also to the secession of territories settled by non-Russian nationalities; for with regard to these as well as to its Asiatic neighbors Russia had played the part of an imperialist colonizer. For many reasons Russia was the weakest link in the chain of European capitalism and imperialism.

The overthrow of the czarist government initiated the fourth stage of the Russian revolution, which under the conditions then existing proceeded logically and irresistibly to its consummation in the establishment of Soviet rule in October, 1917. The first manifestation of mass action came on February 23 in the form of a demonstration in the principal streets of Petrograd by working class women who were turned away empty handed after they had stood in line for many hours to purchase bread. Within two days a spontaneous mass outbreak developed; organized revolutionary leadership was entirely absent, but under conditions of fundamental instability the chaos was bound to increase rapidly. If the government had not been in the hands of the autocrat and his inept ministers it might still have saved the situation, for the time being at least, by far reaching concessions coupled with energetic action. But the estrangement between the autocracy and the people had reached the point where a rapprochement was no longer possible. In a few days, when it became clear

that the peasant army was making common cause with the workers, the outcome of the February outbreak was decided.

While the old government was overthrown, there was as yet no leadership capable of setting up a new government. The provisional committee of the Duma, motivated by the desire to assure continuation of the war and stabilization of the social order, implored the autocrat to grant reforms; as the unrest developed it spared no effort to save the monarchy. But the czar abdicated in favor of his brother, who hesitated to accept the crown without the consent of a constituent assembly. The Duma committee was thus forced, in order to avert chaos, to undertake the creation of a new government. A workers' and soldiers' soviet after the 1905 pattern was organized under the guidance of the moderate socialist parties. These were not prepared to assume full power; they hastened to assure the Duma committee of their willingness to support a government formed by it.

Thus there came into existence the first Provisional Government, whose authority was quickly recognized by the administrative apparatus of the old regime and by foreign countries. It was headed by Prince Lvov, who was widely known as chairman of the Union of Zemstvos, a vast organization which assisted the government in provisioning the army and caring for its wounded; and it included conservative and liberal representatives of the educated middle classes and one right wing socialist. The two outstanding personalities in the new set up were Milukov and Kerensky. The former, leader of the Kadets and foremost parliamentary critic of the slackness and stupidity of the czarist government in the prosecution of the war, apparently believed that the elimination of autocracy would strengthen Russia's will and capacity for war. As minister of foreign affairs he continued to stress the necessity of a decisive victory and of the fulfilment of Russia's historic mission in the annexation of Constantinople and the Straits. Kerensky, a brilliant young lawyer who had defended the Lena strikers in 1912, a member of the Duma and a vice president of the Petrograd Soviet, was the only member of the government whom the masses trusted at the outset. But Kerensky's grasp of the situation was no more realistic than that of his colleagues; like the other right wing socialists, he believed in the existence of a nationally conscious Russian people willing to continue the war and therefore convinced of the necessity of preserving the

framework of orderly government inherited from the autocratic regime.

Like many of the liberals and Socialist Revolutionaries, the Provisional Government idealized the Russian masses, their patriotism and their innate maturity and shaped its policies to a preconceived pattern of national democratic revolution. It was moreover pushed in the wrong direction by the official and unofficial representatives of the Allied countries, who not only failed to understand the trend of events but also were astonishingly devoid of sympathy with the Russian people, regarding Russia merely as a tool to be used in the achievement of their own war aims. For eight months the growing restlessness of the workers and peasants compelled frequent shifts to the left in the composition of the government and in its program, but these came always too late to effect a permanent adjustment. The first such change occurred during the week ending May 6, when the Kadet Miliukov and the Octobrist Guchkov, the two members prominently associated with the policy of war for imperialist ends, were replaced by Chernov, leader of the Socialist Revolutionary party and advocate of land socialization, and the Menshevik Tseretelli, the strongest man in the Petrograd Soviet.

Both in Petrograd and in the provinces, which quickly and spontaneously followed the example of the capital, the Provisional Government enjoyed only such power as was vouchsafed it by the soviets of workers' and soldiers' deputies. For the masses made the revolution against the wishes of the Duma, from which the Provisional Government issued; and they recognized only the authority of their representatives organized into soviets, considering the latter the guardian of the revolution. At first soviet leadership was in the hands of Mensheviks and right wing Socialist Revolutionaries, who were ready to cooperate with the government. But these groups could no more control movements from below than could the government itself. In the following months the masses veered rapidly to the left from their original toleration of a defensive war and a bourgeois government with a minority of moderate socialists; the executive committees of the soviets, which reflected this trend albeit tardily, could moderate its violence and delay its culmination but were powerless to check or reverse it.

While a semblance of order was thus preserved, the situation was fundamentally unstable. In a vast country characteristically lack-

ing an integrating national consciousness the downfall of the only legitimate and traditional unifying institution, the autocracy, inevitably led to anarchy. The ruling classes of the old order were distrusted and despised by the masses. The leading bourgeois groups, lacking the authority which the autocracy had enjoyed, were too inefficient or too weak to produce a coherent and devoted élite able to salvage the country from the chaos of war and revolution which undermined the defective structure of the state. Once the restraint of centuries was removed, "direct action" in industry, on the land and in the army became the order of the day. The soldiers longed for peace, the peasants coveted the landed estates and the workers pressed for the control of industry. Any well knit group under energetic leadership with an understanding of these demands which in seizing power would give some promise of their fulfilment could direct the course of the revolution. Eventually power passed into the hands of the Bolsheviks, the one party which had a clear program and a definite line of action. In conformity with the principles advocated by Lenin since 1903 it was an organization of picked men united by strict discipline. At its head stood Lenin, who combined a fervent faith in the future of a socialist and internationalist society with an astute understanding of the exigencies of the immediate situation and of the psychology of the Russian masses.

While the Bolsheviks were manoeuvring into a position of leadership, other groups which formerly had been sympathetic to the revolutionary cause turned against it. In the first month of the upheaval class distinctions were submerged in a wave of universal jubilation and general fraternization. The bourgeois intellectuals welcomed the revolution as the realization of a seemingly lost hope. The comparative bloodlessness of the change was hailed as evidence of its superiority over the French Revolution and as proof of the nobility of the Russian soul. The future of Russia appeared bright and clear: as the ally of western democracies it was engaged in a war to destroy Prussian militarism and to liberate the enslaved nationalities of central Europe, and as the foremost representative of the Slavic tradition it was fulfilling its mission in the spirit of love. But this dream was ended abruptly; when the revolution passed the point at which they should have liked it to stop, the intellectuals were driven to counter-revolution. It would be unfair to say that they were

animated solely or even largely by the desire for the preservation of their vested interests. To many of them who were brought up to revere revolutionary ideals and who had always longed for a revolution in Russia the turn of events and their reaction to it involved profound personal tragedy. They were frightened by the chaos and cultural barbarism which appeared about them and were horrified by the instincts of the primitive masses, now unleashed. They became sincerely convinced that the old order, despite all its defects, was infinitely preferable to the chaos and ugliness of the rule of Smerdyakov. The Russian intelligentsia remained true to tradition: once more it recoiled from the realities of life, thereby losing its power to shape them.

The groups of socialist intelligentsia fared little better. The largest among them, organized in the Socialist Revolutionary party, had for nearly half a century fought for the socialization of land and the convocation of a constituent assembly. It now seemed that the work of three generations had borne fruit, for the masses adopted these demands as their own. At the first All Russian Congress of Soviets in June, 1917, the Socialist Revolutionaries in combination with the Mensheviks still controlled a majority of the delegates. This appeared to be the correct historical moment for the realization of their program, but they delayed action from month to month. The difficulties and problems involved were grave, and the longer they were discussed the more insuperable they seemed. The leaders knew too much and doubted too much; the masses knew nothing but demanded swift action. Chernov appeared to have grasped the situation. He drafted a law for the socialization of agricultural land, but the Allies put all their influence against it, arguing that nothing should be done to divert energy from the successful prosecution of the war. This attitude prevailed in the Provisional Government and sealed its fate: for the Russian masses the revolution took precedence over war.

Kerensky tried to find a middle road between the two but failed in this impossible task and lost the confidence of both the middle classes and the masses. From March to July he had drawn to himself the hopes and the love of the majority of the people, yet a few months later his power collapsed like that of the czar in the preceding February. In June Kerensky carried out an extraordinary oratorical campaign which galvanized the army into action, but the offensive collapsed after a fortnight. In early July the

government in which he was the most prominent figure suppressed an uprising of Petrograd workers. The insurrection had developed from a spontaneous demonstration against the Kerensky offensive; and although the Bolsheviks considered it premature, they assumed the leadership after its inception. A few days later, on Prince Lvov's resignation, Kerensky became prime minister and in fact dictator of Russia. But the All Russian Conference, convened by the government in Moscow on August 12, revealed the weakness of his position. A fortnight later the attempt at a counter-revolution led by chief of the army command, General Kornilov, marked the turning point. Although Kerensky, who was Kornilov's immediate superior, was finally forced to take an open stand against the latter, Kerensky's vacillation made the ambiguity of his standpoint even more pronounced. The soviets rallied to Kerensky's support and "saved" the Provisional Government; but the respect of both radicals and conservatives for Kerensky was irretrievably lost, the army became completely disorganized and the soviets moved farther to the left.

In the meantime Trotsky, who together with the group of united Social Democrats (Mezhrayontsi) had joined the Bolshevik party in July and was rapidly becoming a most influential figure in the left wing, was elected president of the Petrograd Soviet. Together with Lenin, who had put forward the slogan "All power to the soviets" immediately upon his arrival in Petrograd early in April, Trotsky insisted, against the advice of other Bolshevik leaders, that the proper time had arrived for the seizure of power on behalf of the soviets. It was Trotsky who created the Military Revolutionary Committee of the Petrograd Soviet and obtained complete control of the garrison and the arms of Petrograd. In October all Russia was aware that a Bolshevik insurrection in the capital was impending. When it occurred on October 25, the Provisional Government was overthrown as easily as the czarist government had been eight months before. But whereas the February rising had been entirely spontaneous and unorganized, in October the masses were led by the Bolshevik party with Lenin at its head. When the government headquarters in the Winter Palace were occupied by a detachment of Kronstadt sailors, the second All Russian Soviet Congress, which convened in Petrograd on the day of the insurrection, declared that all power was now transferred to the soviets of workers', soldiers' and

peasants' deputies. Through their chosen representatives the Russian masses had assumed the government of the country. In the midst of complete chaos a group of men breaking entirely with the past and filled with a fanatical faith in the future had taken upon itself the gigantic task of creating a new order.

While other parties allowed themselves to be dragged along in the wake of the revolutionary process, Lenin had the courage to accept the dynamics of the revolution and to put the Bolshevik party in the lead. His own views allowed him easily to adopt the demands of the masses and to become their mouthpiece. There were four major problems which determined the unfolding of the revolution: war, land, control of industry and the status of the non-Russian nationalities. Lenin could sponsor wholeheartedly the demand for an immediate peace. Whereas old revolutionary leaders like Plekhanov and Kropotkin had become war patriots, Lenin had since the outbreak of the war maintained that it was a struggle between two imperialist blocs which the proletariat of each country should endeavor to transform into a civil war against its own bourgeoisie. On the issues of workers' control of industry and of the partition of landed estates Lenin had only to follow the trend which had manifested itself in direct action throughout the country. Likewise the problem of the non-Russian nationalities had found a *de facto* solution even before November, 1917; Finland, the Ukraine, the peoples of the Caucasus, the Mohammedans of the lower Volga, Crimea and central Asia and the peasant nationalities of the Baltic provinces had set up national governments which declared their autonomy or even complete independence of the Provisional Government. The bourgeois parties fought against this spontaneous process of devolution; in fact it was the demands of the Ukrainian Rada which precipitated the final break of the Kadets with the Provisional Government. But Lenin in accord with his internationalist viewpoint proclaimed the right of all peoples to self-determination and applied this principle not only to the oppressed nationalities in the enemy camp, as the other governments did, but also to those in his own country.

In taking over the government of the former Russian Empire Lenin was supported by the good will of all numerically important elements of the population—the soldiers, the peasants, the workers and the non-Russian nationalities. The new government set out immediately to

fulfil the demands of these groups, invalidating thereby the contention of its opponents that it could not last longer than a few weeks. It proved stronger than the apparently powerful coalitions of czarist generals, who stood for the past, with the Entente or the Central Powers, which represented an element alien and repugnant to the Russian masses. During the period of civil war and foreign intervention, from 1918 to the close of 1920, the Communist party, as the Bolshevik party renamed itself, was able to consolidate its power in the face of seemingly insurmountable economic and strategic difficulties.

The second Soviet Congress, which established the new government, issued a call to all belligerent nations to open immediate negotiations for a just, democratic peace. It also promulgated a decree confiscating landlords' estates as well as crown and church lands and placing them under the protection of district soviets and local land committees. This decree legalized the agrarian revolution, which had been in process since early summer. It was not a realization of the Bolshevik program of land nationalization but the fulfilment of the aspirations of the peasants, who had to be won over if the new government was to be established on a firm base. On November 2 a "declaration of the rights of peoples" conferred upon the different nationalities in Russia the right of self-determination and even of separation. Workers' control of industry was authorized on November 14, when it was provided that the shop committees should assume control over production, purchase and sale of raw materials and products and the finances of all business units employing hired labor.

To secure "all power to the Soviets" it was necessary to prevent the reappearance of dual government through the Constituent Assembly. Although for several decades the intelligentsia had dreamed that a free and happy Russia would issue from the deliberations of a constituent assembly, the latter remained a formal ideal without any content; in typical Russian fashion it was expected to work miracles as a pure idea. When the turn of events in February made possible the convocation of the assembly, the intelligentsia suddenly awoke to the fact that the masses were not prepared for this enormous task of democratic reconstruction and postponed elections from month to month. Certain groups moreover wished to delay the assembly until the army was demobilized, on the ground that the settlement of fundamental issues would inter-

ferre with the active prosecution of the war. In the first months of the revolution the Bolsheviks pressed for an early convocation of the assembly; even after the demand for Soviet rule had been voiced, they maintained that only a Soviet government could assure the speedy arrangement of free elections. These were provided, however, by the Provisional Government before its demise and were held a fortnight after Soviet accession to power. The Socialist Revolutionary party won a large majority of the seats.

The Constituent Assembly met on January 5, 1918, in an atmosphere of extreme tension. If it had been convened six months earlier it might radically have altered the development of the revolution. Now, however, it was too late. The Bolsheviks declared that the revolution had already recognized the Soviets as the sole government of Russia and that only a dictatorship of workers and peasants could lay the foundations of a socialist society. The popular mind was changing so rapidly in this dynamic revolutionary period that the representatives elected in November no longer reflected the true spirit of the masses. Once more the Socialist Revolutionaries showed that they lived in a world of fictions, for they actually believed that the Soviet government would not dare to attack an assembly which expressed the supreme will of the people and that the people would rise spontaneously to its defense. They were sorely disappointed. In the early morning of January 6 the Constituent Assembly was dispersed by the military guard without any resistance by the members or by the public. Long a cherished ideal, it had come to an abrupt and undignified end. The prestige of the Bolsheviks was greatly strengthened by this easy victory.

Meanwhile peace negotiations with the Central Powers had been opened at Brest Litovsk on November 19, 1917. The Soviet Congress appealed for an armistice on all fronts and urged a general peace based on the principles of no annexations or indemnities and of national self-determination. The Entente ignored the request for a general armistice and the Central Powers defeated the demand for a democratic peace. When the Germans attempted to cloak annexationist proposals with the phraseology of national liberation, Trotsky, who directed the Russian delegation, forced the issue and broke up the negotiations. But Russia was entirely unprepared for the continuation of war, which daily stiffened Germany's position. As usual Lenin did not flinch; he derided the talk of a

"holy war" of revolutionary Russia against imperialist Germany and forced the signing of the peace treaty on February 18, 1918. It involved the loss not only of Poland and the Baltic provinces but also of the Ukraine with its rich agricultural land, vast mineral resources and important heavy industries. Acceptance of the humiliating treaty was necessary if the revolution was to be saved. Furthermore the Bolsheviks were quite certain that the treaty would soon be scrapped, for they expected that the establishment of a dictatorship of the proletariat in Russia would be followed by an international proletarian revolution. Although this hope proved vain, the Germans were compelled a year later to submit at Versailles to a peace treaty which was not only very similar to that imposed by them at Brest Litovsk but which abrogated the latter.

In March, 1918, the revolution seemed secure in its achievements. The Soviet government was constituted as the sole government of Russia and its seat was transferred from imperial Petrograd to Moscow, which was more centrally located and always had been closer to the real life of the country. It had rid itself of a foreign menace and was rapidly overcoming such internal resistance as the sabotage of the administrative apparatus taken over from the old government. A period of internal reconstruction was pending. By the end of June, 1918, banks and insurance companies, large scale industry, mines, water transport and the few railways formerly operated by private companies had been nationalized, foreign debts incurred by the czarist and provisional governments were repudiated, foreign investments in private industry were confiscated and foreign trade was declared a monopoly of the state. The cooperation of the professional and technical intelligentsia was sought when it became clear that their skill and experience were indispensable. But the Soviet government was not allowed to proceed in peace. It was forced to defend a country shattered by war and revolution in a desperate struggle against external and internal aggression.

Aggression from within was met by the execution of the dictatorship of the Communist party and by the Red terror. The Extraordinary Commission for the Repression of Counter-revolution, Sabotage and Speculation (Cheka) created in December, 1917, was now given a free hand. The terror was carried out with the utmost ruthlessness, but it began only after the uprising of left Socialist Revolutionaries, the former allies

of the Bolsheviks, in July, 1918, the assassination of the president of the Petrograd Cheka and the attempt by the right wing Socialist Revolutionary Dora Kaplan to assassinate Lenin at the end of August. In the merciless struggle which ensued the iron discipline of the Communist party proved superior to the terrorist idealism of its adversaries, who once more proved themselves out of touch with the real life of the masses. The Communist party, which suppressed the supreme representative assembly of the country and accepted a humiliating peace for Russia, was considered by the Socialist Revolutionaries as insidious an enemy of the people as the czarist autocracy had been. It was overlooked that whereas the autocracy had been estranged from the people, the Communist party had risen to power by accepting and following their aspirations.

Aggression from the outside, by the armies of White generals and foreign states, served only to strengthen the Soviet government. Russia was practically surrounded by armies of foreign invaders: German and Austrian troops occupied the Ukraine and assisted White armies in the northern Caucasus; a Czech corps of former Austrian war prisoners was operating in the Urals and in Siberia, which was invaded also by Japanese forces; English and French troops established a "democratic" government in northern Russia; and French warships entered the Black Sea ports of Odessa, Nikolaev and Kherson. But the most dangerous enemies of the Soviets were the volunteer army in southern Russia under the command of generals Alekseyev and Kornilov (November, 1917–March, 1918), Denikin (April, 1918–March, 1920) and Wrangel (March–November, 1920) and the Siberian army under Admiral Kolchak (November, 1918–January, 1920), who was proclaimed by the Whites supreme ruler of Russia. For some time the situation of the Moscow government appeared desperate. It was cut off from the regions supplying wheat, meat, coal and oil, and it had no army or ammunition for defense against foreign troops and the forces of former Russian officers and Cossacks, supplied as these were with technical advice, munitions and money from abroad. Eventually the Soviets won, for the conflict was not primarily a trial of military strength. It was a class war. Although in several instances the commanders of the White armies arranged at the start for an agreement with right wing socialists and created a semblance of democratic government, this policy was

quickly discarded in favor of military dictatorships which treated the regions under their control as conquered territory. The workers, peasants and non-Russian nationalities soon realized that government by the Whites meant the return to power of their old masters and gave their sympathies to the Communists. In certain of its aspects the conflict was indeed a national war. For in a desperate attempt to restore the old order the dispossessed nobility and upper bourgeoisie indiscriminately "sold out" Russia to the Allies and to the Germans, in fact to every foreign power willing to stake money and men on the alluring prospect of the victory of reaction. In the last analysis the issue was decided perhaps by a moral factor. The war was waged with ruthless cruelty on both sides, but on the side of the Whites the ruthlessness was coupled with a deliberate disregard for human values. The corruption and incompetence of most of the White officers and their civilian underlings in southern Russia and Siberia were more disgusting than the witches' sabbath of the last months of the czarist regime. On the other side the Red army of workers and peasants created by Trotsky's genius bore witness, by its simplicity and idealistic devotion, to the inner strength of the Soviet cause. The Red army was moved by an overwhelming enthusiasm for the revolution in Russia and in the world. As in 1792, the badly equipped revolutionary amateurs fighting for the freedom of their own country and a new deal for humanity defeated the well trained professionals of the old order. A new dynamic spirit was born in the formerly apathetic Russian masses.

By the end of 1920 the Soviet power was consolidated both internally and externally. The White armies were dispersed. The war against Poland was lost after initial conspicuous successes, but on the other hand it had induced nationally minded groups actively to support the Soviet government. Russia was reconstituted within its old borders, except for the western provinces now organized into independent states—Poland, the Baltic countries and Finland—which, it may be noted, represented the most Europeanized sections of the old empire. The capitalist powers were forced to give up for the time being their designs upon Russia or the Soviet government. In a war weary world it was difficult to marshal new troops for the fight against the "Bolshevik pest," and the political and economic blockade by the border states under Entente guidance eventually collapsed.

The Soviet government on its side had to abandon hope of immediate world revolution. The Communist, or Third, International, founded by Lenin in 1919 as the legitimate successor of the First International, was intended to expedite and direct the world revolution; but it proved ineffective and in the course of the following decade lost much of its early vigor. It was transformed in fact into an instrumentality for the support of the only proletarian state in existence, the Union of Soviet Socialist Republics. Outside Russia nationalism was stronger than socialism. The short lived Soviet governments of Hungary and Bavaria were overthrown by reactionary dictatorships, Fascism was on its march to power in Italy, while the Social Democratic parties in central Europe collaborated with the bourgeoisie in strengthening the national states. In western Europe capitalism seemed to be entering upon a new period of post-war stabilization. From a revolutionary standpoint the objective conditions in the Orient seemed much more promising. The colonial and semicolonial peoples of the East suffered from political oppression by foreign masters and economic exploitation by western capitalists; their national revolutions could therefore easily be turned into social revolutions. But after 1922 even Asia witnessed a period of comparative stabilization, due in part to the skilful policy of concessions adopted by Great Britain. The great Communist Congress of the eastern nations convoked at Baku in September, 1920, had no successor. Yet Soviet policy in the Orient was of far reaching importance. The Asiatic peoples, having entered the stage of conscious nationalism after the World War, were no longer confronted by a relentless aggressor against their nationhood and progress; the new Soviet state was a friendly neighbor, encouraging in every conceivable fashion their national and economic independence. The Soviet policy based on the principle of complete equality of all nationalities and races effected a revolution in the relations between the Orient and the Occident. This was not, however, the hoped for prelude to a Communist world revolution; the "emancipation of the East" benefited the Soviet Union only to the extent that it resulted in weakening western imperialism and capitalism.

External consolidation of the Soviet government was accompanied by a major change in its internal policy. Although it conformed in a general way to Communist doctrine, the system of war communism which obtained in Russia

after the middle of 1918 was inaugurated hastily under the pressure of civil war, internal sabotage by capitalists and technicians and the rapid taking over of industrial plants by the workers. The state or cooperative organizations closely integrated with the state operated under this system virtually all enterprises in industry and trade. Agriculture remained in the hands of the peasants, but cultivation of the soil was compulsory and grain surpluses were requisitioned by the Soviet. While war was raging this system was needed to assure the equipment and provisioning of the army and to prevent starvation in the cities, but it could not be maintained when the danger of external and internal counter-revolution had waned. It was moreover a heavy drain upon the capital resources of the nation, already seriously depleted after more than three years of war and revolution. At the end of the civil war the transportation system was in a state of disrepair, the shortage of materials and fuel brought the productivity of industry to a very low ebb, inefficient husbandry reduced crops and livestock and resulted in widespread food shortage, which a drought in 1921 transformed into a devastating famine, particularly in the Volga region. Peasant revolts against grain requisitions in 1920 and the mutiny of Kronstadt sailors in March, 1921, revealed the necessity of prompt measures to relieve the desperate economic situation. Once more Lenin's realism came to the rescue; he declared that communism could be built in Russia only after a short breathing spell, which would restore some measure of economic productivity and rehabilitate the political strength of the government. The tenth congress of the Communist party in March, 1921, adopted Lenin's program of a New Economic Policy, the NEP.

Lenin realized that large scale social and economic transformation in Russia must encounter tremendous obstacles. He saw that the revolution would have to overcome not merely the deliberate opposition of vested interests, which was weaker here than in richer western countries, but also the stronger and more insidious psychological resistance to radical change. Unlike the peoples of the West, the Russians were still bound by tradition and lacking in initiative and efficiency. To build socialism in Russia, to assure a decent standard of living for the masses, it was not sufficient to redistribute wealth or to socialize the means of production. It was essential to raise all branches of production to a higher technical level, to introduce into Russia

the modern technology of progressive industrialism. But before the Russian could appreciate the need for an advanced technical civilization and adapt himself to its requirements, a process of drastic reeducation and indoctrination was required. The Communist party could not attempt to impose industrialization from above, as is done in backward countries by alien interests; if it was to reshape the Russian economy into a foundation suited to a socialist society it had to enlist the cooperation of the masses, to arouse in them a sense of self-respect, to dignify labor for them and through them. The period of the NEP served as a respite also in this respect, it provided an opportunity for the training of the party membership to the new tasks of economic administration and for the preparation of a comprehensive reeducation of the masses.

Perhaps the most important single feature of the NEP was the replacement of the system of requisitions by a fixed grain tax, which in 1924, with the stabilization of the ruble on a gold basis, was commuted into a money tax on agriculture. The peasant was thus set free to dispose of his products in the open market. Small business reverted to private traders, but large scale industry and the important monopoly of foreign trade remained in the hands of the government. There quickly developed a new class of prosperous peasants (kulaks) and urban middlemen (Nepmen), whose wealth, however, gave them neither political rights nor social standing; moreover they were heavily taxed and closely supervised. In general the danger of a new capitalism was slight. Bourgeois experts were utilized, in so far as they were available, to assist in the economic reequipment of the country, but they were kept under strict control. Reliance upon the profit motive and the market mechanism was reintroduced even in the nationalized sector of the economy, but it was kept within narrowly defined bounds. Special emphasis was put upon the *smichka*, the economic link between the industrial proletariat and the peasantry. State factories were charged with the task of supplying at a reasonable cost the industrial products needed by the peasants, and the danger inherent in the excessive disparity between industrial and agricultural prices was combated.

During the period of the NEP, which lasted from 1921 to 1928, the position of the bureaucracy in the governmental and economic spheres was strengthened and the importance of the party apparatus increased *pari passu*. In these years the Communist party passed through a

phase of factional dissension and inner conflict which brought a new emphasis on party discipline and teamwork. The latter was essential in preparation for the rapid reconstruction of a vast and backward country, which would inevitably strain the forces of the party to the utmost. The heroic period of the revolution, the epoch of brilliant improvisation and genial guessing, was over; the industrial period of systematic, carefully planned construction was pending. As an organization of picked men under iron discipline the Communist party was well equipped to overcome the danger inherent in all parties of revolution and especially in Russian parties—the fatal predilection for interminable abstract discussion and the consequent incapacity for leadership.

Lenin's unique position in the party and in the revolution may be attributed to the fact that he combined the traits of an organizer and educator with those of a penetrating thinker. Upon his retirement from active participation and especially after his death in 1924 Trotsky, the brilliant intellectual, the hero of the October insurrection and the civil war, fell heir to Lenin's position as the party's foremost theorist. But during the period of consolidation the party machine had come into its own. At its head stood Stalin, a man devoid of theoretical profundity, incapable of stirring the masses by his eloquence but energetic and persevering in the practical work of building the party organization. Totally unlike the older type of the Russian revolutionary intellectual, Stalin is not a dreamer with broad cultural interests but a practical man who has his ear close to the ground; he is representative not of the party as it was before 1917 or during the heroic period of the revolution but of the party as it developed after 1924, of the new Soviet intelligentsia. In the struggle for power between Stalin and Trotsky, which marked the second half of the NEP period, the latter was almost always theoretically correct and accurate in interpreting Lenin; but Stalin preserved an equally important aspect of Lenin's heritage in being more skilful in fixing upon the practical needs of the hour. It was a conflict between two generations and two temperaments. Stalin won; his opponents had to submit or suffer expulsion from the party. Under the regime of the "general line" the party had developed into an apparatus governed by the most rigid discipline, an instrumentality of action directed by a few men at the top. This characteristic of the party served to give it a commanding

position in 1917; it was reenforced and indeed overemphasized as the revolution resumed its stormy march upon the termination of the NEP in 1928.

One of the points at issue in the Trotsky-Stalin controversy was the agricultural policy. As early as 1925 Trotsky had led the left wing in opposition to the party line, insisting on a vigorous policy against the kulaks. He asserted that the kulaks, who rented land and hired outside labor, were becoming the chief source of supply of food for the cities and of grain for export; their economic influence was growing and the situation was rapidly approaching a point where the fate of the country might have to depend largely upon their willingness to cooperate. The "right deviation," which crystallized somewhat later, feared on the other hand that an attack upon the kulaks and abandonment of the NEP would result in a complete economic breakdown. Stalin maintained a position midway between the two, but in 1929 he adopted Trotsky's agrarian program. Stalin's shift did not, however, effect a reconciliation with Trotsky, for the fundamental ideological difference between the two was much broader than this issue; it had been at the basis of their disagreements on every concrete question of domestic and foreign policy and there is every likelihood that the divergence will continue. Stated in most general terms it concerns the problem as to whether socialism can be built in a single country. Trotsky maintains, in accordance with Lenin's position both before and during the revolution, that the establishment of Communist rule in Russia must lead to a world proletarian revolution and that socialism cannot be achieved in Russia alone; policies which go contrary to this assumption and count on the persistence of capitalism in the West are bound to lead to a degeneration of the proletarian dictatorship in Russia and to the loss of its effectiveness as the leader of world Communism. Stalin, on the other hand, proceeds from the apparently more realistic assumption that there is no hope for a world revolution for the time being, that socialism must therefore first be developed in the Soviet Union and that the necessary conditions for such development must be created through the industrialization of the country and the collectivization of its agriculture. This policy, it is asserted, accords with the internal economic and educational needs of the Soviet Union; it has an important bearing also on the international situation, for the achieve-

ment of socialism in Russia will be the most effective form of propaganda for world Communism.

Stalin's policy was adopted when the NEP was abandoned in 1928. Since that time a direct and relentless drive toward the goal of socialism has been pursued, although compromises, concessions and temporary retreats are still employed to rectify maladjustments arising from excessive speed. The current aim is the rapid transformation of a backward agrarian community into a progressive industrial nation. Internally it involves the mobilization of the entire nation under the centralized command of the Communist party operating as the general staff of an army through its own apparatus and the more ramified structure of the totalitarian state. The pace which has been set, conditioned in part by military considerations, leads despite centralized organization to much waste and, in a country poor in accumulated capital, to terrible suffering, which can be borne only by those peoples who are ready to sacrifice the present to the future. In its international aspects the policy of industrialization leads to the emancipation of Russia from economic dependence on the West, upon which it had to rely even after the revolution for the importation of machinery and technical experts available only in exchange against agricultural exports. The aspiration toward economic self-sufficiency has also a political angle; the revolution is to be protected from a possible attack by imperialist powers which would seek to destroy the beginnings of socialism.

The drive toward socialism calls for advance planning in all branches of the economic and cultural life of the country; indeed the post-NEP era has been characterized as the period of planned economy, more accurately, of planned society. Broadly speaking, the advance proceeds along three roads: industry, agriculture and culture, or education. Work on the industrial front will provide the plant necessary for the introduction of a universally high standard of living. In the first stages it is proposed to establish the conditions essential for the efficient exploitation of the natural resources and to build up the heavy industries supplying the equipment needed in the manufacture of consumer goods and in agriculture. This campaign is closely bound up with the awakening of the spirit of initiative and self-reliance in the working masses and with their training in technical and managerial skills. On the agrarian front the

program involves the introduction of machinery and modern methods of cultivation as well as the substitution of technically efficient collective farming for the primitive and deficient individual farming of the Russian peasant, it is expected to assure not only an increase in the supply of foodstuffs for domestic consumption and of raw materials for industrial expansion but also the establishment of a real community of interest between the workers in city and country, the *smchka* which Lenin insisted upon. Advance on the cultural front is a necessary supplement to the work in the economic sphere, for it is designed to combat illiteracy and traditionalism, to change the habits and ways of life of the masses. Cultural activity is dominated by as strict a discipline as that which controls economic processes. Adult and child are indoctrinated with the new spirit, a boundless enthusiasm for the task of building a classless society and a high efficiency in the performance of concrete tasks. The arts and sciences are mobilized to this end; and cultural treasures, formerly inaccessible to the masses of Russia, are spread before the new citizens to awaken in them a sense of independence and dignity as active participants in the new society. Religion is fought as an element of reaction, which tends to make men look back to the past rather than forward to the future. But the propaganda of the goddess is effective only because the youth in the Soviet Union has a new faith in the possibility of human happiness.

Since the inauguration of comprehensive planning Soviet development has been controlled by two five-year plans. The first, dating from October 1, 1928, was declared successfully terminated at the end of 1932. In accordance with it much progress was made in the development of heavy industries. the coal industry was modernized, oil output was expanded, the production of electric energy was almost tripled, new blast furnaces, automobile and tractor plants and machine factories were erected. But the transportation system remained weak, the development of the light industries manufacturing consumers' goods lagged behind and the population, still suffering from the shortage of many essential articles of consumption, was put under a terrific nervous strain. The excessive speed of industrialization interfered with the proper coordination of the various branches of production, while the lack of technical experience and the ineptness of the bureaucracy resulted in considerable waste. In keeping with

Lenin's policy of elastic readjustment Stalin in 1931 abandoned exclusive reliance upon "socialist competition" and introduced a system of bonuses, piecework and graduated wages to stimulate efficiency and workmanship, stressing also the necessity of greater confidence in experts and more wholehearted cooperation with them.

During the period of the first Five-Year Plan the changes in agriculture were more drastic than in any other branch of the Soviet economy. These were necessary in view of the inability of agriculture, as carried on under the archaic Russian system, to meet the growing needs of an expanding industrial society and the development of a class of capitalistically minded peasants, which represented a potential danger to the state. The World War interrupted the work of consolidating the scattered holdings of peasant families, which was an important feature of Stolpin's reforms. During 1917 the system of communal land tenure with periodic repartitions, which retarded the adoption of more intensive methods of cultivation, was restored throughout Russia. The period of civil war and the early years of the NEP involved considerable retrogression even from the low standards of pre-war agriculture. Since the population increased at a high rate and industry expanded rapidly, it was possible that in the not too distant future there would be a shortage of foodstuffs and organic raw materials. In 1925 the government resumed the work of rearranging intermixed strips of land into solid plots, put credits and machines at the disposal of peasant cooperatives and sent agricultural experts into the villages. By 1927 agriculture reached the pre-war norm and the livestock losses incurred in 1921-22, the years of famine, were recouped. But industry could not as yet meet the demand of the peasants for finished goods, and the disparity between industrial and agricultural prices increased to the detriment of the latter. Agricultural output was therefore reduced, and the government, unable to purchase a sufficient quantity of grain, especially for export, resorted once more to requisition at fixed prices. The year 1928-29 was marked by widespread peasant unrest. In the autumn of 1929 the government inaugurated a vigorous campaign of rapid collectivization of farms. Because of the ruthlessness and inexperience with which it was carried out, the reform provoked considerable resentment. In the spring of 1930 Stalin was compelled to remind overzealous Communists that

collective farms could be formed only after due preparation and with the voluntary consent of the prospective members. It was moreover agreed that for the time being a modified form of collective organization in which only land, implements and draft animals were pooled was preferable to the commune which would socialize all property and provide for common living quarters. The ruthless war against kulaks was continued, but the middle and poor peasants were subjected only to the indirect pressure of tax and credit discrimination in favor of the collectives and of a vast educational campaign. The number of machine tractor stations, which lease machines in exchange for a share of the crop, was greatly increased and sections were attached to them charged with the task of organizing new collectives and reorganizing those which had received a bad start. Poor harvests in 1931 and 1932, sabotage by kulaks who slaughtered their animals and the preparations for a war which threatened in the Far East brought on a grave crisis in 1932. The prolonged unrest in the Ukraine and in the northern Caucasus was appeased only after large peasant groups were banished to the north and to Siberia, the cities experienced a hard winter. But in 1933 an excellent harvest eased the situation. In the spring of that year the government introduced a fixed grain tax sufficient to provide for its needs; the surplus grain was left to the collectives for distribution to the individual members in proportion to the number of days worked. Such grain might be sold or exchanged against manufactured goods on the free market; the same rule was applied to the products of poultry yards and vegetable gardens held as individual property by the members of collectives. A working compromise was thus reached in 1933-34, assuring the socialization of the countryside—the education of the peasantry in collective and efficient work and its cultural indoctrination—and allowing at the same time a measure of individual profit making as an incentive.

A similar evolution of the original policy is to be observed in the field of industry. The speed of industrialization which proved so onerous in 1928-32 was moderated under the second Five-Year Plan launched in 1933. The latter lays more stress upon light industries manufacturing goods for popular consumption in the city and especially in the country. It envisages a more intensive development of the Asiatic parts of the Soviet Union, less exposed to the attack of the western powers. The sparse and primitive popu-

lation of these regions is to be raised to the highest levels attained in European Russia, while new railways will tap the potential riches of the vast forests of northern Siberia and of the steppes of Kazakhstan.

Soviet concentration upon the building of socialism in one country affects also the foreign policy of the government. After the defeat suffered by Communism in China at the hands of the nationalist upper class, the attitude of the Soviet Union to oriental nations, always one of friendship and equality, is no longer colored by expectation of their rapid conversion to Communism. In recent years the relations between the U S S R. and Turkey, which like Russia is passing through a process of Europeanization, have been particularly close. The desire to prevent aggression against Russia, which was early crystallized as an important factor in the western policy of the Soviet, has virtually excluded almost every other aim since the inauguration of planned economy in Russia and particularly since the economic crisis of 1929 with its aggravation of the international situation in Europe. The Soviet government has pursued a very active policy of non-aggression treaties, has advocated total disarmament and has proposed pacts looking toward the complete cessation of all forms of economic aggression. At the present time the international prestige of the Soviet Union, friendly to the nations of the East and sincerely anxious for peace with the nations of the West, is probably superior to that enjoyed by imperial Russia in the twentieth century.

The revolution in Russia has not ended, but its direction and goal appear to be fixed. In a vast Eurasian country it is accomplishing a change comparable to that which the French Revolution effected in France and initiated for the other nations of continental Europe; it is secularizing a civilization formerly bound by religious traditionalism and raising the bulk of the population to new levels of material and cultural life. Politically its role in Russia is not unlike that of democratic nationalism in the West—it is building a state deeply rooted in the consciousness of the masses. Russian autocracy perished because it was neither integrated with the people nor linked to the economic organization of the country; the government of the Soviet Union will not fail in either respect. The transition from one to the other has followed two characteristically western principles—industrialism and its critical evaluation, Marxism.

The fourth stage of the process designated above as the Russian Revolution was initiated by a generation of émigrés who brought to the Asiatic chaos of old Russia the discipline of western intellectualism and the vigor of European activism. At present it is being pushed forward by a generation which has its roots in the Russian soil and which embraces the various nationalities of the Soviet Union. To the third generation of leaders, which will take the helm in the future, life in old Russia will be as little known as that of foreign countries. Thus the Europeanization of Russia will be continued as an autonomous process directed entirely by indigenous forces.

The transformation of Russia from a backward country with an illiterate population and a primitive agrarian economy into a progressive state with a cultured population and a modern industrial economy is in keeping with the general trend of the twentieth century. The weakness of old Russia, idealized by the Slavophiles as its peculiar virtue, lay in the fact that from about 1800 it was out of harmony with the rest of Europe. With an increase in international interdependence characteristic of the period of imperialism this comparative isolation could no longer be maintained; the pressure for the effective utilization of natural resources throughout the world was too strong to be resisted. Russia was drawn into the orbit of world economy before 1917, but in a wholly inadequate fashion; its resources were often exploited by and for foreign capital. The revolution of 1917 impelled the Russian people to assume control of this process and to guide it in their own interest. This interpretation of the 1917 revolution, advanced by Hans von Eckardt, makes it appear a Russian variant of a post-war phenomenon characteristic of many countries which like Russia had been virtually semicolonial dependencies of European powers. Europeanization, which before the World War had been passive, has now become active. Oriental and Latin American nationalities are taking over European civilization in order to raise the economic and cultural levels of their own populations and to achieve independence of European masters. At present the Soviet Union, with its emphasis upon industrialization and mass education, is leading in this process.

In any discussion of the 1917 revolution in Russia and of the essentially similar processes of active Europeanization elsewhere which sets out to treat these developments as reproductive of

the significant tendencies of the French Revolution, certain transitional phenomena are necessarily disregarded. These may be described as the superficial resemblances between Bolshevism and fascism. Both erect the colossal structure of the totalitarian state dominated completely by one party, both resort to the total mobilization of all resources in the interests of the state. But in fascist countries the national or racial state is an end in itself, its totalitarian character is a permanent feature, while in Bolshevik ideology the dictatorial state is a tool eventually to be replaced by a society of free and equal individuals. Fascism and reactionary nationalism appeal to emotions linked with the past, seeking to infuse new vigor into the traditional ideals of the nation or race. Bolshevism appeals to science and reason, destroys the links with national and racial traditions and looks toward a future when all distinctions of the past will be abolished. Bolshevism has been characterized as an effort to establish the kingdom of God against God; it could as well be described as an effort to realize the ideals of liberalism and humanitarianism by means thoroughly abhorrent to liberals and humanitarians.

It is sometimes asserted that the strengthening of the Soviet Union through the building of "socialism in one country" will lead to a development of Russian nationalism. This contention disregards the important fact that the Soviet government is not a Russian government; it is a government representing equally the various nationalities and ethnic groups within the union. It seeks not to promote a particular national or racial culture at the expense of others but to impregnate the masses with a common supranational culture freely expressed and developed by each nationality in its own language. In creating a large economic unit, which alone under modern conditions can assure the efficient combination of the resources of different geographic and climatic zones, and in avoiding at the same time any discrimination against or in favor of a particular racial element the Union of Soviet Socialist Republics sets an important example in the organization of vast territories inhabited by many nationalities at different stages of cultural development.

The Soviet revolution, which aims to elevate the cultural and economic status of the Russian masses, is likely to serve as a model for other semicolonial countries; their development will combine the features of national liberation and social emancipation. Under the "law of com-

bined development," to use Trotsky's phrase, they will profit simultaneously by the experience of both the French and the Russian Revolution. But to the western nations, which have benefited directly from the French Revolution and its seventeenth century forerunners in England, whose economies are industrialized and whose standards of living and culture are high, the Russian Revolution has thus far had little to offer. Communist parties organized after the pattern and under the guidance of the Communist party of the Soviet Union have been unable to attain a strong foothold in the countries of western Europe even in times of great economic stress or of crushing military defeat. This failure cannot be explained merely on grounds of incompetent leadership. The communist parties have not awakened to the fact that liberal nationalism and rationalistic individualism are an inalienable heritage of the past of western Europe. They have remained a sect essentially foreign to the environment in which they propose to function, and their doctrinaire terminology has carried no conviction. In capitalizing upon their ideological affiliation with the Soviet Union they have overstressed those aspects of the Russian Revolution which are the peculiar product of Russian social and economic history, such as the rapid advance of industrialization in agrarian Russia as compared with the economic crisis in the overindustrialized countries of Europe. On the other hand, they have passed lightly over those aspects of Soviet life which would be most likely to appeal to the western imagination, the creation of a new scale of social values under which man's worth is no longer measured by the size of his income; the new dignity of labor; the tendency toward the equalization of the standards of life for various population groups, including the leaders, who remain on a footing of comradeship with the masses; the free access of all to the cultural treasures of the nation.

The effects of the French Revolution could not clearly be appreciated until long after its apparent end. The effects of the Russian Revolution are operating upon a much wider area than those of the French, and the revolution itself is still in progress. It would be vain at present to attempt an appraisal of them. The Russian Revolution is the particular national expression of a common human hope. It will affect world history to the extent that it succeeds in attaining its avowed goal, the creation of a free society assuring the participation of every individual in its spiritual life and ma-

terial culture and the enjoyment by him of a full share of their product.

RUTHENBERG, CHARLES EMIL (1882-1927), American Communist leader. Ruthenberg, who was born in Cleveland, Ohio, joined the Socialist party in 1909 and shortly thereafter became recording secretary of the Cleveland Central Committee. He led the fight against the reformist policy of the Socialist party and in 1917 was one of the founders of the left wing within the party which forced the adoption of the antiwar platform at the St. Louis convention. As the first leading Socialist to be sentenced for antiwar activity he served a year in the Ohio state penitentiary at Canton. It was in protest against this imprisonment of Ruthenberg that Debs made the speech denouncing the government of the United States for entering the World War which led to his own incarceration. While Ruthenberg was appealing his conviction for antiwar activity he ran for mayor of Cleveland on an antiwar platform and received 27,000 out of a total of 100,000 votes. He organized a series of mass demonstrations against the World War, the most significant of which was that in Cleveland on May 1, 1919. The success of the Bolshevik revolution in Russia and his own experiences in antiwar work led Ruthenberg to join with other Socialists to transform the left wing of the Socialist party into a revolutionary party and in September, 1919, to organize the Communist party affiliated with the Communist

International. He was the first secretary of the party and, except for the three years from 1919 to 1922 which he spent in prison in New York state under conviction for criminal syndicalism, he was its leader until his death. In the fall of 1922 he was arrested with other leading Communists for participating in a secret party convention at Bridgman, Michigan; his conviction on charges of criminal syndicalism was under appeal when he died.

Ruthenberg brought to his task an exceptional ability for practical organizational work and keen political acumen. He was one of the first of the American Socialists to interpret the nature of American imperialism. He sought to root the Communist party in the trade unions, to win the Negroes to the revolutionary movement, to organize the agricultural workers and to develop a mass struggle against imperialist war. His program combined everyday demands for the improvement of the economic conditions of the workers with a constant emphasis on the need for a proletarian revolution in the United States.

RUTHERFORD, SAMUEL (c. 1600-61), Scottish ecclesiastic and political theorist. As minister of the parish of Anwoth, Rutherford attracted attention by preaching against prelay and Arminianism. For this defiance of the current High Church tendencies he was deposed in 1636 and banished to Aberdeen. Restored to influence by the events of the civil war, he took an active part as member of the Glasgow Assembly of 1638 and as a commissioner from Scotland to the Westminster Assembly in developing antiroyal public opinion. His position in the University of St. Andrews as professor of divinity and in 1651 as rector increased his power as propagandist. During the Commonwealth he led the group of protesters who favored Cromwell.

The zeal with which Rutherford defended presbyterianism against Erastians and advocates of episcopacy characterized his pamphlets against the absolutist claims of the royalists. In *Lex Rex*, while he admitted mixed monarchy to be the "sweetest of all governments," he main-

tained law to be above the king: *Salus populi, suprema lex*. The king's coronation oath bound him to rule justly, for his power was fiduciary. Sovereignty lay in the people, who retained a "natural power" to depose the unjust ruler. But if civil government had a natural origin, that of church government was supernatural, the power of the presbyters coming directly from God (*The Due Right of Presbyteries*). Nevertheless, pastor and magistrate must each admit the superiority of the other, each in his own sphere, by what Rutherford termed a "reciprocation of subordinations." Because the "power of the keys" was withheld from the ruler he could not be dethroned for heresy, yet a just king must, as father of the commonwealth, strive to promote godliness. At the Restoration Rutherford was regarded as such a violent opponent of the monarchy that his best known pamphlet, *Lex Rex*, was publicly burned in Edinburgh and he was summoned to appear before Parliament on a charge of high treason. He died before the trial could be held.

RYAN, THOMAS FORTUNE (1851-1928), American financier and traction magnate. Ryan became a Wall Street broker in 1870 and for several years executed orders for Jay Gould and other large scale speculators. In 1884 he joined forces with P. A. B. Widener and William C. Whitney, the one identified with Morgan and the other with Standard Oil interests; with them he headed the notorious extralegal syndicate that for almost two decades controlled the traction and lighting systems of dozens of cities, using political power to obtain franchises and immunity. Ryan and his associates made most of their great wealth in merging, monopolizing and manipulating the traction systems of New York City, providing at the same time very poor service. They organized the first important holding company, the Metropolitan Traction

Company, to exchange subsidiary traction companies for watered securities of their operating company; after forcing up the market they unloaded these on the public. In addition they frequently had interests in subsidiaries leased or sold to the operating company and in construction companies receiving exorbitant contracts from it. Ryan's interests became increasingly widespread. He was the directing power in the formation of the American tobacco trust (legally dissolved in 1911), which by 1901 controlled about 80 percent of the domestic tobacco business. To end international competition, in 1902 he helped form the British-American Tobacco Company, with a two-thirds interest for his American companies, to operate beyond the agreed jurisdictions of the English and American monopolies. His many other interests included railways and coal mines and a partnership with Leopold II and the Belgian government for exploiting Congo mines and rubber plantations. When Ryan retired in 1908, he dominated over thirty corporations and controlled public utilities valued approximately at \$1,500,000,000. In order to facilitate his many promotions and syndicate operations Ryan organized or secured control of trust and insurance companies and banks. Some of these as well as certain of his traction undertakings were involved in scandals which followed exposures by government investigations. However, the most important corporation lawyers were employed to keep his speculations and promotions within the law. He was the invisible power in Tammany Hall, a large contributor to the national Democratic party and a leader of the opposition to William J. Bryan. When he died his estate was estimated at from \$200,000,000 to \$300,000,000.

SABATIER, PAUL (1858–1928), French historian. Sabatier's *Vie de Saint François d'Assise* (Paris 1894, 47th rev. ed. 1926; tr. by L. S. Houghton, New York 1894) might well be called his life work. Shortly after the publication of the first edition he resigned his post as a Protestant pastor and removed to Assisi, the native town of St. Francis, where he prepared the successive editions and undertook a systematic study of the manuscript sources, which led to his editions of the *Speculum perfectionis* (Paris 1898), the *Fioretti* (Paris 1902) and its Latin original, the oldest rule of the Third Order, the *Legenda vetus* (Paris 1902) and various other documents pertaining to the early history of the movement. In 1898 he established a series of publications entitled *Collection d'études et de documents sur l'histoire religieuse et littéraire du moyen âge* (7 vols., Paris 1898–1909) and in 1901 *Opuscules de critique historique* (2 vols., Paris 1901–19). He also founded the Société Internationale des Études Franciscaines in 1902 and the British Society of Franciscan Studies in 1908. Outside the field of Franciscan history his best known work is perhaps his study of Catholic modernism, *Les modernistes* (Paris 1909; tr. by C. A. Miles, London 1908). From 1919 until 1927 he taught ecclesiastical history at Strasbourg.

The *Vie de Saint François* was undertaken under the inspiration of Renan and in general conception resembles the latter's *Vie de Jésus*. With an enthusiasm which despite his self-imposed labors among the sources not infrequently made him uncritical, Sabatier strove to resurrect in his own emotions and in his work the life of Francis, convinced in any case that objective history was a "utopia." In Francis he found a saint who belonged not exclusively to the church but to humanity, who in fact was an unconscious rebel against ecclesiastical discipline, although Sabatier later disclaimed the view that Francis was a forerunner of Protestantism. The book thus became a colorful but reasoned act of faith, occupying a unique place in Franciscan literature between the hagiographical *Fioretti* and the erudite biographies. The modern enthusiasm for Franciscanism among both laity and scholars is largely attributable to Sabatier's work. Not only through these indirect channels but through his own enormously popular book he played a part of great importance in turning attention to the spiritual and cultural revolution which was in process in the towns of the thirteenth century. By repeatedly

emphasizing that Francis was the product of the restless, dynamic and incipiently individualistic spirit stirring among the urban masses he helped to break down the static conception of the Middle Ages and so to cast doubt upon the notion of a cataclysmic break between the mediæval period and the Renaissance.

Consult Maugain, G., "Paul Sabatier Notes biographiques" in *Revue d'histoire franciscaine*, vol. v (1928) 1–22, with excellent bibliography, Little, A. G., *Paul Sabatier* (Manchester 1929).

SABOTAGE, in the parlance of the labor movement, refers to the strategy of obstruction or interference with the processes of industry by employees in order to reduce the profits of the employer and so compel him to accede to their demands. It is one of the forms of direct action (*qv*), a means of exerting economic rather than political pressure. Sabotage may assume a variety of forms, ranging from the peaceful practices of restriction of output and "taking things easy" to the disabling of machinery and the dynamiting of plants. The leading advocates of sabotage, however, have opposed the permanent disabling of machinery and personal violence, and it is generally agreed that sabotage does not include acts directly involving danger to human life. Furthermore the use of the devices of sabotage is in theory not wanton or indiscriminate, their scope and incidence being consciously limited to the requirements involved in the realization of the scheduled demands.

The origin of the word is commonly traced to the act of a French workman in throwing his wooden shoe (*sabot*) into the machinery and stalling it in an effort to induce the employer to grant certain demands. Vebien relates it simply to the dragging clumsy movement which the wearing of wooden shoes entails. According to Pouget, the leading authority on sabotage, the word originally meant simply to work clumsily as if by *sabot* blows, it received "its syndical baptism" as the name of a recognized form of labor strategy at the 1897 congress of the Confédération Générale du Travail in Toulouse. Thereafter its systematic use in one form or another became an accepted part of the repertory of the syndicalist movement in France, Italy and Spain. Meanwhile in Anglo-Saxon countries, where the expressions "ca' canny" and "soldiering," roughly equivalent to peaceful sabotage, were already well understood and given frequent practical expression by both

organized and unorganized workers, the sophisticated use of this strategy found some application, especially among the more radical, left wing organizations. In England the dock workers in their strike of 1896 openly advocated the conscious use of 'ca' canny and for a time made the issue a very live one in trade union circles. In the United States the outstanding advocate of sabotage was the Industrial Workers of the World, which gave it much verbal and some practical application during the decade preceding the World War, even publishing in Los Angeles a journal called the *Wooden Shoe*.

The exponents of sabotage defend it as an inescapable concomitant of the struggle between labor and capital wherever production is conducted on the basis of private, laissez faire capitalism. Political action in a capitalist country, they argue, is necessarily sterile, because the political machinery is controlled by big business. The worker therefore must use economic pressure. The strike moreover is likely to be an ineffective method of exerting such pressure, because labor is unable to continue it long enough and because the usual oversupply of labor so often enables the employer even in the face of picketing to continue to operate and make profits by the use of scab labor. It is therefore necessary, they assert, to use tactics that will effectively reduce or interrupt the flow of profits. The workers should apply the tactics of sabotage to the conduct of the strike or substitute them for the conventional strike tactics. They should stop work but stay on the job at their machines so that the plant cannot be operated. They should remove key parts of the machinery when they walk out, like the Los Angeles street car motormen who suddenly left their cars in the streets, taking their control bars with them. Limitation of output, the syndicalists point out, is a universal accompaniment of capitalist production. When employers deliberately limit production or destroy part of their product to maintain the price or order their employees to slow down, as they not infrequently do, they are practising sabotage. This analogy has also been effectively pointed out by Thorstein Veblen. In any economy where the individual's profits often depend on the creation of an artificial scarcity, sabotage is likely to be as much a feature of the conduct of employers as of employees.

To syndicalists sabotage is much more than an opportunistic imitation of this price strategy of the employers; it is an integral part of a

revolutionary philosophy, which rejects outright the ethics of predatory capitalism and substitutes a proletarian ethics in which property occupies a much less sacrosanct position. This revolutionary syndicalist philosophy, however, also embodies the idea that the *syndicat*, or union, must and shall take over, own and operate the industries. The inconsistency of the strategy of sabotage with this aspect of the theory has not gone unnoticed even among syndicalists. Georges Sorel, sometimes referred to as the philosopher of violence, opposed such tactics on the ground that workers who expected some day to own and use the machines were not wisely preparing themselves for the responsibility of such power by practising sabotage. In a partial attempt to meet such criticism advocates of sabotage have praised particularly those forms which injure the employer by protecting the consumer. Among these are "open-mouthed" sabotage, or telling the consumer the truth about the goods, and the practise of putting in better materials and workmanship than the employer had counted on.

Both the French syndicalist movement and the American I. W. W. comprised vigorous anarchistic elements. To the anarcho-syndicalist the idea of sabotage, even in its more violent and destructive forms, was more congenial than to the radical trade unionist, whose very dislike of laissez faire capitalism was in a measure and perhaps unconsciously the result of his distaste for its economic anarchy. The swing away from anarcho-syndicalism in France after the World War brought with it an almost complete abandonment of sabotage by the organized trade union movement. In the United States too the I. W. W. after the war modified to some extent its endorsement of sabotage.

The forms of sabotage that are perhaps adequately defined by the words 'ca' canny and soldiering were practised long before its elaboration into a social philosophy. Many unorganized workers persist in its use even though it has ceased to be a cardinal element in the tactical programs of organized groups. These facts suggest that there must be other causative factors at work than radical class struggle philosophies. These additional factors are found in the very common belief—sometimes reasoned, perhaps more often quite unconscious—on the part of workers that the amount of work is limited and that by restricting output or even destroying it they are stretching this limited amount of work to provide more employment for them-

selves. Thousands of workers, both organized and unorganized, continue to regulate their own efficiency and productivity in substantial accord with the implications of this crude form of the lump of labor theory. Such action is perhaps most feasible where day wages are paid, but it is practicable and often applied to piecework. Indeed straight piecework payment plans, especially where rates are crudely fixed upon the basis of past production experience, seem to encourage restrictive practises because of the workers' fear, too often justified by their experience, that a high productivity will precipitate a reduction in the piece rate.

In recent years growing realization by trade union leaders that wages come out of product and that one way to get higher wages is to produce more goods has tended to some extent to discourage restriction of output. In some industries, for example, in the manufacture of women's clothing in the United States, agreements provide that the organized workers shall guarantee high (quantity and quality) standards of production in consideration of the reciprocal guaranty by the employer of regular employment and abstention from rate cutting.

Another cause for the decline in the systematic use of sabotage arises from the fact that the position at the left in the labor and radical movements, occupied before the World War by the French syndicalists and the American I. W. W., has since the war been preempted by the communists. Although individual communists have continued to employ this blind type of protest, the communist movement itself has consistently opposed the use of sabotage. In part no doubt this attitude reflects its political-mindedness and its emphasis on indirect political action rather than on direct action. In part it arises from the communist emphasis on disciplined mass action and opposition to individual acts of "economic terror." Apparently also the communists hold that the strategy of sabotage is peculiarly the strategy of *laissez faire* capitalism and of capitalists. The Russian Communists have special reasons for this conviction. Their enemies abroad—the counter-revolutionists—resorted to sabotage on a colossal scale, or at any rate so the communists construed their activities. At home moreover first the anti-communist intellectuals and public officials and later the anti-communist kulaks sabotaged the revolution with the utmost vigor.

Orthodox socialists have generally opposed sabotage. The Socialist party of the United

States was in fact so deeply incensed by the sabotage propaganda of the I. W. W. that its national convention in 1912 incorporated into the party constitution a clause expelling "any member who opposes political action or advocates crime, sabotage or other methods of violence as a weapon of the working class." Here again preoccupation with political to the exclusion of economic strategy is a conditioning factor. A more important determinant of their position, however, is the relatively conservative ideology of the socialists. They are too firmly constrained by what the syndicalist would call capitalist ethics or bourgeois ideology to look upon sabotage with anything but feelings of ethical disapproval.

Where sabotage results in the destruction of property, it is punishable under the common law as malicious mischief. In addition a few statutes in the United States provide definitely for the punishment of sabotage as such or of specific acts of sabotage. The most effective means of punishing sabotage in the United States, however, has been the criminal syndicalism laws, passed during and shortly after the war. Most of these statutes made the advocacy or practise of sabotage proof of criminal syndicalism and punishable as such.

SACRAMENT. See RELIGIOUS INSTITUTIONS, CHRISTIAN; MYSTERIES.

SACRED BOOKS have their characteristic functions primarily in a context of oral and practical sacred observance. But the term sacred book is not applied to every book whose functions lie in such a field; it is generally reserved for those that have the powers and values of the

sacred attributed to them inherently. Such books may undergo many changes in both their genesis and use; they have served as fetishes, as revelations, as foundations of law and as symbols of allegiance. The *Adigranth* of the Sikhs, the Swedenborgian, the Mormon and the Christian Science scriptures are examples of sacred books that have appeared in modern times. But the sacred books which have exerted the greatest influence upon existing civilizations were written between 1000 B.C. and 1000 A.D., although portions of their contents are much older. They are the Hebrew Bible; the Zoroastrian *Avesta*; the Christian New Testament; the Moslem Koran; the *Vedas*, *Brahmanas* and *Sutras* of the Brahmans and the *Upanishads*, *Epics*, *Puranas* and *Tantras* of Hinduism; the Jainist *Angas*; the Buddhist *Tipitaka*; the Chinese Classics and the Taoist scriptures; and the Shinto records of Japan. Besides these, all of which are still used as sacred scriptures, there appeared in the same period other influential sacred books, especially those of Hellenistic religions and cults no longer extant: the Sibylline, Orphic, Hermetic and Gnostic books as well as the scriptures of Mithraism and of the Manichaeans. The Homeric poems and the sagas of north European peoples also at least approximated the status of sacred books.

These books had a vast background in earlier literatures and sacred writings, portions of which may still be found in the records of civilization on the Nile, in the eastern Mediterranean, in the Tigris-Euphrates valley and probably in the Indus valley as well. Undoubtedly the veneration felt by the Egyptians, Hebrews, Hindus, Chinese and other peoples for the art of writing and for the properties of the written character contributed to sacred books certain elements of their sacredness. But the more constant, direct and pervasive influences behind such books both before and after 1000 B.C. derived from oral and practical culture. In a general way all the principal types of material to be found in sacred books were preexistent in oral culture. Such types are: formulae of magic, sorcery, exorcism and healing; oracles and procedures of divination; songs of celebration and penitence; liturgy and ceremonial law; sacred community law; folk tales, myths, legends and history; prophecies; eschatological revelations and apocalypses; proverbial wisdom, teachings of sages, lives and gospels of saviors; apostolic advice and exhortation; discussions and elaborations of doctrine; and esoteric mystical systems.

But the content of sacred books is by no means strictly limited to these types. For example, the canonical literature of Buddhism, which professes to be a philosophical religion of universal enlightenment, bears in certain countries some resemblance to a general library: thus, the Japanese *Tipitaka* lists some 2236 items in 9006 volumes, including works on physical science, history, geography, archaeology, travels and philology as well as dictionaries. Many of these works are very seldom read, but they all constitute a venerated treasure of Buddhism, to honor or use any part of which may be an act of merit or even involve magical effects. While the Buddhist canon presents in some respects an extreme case, secular or profane matter is to be found in small or large degree in virtually all sacred literatures; and it is to their range and inclusiveness that sacred books owe much of their power to survive as books of life, irrespective of their specific cultic uses.

The explanation for this range and inclusiveness is not merely the pervasive relation which religion in the past bore to culture but also the variety of processes through which the books acquired their sacred properties. In some cases writings originally secular and with a content in whole or in part secular have later become sacred books. In other cases the books were sacred from the start, in that their content was thoroughly sacred for some group of people before it was written down. The utterances of ecstatic seers and prophets are sacred speech, and of such material consists much of the Old Testament prophetic literature and virtually the entire Koran, which purports to contain only the divine revelations recited by Mohammed. In all probability many of the "sayings of Jesus" and of his apostles in the New Testament originally circulated orally as inspired words. Ritual formulae and liturgical poetry have likewise very commonly had a sacred status in oral usage before being collected in books. Most of the sacrificial hymns, the chants and the magical formulae of the *Vedas* were probably transmitted orally for centuries as an exclusive sacred possession of certain Brahman families and castes. The *Brahmanas* and *Sutras*, expository treatises on the Vedic sacrifices and the priestly life, as well as the *Upanishads* and the early philosophical sutras all have a form which suggests oral transmission. Exclusive caste rights and secrecy of doctrine may have helped to maintain the oral form. But the teachings of Buddhism, which admitted all castes, were probably also

disseminated and preserved in their first centuries through oral repetition and amplification rather than by scriptures.

The highly dynamic era of the first millennium B.C. was characterized by rapid evolution in the sphere of religion. Hence although in many portions the sacred books produced during this period testify to the longevity and perdurance of sacred traditions, they were not merely repositories of bygone custom but also vehicles and reflections of the changes which were taking place. As modern historical criticism has established, the authors of the Old Testament and the Chinese Classics by selection, revision and addition frequently modified the traditional teachings so as to promulgate new ideas. Many sections when first written down represented merely individual or special points of view and were in no sense the charters of a common orthodoxy which they later became. Thus the Chinese Classics were compilations, redactions and interpretations of ancient material, both secular and religious, made chiefly by one school of scholars, the Confucian, who imputed to the ancient past their own ideas and ideals for the correction of life in the present. In the case of the Hebrews the strong theocratic tradition of a covenant between the people and their god gave historical narrative a distinctive religious tinge; but here again books attributed to remote antiquity were written and rewritten, freely revised and supplemented before they became a fixed collection of sacred scriptures. In India, while the Vedic texts were handed down unchanged, new sacred literature grew to enormous proportions, and the usage of the old was generally entirely transformed in its new contexts.

The rise of the Confucian, Jewish, Christian and Moslem orthodoxies in the first millennium A.D. fixed the chief canons or lists of sacred scripture that have lasted to the present day. Neither the Buddhists nor the Hindus established a closed canon which obtained comparably general recognition, although all orthodox Hindus recognize at least three *Vedas*. But various orders, sects and nations within both Buddhism and Hinduism as well as among the Jains have made canonical collections of scripture. These orthodoxies have tended not only to fix, but also as a rule to enhance the authority and importance of the sacred books. While the books themselves were a factor in producing the attitude of mind which thus elevated them, the formation of the orthodoxies was promoted

fundamentally also by a variety of other circumstances, prominent among which was the disappearance of the customary social and political orders both in the Hellenistic world and in China and India. As older local units were dissolved by imperialism and the mingling of peoples, the orthodoxies sought to provide new bases of integration, and they prized their collections of sacred writings from the past as agencies through which they might preserve the essential meaning and inspiration of life throughout eternity. But since the old scriptures were obviously incapable of defining the character and content of the new orthodoxies, there arose new groups of teachers, who as a rule conveyed their doctrines in the form of commentaries on the sacred texts. Thus Orthodox Judaism acquired its norm from the rabbinical teachings in the Talmud rather than directly from the Bible, while the dogma of Catholic Christianity was established by the doctors of the church and the councils. Hinduism received new regulation from the commentaries made by the *acharyas*, such as Sankarā, Rāmānujā and others. And Moslemism, which from the outset was uniquely Koran centered, constructed its orthodoxy upon extensive supplementary collections of traditions (Hadith) concerning the custom of the prophet (*sunna*) and upon a system of jurisprudence (*fiqh*), which recognized consensus (*ymā'*) as a further source of authority.

Such reinterpretations of the scriptures implied new types of religious leadership and learning distinct from those represented by the ecstatic prophet or sacrificial priest. The elevation of the sacred book was accompanied by the rise of a scholar class to prominence in the sphere of religion. This development promoted new phases of thought, education and government. In China a system of examinations in the Classics was introduced for ranking officials. In Judaism and Islam the study of religious law became a governing discipline, the sacred books being regarded as the ultimate foundations of law in general. Theologies of "The Word," or the Logos, were elaborated, and the idea grew that religion might be in some sense a logical matter, a development which led eventually to rationalism. A similar trend was subsequently to be followed by Calvinist Protestantism, in which the Word and the ministers elected to expound it became supreme. Where, on the other hand, priesthood and its functions retained a leading place, as in Hinduism and Catholicism, these tendencies were not absent

but were counterbalanced by opposite emphases.

As the history of Islam and of Protestant Europe abundantly illustrates, the elevation of a sacred book above all offices of society provides an excellent potential support for dissent from established regimes. The issues of conflict generally arise chiefly from practical circumstances, but the dissenters—whether from church or civil decree—appeal to their scriptures as a higher law. Since the appeal usually implies that both parties recognize the same sacred books, the dispute tends to focus on their correct exegesis. A different type of religious separatism, represented both by individual mysticism and by broader mystical movements, such as Zen Buddhism, Quakerism and Jewish Chassidism, rejects as too external not only established offices but also the rule of a book and, when it assumes organized form, places stress upon spontaneous leadership. Another special phenomenon, also associated as a rule with mysticism, is the rejection of all normal exegesis in favor of esoteric interpretations of scripture, such as may be found among the Kabbalists, the Swedenborgians and the theosophists.

Through the prestige and importance which they enjoyed during the growth of existing civilizations sacred books have exerted a powerful influence upon virtually all fields of culture. While in general they have served as a tremendous integrating factor, at the same time they have helped to generate a variety of cultural divisions and tensions. The original languages of sacred books are usually different from the living vernaculars, with the result that a sharp line of cleavage existed for centuries and in many parts of China, India, the Islamic and the Catholic world still exists between the illiterate masses and the literate clergy or the scholarly officialdom with access to the sacred literature. The statements of sacred books frequently conflict with findings of natural science, critical history, social science or philosophy. Art that conforms to the requirements of sacred scripture is distinguished from other art. Education that observes and communicates the sacred texts becomes differentiated from other types of education. These cleavages, while giving rise to new issues and new problems of accommodation in every age, are in one form or another as old as and in some respects older than the sacred books themselves and quite as universal. Yet there has never been a complete divergence between the use of the sacred book and other cultural usages. In mediaeval times the method of appealing to

the authority of the sacred book and the rules for its interpretation were widely employed with other books as well. Today the ascendant canons of scientific inquiry and literary criticism recognized in secular learning are widely applied to determine the meaning of sacred books.

The rise of modern hermeneutics has played a very important part in the development of historical scholarship and critical method in the interpretation of texts. The Protestant reformers rejected the allegorical and emphasized the plain, historical meaning of the Scriptures. Flacius and others stressed the reading of individual passages in their context. At the climax of the attacks launched during the seventeenth and eighteenth centuries against the Christian philosophy of history men like Herder urged that sacred as well as secular literature be approached as an expression of human nature. Scholars of the nineteenth and twentieth centuries have emphasized further the necessity of investigating the whole cultural context of a document, not only in order to advance correct exegesis but in order to utilize the full potentialities of sacred books as historical sources. Seventeenth and eighteenth century China also produced a succession of outstanding historical critics, such as Tai Chen, Chang Hsueh-ch'eng and T'sui Shu, whose work was of fundamental importance in promoting truer historical views of the Classics and their times. Among the Hindus and Moslems such criticism appears less advanced.

There is no way of measuring the integrating effect of sacred books on culture, especially since it is impossible to separate their influence in this regard from other aspects of religion. But it would seem difficult to exaggerate the role of the Bible, the Koran, the Hindu Epics, and the Chinese Classics in producing some unified character in European, Islamic, Indian and Chinese cultures respectively. It is necessary only to recall the influence of these books on temple and folk art, for instance, and with the spread of literacy their importance as common readings of the people (*see* LITERACY AND ILLITERACY). The philosophic traditions which have had most pervasive influence on the thought of the various civilizations also owe many important traits to distinctive characteristics of the sacred literature in each case. Not only the civilizations in their entirety but many subgroups within them have been molded to a large extent by the sacred books. The family Bible has been a widespread symbol and often a

vehicle of family integrity. Among the chief public possessions of the traditional Jewish community were its scrolls and books. The formation of national languages and literatures, not only in Europe but also in India, owes much to the translation of sacred books. Luther's Bible, the King James Bible, the Hindu version of the *Rāmāyana* by Tulasi-Dāsa (1532-1623), are notable cases. In still other circumstances, as with the dispersed Jews, the prolonged refusal to translate the sacred books from the original sacred tongue helped to conserve a common morale. Because of their historical associations and in some cases also because of their character as great books of life, the power of sacred books to symbolize a common cultural and social destiny is not strictly limited by cult and dogma. Thus in recent times the *Bhagavad-Gita* has been accepted as a symbol of a more virile India by Hindu nationalists, whose attitudes toward sacred observances diverge extremely from each other and from orthodox standards.

SACRIFICE is usually defined as the slaughter of an animal or person or the surrender of a possession as an offering to a deity; the original meaning, to make sacred, may be applied to all kinds of ritual. The word has received its restricted connotation because in Christian ritual the slaughter of the victim is the core and the

essence; in other rituals it is merely an episode.

In Europe and the Near East there was apparent a tendency to emphasize sacrifice long before the appearance of Christianity. Among the Hebrews and in pagan Greece and Rome the ritual slaughter was already prominent, whereas in Brahmanism lustration and in Egypt the preservation of the body were especially featured. Although it is not equally important everywhere, sacrifice is universally present in ritual. In sacrifice the offering is identified with the deity; thus in the slaying of the animal the deity is slain. This episode of the dying god, discovered by W. Robertson Smith and discussed further by Frazer, is illustrated by the Koryak whale festival and by the Ainu bear ceremony. The ritualistic principle that the worshiper becomes identified with the deity in order to exercise the same control over nature as the deity is involved in sacrifice in that the worshiper is identified with the victim; Brahmanic theory declares: "The sacrifice is the victim at his own sacrifice." In the case of the horse sacrifice the victim is only the equivalent of the worshiper; thus the horse is slain, but not the worshiper. In some instances, however, the victim and the chief worshiper are actually one and the same, in which case the leader of the cult himself is slain. This slaying of the man-god appears to have been confined originally to those state rituals of which the king was the chief and was not found in household cults. Even the slaying of the king seems to have disappeared at an early period: the practise is known mainly from myths and from a few survivals in Africa. The slaying of the king when his vigor wanes or when crops fail, until recently not uncommon in Africa and on the islands of the Pacific, may be regarded as a relaxation of a more ancient practise of putting the king to death after a fixed number of years.

Communal feeling may intervene to prevent the sacrifice of a member of the community and a stranger may be substituted. The need of outside victims necessitates forays and probably has contributed greatly to the development of war. Fellow tribesmen who have broken the law may also be used as victims; some writers regard this as the origin of capital punishment.

In the family cults or where humanitarianism has prevailed against the rigor of the law, the sacrifice is carried out only symbolically and the worshiper merely acts as if he were dying. The Igbo king is actually laid in a grave and mourned as if dead, then told to arise; the fiction

of his death is maintained so consistently that when he eventually dies in the flesh he is not mourned, because he is considered to have died previously. An alternative is to provide an animal victim. Numerous myths tell how an animal was substituted for a human victim; the legend of Iphigenia and the attempted sacrifice of Isaac are among the most famous. Such substitutions have without doubt taken place repeatedly in different parts of the world and have helped to do away with human sacrifice, but the conclusion that all animal sacrifice results from such a substitution is not yet warranted. Animal and human sacrifices are both the outcome of the same system of ideas, and animal sacrifice may gradually have ousted human sacrifice as a solution of the conflict between the claims of tribal welfare and humane feelings.

Ritual theory requires that a human victim be sacrificed so that the crops and the cattle may flourish, while family affection and tribal loyalty to a good chief constantly exert a counter force; the first requirement is therefore satisfied by the slaughter and by the fiction of dying, the second by the substitution of a foreigner for the king. Christianity has solved the conflict by a single sacrifice of the divine victim; the efficacy of this performance extends to all times, but the act must be repeated daily in symbols.

The victim may be slain in various ways; he may be strangled or clubbed or have his throat cut. In Vedic ritual strangling is reserved for sacrifices to the gods, since it is believed that the strangled victim does not die as he would were his blood shed, and the gods do not die; the victim sacrificed for the spirits of the dead suffers a more violent execution. Methods of criminal execution, such as beheading, hanging, stoning, crucifying, were probably originally methods of sacrifice.

The methods of disposing of the victim are the same as for the other dead. Burnt offerings correspond to cremation. Simple interment and exposure are also found; as an animal victim is usually consumed by the worshipers, only its bones are disposed of. Drowning the victim through sea burial, as in the case of Jonah, is unusual. Certain portions of the victim are usually assigned to officeholders, particularly to the priests. This may constitute a source of revenue to the temple, for in a much frequented temple there may be a surplus over what the staff can consume (*I Samuel* II: 12-16).

Psychologists have contended that sacrifice has its origin in the emotions, especially in their

pathological manifestations. On the other hand, it may well be held that the emotions counteract ritual theory and prevent its rigorous application. Sacrifice is a cold blooded pursuit of social welfare; but when this pursuit becomes so intense and exacting that it conflicts at too many points with the feelings of the individuals involved, an emotional reaction against it is inevitable. Sacrifice is not entirely antagonistic to the emotions of affection but can be converted into an outlet for the hypertrophy of love, whether this is congenital or caused by the damming up of normal outlets. Some men find supreme satisfaction in being sacrificed for the good of the community and may volunteer themselves, as in war. It has become the Christian ideal for a man "to lay down his life for his friends," an ideal already known to the pagan world, as is shown by the legend of Alcestis. The ecclesiastical conception of martyrdom as a sacrifice has made little progress in India, because the Indian condemns the taking of another's life, especially an animal's. It has dropped out of Buddhism entirely; but India does not condemn suicide, with the result that self-immolation plays a significant role.

The substitution of fictitious for real death has provided an outlet for the feelings without the fatal consequences of reality; the worshiper suffers with the deity in spirit only. This ideal is salutary if it serves as a stimulus for devotion to the family or to society; it is pernicious if it acts merely as a cathartic, leaving the worshiper to pursue, with a conscience unburdened of emotion, a policy of complete individualism.

ŠAFAŘÍK, PAVEL JOSEF (1795-1861), Slovak philologist and archaeologist. Šafařík was the son of a pastor; during his studies at Jena he absorbed the ideas of the romantic philosophy and the nationalist doctrines of Herder and the *Burschenschaft* movement. He set out to

write poetry but later devoted himself to the study of Slavic philology. His *Geschichte der slavischen Sprache und Literatur nach allen Mundarten* (Novisad 1826, 2nd ed. 1869), in which he discussed the origins, religion, morals, culture and languages of the Slavic peoples, advanced the thesis that the Slavs are a composite people with but one language, which is subdivided into several groups of dialects. In his most famous work on Slavonic antiquities, *Slovanské starožitosti* (Prague 1836-37, 2nd ed., 3 vols., 1862-64; tr. into German as *Slavische Alterthümer*, 2 vols., Leipzig 1843-44), he attacked the prevailing view that the Slavic peoples reached Europe comparatively recently and maintained that they had been indigenous to Europe at least since the fifth century B.C. His third important work, *Slowanský národopis* (Prague 1842, 3rd ed. 1849), is a statistical study of Slavic peoples and languages. Although Šafařík's theories have since lost their scientific value, they were of tremendous significance in the development of Slavic national sentiment. His doctrine of the unity of Slav peoples gave a decided intellectual impetus to pan-Slavism, and his thesis of the antiquity of the Slavic peoples, accepted with enthusiasm by his contemporaries, served to create a feeling of self-esteem and national pride among the various Slavic groups.

SAFETY MOVEMENT. The increasing physical hazards to workers as a result of the mechanization of industry and the necessity for their elimination became matters for general concern shortly after the middle of the nineteenth century. The movement appeared first in continental Europe, its origins being in part humanitarian and in part an outgrowth of class conflicts. As early as 1867 the Alsatian industrialist Dollfus organized an association for the prevention of accidents and founded what was the beginning of a safety museum. This example was followed in other European countries, so that by the end of the century there were some twenty-five such associations and museums in the principal manufacturing centers of the continent. The voluntary movement led by industrialists was paralleled by legislation relating directly or indirectly to accident prevention. The German social insurance laws of

the 1880's were the most advanced in that they not only made accident insurance compulsory but required members of associations to contribute to compensation funds. In Great Britain, with its common law traditions, the movement developed more slowly; but by 1897 the necessity for giving labor more safeguards than were possible under the common law resulted in the British workmen's compensation acts. Both on the continent and in Great Britain subsequent legislation has further extended and improved the conditions of accident prevention and compensation.

In the United States the safety movement developed later. Although factory legislation, labor departments and commissions and provision for the inspection of working conditions had been in existence in many states for a considerable period, these were too often rendered ineffective because of the indifference of politicians. Concern for safety, as a movement, did not become significant until about 1905. At that time American industry had the reputation of being the most reckless in the world. The safety movement once inaugurated immediately gained and retained a noteworthy momentum; its strength is indicated by the fact that within a quarter of a century compulsory accident insurance laws had been enacted in all but four states of the union.

The development of the American safety movement was greatly assisted by the operations of three different sets of forces. The first was the purely humanitarian reaction of industrialists and non-industrialists alike to the shocking situations in which an increasing number of victims of industrial accidents found themselves because of the inadequacies of the common law doctrines of liability. The result was the beginning of voluntary efforts on the part of many factory owners and managers toward the elimination of accidents. Second, accident elimination came to be viewed fairly widely as an aspect of good management. And, third, mandatory legislation appeared on statute books to compel unenlightened and indifferent employers to adopt measures which had been proved to be as much in the interests of industry as of labor.

In the United States the first voluntary efforts toward accident prevention on an organized basis appeared in a few large enterprises which at the turn of the century had already become conspicuous for their efficient operation. These companies established, as auxiliary to their operating organizations, staffs of specialists

for research into and improvement of various phases of management, including working conditions; and it did not take long for investigations to result in recognition of the fact that accidents leading to the turnover and absence of workers and the idleness of machines constituted a real cost and that accident prevention was therefore logically an essential part of any waste elimination campaign. Studies of the Committee on Safety and Production of the American Engineering Council have since justified the conclusions that material reductions in accident rates can be obtained simultaneously with an increase in the production rate, and that maximum productivity is ordinarily secured only when the accident performance tends toward the irreducible minimum. Both the humanitarian and the efficiency attitudes toward accident prevention were so widely represented in the Association of Iron and Steel Electrical Engineers that, from its organization in 1907, accident prevention became an outstanding interest of the society. The result was the establishment, under its auspices, in 1912 of the National Safety Council, and it has largely been due to the activities of this body that the safety movement has since made such rapid progress in the United States. Another important influence has been the work of the American Standards Association.

Although initiated and developed by large and important business organizations, the voluntary phase of the safety movement affected only a limited proportion of the industrial workers of the United States. Simultaneously therefore progressive labor departments and commissions as well as social workers advocated legislation making accident prevention, and eventually accident compensation, compulsory for all industry. In this phase of the movement accident prevention and compensation were conceived of as something more than a matter of efficient management and as properly in the domain of public policy. In 1908 the federal government passed the first workmen's compensation act, which covered certain classes of federal employees; and in 1910 New York led the states with a limited and in 1914 with a general compensation law. The next five years witnessed a succession of such laws in other states. At first encountering considerable difficulty as a result of the constitutional and common law objections raised by many industrialists, advocates of this type of legislation eventually were successful—by constitutional amendments where necessary

—in securing compensation laws in forty-four states and three territories. These statutes, requiring as they did contributions to compensation funds, burdened industry with an additional overhead cost; and in view of the fact that such contributions were scaled in direct proportion to the individual employer's accidents, a direct link was established between accident reduction and lower costs of operation.

The entrance of government into the field of industrial safety has turned the attention of official bodies to the problems associated with prevention and compensation. Valuable work in research, publicity and the like has been done by organizations like the International Association of Industrial Accident Boards and Commissions, the United States Department of Labor and the International Labor Office. The last named has also concerned itself with standardization of practices on an international scale.

From the viewpoint of content the safety movement has progressed through five stages. At first experience seemed to indicate that accidents were caused by the inadequate safeguarding of machines and other physical conditions, and that prevention of accidents would be accomplished by provisions incorporated in equipment design and by guards for dangerous parts. Large sums were spent in making the necessary corrections in prime movers, transmission equipment and machines generally, in the improvement of illumination and the clearing of passage ways and in revisions of processes and procedures. Important as these efforts were, it was soon perceived that accidents were not reduced to the degree anticipated.

The second stage was based on the recognition, resulting from analysis of records, that the human factors of carelessness, ignorance, inexperience, inadequate skill and improper supervision entered into the majority of accidents; further advances therefore depended on the education of supervisors and workers in the conditions and principles of self-preservation. The upshot was that plants established committees, organized meetings of workers and their families, issued bulletins, offered prizes for good records and devised various other inducements to the adoption of habits of care. Marked reduction in the frequency and severity of accidents was indicated with the full development of this program, and the guarding of equipment and education in caution became the two most significant principles in advancing the safety movement.

The third stage consisted of the refinement, through better organization, of the safety function in labor management departments; the extension, improvement and engineering analysis of statistical records; an increased regard for the safety factor in process and job analyses; provisions for better supervision; the establishment of medical units; and the introduction of psychological studies. Advances in better statistical reporting are largely to be credited to the activities of the federal Bureau of Labor Statistics and the National Safety Council; but despite real improvements in this field it is generally admitted that data are not satisfactory in quantity or quality.

The fourth stage was characterized by a greater attention to the problem of safety on the part of major executives, elevation of the movement from second rank to first rank status and its inclusion among questions of general administrative policy. The cost of compulsory compensation has acted as a powerful force in this direction, bringing into an integrated whole the related problems of organization and management methods; the guarding of machinery; the selection and assignment of personnel, their training, hours of labor and rest periods; education in self-preservation; statistics and research; and industrial medicine and psychology. Thus since the turn of the century the prevailing attitude toward industrial accidents has progressed from the supposition that these were entirely a matter of individual responsibility and risk to recognition of the social and industrial advantages to be derived from assumption of the costs of accident elimination and of compensation for those accidents not eliminated.

The fifth and most recent stage has been the preparation of safety codes, especially the standard safety code program of the American Standards Association. Although many state labor departments and commissions have been given legislative authority to develop and administer safety codes in their accident prevention work, most public agencies are restricted in this effort by budgets which do not permit more than reasonable enforcement of general factory laws. Consequently the activities of the Bureau of Standards, the American Standards Association and the International Association of Industrial Accident Boards and Commissions in securing the adoption by various industries of safety codes have become a major factor in the safety movement. The fundamental principle in those states which have been most successful in safety

code development has been an appreciation of the fact that codes should really be created by industries themselves. This sound policy has been followed by better relations between public authorities and industry and by definite efforts on industry's part to police itself in accident prevention work.

In other fields than the industrial, accident elimination has been largely the concern of public bodies. All states and most local governments have passed statutes and ordinances for the purpose of promoting safety in theaters and other private places of assembly, in schools and other public buildings, on highways and sidewalks, on public carriers and at bathing beaches. Such legislation as a rule has been concerned with matters relating to the protection of structures and persons from fire, the removal of obstacles from sidewalks, care in the operation of movable apparatus and the like. The increasing use of the motor vehicle has caused preoccupation with the development of new safety techniques, although in a general sense the safety movement here has recapitulated the experiences in the industrial field. In the beginning emphasis was on physical and mechanical aspects of the problem, such as road construction, traffic lights and signal lights on vehicles. There was next developed educational propaganda to inculcate in operators and pedestrians concern for safety and carefulness. At the same time legislation and regulations have been designed to govern speed and other driving conditions and to provide for a vigorous policing of highways.

SAGRA Y PÉRIZ, RAMÓN DIONISIO DE LA (1798-1871), Spanish economist and social reformer. Sagra studied at the University of Madrid. He was director of the botanical gardens and professor of botany at Havana from 1823 to 1835, during which period he began his extensive statistical survey of Cuba, *Historia física, política y natural de la Isla de Cuba* (13 vols., Paris 1842-61, published also in French). A visit to the United States in 1835 stimulated his interest in the social sciences, especially with a view to reform in Spain, and thereafter he devoted himself almost exclusively to studies in this field. The United States appeared to Sagra as a land of peace and well being; these attributes he ascribed to liberalism in government, a proper emphasis in education upon religion and morals, and the extensive growth of philanthropic institutions and industrial associations. Some of these principles he hoped to introduce into his native country. After his return to Spain Sagra was twice elected to the Cortes. He lectured at the Ateneo in Madrid and wrote more than thirty works in the social sciences, including *Lecciones de economía social* (Madrid 1840).

Sagra envisioned the development of a science of human felicity, *economía social*, which should serve as a guide for governments. Various European thinkers, including Villeneuve-Bargemon, Pecqueur and Proudhon, successively influenced his doctrines. About 1844 he adopted the rational socialism of Jean Hippolyte Colins, a "scientific mystic" like himself. His program, which had originally been based upon the principle of Christian love and which had emphasized educational and moral improvement, finally called for a complete reorganization of society along collectivist lines, including the abolition of interest and of private property in land. Sagra favored decentralization in political

administration and came to oppose democracy as rule by "passion" instead of by "truth." Universal disarmament without the social reorganization which alone can assure peace would, he believed, result in anarchy. Toward the end of his life he returned to the Catholic tradition. In recent years there has been a revival of interest in Sagra as a forerunner of the generation of 1898.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804-69), French essayist and literary critic. Sainte-Beuve played an important part in championing the insurgent romantic school of 1830, particularly Victor Hugo. After numerous quarrels, however, he broke away completely from his former associates. In the celebrated series known as *Causeries de lundi* (15 vols., Paris 1857-62) and *Nouveaux lundis* (13 vols., Paris 1863-70; rev. ed. 1872-81) he presented a rich gallery of literary portraits, in the main French. Suspicious of a rigid critical "system," Sainte-Beuve focused his analytical powers on "the man in the work," "the man shown by the work," "the work equivalent to the man" and the various ramifications of such an approach. With little zest for following the flights of heroes, idealists or mystics he came to rest among those "moderate hills" where his own poetry had once felt at home. Although skeptical of the extreme environmentalist formulations of literary historians like Taine, he sought to correlate the writings of an individual author with the forces of heredity, environment, temperament, education and the like playing upon him. Sainte-Beuve's subtlety and insight enabled him to analyze the mixture of virtues and defects which are present in all literary greatness. Such criticism, when carried to its logical conclusions, resulted in a "natural history of minds" rather than in "constructions of a social character." The various kinds of spirits were classified according to their dominant characteristic. "Literature and literary production," wrote Sainte-Beuve, "as I take them, are not distinct, or severable, from the rest of the man and his entire make up. I am able to read with *gusto* any

work, but I feel it difficult to judge it, apart from a knowledge of the man himself."

SAINTHOOD. See RELIGION.

SAINTE-PIERRE, ABBÉ CHARLES IRÉNÉE CASTEL DE (1658-1743), French political thinker, moralist and writer on economic subjects. In his passionate desire to promote the welfare of mankind Abbé de Saint-Pierre, a member of an old Norman family, became a prolific author of reform projects, which were sometimes naive but always concrete and ingenious. Although a pupil of the Jesuits, he developed into a fierce antagonist of intolerance and a proponent of natural religion. In morals as in political matters he took the Cartesian principle of evidence as his methodological point of departure and derived therefrom a doctrine of utilitarianism curbed by the dictates of philanthropy and the golden mean and especially by the universal obligation to pursue virtue. But the problems which preoccupied him both in his principal writings and in the lively discussions at the Club de l'Entresol were political in nature. While he favored enlightened despotism, he proposed in his *Discours sur la polysynodie* (London 1718) that it be tempered by a complex system of councils; an important feature of the system was to be a political academy of forty experts, who should be appointed by the king upon nomination by the heads of the great corporations—magistracy, clergy and nobility—and who should in turn recommend candidates for the principal state offices, in addition to studying all political questions. This government, which he called "aristomonarchy," would both deny any political role to the masses and strictly limit the functions of the hereditary nobility, to whom the abbé was hostile. Some of his other schemes called for the inauguration of political, economic

and demographic statistics; the establishment of an official press; the reform of taxation by the institution of a tax graduated according to income or, as he proposed in another project, according to capital; the suppression of begging; the improvement of the judicial system; the building of roads; the creation of a system of public instruction; the vocational and professional training of children; the elimination of most of the inequalities between the sexes in matters of education; and certain advanced innovations in pedagogical method.

Saint-Pierre's celebrity rests chiefly on his *Projet pour rendre la paix perpétuelle en Europe* (3 vols., Utrecht 1713-17), wherein he claimed to be reviving an idea previously advanced by Henry IV as well as by the natural law jurists, notably Grotius. Here he suggested the foundation of a permanent international association, through which the relationships of states would be regulated not only by the law of nature but by positive international law. The states should renounce war, institute arbitration for the settlement of their differences and establish a common force to maintain peace and the alliance. Saint-Pierre limited his system to the European states as they were after the treaty of Utrecht (1713) and moreover, by proposing an alliance of governments or princes rather than of peoples, completely excluded the democratic element. Nevertheless, his project was taken up and developed by Rousseau and by Kant, the former of whom rewrote and revised it for popularization. It still deserves mention as one of the first forerunners of the League of Nations. His internationalism and many of his other ideas exerted great influence upon his friend the marquis d'Argenson.

SAINT-SIMON, DUC DE, LOUIS DE ROUVROY (1675-1755), French political theorist and historian. Saint-Simon was a member of one of the oldest noble families in France. In 1702, having become convinced that the career of arms did not offer the prestige and position to which a person of his estate was entitled, he joined the retinue of the duke of Bourgogne, presumptive successor to Louis XIV. In the atmosphere of intrigue which permeated the ducal court Saint-Simon articulated, in a number of reform projects, the antipathy of the upper French peerage to the new type of centralization and absolutism perfected by Louis XIV and his essentially bourgeois ministers and agents. Although fanatically opposed to the pretensions of the third estate in any form and in much less degree to those of the so-called first estate, Saint-Simon advocated a reconvening of the Estates General and of the provincial estates on the theory that, if rigidly limited in their function to administering the national and provincial finances, they were a less undesirable type of administrative institution than the *fermier* bureaucracy dominated by the king and his ministers. Uncompromising spokesman of the second estate, which he extolled as the original and only legitimate group in French history for exercising political control, he protested repeatedly against the corruption of the nobility resulting from the king's policy of extending the peerage to ambitious representatives of the bourgeoisie. As a corrective to the excesses of centralized absolutism Saint-Simon recommended a return to the older feudal order, but in his pioneer attacks on the hitherto generally acclaimed monarchical system of Louis XIV he formulated many grievances which were exploited by more forward looking opponents of absolutism in the period preceding the French Revolution. Saint-Simon's political theory, like that of his contemporaries Boulainvilliers and Montesquieu, is significant as a manifestation of the process whereby in a variety of forms the second estate forwarded the anti-absolutistic offensive which was carried to successful completion by its inveterate enemy, the revolutionary middle class.

The death of the duke of Orléans in 1723 brought to an end Saint-Simon's minor activities in the regency, and for the rest of his life he

remained in rather bitter retirement. During this period he composed his famous *Mémoires*, which, by reason of the brilliancy of its writing and the keenness of its first hand observation and delineation of character, has won for its author a lasting acclaim out of all proportion to that accorded to his more strictly political writings. The same prejudices which motivated his reform projects are clearly discernible in his descriptions of contemporary court and political life, and critically minded scholars of the modern historical school have felt it necessary to offer numerous cautions regarding the value of the *Mémoires* as source material.

SAINT-SIMON AND SAINT-SIMONIANISM. Claude-Henri de Rouvroy, comte de Saint-Simon (1760-1825), French social philosopher, was the brilliantly original but sketchy precursor of many tendencies in modern thought, among them socialism, positivism, technocracy and internationalism. He once described his bizarre life history as "a series of downfalls." He was born in Paris and was a descendant of the proud Picard house which claimed Charlemagne as ancestor. A sublieutenant at seventeen, he went to the West Indies two years later on the staff of his relative Claude-Anne, Marquis de Saint-Simon. Fortune brought him with de Grasse's fleet to Yorktown, where he fought "for the cause of industrial liberty," and later to the naval defeat at the Saintes, where he was wounded and made prisoner.

Already the ambitious young nobleman yearned "to enter upon a scientific career useful to humanity." Released in Jamaica, he proposed to the viceroy of Mexico a plan for a Nicaraguan canal and on returning to Europe advanced a similar scheme to connect Madrid with the sea. Although a colonel at twenty-three he was not interested in wars without lofty social aims, and he left the army to reeducate himself by associating with savants and by worldly experiments, first seeking in varied commercial

enterprises the wealth he deemed essential. During the revolution he renounced his titles with enthusiasm but avoided political activity as merely destructive. Instead, with the Saxon count von Redern, he speculated in confiscated church lands worth millions and was imprisoned for eleven months preceding the fall of Robespierre. Thanks to currency depreciation he emerged with a fortune, which he swiftly expended in keeping open house for scientists in preparation for his career as the combined Descartes, Bacon and Newton of the new social order which must, he felt, replace the anarchy resulting from eighteenth century individualism. The revolution had destroyed the old regime, but "mankind was not meant to live among ruins."

In 1798 occurred his epochal conversation with Burdin, which contained in germ the whole program of positivism, and which started Saint-Simon on a lifelong quest for a "physiopolitics." Social reorganization must rest upon a restored intellectual unity: "it takes a system to replace a system." Tirelessly he insisted that a *nouveau pouvoir spirituel* based upon a synthesis of the positive sciences must be substituted for the discredited theology of feudalism, combining the content of the *encyclopédiste* doctrine of progress as presented by Condorcet with the orderly form demanded by theocrats, such as de Bonald and de Maistre, in an authoritative body of scientific dogmas which should regulate human conduct and provide for universal worldly well being. Saint-Simon's first version in 1803 called for a supranational cult of science based upon gravitation, to be administered despotically by savant priests, women as well as men being eligible. The next ten years, during which he was reduced to living on the charity of a former valet, were spent in vain endeavors to synthesize the sciences by generalizing Newton's laws.

Incapable of organizing the intellectual arm, Saint-Simon turned toward the immediate realization of the temporal power of the new society. This abandonment of theory for practise did much to alienate his secretary, Auguste Comte, in 1824, the latter going on to carry out, in his positive philosophy culminating in *sociologie*, substantially the program his master had outlined. As early as 1797 Saint-Simon had tried unofficially to assist in bringing about peace with England at the Conference of Lille; and in 1814 he and Augustin Thierry anticipated the *entente cordiale* by their untimely plea for a

politico-economic league of nations based upon British parliamentarism.

Disillusioned by the kaleidoscopic changes of the Restoration period, Saint-Simon turned from liberal politics to find in nascent industry the temporal basis of the new era, adopting in 1817 the motto: "Everything by industry; everything for industry." By industry he meant not simply machine tending, then relatively rare, but all "pacific works of positive utility." Although he defined a nation as "nothing but a great industrial society" and politics as "the science of production," he hoped, unlike Marx, to end the class struggle by securing voluntary obedience to a hierarchy of benevolent captains of industry, who were "to undertake the most rapid amelioration possible of the lot of the poorest and most numerous class." Always he held that society must be administered scientifically from above by a dictatorship of the competent, at first scientists and property owners, but finally technicians, business men and bankers. Just before his death his theory of economic incentives, until then an intellectualistic utilitarianism, gave way to the mystical fraternalism of the "new Christianity," purged of dualism and supernaturalism. Unlike the ethical or utopian socialists, Saint-Simon made incessant appeals to those in power for the adoption of his innumerable programs of reform.

Discouragement over lack of recognition had caused him to attempt suicide in 1823; and two years later only a handful of followers listened to his confident deathbed prophecy: "The future belongs to us." Yet these few ardent disciples launched in his name as messiah what shortly became a religious movement, which expanded and collapsed with equal swiftness, only to become indirectly influential many years later. First set forth in the *Producteur* and the *Organisateur* and widely disseminated in the *Globe*, the new faith received its dogmatic formulation in public lectures by Bazard, which rendered far more coherent Saint-Simon's final program, especially his philosophy of history. But many of the doctrines developed by the new sect, notably that of the "rehabilitation of the flesh," were mere caricatures of his ideas; and the joint high priesthood of Bazard and Enfantin was soon wrecked by a schism over the latter's extreme views on marriage, divorce and the equality of women. The final disbandment was hastened by a public trial in 1832, which exposed to ridicule the absurdities of the faithful under the domination of Enfantin's powerful

personality. A group of Saint-Simonians went to Egypt, where they inspired the building of the Suez Canal; and individuals among them later became prominent in the founding of banks, railroads and industries in France.

Thanks to its attempted fusion of the *encyclopediste* and theocratic traditions in terms of science and industry, the Saint-Simonian influence has been extremely pervasive: on the right through Rodbertus, Bismarck and Comte; and on the left through all the socialists save the contemporary Fourier. Cosmopolitan by nature, it has been felt in many lands: in Germany by the utilitarians and positivists; in England by the young Germany movement; in Latin America by the radical intellectuals. More significant recently than the new Saint-Simonian movement in France, which in 1920 revived the *Producteur*, have been the careers of such unconscious Saint-Simonians as Ford, Rathenau and Loucheur, together with the increasing post-war development of capitalism in the direction of a scientific planned economy.

SALARIES. See WAGES.

SALEILLES, RAYMOND (1855-1912), French jurist. Saleilles was professor of law at Dijon and later at Paris. He taught legal history, constitutional, penal and civil law and finally concentrated his attention upon comparative law. His knowledge of these many disciplines and his detailed and meticulous study of problems related to them made possible his methodological works and his extensive syntheses.

Because of the diversity of his interests and the abundance and quality of his scientific writings Saleilles exerted a decisive influence upon contemporary legal science. He is important especially, however, for his definitive limitation of the exegetic interpretation of law which remained dominant throughout the nineteenth century, and for his view that the law must be brought into closer contact with philosophic thought and contemporary social ideas. He sought to reconcile the evolution of law with the fixity of rules which conditions all security in legal life. Traditional institutions should be adapted, he held, to current needs, for "justice, which in principle remains immutable, must, in order to remain justice, yield to economic and social changes." Such adaptation is possible on two conditions. First, statutes must not be considered the only source of the law or even the final expression of ruling principles. Saleilles, who participated actively in the editing of *Le Code civil (1804-1904)*, *Livre du centenaire* (2 vols., Paris 1904), believed on the contrary that legal evolution is continuous, that it cannot be arrested even by codification and that it is realized by progressive interpretations, for which history and comparative law should be utilized. Secondly, the task of the interpreter should not be limited to divining the intention of the legislator whose term has already run its course, but should consist rather in adapting the permanent text to the changing necessities of the social milieu. Saleilles never arrived, however, at juridical impressionism, holding that in interpreting the law attention must be given to the text and the exigencies of formal logic. Many of these theories are developed in "Droit civil et droit comparé" (in *Revue internationale de l'enseignement*, vol. xli, 1911, p. 5-32).

Saleilles was a prolific author. His briefest treatises often express his ideas most vividly, as, for example, the *École historique et droit naturel* (Paris 1902), a discussion of the trend which culminated in the revival of the doctrines of natural law and their adaptation to the conditions of modern science. His *Étude sur la théorie*

générale de l'obligation d'après le premier projet de code civil pour l'Empire allemand (Paris 1890, 2nd ed. 1901) explained the use of comparative law in the interpretation of the fundamental conceptions of national law, while *L'individualisation de la peine* (Paris 1898, 3rd ed. by G. Morin, 1927; tr. by R. S. Jastrow, Modern Criminal Science series, no. 4, Boston 1911) stressed the need for penal treatment based on the psychological and moral character of the individual. Saleilles' other important works include *De la déclaration de volonté* (Paris 1901), *Introduction à l'étude du droit civil allemand* (Paris 1904), *De la possession des meubles* (Paris 1907) and *De la personnalité juridique* (Paris 1910, 2nd ed. 1922); the last mentioned work traces the history of precepts relating to legal personality and presents a synthesis of metaphysical and realistic theories.

ACHILLE MESTRE

Consult. L'oeuvre juridique de Raymond Saleilles (Paris 1914), Thaller, Edmond, *Raymond Saleilles* (Paris 1912), Jonesco, C., *L'oeuvre de Raymond Saleilles en droit civil comparé* (Paris 1919), Michoud, L., "Raymond Saleilles et le droit public" in *Revue du droit public et de la science politique en France et à l'étranger*, vol. xxix (1912) 369-78.

SALES. The sale, or transfer of goods and chattels from one person to another for a price, is the most common transaction of commerce. In legal usage the term sale has come to be applied only to the transfer of ownership in tangible, movable goods and, except as broadened by statute to include barter, for a money consideration. Historical reasons for the narrowing of the definition of sale are to be sought rather in a consideration of the character of the commodities excluded than in the nature of ordinary tangible goods. Real estate has never been fully converted into an ordinary commodity of the markets, nor has labor. Intangibles in early systems of law are non-transferable. Typically they tend to acquire the status of tangibles through the development of the law of assignment and negotiability or by their being given a symbolic body in the form of a token or certificate; and there is a tendency to assimilate the law of real estate to the simpler law of the sale of goods in all systems.

Various legal systems have extended the applicability of the law of sales to cases which seem more doubtful to the lawyer than to the layman. Thus the Roman law permitted the sale of future goods and of *res incorporalis*. Various modern codes embrace barter, or the exchange of goods

for goods, as in the American Uniform Sales Act, section 9 (2), the French Civil Code, section 1703, and the German Civil Code, section 515, but not in the English Sale of Goods Act; the sale of future goods, from which a contract for work and materials must still be distinguished (American act, sect. 5, English act, sect. 5); dealings in undivided interests in a thing or in an unseparated portion or quantity of fungible goods (American act, sect. 6). Fine distinctions still seem to exclude the uttering of food by a restaurateur [Merrill v. Hodson, 88 Conn. 314 (1914)], and special laws in some jurisdictions control, for obvious reasons, features of the sale of particular commodities, such as oil and wine, animals, farm machinery [as to the question of constitutionality see Advance-Rumely Thresher Co v Jackson, 287 U. S. 283 (1932)], automobiles, necessities of life, secondhand goods, liquor, narcotics, weapons and securities; or special methods or conditions of sale, such as door to door canvassing, auctions or disposal of a person's entire stock of goods in bulk outside of the ordinary course of business to the detriment of creditors.

Early legal systems generally had no machinery for the enforcement of an executory contract of sale. Hence selling was of the type known as "real" rather than "consensual" and consisted of the immediate exchange of goods for a price. These systems were deeply concerned with the ceremonial aspect and its attendant publicity. In Roman law the symbolic weighing out of bronze in scales, the transaction *per aes et libram*, and in Anglo-Saxon law the necessity of transaction witnesses and of securing warranties on the basis of which a seller could be called in to defend if a buyer was accused of theft are typical of the principal ideas connected with the early stages of the law of sales. Among the more enduring vestiges of early concepts of the nature of the sale are the symbolic tally, or *festuca*, and the God's penny, which gives way to earnest money.

Gradually the contract inherent in a transaction of sale came to be recognized as an idea distinct from the transfer of title; eventually it became the all controlling feature of the law of sale, while the passing of title was reduced to a mere detail dependent on the intention of the parties as gleaned from the consensual contract, as in the English, the American and the French law (English act, sect. 17; American act, sect. 18; French Civil Code, sect. 1138) and, to some degree, even in the German law and others copy-

ing the Roman law, which continued, to the end, to connect the passing of title with the transfer of physical possession.

Although the law of sales has in modern times been assimilated to and incorporated in the general law of contract, there are still recognizable in it features which depend upon the law of possession and ownership. The isolation of possession from ownership is illustrated in the unpaid seller's lien, a right to withhold possession although title has passed. Even in those systems in which delivery of possession or an arrangement that the law deems equivalent is unnecessary to pass title, it is at least evidence of an intention to pass title. It is not at all unusual, however, for a person to hand over possession while withholding title, whether for credit security, for taxation or accounting considerations or for the purpose of giving the buyer an opportunity to express his approval.

It is important to determine the exact moment of the passing of title, because in modern law risk generally follows title; although in the Roman law, in which title did not pass until delivery, the risk of loss passed as soon as the contract of sale was fully completed. The question of what title passes presents a sharp contrast between the ancient Roman idea that a man cannot ordinarily sell a better title than he has—*nemo plus iuris transferre potest quam ipse habet*—and the modern continental idea that possession is as good as title, which is based on the desirability of maintaining regular transactions, for business convenience, even at the expense of security of vested rights. Anglo-American law occupies an intermediate position: it recognizes a power on the part of the owner of a title voidable for fraud to pass a good title to an innocent purchaser for value without notice. In English law a good title may ordinarily be passed by sale in market overt. Furthermore modern law in general reads into a contract of sale comprehensive implied warranties of title or quiet possession. The modern French law has kept to the rule of the classical Roman law that the seller was not bound to transfer a good title to the purchaser but was bound to warrant his undisturbed possession. By the German law, however, the seller is bound to make the purchaser owner. In the English and American law too the disturbance of the purchaser's possession, actual or constructive, is a condition precedent to any right of action on his part.

In modern law the terms of a contract of sale may be determined to a large extent by the

agreement of the parties. In general the ordinary rules of contract are made to apply to the contract of sale, whether it contemplates an immediate transfer of title (sale) or a future transfer (a contract to sell) But sometimes there are special requirements, such as the formalities for the making or proving of an agreement of sale (the French notarial record or the writing of the Anglo-American Statute of Frauds) The English and American sales acts deviate from the ordinary rules of contract by reading a "reasonable" price into a contract of sale that would otherwise be held defective for uncertainty because of the absence of a stipulation as to price.

Of particular importance in the interpretation of the contract of sale is the extensive reading into it of implied warranties of quality coupled with a very liberal definition of an express warranty The American sales act goes so far as to include any affirmation of fact or any promise by the seller relating to the goods "if the natural tendency of such affirmation or promise is to induce the buyer to purchase the goods and if the buyer purchases the goods relying thereon." The English sales act took from the Scottish law the notion of reading a condition into every warranty in an executory contract of sale; that is to say, the giving of an option to the buyer in case of breach of warranty to return the goods instead of keeping them and asking for damages or an allowance. The American statute follows the British law in this. Anglo-American law awards actual damages, including damages for personal injuries reasonably foreseeable. Continental law, following the Roman law, generally limits the amount of the recovery to the price of goods paid, with an exception in the case of malicious concealment of defects, an offense dealt with in Anglo-American law more effectively as fraud. Continental law further makes it possible to demand the furnishing of goods that comply with the terms of the warranty in accordance with its general procedural advantage of granting specific performance in an ordinary action at law.

Although the trend has thus been to the contractual view of the nature of a sale, the standardization of the contract itself has been effected to a considerable degree by legislation. In the dozens of sales handled daily by a clerk in a retail store, there is no time or opportunity for making stipulations contrary to the standardized statutory terms. The customer, on the other hand, lacks the necessary knowledge to initiate stipulations on his side. In effect therefore the

standardized contract of sale becomes the operative contract in thousands of cases. Among the advantages of such standardization are of course speed, certainty, the breaking down of sales resistance and a tendency on the whole to fairness or at least to equal protection of all purchasers These advantages are, however, acquired at the expense of rigidity and failure to make adjustments to the special needs of special cases. In all countries today the statutes standardizing the contract of sale for practical purposes assume that the buyer is a consumer dealing with a shopkeeper and draw their warranties accordingly, and furthermore that the shopkeeper is like his prototype of a past age who was very generally the grower or manufacturer of the goods. They presuppose chiefly "cash and carry" transactions and an open competitive market in which prices are determined under the regime of freedom of contract.

Current economic life departs so far from the simple picture reflected in the statutes that sales law in practise calls for liberal modification or adjustment, both by contract and by legislation. In the first place, there is the problem of transportation. Delivery to the carrier is reckoned delivery to the buyer, even if the carrier is the seller's agent for collection on delivery, unless this presumption of intent is effectively negated A difficult question of fact is raised when it is alleged that a trade usage exists which counteracts that intent, as in the case of city stores or the purchase of goods requiring setting up by the seller on the buyer's premises. The growth of nation wide markets has led to the incorporation of transportation charges in price lists by means of *f o b*. agreements or agreements for the payment of carriage by sellers to particular points, and in other ways Where these stipulations are merely modes of calculating prices, as in the automobile industry or in the creation of a "basing point" for steel, oil or other commodities, they should not affect the question as to what constitutes delivery of possession or where it takes place. On the other hand, if the seller agrees to pay the cost of transportation to the buyer or to a particular place, there is not only a presumption that delivery is postponed until that place is reached, but the American sales act indulges in the further presumption that title is prevented from passing until delivery is consummated there. This rule has led recently to experimentation in order forms with such expressions as *deliver at our factory* instead of *sell or ship*. Transportation by water in inter-

national trade has led to the development of a species of transaction, not yet internationally standardized, in which documents rather than the goods represented are viewed by the business world as the subject of a sale. The so-called c.i.f. transactions, that is to say, the dealing in documents of title accompanied by arrangements for insurance and transportation charges as well as the cost of goods, make the whereabouts of the goods and even their destruction by accident of no consequence to the banker who advances money on the documents or to the merchant who buys them. To a smaller degree the dealing in tokens for goods, particularly negotiable warehouse receipts and bills of lading, has penetrated domestic banking and wholesale business.

The English and American sales acts, assuming a cash transaction, give the unpaid seller a lien on the goods or a right to retain them for the price while he is in possession of them, a limited right of resale, a limited right to rescind the sale (in the American acts only); and where the property in goods has not passed to the buyer, the unpaid seller has in addition to his other remedies a right of withholding delivery similar to and coextensive with his rights of lien if the property has passed to the buyer (English act, sect. 39; American act, sect. 53). The rights of the seller against the buyer may also include an action on the price and an action for damages for non-acceptance of the goods. The French law, which has not freed itself from the influence of the Roman law, allows rescission only by judicial sale when no specified time of performance is fixed in the contract. In practise the safeguarding of credit is accomplished by a great variety of legal devices written into the sales agreements of dealers who customarily extend credit. Some of these look to the goods; others look to additional personal security or the waiver of special rights and defenses on the part of the buyer. The statutes, however, have not gone so far as to read warranties or conditions with regard to a buyer's credit standing into his purchase agreement to correspond to those which are read into the seller's undertaking.

A particularly important right of the seller is his so-called right of stoppage *in transitu*, based on an anomalous doctrine of the law merchant of the Middle Ages which has survived in modern law in various forms. It is a right of the seller in case of insolvency of the buyer to stop the goods in transit after he has parted with possession of them. The right is recognized by both English and American law as well as by French

and German law and presumably by the law of other continental countries.

The statutes pay no attention to the advent of the middleman. They still conceive of a warranty as existing only between a seller and the person purchasing from him directly. No such relation is established between the manufacturer or wholesaler and the purchaser from a retailer. Courts have attempted to overcome this defect by extending the law of negligence so as to make the manufacturer answerable to the consumer or in fact to the ultimate user of goods for negligence or other fault in the process of manufacture, particularly in the case of foods and dangerous instrumentalities [*MacPherson v. Buick Motor Co.*, 217 N. Y. 382 (1916)]. In the absence of proof of fault or negligence, the manufacturer is not answerable to the person actually injured or otherwise suffering loss by reason of the defect of the goods. One must proceed against the seller, who is often of doubtful financial responsibility. Of course the seller in turn has a right of action against the manufacturer or dealer from whom he bought the goods, but the warranties in the first and second sales may not be coterminous. The dealer must prove in effect that the goods are non-merchandise. The buyer, on the other hand, complains because the goods are not as represented by the dealer or fit for the purpose for which he bought them and with regard to which he relied on the seller's skill or judgment.

Not only is the dealer-purchaser interested in a different type of warranty from that which concerns the consumer, but his seller's interest in his affairs and in the goods in the channels of trade places sales to persons other than consumers on an entirely different basis from those to consumers. A study of the types of agreements actually entered into between producers and distributors shows that the former are deeply interested in the manner of handling their goods, in the continuous availability of a supply of parts, in the servicing of their commodities in convenient localities and in the maintenance of the commercial reputation of their goods, especially if branded or otherwise identified. In spite of legal limitations in the United States, they are interested in the resale price to consumers. The consumer, on the other hand, has a touch-and-go relation with the dealer from whom he purchases. The reading into both types of transaction of the common law doctrines against restraints on alienation in precisely the same way illustrates a failure to

recognize the distinction. Business has been driven to assume curious relationships with dealers who might otherwise have been independent. The enactment of bulk sales laws in the United States represents a tardy and only partial recognition of the legitimate interest, under the credit system, of the producer or wholesaler in the goods on the shelf of the retail dealer.

The manufacturing purchaser represents still a third class, with reference to which many of the ordinary assumptions must be reversed. For example, a manufacturer is likely to know more about the type of goods he buys than the seller. The implied warranty growing out of the situation, in which reliance is placed on the seller's superior knowledge, is frequently inapplicable to him. He is quite likely to be concerned about freedom from patent infringement in the things that he buys in quantities for incorporation into his product, while the ordinary consumer is not concerned over the theoretical danger of an infringement suit for using a single object protected by a patent. The manufacturer's specifications and inspection provisions are generally more elaborate than those contained in the contracts of other types of purchasers.

The codes assume further a simple economic life which has no thought of covenants running with chattels or equitable servitudes on chattels, although commercial reasons for such restrictions are increasingly reflected not only in unsuccessful attempts to control resale prices but in territorial restrictions for dealers or restrictions on the form in which articles may be resold (involved, for example, in the repackaging of drugs, perfumery and the like), tying restrictions and restrictions on the use of the chattel itself (familiar to users of radio equipment).

The failure of the statutes to adjust themselves to new economic conditions has led to the widespread adoption of "fine print" sales and purchase forms by business houses and by institutional buyers and governmental agencies, which are in many instances constrained to adhere to exact rules in their purchasing methods. In order to facilitate individual small purchases, while at the same time endeavoring to cover the points essential in such a contract, some industries, such as those producing coal and fuel oil, have developed a practise of causing a general form to be signed which, in the absence of stipulations to the contrary, will be read into each contract made between them and their customers in the form of purchases. Many of the

codes of fair competition approved under the National Industrial Recovery Act of 1933 have as their object the standardization of the contracts of sale entered into by particular industries with their customers.

An extreme instance of lag in the law of sales is found in the history of Roman law of *laesio enormis*, or the right of the seller to repudiate a sale for a grossly inadequate price while a buyer has no corresponding right. The rule is understandable if the buyer is regarded as normally a foreign merchant and the seller as a needy Roman citizen parting with his household goods. Yet the idea is still echoed in continental law. On the other hand, the realization in modern times that the seller is more often in a position of advantage as compared with the buyer has led to the development of the protection of the buyer by liberalized warranty laws; to the enactment of elaborate laws for redress, punishment and prevention of fraud, incompetence, irresponsibility and unfair practises in the market place; and in general to the decay of the doctrine of caveat emptor.

SALES TAX. The sales tax is a levy imposed upon the sales of commodities or services. The tax may be levied upon sales: in general, as in Germany; in general, except at retail, as in Belgium; in general, with other special taxes, as in France; of classified enterprises, as in Washington; of producers, as in Canada; or of retailers, as in Kentucky.

The sales tax was collected in ancient Athens, in Egypt by the Ptolemies and the Romans, in Rome by Augustus and later emperors and possibly elsewhere. Carried by the Romans into Spain and France, it survived Roman rule. The alcabala was introduced as a national tax in Spain in 1342, although it had been enforced for centuries in the local communities. It was abolished in 1845. Various sales taxes were known in France, such as that imposed upon the sales of provisions in 1314. Naples collected sales taxes in the fifteenth century and later. There was a lively discussion of the general excise in England and on the continent during the seventeenth and eighteenth centuries. England extended its excises in the nineteenth century, but Gladstone vigorously restricted them. The United States considered general sales taxes during and after the Civil War but chose numerous production and consumption taxes at various rates instead of a uniform system. France in 1871 adopted a stamp tax on payments as an alternative to a turnover tax. A Mexican consumption tax along Spanish lines was levied in 1856. A few states in the United States enacted limited sales taxes during the nineteenth century, and in 1904 the Philippines established a tax upon the commodity sales of merchants. In general, however, the nineteenth century as well as the early part of the twentieth was notable for

an absence of sales taxes in spite of some discussion of their merits and weaknesses.

It was the financial emergency created by the World War which focused the attention of the fiscal authorities upon the sales tax as a new source of revenue. Germany and France introduced payments taxes in 1916 and in 1917 respectively; these were superseded by turnover taxes on the total receipts of business in Germany in 1918 and in France in 1920. The Italian and Belgian stamp taxes on transfers of commodities, the turnover taxes of Hungary, Soviet Russia, Austria, Poland, Czechoslovakia and other countries and the Canadian sales tax were adopted shortly after the war. Continued condemnation of the sales tax by economists has not halted the advance of the sales tax. Familiarity with excise taxes aided in breaking down the barriers to a broad system of sales taxes which might be collected in a stream of tiny payments without much conscious effort on the part of taxpayers. The new form of taxation spread rapidly over the world, until by 1933 some thirty nations had enacted sales taxes, including nearly every leading country. In only a few cases has the sales tax been abandoned.

The repeated rejections of the sales tax by the federal government in the United States has not deterred a considerable number of states from adopting this form of revenue. The Pennsylvania tax on wholesaling and retailing has been traced back to 1821; a supplementary retail levy was added in 1932. Virginia taxed the purchases of wholesalers in 1887 and Delaware taxed manufacturing and mercantile enterprise in 1906. West Virginia adopted its well known classified sales tax at various rates on different classes of enterprise in 1921, followed later by Georgia and Mississippi, the latter revising its law in 1932 with a general basic rate of 2 percent. In Georgia and Pennsylvania the sales tax has since lapsed. Connecticut has collected a tax on the gross income of unincorporated business since 1921. Kentucky enacted a tax on retailing in 1930, the rates increasing with the volume of sales. Louisiana in 1921, North Carolina in 1931 and New Mexico in 1933 levied license taxes varying in amount with the volume of sales of taxable business. Arizona, California, Illinois, Indiana, Michigan, New York, North Carolina, Oklahoma, South Dakota, Utah, Vermont and Washington enacted sales taxes in 1933, and Missouri early in 1934. In Oregon and North Dakota sales taxes were enacted in 1933 but were defeated by the electorate at referenda. In

Oregon the legislature again passed a sales tax in December, 1933, pending a referendum. Nearly all of the taxes adopted in 1933 are retail sales taxes. In several states the sales tax is of temporary nature and will lapse unless renewed by the legislature. Local turnover taxes are collected by St. Louis and Kansas City.

One of the first steps in sales taxation is the definition of taxable transactions. Some exemptions are always allowed; these usually include certain essential foods, farmers' sales, exports, especially taxed transactions, and government enterprise. They may cover sales under a stated sum, imports, fuels, periodicals and various services; personal service paid for by wages and salaries is commonly exempt.

Sales taxes may be imposed upon total receipts, with deductions for returns, allowances and possibly other items; upon the individual transaction; upon the privilege of conducting business, which is supposedly measured by sales; upon sales in general, or upon specified types of sale. Not only different jurisdictions but also the same jurisdiction may employ varying bases of taxation. Taxes may be collected from vendors in general or from a certain class or classes of vendors. Customarily the vendor rather than the vendee is liable for taxation, although both may be held responsible for proper payment of the tax.

The sales tax may be imposed at various stages of production and marketing. A tax upon sales in general enjoys the broadest possible base, yields great revenues at a low rate and is nominally uniform in application. This type of general sales taxation is commonly employed. But such a tax invites industrial integration, and its blanket application hides multitudinous inequalities. A manufacturers' sales tax is limited to a relatively small number of taxpayers whose sales may be large, yields large revenue if manufacturing is extensive and the rate is not too low and obviates open encouragement of integration. Manufacturers, however, usually protest against being singled out for taxation; the rate must be higher than that of the more general sales tax to return equivalent revenue; and interest charges must be added to cover the cost of carrying the tax until the consumer pays it. One variety of the manufacturers' or producers' sales tax has been developed effectively in Austria, where the total tax rate varies according to the number of taxable processes. The industrial products of Austria are classified into four hundred groups for the application of the tax rates. This plan

of so-called lump sum taxation has been tried by several countries in central Europe. Flat rate manufacturers' sales taxes at an arbitrary rate are imposed in Canada, Turkey and Australia. France and Belgium have adopted a number of special flat rate producers' taxes on certain industries in lieu of general sales taxes. Retail sales taxes are imposed upon numerous retailers, thus augmenting taxable sales but creating administrative complications because of many small taxpayers, unless the smallest retailers are exempt. The retailing tax does not directly foster integration. Imposing the tax upon the last sale to the consumer reduces the interest charges for carrying the tax. Retail sales taxes are advocated frequently in the United States and are collected by half of the states imposing sales taxes; France and Italy have found them unproductive. The tax may be laid upon all sales except at retail, as in Belgium and Italy. This obviates the costly collection of small taxes from numerous retailers and provides a broader base than manufacturing alone but also encourages integration.

The sales tax rates are commonly 1 percent or 2 percent and range from a small fraction of 1 percent up to 6 percent or higher. Supplementary luxury taxes are collected at customary rates of 5 to 15 percent in foreign countries. Rates may vary with the volume of sales, with classes of taxpayers or with commodities and services. There was a marked increase in rates for the purpose of augmenting revenues following the depression which began in 1929. Export sales are usually exempted in order not to discourage foreign trade; imports may be exempted so that desirable raw materials or other products may be obtained without the addition of the tax. Sometimes the rates on sales of imported goods may be above those on domestic transactions in order to protect domestic enterprise from foreign competition. It is commonly thought that sales taxes on exports place the producing nation at a disadvantage as compared with other nations which either employ no sales tax or have lower rates. It is argued that exporters must compete with foreign vendors who may pay no sales taxes, and that in such a situation a sales tax cannot be shifted to foreign markets. The problem is especially acute when one state employs a sales tax while neighboring states do not. When a sales tax places domestic concerns at a disadvantage with respect to foreign concerns, it acts to foster foreign domination of markets. On the other hand, the fact that foreign competitors

may pay other taxes, as heavy or heavier than a sales tax, is often ignored. A sales tax is only one factor in this problem, and other factors may be more important in determining the direction of trade.

Experience with the sales tax in many nations since the war has proved it both productive and practicable under favorable circumstances. The yield varies with the scope and rates of the tax, business conditions and administrative efficiency. The sales tax has become a major source of revenue in a number of countries, yielding more than the income tax in a few instances and nearly as much in others. It frequently results in more revenue than customs or excises. It is, however, of merely minor importance in the United States.

In some countries attempts have been made to superimpose upon the general sales tax a system of supplementary luxury taxes. These are usually supported by public opinion but are difficult to collect because of the serious obstacles to satisfactory definition of luxuries for taxation. They have been relatively unimportant in yield as a rule, and opposition among the taxed interests has developed. In Germany and Danzig the experiment was tried and abandoned.

National sales taxes are collected commonly through centralized administrative machinery, although local officials may lend assistance. Collections may be used exclusively by national governments, as in Canada, or they may be shared by national and local governments, as in France and Germany. Local governments sometimes collect sales taxes for their own use, or national governments may permit a local supplementary tax. The state governments in the United States usually employ collections for state purposes, but they may be diverted partly to local governments.

The so-called sales tax, as a system of sales taxes, tends to be shifted to the consumer in the form of higher prices, although sellers may resort to lowering the quality or quantity of taxed articles at existing prices. As a business cost, sales taxes must be shifted to buyers or profits must be sacrificed or losses increased. The shifting of sales taxes can be considered only in the light of variable conditions affecting production costs and demand for each commodity or service. Various articles are related to one another in their production or consumption, and prices of articles not subject to the tax may be affected indirectly. The more mobile the investments in taxed fields and the more inelastic the demand

for taxed articles, the easier are adjustment of supply and raising of prices. Consumers may pay sales taxes by sacrificing consumption of taxed articles, of other articles, or of savings.

Regardless of the place of imposition sales taxes react ultimately upon production, marketing and consumption. Although they affect individual prices in various ways, they have no noticeable influence on the price level, for values in general do not change. Moreover a government spends what it collects in taxes, and government spending tends to offset the loss of private spending.

If a sales tax is shifted to consumers, it is regressive in its effects in that it falls most heavily upon the poorest consumers. Farm and labor organizations in Canada, the United States and other countries have uncompromisingly denounced general sales taxes. The poorer classes spend a larger part of their incomes on necessities and save a smaller part than the wealthier classes. Because gross expenditures are a crude basis of taxation, a sales tax is faulty in its distribution of tax burdens among consumers. It disregards the number of dependents of taxpayers, sources of income, savings from income and methods of spending. Those who believe that restricted consumer buying is a causal factor in economic depression argue that sales taxation aggravates depression and retards recovery by reducing consumers' purchasing power. As popularly stated this argument overlooks the fact that taxes taken from consumers are paid out by governments, whose demand is substituted for consumer demand.

The luxury taxes supplementary to sales taxes are not heavy enough to counterbalance the repercussions of sales taxes on the poorer classes. The richer classes enjoy the further advantage that services supplied by household servants are exempt from sales taxes. While the regressive effects of sales taxes might theoretically be balanced by progressive income and inheritance taxes, sales taxes are in practise commonly found in tax systems which are otherwise regressive in their final effects.

If sales taxes are not shifted, as is frequently the case, they remain with business as a charge on sales. Business interests have come to realize in many countries that a sales tax is not the burdenless tax the enthusiasts have pictured. If it is shifted, sales decline and readjustments in supply are necessary; if it is not shifted, it rests on the unequal base of total sales. Taxes on sales in general foster business integration by permit-

ing multiprocess concerns to pay smaller sales taxes than the single-process concerns; integrating effects have been noted in different countries by a number of economists. Single levies on producers or retailers, however, avoid direct stimulation of integration. From the administrative standpoint, national producers' taxes are preferable to retailers' taxes. The growing popularity of producers' taxes may be ascribed to their ease of administration and their non-integrating influence.

The sales tax has proved its productivity and practicability where conditions are favorable. Collection costs and administrative complications may be kept at a reasonable minimum. The sales tax has not proved, however, to be a desirable substitute for the income tax or selected excises, which are productive and more equitable. It should be counterbalanced by a progressive income tax wherever practicable. The proper role of the sales tax in the fiscal system appears to be that of an emergency revenue, to be resorted to only when normal revenues are inadequate.

SALESMANSHIP. In ancient and mediaeval times selling was scarcely differentiated as a business function. The merchant mariner who carried his cargo, largely of luxury goods, from port to port and the itinerant trader who transported similar wares overland from fair to fair

alike made sales and deliveries from the stocks at hand. There was no such thing as a specialized army of salesmen taking orders for future delivery. The guild system discouraged active salesmanship as disturbing to the economic status quo. But quite as important, periodical fairs and markets took care of the small surplus stocks produced; it was not until the advent of the factory system that large surpluses of manufactured goods in need of marketing appeared and continuous selling became necessary to the making of a profit upon the manufacturer's capital investment. Traveling salesmen began to be employed in Europe in the middle of the eighteenth century. By the 1860's England was estimated to have about 20,000 commercial travelers and Germany almost as many. A professional journal for salesmen appeared in England in 1856; two years later the first association of travelers was formed in France.

The methods and technique of salesmanship developed through a somewhat similar cycle in all western countries. In the United States the earliest specialized salesmen were peddlers, retail clerks, drummers and "traveling representatives." Prior to 1850 drummers were stationed at city hotels to welcome merchants and jobbers on their semi-annual buying trips. With the improvement of railroad and shipping facilities the drummers took to the road, and merchant customers found it safe and economical to order from a distance. Wholesalers came to depend for their sales less upon visits from buyers and more upon the selling efforts of traveling representatives, whose number increased from 7262 in 1870 to 92,919 in 1900. During almost this entire period manufacturers, distributors and salesmen worked in the relatively effortless atmosphere of a seller's market, in which demand was greater than output and selling was largely a matter of taking orders.

Before 1900 few American manufacturers had attempted seriously to obtain a national distribution for their products. After the turn of the century, however, national distribution became a dominating objective, national advertising developed on a tremendous scale, and in order to gather its fruits sales organizations were thoroughly revamped and sales management developed new techniques. Market research was entered upon in an effort to secure reliable data for the allocation of sales territories and the determination of the quotas of business to be obtained by individual salesmen. Attention was given to the selection and training of traveling

salesmen, whose number had increased to 223,732 by 1930. Attempts were made to decrease the turnover of salesmen, averaging normally about 85 percent a year according to one investigation covering 35 concerns and 20,000 salesmen. A wide variety of devices was developed to stimulate the efforts of the sales organization: annual conventions, district conferences, contests and rewards, bonus plans and quotas. "Missionary" salesmen were sent out to demonstrate new products and to distribute aids to dealers; and the whole system was checked as to results by elaborate sales research departments. To a large extent the jobber, hitherto an important link in the marketing chain, was pushed aside while the manufacturer attempted to deal directly with the retailer or consumer through his sales organization. Liberal credit policies and instalment payment plans extended the consumer market to unheard of proportions. The intense competition for sales was accompanied by high pressure methods of selling, skimming the market for the sake of huge immediate sales volume with neglect of satisfactory permanent relationships between manufacturer and dealer. Forcing of sales became widespread in the real estate, stock and bond and insurance fields, with resulting speculation and overdevelopment throughout the business system. These methods received an abrupt check after the stock market crash in 1929; as the business depression deepened many organizations came to realize that they had made a fetish of national distribution and now turned to regional distribution and selective selling; there began a more discriminating study of markets and of customers and their needs as the more profitable and attainable goals.

Although salesmanship includes the efforts of an army of retail clerks and house to house canvassers, it is in the work of the manufacturer's representative, selling to jobbers and retailers, that the more characteristic features of modern selling technique have developed. Formerly an individualist, traveling under nominal or very loose supervision, the manufacturer's representative has come to be only one instrument—although a very important one—in a carefully coordinated marketing organization, which makes use also of general and direct mail advertising, special demonstrations of the product, dealer helps or attractive credit policies. Since the salesman must integrate his efforts with the other elements in his company's market strategy, sales recruits are commonly given a pre-

liminary orientation as to a company's history and policies, as well as training in the practical business of making a sales presentation. This is frequently reenforced by a sales manual, and by daily or weekly letters of instruction after the salesman goes into the field; analysis of his daily and weekly reports to the branch or central office is supplemented by occasional visits of inspection.

The technique of salesmanship has received a certain amount of attention from psychologists and a measure of systematic study in university schools of business. In 1930 approximately 19,500 students in the United States were enrolled in university courses in marketing, and 7200 in specific courses in salesmanship. Commercial education in the high schools has laid great emphasis on preparation for retail selling. The literature on salesmanship, which has come into existence almost entirely since 1900, is extremely empirical in scope; and the influence of university studies has been indirect, reaching salesmanship only through its application to marketing, advertising and sales management. Personal selling still uses the broad principles laid down by such pioneers as Arthur E. Sheldon, a book salesman and publisher who formulated a "science of salesmanship" and founded a correspondence school to teach its principles, and John H. Patterson, the first president of the National Cash Register Company, who in 1894 established the initial company training school for salesmen. Prior to these innovations salesmen had been trained through an apprenticeship system in the wholesale houses, handling merchandise and orders for years before venturing on the road. Sheldon and Patterson abridged this process by generalizing those psychological steps in persuasion which are involved in all selling: the familiar sequence of attracting attention, arousing interest, stimulating desire, overcoming objections and obtaining action. The "standard presentation," first developed by Patterson, is now generally used by sales organizations, each company working up its own form on the basis of its own salesman's experience. From this viewpoint salesmanship becomes an exercise in the art of influencing human behavior toward a definite economic end. More broadly conceived salesmanship is a function of any business organization in its entirety. It may be doubted whether under modern conditions of production any business can achieve maximum success without salesminded executives. The older policy of capacity production, with the

sales organization required to dispose of the output, is giving place to production with reference to consumer requirements

The methods and traditions of salesmanship have spread from business to other fields of activity. Not only insurance companies, banks, investment houses and public utilities but organized charities, political parties, schools and churches have attempted to make use of modern selling techniques and to mold them into instruments of mass persuasion. Salesmanship may even have a part in economic planning, where demand has fallen below normal standards and must be stimulated. If it be granted that human inertia is such that most men must be urged to act in their own interest, salesmanship has a valid and even a necessary part in social progress. It has made mass production workable, with consequent lowering of costs and raising of the material standard of living for vast populations. This achievement is offset only in part by its excesses: the overselling of products not really needed or to consumers who cannot afford them; the production of waste through arbitrary style changes; the emphasis upon sales volume at the expense of quality; and the occasional selling of fraudulent or socially undesirable goods. It must be recognized also that overlapping of sales effort results in a high cost of distribution. Reports for eleven of the largest life insurance companies in the United States for 1931 indicate that 51.1 percent of all expenses were selling expenses. How far the wastes of distribution can be reduced in an economic order based upon production for profit or whether any great reduction can be made without governmental regulation, are questions for the future. Methods of salesmanship, like those predominant in production, finance and the development of natural resources, have reflected the trend toward exploitation characteristic of the past century. Similarly, selling has more recently come to be based, at least to some extent, on the recognition that natural and human resources must be conserved, that consumers are too valuable to be exploited. It is possible to envisage a higher type of salesmanship in which selling would be viewed as the art of assisting rather than compelling people to buy—of showing consumers how best to satisfy their needs or desires through the purchase of goods or services with less emphasis upon persuasion and more upon the economics of consumption.

SALISBURY, THIRD MARQUIS OF, ROBERT ARTHUR TALBOT GASCOYNE-CECIL (1830-1903), British statesman. Although he was the dominant figure in English parliamentary life during the period of conservative reaction which followed the overthrow of Gladstonian Liberalism in 1886, Salisbury was less directly concerned with problems of domestic politics than with the vigorous conduct of England's foreign policy. His work as secretary of state for foreign affairs (1878-80, 1885-86, 1887-92 and 1895-1900) formed the transition between the British policy of aloofness from Europe of the 1860's and 1870's and the entente diplomacy of the twentieth century; while in the colonial world his objectives were definition of claims and the protection of recognized British interests. With the outlook of a great aristocrat he regarded the conduct of foreign relations as vested in himself, subject to parliamentary ratification but not to popular control or interference. Although he blustered occasionally, he was reluctant to press British claims when not well founded, willing to barter concessions and ready to enforce upon his own countrymen the established rights of other nationals.

During his first term as foreign secretary (1878-80) he won the praise of Disraeli for his skilful handling of the involved near eastern negotiations which culminated in the Berlin

Conference in 1880. After 1885, when as Conservative prime minister Salisbury formed the first of his three cabinets (1885-86, 1886-92, 1895-1902), he turned his attention to the reconciliation of European interests in Africa: initiating the Brussels Conference of 1889-90, which outlawed the slave trade, exchanging Heligoland in the same year for German recognition of the British protectorate of Zanzibar; and purchasing French acquiescence by concessions in the Algerian hinterland and Madagascar. The friction resulting from the failure of his determined efforts to secure France's recognition of British control in Egypt and the Nile valley culminated in the conquest of the Sudan by Kitchener and the occupation of Fashoda by Major Marchand. African and other colonial questions largely determined Salisbury's relations with other European powers. His adhesion to the doctrine of splendid isolation was a method, rather than a policy, which permitted the balancing of European powers one against the other. French hostility led him to consider greater friendliness with Italy and Germany. Yet he did not respond to four invitations from Germany for an alliance, rationalizing his desire to retain freedom of action as distrust of Bismarck and William II.

SALMON, THOMAS WILLIAM (1876-1927), American psychiatrist. Salmon's accomplishments in the field of mental hygiene began in 1905 when as an officer of the United States Public Health Service he established a psychiatric service for immigrants on Ellis Island. There he raised the standards of the care of the mentally unfit and instituted measures for their exclusion from the country. As first director of the National Committee for Mental Hygiene (1912-21) he laid the scientific groundwork for the now world wide movement for the control and prevention of mental disorders and the promotion of mental health. He initiated the system of uniform statistical reporting of mental and nervous diseases now in use throughout the United States. During the World War he

mobilized the psychiatric personnel for the United States army, planned the elimination of the mentally unfit from the draft army and, as chief consultant in psychiatry, organized and directed the psychiatric services which contributed to the control of war neuroses, the conservation of man power and the maintenance of fighting efficiency and morale among the American troops in France. He was the prime mover in the difficult task of creating a system of government hospitals for mentally disabled ex-service men. As professor in Columbia University he brought psychiatry into a closer relationship to general medicine by securing greater attention to the subject in medical school curricula and by improving clinical, research and teaching facilities. He conceived the plan for the establishment of the New York State Psychiatric Institute and Hospital at the Columbia Medical Center in New York City.

Salmon did much to advance the social applications of psychiatry. He developed the concept of mental hygiene as a useful instrument of social progress in all its phases and contributed to a clarification of the relationship between mental disorders and other problems of human behavior and maladjustment. The rapid multiplication of psychiatric clinics and other mental health services in connection with hospitals, schools, churches, prisons and other social agencies, and the growth of child guidance work and private psychiatric practice throughout the United States, were due, in great measure, to his initiative and efforts as well as to the mental hygiene movement, of which he was the guiding spirit.

SALT, used in either solid or dissolved form, is one of the most important food and chemical raw materials. As a food constituent the use of salt dates back beyond the dawn of history, and it has been involved in a significant series of social, economic and religious relationships. The upward trend in salt consumption seems certain to continue, although at a slower rate so far as food is concerned. The chemical-industrial requirements of salt, developed chiefly during the

past century, while today still second to food uses, seem likely to assume first place in the near future.

Common salt, or sodium chloride, is found in the form of rock salt as the mineral halite, but it occurs also and in even larger quantities dissolved in sea water, in the water of numerous desert lakes and in many natural brines issuing from underground sources. The need for salt as a food arises chiefly from the fact that the human body requires a notable percentage of mineral salts, predominantly sodium chloride. Meats supply a maximum of salt: raw or roasted meats supply far more than boiled meats, from which the salts are leached during the cooking. Vegetable foods rank far lower in salt content, the cereals lowest of all—barley, oats, wheat, maize and rice representing the order of decreasing salt content.

Although salt is at present considered an absolute necessity of human life, it came into common use only at a rather advanced stage of human existence as a result of changes in living and food conditions. Tribes living largely on meat or fish, raw or roasted, needed practically no additional salt in their diet. As the meat gave way to vegetables, additional salt became more and more necessary. Salt needs therefore increased with each move inland from the sea, with any decline in meat supply and rise in cereal consumption and with the development of massed sedentary communities. The growing use of salt was therefore bound up with the shifts from nomadic to agricultural and urban civilization. In most parts of Europe the cumulative effects of such changes in customs and habitats made an organized salt supply a necessity thousands of years ago; while in America the Iroquois had so little need for salt that the easily accessible Onondaga brines were never used by them prior to white occupation.

Salt early acquired a religious significance. It was used in many offerings to the gods, especially of cereals. Every meal with salt had a sacred character. Because of its properties as a preservative salt was considered a symbol of enduring compacts and was used to seal them. By virtue of its food value and religious significance a considerable part of ancient commerce consisted of salt, which was produced almost entirely by the evaporation of sea water. Salt provided the impetus for the development of many of the oldest trade routes. The salt trade languished in Europe during the early Middle Ages but revived after the thirteenth century.

The technique of salt making changed little except in detail from the dawn of history to the latter part of the nineteenth century. The primitive method, the evaporation of ocean water in enclosed basins by solar heat, was used along the North American coasts in the American Revolution and the Civil War and is still employed in California on a large scale. Two variants arose because of environment rather than choice. Far from the ocean it was found that salt was contained in natural brine springs or desert lake waters; and in more temperate regions, where solar heat was uncertain, the brines were evaporated in kettles or pans heated by direct fires. In Tennessee and probably elsewhere there have been discovered salt kettles of Indian fabrication. Even today pan and kettle evaporation is still practised in many parts of the United States as well as in other countries. The developments during the latter part of the nineteenth century involved the use of waste steam for heat, the creation of partial vacuums to reduce the evaporation temperature and the introduction of mechanical rakers to decrease the amount of human labor required to handle the raw material and its products. Since the 1890's the trend has been toward increasingly automatic processes of production.

Because of the widespread need for salt it has been a convenient source of government revenue in many countries and under widely differing conditions. The obvious advantages of salt taxes from the fiscal standpoint are that in most areas the sources of economic salt supply are few and can easily be controlled, while the needs of the consumer are pressing and constant. The social objections to salt taxes are, however, very serious. At first sight it might seem that a salt impost would bear equally upon rich and poor, on the theory that per capita consumption of this necessary must be approximately equal. Yet in reality such a tax falls differentially upon diverse races and classes, constituting a heavier burden upon the poorer individuals and groups. The poorer classes are in every case forced to rely on a bulky meatless diet, which requires a larger per capita use of salt to maintain health. Similarly a salt tax is a greater burden upon tropical races, living chiefly upon green foods and especially on rice, than upon those in more temperate regions where meat and grain are available. The French salt *gabelle*, which originated in the thirteenth century, was imposed in an effort to secure a broad base for taxation by a levy upon a universal necessary and in actual

operation bore most heavily upon the poor. The government forced each individual to buy a minimum of salt at fixed prices. The most hated and the most inequitable of taxes, the *gabelle* did much to awaken the passions which burst forth in the French Revolution. Like that in France, the salt tax in India has stimulated abuses, evasion and adulteration and has aroused political opposition, culminating sporadically in armed revolt. The Indian nationalists have used the salt tax as a weapon in their struggle against British imperialism. In China the salt tax has been used by foreign governments to insure the payment of principal and interest on loans made by their nationals to the Chinese government.

During the nineteenth century there was a steady increase in the world's output and consumption of salt. The major factors in this development were population growth and rising standards of living and the constantly greater requirements for salt to be used in chemical processes and in agricultural fertilizers. Although according to available statistics world output in 1929 amounted to nearly 30,000,000 metric tons of salt, the actual output, allowing for defects in the data, was probably 40,000,000.

WORLD'S OUTPUT OF SALT, 1929
(In metric tons)

| CONTINENTS | | PRINCIPAL COUNTRIES | |
|---------------|------------|---------------------|------------|
| Europe | 13,340,000 | United States | 7,750,000 |
| North America | 8,260,000 | Germany | 3,050,000 |
| Asia | 5,845,000 | Soviet Union | 2,800,000* |
| Africa | 647,000 | France | 2,190,000 |
| South America | 337,000 | United Kingdom | 2,006,000 |
| Australia | 130,000 | China | 2,000,000† |
| | | India | 1,750,000 |
| | | Japan | 809,000 |
| | | Italy | 910,000 |
| Total | 28,559,000 | | 23,265,000 |

* Figure for 1928, for 1929 not available

† Estimated annual production

Salt prices are open to easy misunderstanding, because of the fact that a very large and steadily increasing fraction of the total output, 45 percent in 1931, is never placed on the market as actual salt but is used by chemical companies in the form of brine. To these companies brine is merely one raw material, produced on their own properties and usually valued at mere cost of production. In recent years this chemically used fraction of the total United States salt output has been valued at around fifty cents per ton of included salt, while evaporated salt for open

market has ranged around seven dollars per ton, and crushed rock salt around three dollars per ton. It is obvious that in view of such differences it is idle to say that the average value of American salt was \$4.04 in 1922 and \$2.93 in 1931. This makes an estimate of the value of salt output extraordinarily difficult.

Sources of commercial salt may be grouped as follows: oceans; salt lakes and inland seas, in which water has been concentrated because of high temperature and limited outlets; brine springs and wells, containing salt from underground deposits left by oceanic evaporation in geologic ages; rock salt deposits formed by natural evaporation of lake or ocean waters, underground in moist climates, often at the surface in arid regions. All of the possible sources are now being worked for supplies of commercial salt. The sequence in which they are arranged above represents in general the order in which man came to make use of the possible sources. To some extent this was fixed by habitat. Tribes living near the ocean learned the use of ocean salt, while desert tribes found salt lakes, salt springs or local rock salt surface deposits. In the New World settlers on the Atlantic coast from Brazil to Massachusetts evaporated ocean water. The first trans-Allegheny pioneers in the United States found and used salt licks and springs. In northern Mexico and in the interior of Louisiana and California both surface rock salt beds and salt lakes were found. The first underground development of rock salt beds took place a century or more after other sources had been utilized.

In making salt the mineral raw material may be either a deposit of rock salt mined as such, a brine made by pumping water into a rock salt deposit or a natural brine, such as ocean or desert lake water. After the raw material is secured by mining, pumping or simple enclosure, the subsequent treatment depends on raw material, product desired and climate or habit. Mining and simple crushing are adapted only to rock salt deposits; brine making and subsequent evaporation are designed to secure purer salts from impure rock salt deposits; brine enclosure or pumping and subsequent evaporation are the methods used to derive salt from ocean, desert lake or salt spring waters; unevaporated brine is employed directly in the manufacture of alkali and the like. The methods which pertain exclusively to the salt industry are brine making and brine enclosure, which differ only in the manner in which the brine supply is secured. As

to the subsequent evaporation processes, the following variants may be found: evaporation by solar heat in tanks or pans, by furnace heat in kettles or pans, by steam heat in grainers or by steam heat in vacuum pans. Of these processes the first and second date back to prehistoric times. The third and fourth were developed in the later nineteenth century; both possess certain advantages as regards heat utilization and use of machinery at certain stages, and today those processes which show the minimum of man hours per ton are the grainer method with mechanical rakers and the vacuum process with automatic discharge of product.

The salt industry of the world is affected by several factors of widely different type and origin. On the one hand, salt can be made in many parts of the world, so that absolute concentration does not obtain as it does in the coal industries. On the other hand, climatic differences do effect a very marked localization in the production of cheap salt, and chemical and food demands impose a notable degree of localized production and large scale industrial organization. The manner and extent to which these different factors have operated can best be understood if conditions for two widely separated periods, for example, the early nineteenth century and the present time, are compared. In the closing decades of the eighteenth century and the opening decades of the nineteenth salt had apparently reached a certain static position as far as sources and uses were concerned. In addition to numerous scattered localities all over the world where salt was produced essentially for local consumption, there were four or five great rock salt mine regions in England and on the continent whose output exceeded local and even national needs. Moreover in the West Indies (notably Turks and Caicos Islands) and along the Mediterranean coast of Spain climatic conditions and easy transport by water had encouraged extensive production of salt by sea water evaporation. Most of the output of these salt fields was exported for use in the great fishery industries of the North Sea and the Newfoundland banks. During the Napoleonic wars the trade attracted particular attention because of the fact that war conditions had affected it adversely. The salt requirements of the fisheries and their chief sources of supply have changed little since that time.

At present, however, there are two additional and rapidly growing demands for salt: in the larger meat packing enterprises and in the alkali

and heavy chemical industries. The first differs little from the earlier fishery salt trade except for the location of the new markets and the larger requirements. The chemical industry, however, has introduced new variants with regard to location of demand, tonnage needed, cheapness of supply and economy of form. Modern alkali industries are based on three primary raw materials: salt, sulphuric acid and lime; the plant is usually located close to the salt and limestone supplies and the acid is normally transported. The industry calls for substantial amounts of capital and highly skilled labor; furthermore it is dependent upon large power supplies, preferably electricity.

All of the new conditions suggest that it has now become possible to organize national salt industries along two different lines. On the one side, integrated chemical plants produce directly large amounts of salt, use it chiefly as brine and generally do not enter the commercial salt market. In such cases, which cover perhaps half the salt output of the leading industrial countries, labor and organization are conditioned by the structure of the great chemical industries. On the other side, this very absorption of the chemical plants in producing salt for their own needs has narrowed the areas available for salt exploitation for ordinary commercial needs and has facilitated concentration of the greater salt producing fields in a few hands. In the United States one monopolist company, after considerable litigation, seems to have reached a position of dominance. Most of the salt consumed by the people of the United States is sold under the trademarks of a small number of companies.

The salt trade of the world, internationally considered, is today, as it has been for some centuries, dependent upon certain differences in climate and religion aided by certain trade flows in entirely different staples. Broadly speaking, the Mediterranean and South American countries import northern (i.e. Newfoundland and Scandinavian) cod and other fish in large quantities, for purely religious reasons. The return trade flow is largely made up of sun evaporated salt from Spain and the West Indies. The fish originate in areas where rock salt does not exist or is not worked and are shipped to areas where sun making of sea salt is easy.

SALT, SIR TITUS (1803-76), worsted manufacturer of Bradford and Saltaire, Yorkshire, England. Salt was the son of a cloth merchant and wool stapler, whose partner and successor he became. Finding manufacturers unwilling to handle Donskoi Russian wool, he began to manufacture it himself in a hired mill with specially adapted machinery. By 1836, when he introduced the manufacture of alpaca into England, he had four mills at work. His business thrived greatly, and in 1848 he was elected mayor of Bradford. Soon afterward he decided to concentrate all his operations in a single establishment, which he set out to build himself as a complete town. Saltaire was opened in 1853 and became at once a show place for visitors from all parts of the world. For the rest of his life Salt steadily added to the new town, providing not only houses and public dining rooms, recreation rooms, baths and washhouses but also factory schools, almshouses and places of worship as well as a public park. After his death the various Saltaire properties, except the works, were placed by his heirs under the control of a trust which he had left money to endow. Salt was an active nonconformist, and in politics a liberal

closely akin to John Bright. He was elected member of Parliament for Bradford in 1859; but he disliked parliamentary work and retired from his seat in 1861. He was made a baronet in 1869. Saltaire recalls in some respects New Lanark and foreshadows Bournville and other similar modern industrial establishments. But Salt, a man of no great culture or education, had no touch of Owen's idealistic socialism, although he was prepared to give generously, especially in the cause of religion. He was simply a successful manufacturer with liberal leanings and the business imagination needed to found Saltaire.

G. D. H. COLE

Consult: Baggernie, R., *Sir Titus Salt* (London 1877); Holroyd, A., *Saltaire and Its Founder* (Saltaire 1871).

SALVIOLI, GIUSEPPE (1857-1928), Italian jurist and economic historian. Salvioli received his doctorate in law at Modena in 1878 and taught history of law at Camerino, at Palermo from 1884 to 1903 and finally at Naples from the latter date until his death. His first great work on legal history, the *Manuale di storia del diritto italiano*, appeared in 1890 (9th ed. Turin 1930). Its fundamental thesis was the continuity of Roman law in Italy, even in the centuries of German domination. But the special merit of the work, especially in its later editions, lay in the fact that it was not merely a legal history but also an excellent social history of the Italian people. Salvioli's first notable study in the field of economic history was *Stato e popolazione d'Italia prima e dopo le invasioni* (Palermo 1890), in which he explored one of the fields of mediaeval Italian history, at that time virtually neglected. Here he advanced a thesis parallel to that of his *Storia del diritto*—the continuity throughout the Middle Ages of the Roman economic institutions. His most famous book on economic history was *Le capitalisme dans le monde antique* (tr. from Italian ms. by A. Bonnet, Paris 1906; Italian ed. by G. Brindisi, Bari 1929), in which he denied the existence of a true capitalism in classic antiquity. Salvioli later returned to this conception, but although it can be termed more original than the dominant opinion, it encountered numerous objections and contradictions. On the other hand, his minor thesis of the widespread persistence of small holdings in Italy in the period of the Roman Empire and of the early Middle Ages, which he developed in his article "Sulla distribuzione della proprietà fondiaria in Italia al tempo dell' Impero romano" (in *Archivio giuridico*, vol. lxii, Modena 1899,

pts. ii-iii) and in other writings, is now generally accepted as the correct historical interpretation.

SAMARIN, YURY FEDOROVICH (1819-76), Russian Slavophile Samarín was early imbued with the patriotic spirit of Pogodin's historical writings and was converted to Slavophilism and Hegelianism by K. Aksakov. Unable, however, to reconcile the philosophy of Hegel with Eastern Orthodoxy, he discarded the former and came under the lasting influence of Khomyakov, whose theological works he edited in 1867. In his dissertation, which except for the third part, published as *Stefan Yavorsky i Feofan Prokopovich kak propovedniki* (Stefan Yavorsky and Feofan Prokopovich as preachers, Moscow 1844), was suppressed by the church authorities, he developed Khomyakov's theory of the essence of the Orthodox church as the "synthesis of unity and freedom" and presented a highly dialectical interpretation of the contradictory positions of the two churchmen as representing the two complementary elements of Orthodoxy: that of unity in the nearly Catholic anti-Protestantism of Prokopovich and that of freedom in the nearly Protestant anti-Catholicism of Yavorsky. Samarín reverted to religious controversy in his brilliant essay *Iezuiti i ikh otnoshenie k Rossii* (Moscow 1866, 2nd ed. 1868; tr. by P. Boutourlin as *Les jésuites et leurs rapports avec la Russie*, Paris 1867) directed against the defense of the order presented by the Russian Jesuit Martinov.

After a brief and unsuccessful administrative career Samarín devoted himself to political and literary activity. As author of a number of studies on peasant emancipation, which were suppressed by the authorities, and as member of the committee in charge of drafting the reform project he participated in the movement for the

liberation of the peasantry under Alexander II. Together with Cherkassky and Kolupanov he was an ardent defender of the *obshchina* (village community), an institution which occupied a foremost place in the program of the Slavophiles. In his political writings, notably *Pisma iz Rigi* (Letters from Riga, Moscow 1849) and *Okrami Rossií* (The borderlands of Russia, 5 pts., Berlin 1868-76), he rejected all separatist attempts, particularly those of the Germans in the Baltic provinces, and sponsored a highly illiberal although not undemocratic imperialist Russian policy based on the principle of federative organization of the empire. A member of the municipal and county councils of Moscow, Samarín elaborated a program of tax reform along the lines of Prussian fiscal reforms, which he reviewed in a masterful essay, "Finansoviya reformi v Prussii" (Financial reform in Prussia, in *Sbornik gosudarstvennykh znany*, ed by V. P. Bezobrazov, 8 vols., St. Petersburg 1874-80, vol. vi, p. 257-326).

SAMPLING. See STATISTICS; PROBABILITY.

SAN MARTÍN, JOSÉ DE (1781?-1850), Spanish American revolutionist Born in the province of Misiones, now part of the republic of Argentina, San Martín was educated in Spain for a military career and served in the Spanish army for nearly twenty years.

In 1812 he returned to South America and enrolled with the revolutionary forces of Buenos Aires. Two years later, while governor of the province of Cuyo, he began to recruit and drill an army for the invasion of Peru by way of Chile. When the Platine revolutionary congress met in 1816, San Martín, by means of stirring letters to one of its delegates, did much toward influencing that body to declare independence from Spain. At that time he expressed his conviction that a federal government for the La Plata provinces, with their regional rivalries, would not be strong enough to withstand Spanish intrigue and that only a constitutional monarchy could assure the safety of the new state. In 1818 San Martín crossed the Andes, obtained control of Chile and saw its independence

proclaimed. After refusing the dictatorship of that province, he entered Peru and in 1821 declared it an independent country.

San Martín became dictator of Peru, holding that representative government at that time would mean a loss of independence, since the Spanish still controlled a large part of the country. He favored European princes as heads of the new Latin American states and sent envoys to Europe to treat with various countries concerning possible candidates for Peru. Convinced that his troops were too weak to defeat the Spanish army in Peru, which had withdrawn eastward, he turned for aid to Bolívar, who, however, did not wish to release the number of troops desired by San Martín and also differed from the latter in advocating a republican form of government for independent Spanish America. Unwilling to hurt the revolutionary cause by an open quarrel with Bolívar, San Martín retired in 1822, leaving his rival to complete the work for independence.

SANATORIA. See HOSPITALS AND SANATORIA.

SANCTION, INTERNATIONAL. Sanction was a term used in Roman law to signify a penalty visited upon a person who violated the law. It is not, however, a term of art in municipal or international law. Single states, usually the more powerful, have on occasion applied unilateral sanctions against weak states, with or without the use of armed force, to redress an alleged grievance. Such sanctions have included withdrawal of diplomatic officers, a demand to salute the flag, refusal of recognition, embargoes, so-called pacific blockades, intervention by landing troops or similar steps, naval demonstrations and reprisals of various kinds. This form of self-help aroused challenge, for it disturbed international relations and was undertaken by a party who was plaintiff, judge and sheriff in its own cause.

Until after the World War it had been gener-

ally recognized that any attempt to penalize a state was a precarious enterprise subject to difficulties not known to municipal law in dealing with individuals. In the moral exaltation at Versailles in 1919, however, theories of the League to Enforce Peace and postulates of a well ordered world of abnegating states resulted in a professed disinclination for unilateral sanctions and war. There was proposed instead a cooperative "enforcement" of peace and law by collective judgments and execution modeled upon the behavior of a state in its domestic relations with its own citizens. This idea was embodied primarily in article 16 of the League of Nations Covenant, which authorizes and contemplates collective economic and military sanctions against a state that resorts to war in disregard of its covenants peacefully to settle its disputes under articles 12, 13 or 15. Article 10 requires the member states to guarantee the territorial integrity of all the other members against aggression.

Few analogies have less substantial foundation or have led to more unfortunate results. International sanctions interest the layman more than they do the lawyer. When the former thinks of law he thinks of a policeman as its embodiment. He does not realize that without public opinion, which stands behind the policeman, law could not be enforced, as is shown by the history of the Eighteenth Amendment and the Volstead Act. Similarly custom, tradition, the sanction of public opinion and the realization that breach entails consequences, including the possible judgment of international tribunals, account for the fact that, in time of peace at least, international law is observed more uniformly than municipal law. Violations do not escape detection and redress as readily as in municipal law. The difficulty in international relations is not to enforce the observance of a rule of law, which is rarely necessary, but to persuade nations, where the law is uncertain or doubtful, to submit their dispute to conciliation or adjudication. Once these processes are invoked, the enforcement of the award or decision is not a serious problem. Moreover even in war the rules of international law are observed more commonly than is generally supposed; it is only when a powerful belligerent defies neutral opinion and is willing to run the risks of neutral intervention that law is seemingly violated with impunity; even then redress is often obtained after the war, as a sanction for the rule of law.

A major difficulty, not obviated by sanctions.

is that so many aspects of national activity having international repercussions escape legal control, as in the case of trade and tariff policy, economic, political and military competition and the harboring of resentments. Wars are caused mainly by political, historical and economic conflicts of interest, inflamed by passion or hysteria, but rarely by differences over purely legal questions.

While the recalcitrant individual in a community can be coerced by societal agents, a state, particularly a strong state, cannot be coerced by supposed societal agents or by other means without unhappy consequences. Only on paper is this possible; Dupuis, a famous Frenchman, speaking of the French plan for a League to Enforce Peace, remarked that it was "neat, complete, logical, chimerical, and impracticable." James Madison in 1787, although speaking of so coherent a group as the thirteen American states, said that "the practicability of making laws, with coercive sanctions, for the states or political bodies, has been exploded on all hands"; and Hamilton added, "To coerce the states would be one of the maddest projects ever devised. No state would suffer itself to be used as an instrument of coercing another." The supposed analogy between the individual within a single state, to which he is subordinate, and an independent state in the world of nations fails in fundamental respects. The individual cannot successfully resent or resist arrest or coercion; the state and its citizens can do. Even against groups of individuals like trade unions the state is very chary of applying coercion.

Yet the 1919 League plan for "organizing peace" among the motley nations of the world was founded on coercive sanctions. Even the United States has never sought (except by war, the inevitable consequence) to coerce a state of the union. Against an independent state of the family of nations, outside coercion, even if considered justified, has profound political connotations. Concerted action in pursuit of abstract justice is unknown. Hence concerted action is likely to be primarily political in character, however high sounding the alleged justification. Collective coercion in support of a rule impartially applied by impartial judges is not likely to be realized and would not be credited if alleged. Concerted sanctions by Great Britain, Germany and Italy against Venezuela in 1902 were aimed to enforce a claim of right of the participating states; in other cases alliances of

states have acted in concert to enforce their political claims or interests; under treaties of guaranty collective sanctions have very occasionally been employed, as in Greece; by the Locarno treaties Great Britain and Italy undertook certain vague commitments to enforce the immunity of the Franco-German and Belgian-German frontier against "unprovoked . . . aggression"; but never has a nation knowingly used force against another except in what it believed to be its own self-interest, in which case it necessarily assumed all the risks of such violent action. Armed sanctions not intended to result in war and not so resulting have been used only by strong against weak states.

There are publicists who admit the dangers of attempting to use force to secure the observance of international obligations. They rely, however, upon the economic sanctions of the League covenants. But the effectiveness of even such sanctions must be regarded as illusory. Economic boycotts and trade reprisals are likely to have the same effect as force. Only when invoked against weak states will such measures generally not lead to war.

Not only have the sanctions failed, but their very existence and occasional threat jeopardize the life of the League of Nations and international peace. They are based on certain fundamental postulates which are contrary to historical and human experience. The world charted in 1919 at Versailles was not founded on the equality of nations, but on the superiority of some and the subordination of others. A guaranty of that status quo was hardly conducive to friendly relations, even if temporary "peace" was "enforced." The member nations were privileged to resign from the League when they saw fit, on two years' notice. The decisions of European nations are usually dictated by self-interest and are likely to be political rather than legal in character. In the case of the Japanese invasion of Manchuria, before making a decision that Japan was the "aggressor" they found it advisable to consult their interests either as to the fact or as to the consequences. The Lytton Report and the Assembly Resolution of 1933 avoided stigmatizing Japan as an "aggressor," doubtless for this reason. Only a few nations will be in a position to employ sanctions, and against a strong nation like Japan sanctions virtually mean war; this explains Great Britain's caution and insistence on neutrality. Unless a nation's vital interests are involved, it is not likely to run the risk of war; a government which invites its

people into measures of boycott and possible blockade risks much. The assumption that collective action reduces the risk is not well founded, partly because wide collective action will generally be only a hypothesis and otherwise may mean a great war. The nation selected as the pariah will hardly regard the decision as anything but prejudiced or uninformed and will resent the collective action, by force if necessary. "Aggression" is a political more than a legal term; it cannot be defined in advance, for the question whether it is defensive and whether aggressive action is or is not justified depends altogether upon circumstances, as is recognized by private law. No nation can conscientiously make advance commitments in the abstract to use force or sanctions against another nation, unidentified. The more genuine the aggression, the greater the effort will be to cover it up by excuses. The "aggressor" will moreover seek to avoid the application of article 16 by refusing to admit that its action involves a state of war but will assert that forceful measures are peaceful, thus promoting international confusion and hypocrisy. Unilateral sanctions in support of a legal claim have not therefore been seriously impeded; a striking illustration is Mussolini's bombardment of Corfu. If challenged by the League machinery a state is apt to resign from the League. The proposal of a boycott by the United States against Japan on account of the Manchurian adventure had even less justification, for the United States was not a member of the League and war would doubtless have been an early consequence.

From every practical point of view therefore it would seem that sanctions against an "aggressor," when the latter is a strong power, are either impracticable or are likely to lead to war. Force is hardly an antidote against force. Collective force may occasionally be effective against small powers, but even then grave results are incurred. The fundamental notion that the League sanctions constituted a practical instrument of pacification was erroneous. It has probably postponed that reconciliation and appeasement and composition of differences which are the only trustworthy basis of peace. It has extended the life of the Treaty of Versailles and its analogues, until now vested interests make it more difficult to secure necessary changes.

An international police force encounters the same obstacles as collective sanctions. Had there been after 1919 a genuine growth of internationalism by mutual cooperation of all the major

powers, such an experiment might have been tried and in minor matters might have had a bare chance of success, despite overwhelming obstacles. But with the perpetuation of the spirit and methods of war inherent in the Versailles policy nationalism was bound to increase, so that an international police force now seems a fantasy.

It would be an advantage if a limitation were imposed upon the use of force at the initiative of a single power or group of powers. Such an effort is exemplified in the second Hague convention of 1907 on the limitation of the use of force in the collection of contract claims, although the loopholes are considerable. But the obligatory submission of all legal disputes and, if possible, the submission to conciliation of non-legal issues would do much to render the use of force or sanctions unnecessary. For the rest an agreement to forego unilateral sanctions until an international commission, court or board rendered a favorable judgment and obedience was refused would be helpful. But in a world organized as at present, with political and commercial conflicts of interest becoming ever more acute, no infallible guaranty against the use of force seems possible.

SANCTION, SOCIAL. In any community there are certain modes of behavior which are usual and which characterize that particular community. Such modes of behavior may be called usages. All social usages have behind them the authority of the society, but among them some are sanctioned and others are not. A sanction is a reaction on the part of a society or of a considerable number of its members to a mode of behavior which is thereby approved (positive sanctions) or disapproved (negative sanctions). Sanctions may further be distinguished according to whether they are diffuse or organized, the former are spontaneous expressions of approval or disapproval by members of the community acting as individuals, while the latter are social actions carried out according to some traditional and recognized procedure. It is a significant fact that in all human societies the negative sanctions are more definite than the positive. Social obligations may be defined as rules of behavior the failure to observe which entails a negative sanction of some sort. These are thus distinguished from non-obligatory social usages, as, for example, customary technical procedures.

The sanctions existing in a community constitute motives in the individual for the regulation of his conduct in conformity with usage. They are effective, first, through the desire of the individual to obtain the approbation and to avoid the disapprobation of his fellows, to win such rewards or to avoid such punishments as the community offers or threatens; and, second, through the fact that the individual learns to react to particular modes of behavior with judgments of approval and disapproval in the same way as do his fellows, and therefore measures his own behavior both in anticipation and in retrospect by standards which conform more or less closely to those prevalent in the community to which he belongs. What is called conscience is thus in the widest sense the reflex in the individual of the sanctions of the society.

It is convenient to begin a discussion of sanctions by a consideration of the diffuse negative sanctions, comprising reactions toward the particular or general behavior of a member of the community which constitute judgments of disapproval. In such reactions there are not only differences of degree—for disapproval is felt and

expressed with different degrees of intensity—but also differences of kind. Such differences are difficult to define and classify. In the English language, for example, there are a large number of words which express disapproval of individual behavior; these vary from discourteous, unmannerly, unseemly and unworthy, through improper, discreditable, dishonorable and disreputable, to outrageous and infamous. Every society or culture has its own ways of judging behavior and these might conveniently be studied in the first instance through the vocabulary. But until comparative study of societies of different types has proceeded further no systematic classification of the kinds of diffuse negative sanction is possible. Provisionally the negative moral or ethical sanction may be defined as a reaction of reprobation by the community toward a person whose conduct is disapproved; moral obligations may thus be considered as rules of conduct which, if not observed, bring about a reaction of this kind. Another distinguishable sanction is that whereby the behavior of an individual is met with ridicule on the part of his fellows, this has been called the satirical sanction. The varieties of diffuse positive sanctions, being less definite than negative sanctions, are therefore still more difficult to classify.

From the diffuse sanctions already described there should be distinguished what may be called (by a wide extension of the term) religious sanctions, these have also been named supernatural sanctions and mystic sanctions, but both these terms have unsatisfactory connotations. The religious sanctions are constituted in any community by the existence of certain beliefs which are themselves obligatory; it is therefore only within a religious community that these sanctions exist. They take the form that certain deeds by an individual produce a modification in his religious condition, in either a desirable (good) or an undesirable (evil) direction. Certain acts are regarded as pleasing to gods or spirits or as establishing desirable relations with them, while others displease them or destroy in some way the desirable harmonious relations. The religious condition of the individual is in these instances conceived to be determined by his relation to personal spiritual beings. The change in the religious condition may elsewhere be regarded as the immediate effect of the act itself, not mediated by its effects on some personal god or spirit, a view common not only in many of the simpler societies, but also found in a special form in Buddhism and in other advanced Indian reli-

gions. Sin may be defined as any mode of behavior which falls under a negative religious sanction; there is no convenient term for the opposite of sin, that is, an action which produces religious merit or a desirable ritual condition.

The religious sanctions involve the belief that most unsatisfactory ritual or religious conditions (pollution, uncleanness, sinfulness) can be removed or neutralized by socially prescribed or recognized procedures, such as lustration, sacrifice, penance, confession and repentance. These expiatory rites are also considered to act either immediately, or mediate through their effects on gods or spirits, depending upon whether the sin is regarded as acting in the one way or the other.

While in modern western civilization a sin is usually regarded as necessarily a voluntary action or thought, in many simple societies an involuntary action may fall within the given definition of sin. Sickness—for example, leprosy among the Hebrews—is often regarded as similar to ritual or religious pollution and as therefore requiring expiation or ritual purification. A condition of ritual or religious impurity is normally considered as of immediate or ultimate danger to the individual; it may be believed that he will fall sick and perhaps die unless he can be purified. In some religions the religious sanction takes the form of a belief that an individual who sins in this life will suffer some form of retribution in an after life. In many instances an individual who is ritually unclean is looked upon as a source of danger not only to himself but also to those with whom he comes in contact or to the whole community. He may therefore be more or less excluded for a time or even permanently from participation in the social life of the community. Frequently if not always therefore an obligation rests upon the sinner, or unclean person, to undertake the necessary process of purification.

Thus the religious sanctions differ from the other diffuse sanctions by reason of the beliefs and conceptions indicated above, which cannot be defined or described in any simple way. Somewhat similar beliefs underlie magical practices and procedures in relation to luck, but whereas religious observances and the beliefs associated with them are obligatory within a given religious community, the former are comparable with technical procedures, customary but not obligatory.

Organized sanctions are to be regarded as special developments of the diffuse sanctions, frequently under the influence of the beliefs be-

longing to religion. Organized positive sanctions, or premial sanctions, are rarely developed to any great extent. Honors, decorations, titles and other rewards for merit, including monetary rewards such as special pensions, given to individuals by a community as a whole, are characteristic of modern societies. In preliterate societies a man who has slain an enemy may be given the right to distinguish himself by wearing some special decoration or in other ways.

Organized negative sanctions, important among which are the penal sanctions of criminal law, are definite recognized procedures directed against persons whose behavior is subject to social disapproval. There are many varieties of such procedures, the most important and widespread being the following: subjection to open expression of reprobation or derision, as, for example, through forcible public exposure by confinement in stocks; partial exclusion, permanent or temporary, from full participation in social life and its privileges, including permanent or temporary loss of civil or religious rights; specific loss of social rank, or degradation, the exact contrary of the positive sanction of promotion; infliction of loss of property by imposition of a fine or by forcible seizure or destruction; infliction of bodily pain; mutilation or branding in which pain is incidental to permanent exposure to reprobation; permanent exclusion from the community, as by exile; imprisonment; and punishment by death. These sanctions are legal sanctions when they are imposed by a constituted authority, political, military or ecclesiastic.

In any given society the various primary sanctions form a more or less systematic whole which constitutes the mechanism of social control. There is an intimate relation between the religious sanctions and the moral sanctions, which varies, however, in different societies, and cannot be stated in any brief formula. The primary legal sanctions of criminal law, in all societies except the highly secularized modern states, show a close connection with religious beliefs.

Besides these primary social sanctions and resting upon them there are certain sanctions which may be termed secondary; these are concerned with the actions of persons or groups in their effects upon other persons or groups. In modern civil law, for example, when an individual is ordered by a court to pay damages, the primary sanction behind the order is the power of the court to make forcible seizure of his property or to imprison or otherwise punish him for contempt of court if he fails to obey. Thus sec-

ondary sanctions consist of procedures carried out by a community, generally through its representatives, or by individuals with the approval of the community, when recognized rights have been infringed. They are based upon the general principle that any person who has suffered injury is entitled to satisfaction and that such satisfaction should be in some way proportioned to the extent of the injury.

One class of such procedures consists of acts of retaliation, by which is meant socially approved, controlled and limited acts of revenge. Thus in an Australian tribe when one man has committed an offense against another, the latter is permitted by public opinion, often definitely expressed by the older men, to throw a certain number of spears or boomerangs at the former or in some instances to spear him in the thigh. After he has been given such satisfaction he may no longer harbor ill feelings against the offender. In many preliterate societies the killing of an individual entitles the group to which he belongs to obtain satisfaction by killing the offender or some member of his group. In regulated vengeance the offending group must submit to this as an act of justice and must not attempt further retaliation. Those who have received such satisfaction are felt to have no further grounds for ill feeling.

Satisfaction for injury may be obtained also through the duel, a recognized and controlled combat between individuals, or through similar combats between two groups. Among Australian tribes dueling with spears, boomerangs, clubs and shields or stone knives, with the bystanders ready to interfere if they think things are going too far, is a frequently adopted alternative to one-sided retaliation. In these same tribes there are similar regulated combats between two groups, sometimes in the presence of other groups who see that there is fair play. It is often difficult to draw a dividing line between such group combats and warfare; in fact they may possibly be regarded as a special form of warfare characteristic of primitive rather than of civilized societies. Frequently therefore war may be regarded as a secondary social sanction similar to the duel. A political group maintains recognition of its rights by the threat of war if those rights should be infringed. Even in the simplest societies it is recognized that certain acts are right in war and others are wrong and that a declaration of war may be just in certain circumstances and in others unjust, so that the conduct of warfare is to some extent controlled by diffuse sanctions.

Indemnification is often found as an alternative to retaliation as a means of giving and receiving satisfaction. An indemnity is something of value given by a person or group to another person or group in order to remove or neutralize the effects of an infringement of rights. It may be distinguished from a propitiatory gift by the fact that it is obligatory (i.e. subject to a negative sanction, diffuse or organized) in the particular circumstances. A payment made in anticipation of an invasion of rights with the consent of the person or persons receiving it may be regarded as an indemnity. Thus in many societies taking a woman in marriage is regarded as an invasion of the rights of her family and kin, so that before they consent to part with her they must receive an indemnity or the promise of such. In these cases the process of indemnification bears some similarity to that of purchase, which is a transfer of rights of property for a consideration.

In many preliterate societies procedures of indemnification are carried out under the diffuse sanction of public opinion, which compels an individual to indemnify one whose rights he has infringed. In some societies there is a recognized right of an injured person to indemnify himself by forcible seizure of the property of the offender. When society becomes politically organized, procedures of retaliation and indemnification backed by diffuse sanctions give place to legal sanctions backed by the power of judicial authorities to inflict punishment. Thus arises civil law, by which a person who has suffered an infringement of rights may obtain reparation or restitution from the person responsible.

In a consideration of the functions of social sanctions it is not the effects of the sanction upon the person to whom they are applied that are most important but rather the general effects within the community applying the sanctions. For the application of any sanction is a direct affirmation of social sentiments by the community and thereby constitutes an important, possibly essential, mechanism for maintaining these sentiments. Organized negative sanctions in particular, and to a great extent the secondary sanctions, are expressions of a condition of social dysphoria brought about by some deed. The function of the sanction is to restore the social euphoria by giving definite collective expression to the sentiments which have been affected by the deed, as in the primary sanctions and to some extent in the secondary sanctions, or by removing a conflict within the community itself. The sanctions are thus of primary significance to

sociology in that they are reactions on the part of a community to events affecting its integration.

SANCTUARY. By the institution of sanctuary, which existed in many communities even prior to the development of the state, specific persons or localities may afford a special kind of legal safeguard to persons beyond the protection of ordinary law. Such asylum, which may be either permanent or for a limited period and either conditional or unconditional, arose out of the inadequacy of primitive legal systems based on retaliation. The sanctuaries varied in respect to number and to methods of administration and in the degree of protection afforded, according to the development of law and of particular religious conceptions related to tabu and depending upon whether sovereignty lay in the hands of secular or religious authority.

The system of sanctuaries had an unusually widespread development in Egypt, the land of compulsory and slave labor, of alien political domination and of economic oppression. Here too it was first encroached upon by state regulation. In the earliest times every shrine, including places dedicated to the gods, royal altars, pictures and statues of the ruler, or site used for the taking of oaths, was a protected region sought out by all the persecuted, by mistreated slaves, oppressed debtors and political offenders. This ordinary protection afforded by all shrines was called *hiketeia* and it had a religious basis in that protective powers were attributed to the divinity or to a powerful personality. Building upon the system of *hiketeia*, the Ptolemies by state legislation gave certain shrines the privilege of granting a special kind of protection called *asylia*. Although the shrines which enjoyed the power of *asylia* were not divested of their religious character, they were subjected to state control and protection for certain categories of persons was denied; among those barred were the *debitores publici*. The state tended to recognize only the *asylia* and thus attempted to control the sanctuary system.

Among the Hebrews the sanctuaries bore an individual stamp in that they were regularized by religious legislation as early as the Mosaic law. It was thus possible to escape from the

reach of an avenging or persecuting power by seeking the protection of Yahweh through flight to his temple, especially to the altar. In the earliest period asylum was evidently guaranteed to all who might flee to the shrine, but by the time of the kingdom it was no longer an absolute right. A necessary consequence of the Hebrew conception of God as the embodiment of the highest justice was the limitation of the guaranty of protection to those who were innocent. *Exodus* XXI: 14 ruled that whosoever transgressed against his neighbor, killing him by cunning, should be removed from the altar and slain. *Deuteronomy* marked a new epoch in the administration of criminal justice: blood vengeance was divested of its private character and replaced by public punishment; the purchase of freedom from punishment by the murderer was no longer permitted; and a clear distinction was made between premeditated and unpremeditated crimes. All shrines were abolished except the temple at Jerusalem, where the entire cult was centralized, and the institution of sanctuary was completely transformed. Six cities were named as places of refuge, each being linked with a former religious sanctuary. These cities of refuge, however, were only for those who had killed without premeditation, so that protection of the innocent, like punishment of the guilty, became a public matter, a secular legal institution (*Deuteronomy* IV: 41-43 and XIX: 1-13; *Numbers* XXXV. 9-15) replacing the personal protection of Yahweh, localized at his shrine. It remained a principle of the Hebrew law of sanctuary that the guilty had no claim to the protection of any sanctuary.

The most extensive and most complete sanctuary system in the western world was developed in ancient Greece. Temples enjoyed the character of sanctuaries and under all circumstances could protect the oppressed and the persecuted, slaves, debtors, malefactors and criminals. Even deliberate murderers and those under sentence of death had a claim to protection and could dwell in the sanctuary grounds surrounding a temple, secure under the sheltering wing of the divinity, until death overtook them. Thus the guilty could evade punishment passed upon them and the once humane institution became a means of impeding prosecution and nullifying the law. The sanctuaries were converted into the resorts of murderous slaves, insolvent debtors and notorious criminals. Not until the time of the Roman Empire did the state effectively limit this monstrous development.

In the oldest period of Roman history sanctuaries had little or no importance. Since among the Romans private vengeance and blood feuds gave way very early to public criminal law, the sanctuary, a concomitant of the blood feud, was unnecessary. Only slaves were beyond the protection of the law, and the institution of sanctuary adapted from Greece and formulated in legislation was for their benefit. Nevertheless, the protection afforded them by such asylums was always limited; it never permitted freedom from punishment or prosecution but was rather a means of insuring a legal investigation before punishment. The sanctuary system developed at a rapid pace, however, beginning with the imperial period, when the protective power was extended to persons and objects connected with the cult of the emperor, so that statues, portraits and temples of the Caesars and flags and eagles of the military legions were invested with the properties of asylum.

Christianity effected a decisive transformation in the law of sanctuary. The message of Jesus meant the renunciation of vengeance and retaliation and commanded that Christians love not only their neighbors but even their enemies. From the very outset the church, through the intercession of its bishops, espoused the cause of all whose freedom, person or life was in danger and of all aliens and slaves. The bishops interceded before the courts and the emperor to defend the prosecuted, to obtain a modification of sentence passed upon the condemned and to free those imprisoned. This intercession was enjoined especially when the pursued sought refuge in a Christian church, which, like the heathen temples, enjoyed the character of asylum because of its holy peace. The protection which ecclesiastical places offered against violence was as a rule combined with the positive benefits of intercession before the law. As a result there arose the Christian type of sanctuary, deriving originally from the special holy truce of heathen civilization but with a new positive content which was Christian in spirit. The legal effect of flight to a church sanctuary was that as a result of the rule of *tradi non oportere* the right of the public authorities to take possession of the refugee was suspended. The latter was subjected to the unrestricted right of the bishop over him. The bishop would intercede for him in an effort to obtain a milder sentence or complete freedom from secular punishment and, in the event that he was guilty, would subject him to penitential discipline and

thus to the spiritual punishment of the church. The right of sanctuary won legal recognition through state legislation in the fourth and fifth centuries. The attitude of the Roman emperors on this question was very inconstant, however, and the right was broadened and narrowed from time to time in accordance with considerations of state policy. The *Novellae* of Justinian clarifies the true nature of the Christian institution of sanctuary and clearly recognizes its abuses. By this code public debtors, tax officials and particular categories of criminals, including murderers, adulterers and those guilty of rape, were all denied the protection of sanctuaries.

The church demanded that the German tribes, after their conversion to Christianity, recognize the institution of sanctuary as it had developed upon Roman soil. But there had grown up among the Germans in heathen times a totally different set of principles with regard to this question. While temples were places of supreme peace, so that any outrage or desecration of them was regarded as a crime punishable by death, they were never places of asylum, and outlaws and guilty refugees were barred. During the migrations and in the Frankish period under the Merovingian kings a law of sanctuary was developed through the merging of the Roman and German concepts. According to the new law a criminal who sought refuge in a church was neither subject to the disposition of the bishop nor immune from secular punishment. He won protection only from private revenge and from court punishments of life or limb. Criminals subject to the death penalty might obtain a modification of sentence or its commutation to penitence or banishment, but in all cases they remained subject to the public legal system. The spiritual punishment of the church never displaced but merely supplemented secular punishment. The delivery of the refugee took place only upon a guaranty that he would not be subjected to capital punishment or brutal violence; this guaranty was exacted by the church in the form of an oath sworn on the Gospel. The rule of *trudere in potestate* had become that of *reddere in gratia*.

In the Carolingian period the state reorganized the sanctuary law. The refugee was no longer immune from regular prosecution by the law, remaining under the peace of the church only until he was haled before a court. The obligation to turn him over was absolute and not an exchange for a guaranty of partial protection. All condemned malefactors were excluded from

the right of sanctuary; should they seek it, they must be killed immediately even within the church. Thus Germanic ideas triumphed in the law of sanctuary, all guilty persons being excluded from the peace of the church and regarded as outlaws.

In subsequent centuries the law of ecclesiastical sanctuary was conditioned by the struggle between state and church which dominated the entire Middle Ages. Contractions and expansions of the privilege depended upon whether power lay in the spiritual or in the secular authority. For a time the church was able to use the law of sanctuary to advance its secular power. It extended the protective quality of sanctuary to all grounds connected with the church; these comprised episcopal dwellings and a specific area of surrounding territory, oratories for public divine services including those located in private residences, cloisters, abbeys, ecclesiastical hospitals and other religious institutions. Many of the latter enjoyed this privilege not so much through ecclesiastical right as through grant, either express or implied, from the prince or emperor.

In addition there were in mediaeval Europe the purely secular sanctuaries, the most important of which were the courtyards of the feudal lords. Each might be a refuge for a criminal in flight if the lord cared to grant him asylum. Such asylum was usually limited to six weeks and three days, although there were variations ranging from three days to a year and a day. During this period the lord tried to arrange a settlement of the case and if no agreement could be reached, the fugitive was generally released in a forest where he might escape from his pursuers. The immunity of the lord's courtyard from invasion by state authorities and private seekers of vengeance was sustained by the imperial courts and severe penalties were exacted for violations. In the later Middle Ages criminals who had committed premeditated homicide could not avail themselves of such refuge. Not only the lord's courtyard but the home of every freeman was supposed to be an asylum for himself or for anyone whom he wished to protect. This privilege, however, was soon severely restricted. The statutes of a number of mediaeval cities contain provision for limited sanctuary in private dwellings. In England beginning with the tenth century the chartered or secular sanctuaries attained an extensive development. In places such as the counties palatine and in many of the abbeys which were free of the king's writ,

refugees fleeing from private vengeance or the king's justice could pass the remainder of their lives. The ordinary church sanctuary constituted a much less serious menace to order in the kingdom, since from the twelfth century a felon could be harbored in a church for only forty days, within which period, if he desired safety, he had to confess his crime and abjure the realm.

With the strengthening of state authority and the rise of national states there began a struggle not only against the abuses of the sanctuary system but against the system itself. The Catholic church through its legislation, especially the bull *Cum alias* of Gregory XIV (1591) and the bull *Ex quo* of Benedict XIII (1725), limited the right of sanctuary by barring certain criminals, such as street robbers, assassins, political offenders and counterfeiters, but it insisted upon retaining the institution in principle (*Codex juris canonici*, can. 1160, 1179). Church buildings were declared inviolable and refugees were not to be removed from them except with the permission of the *Ordinarius*, or rector; deliberate and wanton abuse of this immunity was punishable by excommunication. In the areas where the Reformation triumphed the right of sanctuary in Catholic churches was of course abolished, but in many places the character of asylum was retained by the purely secular sanctuaries and by some of the sites of the secularized cloisters and monasteries; in the case of the latter, the privilege was supposed to have been based upon grant from some worldly authority and to attach to the land rather than to the incumbent.

The growth of centralized powers and the development of effective national systems of justice eventually led, however, to the complete abolition of the sanctuary system. In England Henry II had severely restricted the sanctuary privileges of the lay lords and there were subsequently continuous attempts to limit them in the case of ecclesiastical estates. The climax of the struggle came in the reign of Henry VIII, when the right of asylum was restricted to churches and churchyards and was not permitted for serious felonies. Refugees instead of abjuring the realm were to be restricted to one of eight designated towns. The last vestige of sanctuary in England disappeared in 1727. In France it was greatly curtailed in 1539 and during the French Revolution was entirely abolished. Article xv of the Austrian-Papal Concordat of 1855 recognized the material immunity of ecclesiastical buildings demanded by the church

in so far as it was consistent with public security and the ends of justice. Prussian law authorized the public authorities to remove refugees from sanctuaries and to imprison them. In an orderly state with a systematized legal procedure sanctuary is superfluous.

The concept of sanctuary persists today only in Switzerland. Because of its special status in international law as a neutralized state Switzerland guarantees sanctuary to foreigners fleeing prosecution for political crimes, provided they post bail or agree to abstain from all political activity. The sanctuary may be suspended at any time; cantonal authorities decide on the merits of individual cases, and final approval rests with the Federal Council.

SAND, GEORGE (1804-76), French novelist. A disciple of Rousseau, Aurore Dupin (Baronne Dudevant) in her determination to live as "a free being" fled from her quiet Berry countryside and her impossible husband to plunge into the artistic life of Paris of the 1830's. As an artist she claimed the right to complete and unrestricted freedom, the privilege of expressing her personality whether in her writings or in her notorious amours. Around 1836, however, her attitude began to change. Instead of straining to "thrust off the yoke of public opinion and human laws" she was led by a growing sense of the power of human solidarity to champion the cause of the working classes. In revolutionary periodicals, such as *Réforme* (1844) and *Cause du peuple* (1848), she threw in her lot with the forces of popular discontent and in the journal *Commune de Paris* (1849) pointed the way to a class revolution. But with the disillusioning collapse of the movement her role as active participant came to an end. Most of her later years were spent at Nohant in Berry among the peasants of the countryside. Here, absorbed in her responsibilities as guide and judge, she gave expression in her numerous novels, as well as in her practical activities, to popular lore, to the sense of human solidarity and charity uniting all classes and to the gospel of sympathy with every endeavor, however clumsy, which proceeds from mankind's better nature. She had, in the words of Renan, "the divine talent of giving wings to everything, of producing art out of ideas that with others remained rude and without form. She gave life to the aspirations of those who felt but knew not how to create."

While exerting a distinct influence on the feminist movement in France, George Sand's teachings met with stubborn suspicion abroad, particularly in England, by reason of her disrespect for the institution of marriage and her early fondness for male attire. Her influence on

Ibsen, even indirectly, has not been convincingly established. But there is no room for doubt as to her appeal, personal as well as spiritual, to Mazzini both before and after his visit in 1847 or as to her broader influence on the movement for Italian unification. Although her belief in human goodness was more than once shattered, George Sand's optimism was bolstered by a gradually maturing confidence that life and progress follow a process of *itus et reditus*.

SANITARY TREATIES. See SANITATION.

SANITATION. The term sanitation is now used to cover the removal and disposal, usually by public authorities, of all waste matter whether liquid or solid. Liquid wastes, ordinarily called sewage, include rain and other surface waters, all domestic liquid wastes and the effluent from industrial establishments. The solid wastes consist of garbage, ashes, rubbish, street sweepings, leaves and snow.

Throughout the greater part of the history of civilized society but feeble attempts were made to remove filth; the most common method employed until quite recently for getting rid of inconvenient accumulations of rubbish and other waste was to throw them into the street. The housemaids of Edinburgh as late as the eighteenth century, according to Scott and Smollett, flung dirty water from upper windows with the warning cry of "gardyloo." There are numerous descriptions of the inconceivable filth of the streets of ancient and mediaeval cities. The Athenians had their *astynomoi*, who among other duties were responsible for cleaning and leveling the streets before religious processions; while in the Roman cities of the imperial period the *aediles* directed the cleaning, paving and improv-

ing of the streets within the city and for a mile outside. In American and English cities of the eighteenth century each householder had the duty of keeping clean the street before his premises, an obligation which was not very seriously performed.

It is true that so-called sewers, built about 700 B.C., have been excavated on the sites of Nineveh and Babylon and that Greek and Roman cities possessed similar constructions. All of these, however, like the most famous of ancient sewers, the Cloaca Maxima, which drained the site of the Roman Forum and is still in use after twenty-five centuries, were merely drains for the purpose of carrying off surface water. In fact until Sir John Harrington invented the water closet there was little use for the modern sanitary sewer.

Sewering really began in the eighteenth century when the natural water courses, or open ditches, of London and Paris were first covered over. In 1808 Paris had approximately fourteen and one half miles of such drains with some forty openings into the Seine; by 1832 the mileage had been increased to twenty-five. In the latter year a careful topographical survey was made the basis for an extensive sewer system which, by means of large intercepting sewers, eliminated all but three of the river outlets. The characteristic feature of these Paris sewers was their size, a cross section in the smallest of them being large enough for men to work standing up. This early example has been followed and extended in the modern sewer system of the French capital.

Down to the middle of the nineteenth century, however, sewers nowhere were the principal means of disposing of human excrement, which was ordinarily discharged into cesspools. These were cleaned and the residue removed usually by private contractors at the expense of the householder. As a rule the cesspools were not cleaned frequently or disinfected properly in populous places, so that they constituted a continuously increasing nuisance. In some communities it was the custom to place below the soil pipe a pail, which was emptied or exchanged for a clean pail at intervals. The dry vault, or privy, which still remains the characteristic provision for sanitation in farm areas and small villages in the United States and Europe, was common.

The experience of London illustrates the gradual escape from the nuisance such methods produced in crowded cities. The sanitary situa-

tion in London was seriously complicated by the peculiarities of its governmental organization. In the city proper, which in 1855 comprised less than one hundredth of the area and one twentieth of the population, there were commissioners of sewers appointed by the Common Council from its own members. In the surrounding parishes, which contained most of the population, only eight had commissioners of sewers and in these the authority was greatly restricted. As a result such sewers as there were did not form a single system but were extremely varied as to size and grade; many were poorly planned and constructed; while a great number were mere open ditches which were as bad as or worse than the cesspools they were replacing. There was no way of compelling owners to connect their houses with the sewers and the landlords in the tenement districts vigorously opposed all attempts at sanitary regulations. The sewage that was collected was emptied into the Thames in such a way that it was washed back by the tide and remained in the city instead of being carried off. This contaminated a large part of the water supply and contributed greatly to epidemics of typhus and cholera.

In 1847, although the connection of houses with the sewers was made compulsory, no provision was made for adequate enforcement. The cholera epidemic of 1848 forced the establishment of the Metropolitan Commission of Sewers, but because of the failure of the commission to clean the city it was replaced in November, 1848, by the General Board of Health. While the board was empowered to issue directions for the prevention of epidemic or contagious diseases, it met with so much resistance from the local officers in charge of enforcement that little was accomplished.

In 1848 Parliament had enacted a thoroughgoing sanitary code for English cities in general, excepting the London metropolitan area, seven years later similar provision was made for London. The new law set up a Metropolitan Board of Works, which was to be elected by the several vestries and district boards and was to have extensive powers over sewers, streets and the removal of refuse. The city and the twenty-three largest parishes were constituted districts, while the smaller parishes were grouped into thirteen additional districts; the vestries and boards in these districts were to have similar powers over sanitation matters within their local areas. By 1865 the Metropolitan Board of Works had completed a system of intercepting sewers,

while the vestries and district boards had also constructed local units. Many of the open ditch sewers were either abandoned or filled in and work was begun to hasten the elimination of all cesspools.

In the United States conditions were not unlike those in England. Sewers of a sort existed in New York in 1800, but few sanitary sewers were built before 1850. In 1877 Philadelphia had 82,000 cesspools, Washington 56,000 and Chicago 30,000, although the last named also boasted of a sewer system. Even at the turn of the twentieth century Philadelphia and St. Louis had twice as much street mileage as sewer mileage, while Baltimore, New Orleans and Mobile relied mainly on open gutters for drainage.

The experience of London shows clearly the need for a unified plan for a whole metropolitan area. Some efforts have been made in this direction in the United States—the Metropolitan District of Boston is an example—but in most of the large cities of the United States there still remains the difficulty presented by historic boundaries dividing what should be a single administrative unit. Such boundaries must be eliminated before satisfactory sanitary conditions can prevail throughout the whole area.

The disposal of sewage is as important as its collection. The earliest practise was to empty sewage into some nearby body of water, although there is some evidence that the sewage of Athens, which was poured into the stream Eridanus, was used for irrigation. Such methods presented no difficulties when the sewage consisted largely of surface water, but with the introduction of water carriage for fecal matter the problem of disposal became more serious. Where sewers empty into a sufficiently large body of water, the consequent dilution renders the sewage innocuous; but where there is not enough water and particularly where the water is used for drinking purposes by neighboring towns, dangerous pollution may result. Irrigation is a satisfactory means of disposal only in those cases in which a sufficiently large amount of land is available and in semi-arid regions with sandy soil. Nevertheless, these two methods are still largely used both in the United States and in Europe.

The first attempt at the concentrated treatment of sewage was by a chemical precipitation of the solids, a plant for this purpose being erected at Worcester, Massachusetts, in 1890. Trickling filters were introduced to prepare the sewage for final land treatment. The sludge pro-

duced in this way was offensive and it was found necessary to add septic tanks for the purpose of treating it. The two-story, or Imhoff, tank, which was first used in the United States in 1911, followed; in this apparatus sedimentation took place in the top story, while the decomposition occurred in the lower. Baltimore in 1914 introduced the separate sludge digestion system, in which independent units were used rather than a two-story tank. These methods, of which the latter seems the more popular, are very widely used by the small and medium sized cities of the United States. The best form of treatment, however, is the activated sludge process, whereby the sewage is aerated in the presence of previously aerated sludge, causing the suspended solids to be oxidized or collected into a rapidly settling flock. This process affords a high degree of purification as well as a sludge of some value as a fertilizer. Another great advantage of the activated sludge process is that it requires a much smaller area and cubic content for the care of sewage. Thus in a city of 600,000 the following are the area and cubic content requirements for the three outstanding methods of sewage treatment:

| | | |
|--|-----------|------------------------|
| Settling tanks, sludge beds, intermittent sand filters | 800 acres | 140,000,000 cubic feet |
| Imhoff tanks, sludge beds, trickling filters | 60 acres | 17,000,000 cubic feet |
| Activated sludge plant complete | 10 acres | 5,000,000 cubic feet |

The organization for administering a sewer system is simple and relatively few men are required. Ordinarily the work is performed by a division of the department of public works or of streets and sewers; in large cities sometimes a separate department is set up. An engineer is usually in charge of the whole system, while in large cities assistants are employed at the treatment works and for purposes of maintenance and repair. A crew (or crews, depending on the size of the city) is maintained to clean catch basins, make frequent inspections of the sewers, remove obstructions, clean the tanks at the treatment works and the like. Growing cities often maintain office staffs to collect scientific data concerning sewage flow and similar matters and to design the necessary additions to the sewer system; where there is only occasional construction, it has been found cheaper to hire a consulting engineer.

The removal of solid wastes presents fewer engineering difficulties but more serious administrative problems. Ashes, rubbish and gar-

bage may be collected separately or in any combination, the method to be used depending largely on the facilities for disposal. The ordinary practise has been to collect the garbage separately, the collection of ashes and rubbish being sometimes combined and sometimes separated. In some cities collectors are licensed by the city but paid by the householders directly; in others the city pays the contractor; and in still others the city contracts for collection at a certain price to be paid by the householders. While these contract methods have been widely used and in many cases are satisfactory, the best method is direct municipal collection for the following reasons: when properly administered it costs less than contract collection; it eliminates the burden on the householder of dealing with the contractor; and it is more likely to insure regular and complete collections. Whether the collection is made by contractors or directly by the municipality, it has been found desirable to maintain an independent inspection force to see that all ordinances and rules are enforced.

Garbage is ordinarily collected in tank wagons, sometimes in can rack wagons. The most desirable form of tank wagon is one which is easy to clean, is fitted with a cover and is not too high to prevent one man from emptying a can into it. The can rack wagon is so arranged that the ordinary garbage cans of the householder are placed on the wagon and hauled to the loading station, a clean can being left in place of each one removed. As a rule collections are made in the daytime in residential districts and at night in business districts. Noise is the chief objection to night collections in residential areas.

The disposal of garbage has long been a serious problem in large cities. At one time dumping into the sea or rivers was a common practise. River dumping is now generally prohibited by health authorities because of the dangers incident to the pollution of streams; and even sea dumping has been subjected to severe regulations because of the necessity for protecting bathing beaches from the garbage washed back by the tide. Boston and New York and other large seaboard cities, however, still employ this method. Another form of disposal has been to use garbage and refuse for filling low lands. When the garbage is spread in thin layers and promptly covered with ashes or earth to a sufficient depth, this method may be used with general satisfaction; on the other hand, when it is carelessly employed, as is too often the case, it results in a serious nuisance. Feeding to hogs is

still another method of garbage disposal; it involves, first, a complete separation of edible garbage from ashes, broken glass and the like and, second, a willingness on the part of householders to perform the separation. Unless the feeding is done on floors which are cleaned daily, the piggery will become offensive; also the hogs must be inoculated against hog cholera. The length of the haul to the piggery has a great deal to do with the possibility of profit from the enterprise, a factor which excludes most large cities from the use of this method. A number of smaller cities in the United States and Europe are able to find contractors who will take over garbage disposal on favorable terms, largely because of the possible profits in hog raising.

Still another form of garbage disposal which can yield a profit is that of reduction. Garbage ordinarily contains about 3 percent grease, which may be extracted and used commercially for cheap soaps and other purposes. Reduction secures this grease and at the same time renders the garbage innocuous. One method of reduction is that whereby the garbage is cooked and the liquid pressed out; the grease is skimmed when it has cooled. According to another method a solvent is made to flow through the garbage, which is then distilled to yield the grease. The tankage, or remainder, makes a moderately good fertilizer. The use of a solvent is a little more expensive than cooking but has the advantage of eliminating the objectionable odors of the latter method. Neither process can be employed successfully on a small scale, so that reduction is virtually confined to cities of over 100,000 inhabitants. When the price of grease is high and where there is a market for the tankage as fertilizer, reduction may yield a small profit; on the other hand, the return is uncertain, plant provision is costly and the operation itself is expensive.

There has been an increasing tendency for cities to turn to incineration as being on the whole the cheapest and least unpleasant means of garbage disposal. There are two types of incinerator. The low temperature incinerator, or crematory, is cheap to build but is inefficient and expensive to operate. It burns at about 800° F., which often results in incomplete combustion and a considerable odor. The high temperature incinerator, or destructor, burns at about 1200° F. and completely burns all the odoriferous gases. It requires less space, less fuel and less labor.

The collection of ashes and rubbish is similar to the collection of garbage, except that the

seasonal variation is reversed, the heaviest load coming in the winter months. Since collections are less frequent and the bulk is greater, larger equipment may be used to advantage. If ashes and rubbish are collected separately, the ashes may be used for filling in low areas about the city. Rubbish and ashes together make a poor fill, and in view of the fact that there is little else that can be done with the mixture separate collections appear to be advisable. Rubbish may be burned in an incinerator and that part which does not burn can be used as fill. The sorting of rubbish for salable material often simplifies the problem of disposal. The salvaging equipment is cheap and there is a ready market for scrap metal, bottles and rags, the revenue from which pays the expense of sorting.

A great many factors enter into the selection of a method for cleaning streets. The amount of traffic, the amount of sweepings produced, the number of horse drawn vehicles, the character of the neighborhood, the type of pavement and seasonal fluctuations all play a part. There are four general methods of street cleaning now in use. First, there is the squeegee machine, an apparatus consisting of a roller with rubber flaps and designed to scour the street. It operates upon large areas of smooth, comparatively clean, pavement and must be preceded by a sprinkler or flusher to loosen the dirt. The device is highly efficient but costly and is rarely used in the United States. A second method is the use of the machine broom. The most primitive form of mechanical street cleaning equipment, it consists of a large rotary broom placed at an angle to the line of travel for the purpose of pushing the dirt to the side of the road. Machine brooms, however, are now as a rule equipped with a light sprinkling device in front and a pick up, or vacuum attachment, behind, so that they clean, pick up and remove dirt in one operation. A third method, flushing, is ordinarily the cheapest means of cleaning paved streets, at any rate in cities with adequate water supplies and satisfactory sewer systems. It is now usually done by a tank truck with a pressure motor. Flushing by hand with hoses is effective for small areas if skilfully done. Fourth, a certain amount of hand sweeping is always a necessary supplement to machine brooming or flushing. It is the only means of cleaning in heavy traffic, around parked cars and on certain types of rough pavement. The Paris system, in which gutters are flushed from jets in the curb and are then swept and washed by women with brooms, is as effec

tive as any yet devised, although it cannot be used in the United States because of the higher cost of labor. Street sweepings, where they are not flushed into the sewers, are carried to the incinerator or to remote dumps. The material in sweepings is too unstable for filling low ground and has little value as a fertilizer, although attempts have been made to use it for this purpose.

The removal of snow is an important factor in northern cities, not so much as a sanitary measure but as an aid to traffic movement and to prevent injury to the pavements. The snow is ordinarily plowed to the side of the road and then collected and removed in trucks. The major consideration in snow removal is speed and to this end disposal places must be conveniently located. The easiest method of disposal is flushing into sewers, particularly in periods of rising temperature. Snow may also be dumped into rivers or other bodies of water or into any well drained area.

The administration of the collection of solid wastes and of street cleaning is usually entrusted to the same department of the city government. This is sometimes and quite improperly the department of health. While the motive behind these sanitary activities is largely the promotion of health, the means necessarily employed involve engineering problems which health department officials are seldom trained to meet. Garbage and refuse collection and disposal and street cleaning belong rather with the other public works functions or, if the city is of great size, in a department by themselves. The work falls naturally into three divisions: collection, street cleaning and disposal. Each has its own administrative problems, which include the recruiting and organization of numerous employees and their adjustment to costly and elaborate mechanical equipment. The division of the city into routes or districts for the various types of collection, for street cleaning and for the proper organization of the working force of each activity must be worked out by each city in terms of its own local conditions.

SANTA CRUZ, ANDRÉS (1792-1865), Bolivian statesman. Santa Cruz, who was a mestizo, a descendant of upper class Spanish and Inca stock, was born in Bolivia. After fighting with the Spanish forces against the armies of the "patriots" he joined the latter and won distinction in the wars of independence. In 1826 Bolívar appointed him president of the Council of Government of Peru and in 1828 he became Peruvian minister to Chile. From 1829 to 1839 he served as president of Bolivia. During his administration a new constitution was promulgated, more democratic than the constitution given it by Bolívar in 1826. Public credit was restored, reforms were made in education and the *Códigos Santa Cruz* were drawn up. Santa Cruz also furthered the industrial and commercial interests of Bolivia.

His consuming passion was to carry out Bolívar's idea of a united Spanish America; his

numerous enemies declared that he desired to head an enlarged Inca empire. The factional struggles in Peru in 1835 gave him an opportunity to invade that country and led to the division of Peru into the independent states of South and North Peru. In 1836 Santa Cruz decreed the establishment of the Peru-Bolivian Confederation, composed of South Peru, North Peru and Bolivia, with himself as "supreme protector." Great Britain, France, the United States and some of the South American countries formally recognized the confederation. Santa Cruz was now at the zenith of his power. The mantle of leadership, so long worn by Bolívar, had fallen upon his shoulders. But Chile, Argentina, Ecuador and Brazil considered the confederation, or at least Santa Cruz, a menace to the peace and safety of Hispanic America. Chile and Argentina declared war against him, and in 1839 after his defeat he abdicated as supreme protector of the confederation and resigned as president of Bolivia. Between the years 1855 and 1865 Santa Cruz served as Bolivian minister to Great Britain, France, the Holy See, Spain and Belgium.

SARASWATI, SWAMI DAYANANDA (1824—83), Indian religious reformer. Educated in the strict orthodox tradition of the Brahmans, Dayananda was strongly influenced by his later studies under Swami Virjananda, who had rejected the popular form of Hinduism. Dayananda combined a profound knowledge and love of the ancient scriptures with the zeal of a critical reformer. He wandered through India preaching a return to the spirit of the original Vedic gospel away from the later distortions of Hinduism. His attacks on crude polytheism and on the caste system aroused the opposition of orthodox Brahmanism.

In 1875 he founded the Arya Samaj. In opposition to the eclectic and liberal-humanitarian

Brahmo Samaj it sought to reawaken India through its past, to arouse the pride of the Hindus in their cultural heritage and to adhere strictly to the Sanskrit *Vedas*, which it held to be the sole source of all knowledge and of moral law. This doctrine strengthened Indian national sentiment and diminished the influence of the acknowledgment, by the older generation of Indian leaders, of the moral and intellectual superiority of Europe. The Arya Samaj moreover deeply influenced educational theory and social work in India. It taught self-help, demanded equal opportunities for all castes and equality for women, organized relief activities and supported charitable institutions. In the educational field it created the Dayananda Anglo-Vedic College and under the leadership of Lala Munshi Ram the gurukulas, educational institutions, which attempted to be completely independent of the government and to provide nationalist education through a combination of the ancient disciplines and traditions with the modern sciences. Dayananda was a forerunner of the new nationalism; by his teaching and his example he helped check the assimilation to European culture of India's educated youth and opened the way to a revaluation of India's thought and destiny.

SARMIENTO, DOMINGO FAUSTINO (1811—88), Argentine statesman, publicist, sociologist and educator. Sarmiento supplemented his scant formal education by wide reading and study. In his youth he was associated with Echeverría, Alberdi and other liberals and became involved in revolutionary activities on the side of the Unitarians, or Centralists, as opposed to the Federalists. In 1839 he fled for the second time to Chile, where he edited *Mercurio and Nacional*, whose columns became discussion centers for political and religious liberalism. He also established and directed the first normal school in Chile. From 1845 to 1847 he traveled in Europe, north Africa and the United States, coming into contact with the leading intellectuals of the period. He was particularly impressed by the educational system and political

organization of the United States. His admiration for the latter caused him to modify his Centralist doctrines, and upon his return to Chile he advocated in his new journal, *Crónica*, a government for Argentina similar to that of the United States.

Throughout his exile Sarmiento had been a leading figure in the opposition to Rosas, who was ruling in Argentina, and in 1851 he helped Urquiza to overthrow him. From 1855 he held office in the government of Buenos Aires and later in the federal administration. He served as minister to Chile and the United States and from 1868 to 1874 was president of his country. In this capacity he initiated the public school system and brought professors from the United States to direct normal schools for the training of native teachers, for he believed that only through education could the masses be raised to an appreciation of responsible self-government. He also devoted himself to agricultural colonization of the pampas and encouraged railroad building into the interior. His two successors in the presidency continued his policies, and thus Argentina became under his leadership and influence the most advanced of the South American republics with the best system of railroads in Latin America. Sarmiento continued his leadership in politics, journalism and education until his death.

Sarmiento, like Alberdi, was one of the greatest social theorists of Spanish America. His *Facundo; civilización i barbarie* (Santiago, Chile 1845, new ed. Madrid 1924; tr. by M. P. Mann as *Life in the Argentine Republic*, New York 1868), which won him international recognition, was a sociological analysis, with an anthropogeographic slant, of South America. The history of the Argentine and of South America in general was, he believed, dominated by the struggle between the cities and the pampas, which represented distinct phases of social evolution. The cities had been able to absorb European culture and were characterized by a spirit of progress, while the plain, cut off from the civilization of Europe, retained a barbaric and savage point of view. The *caudillos*, such as Facundo and Rosas, were an expression of the spirit of the plain. A number of years later Sarmiento, influenced by the ideas of Herbert Spencer, offered a new interpretation of South America basing it upon the conflict of the various races. European immigration would, he held, aid in race regeneration while mass education would help to raise the lower levels. The *Conflicto y armonías de las*

razas en América (2 vols., Buenos Aires 1883) is not as original a work as his earlier book, and it failed to differentiate clearly between race as a biological fact and the results of psychosocial environment. Nevertheless, it influenced Argentinian social thought for half a century. Sarmiento's other writings deal chiefly with causes for which he struggled as a journalist and public official. His collected works have been published under the title *Obras completas* (52 vols., Buenos Aires 1885-1903).

SARPI, PAOLO (1552-1623), Venetian statesman and historian. Sarpi was a member of the Order of the Serviti, and although he wore the cleric's garb until his death he was very critical of the papacy and the church. As theologian and adviser of the Venetian Republic he was the principal advocate of the policy of resistance in the contest between Venice and Pope Paul V for jurisdiction over two priests, guilty of common crimes, whom the pope sought to extradite in order to turn them over to the ecclesiastical tribunals. In spite of the papal interdiction against the republic in 1606 and the risk to his personal safety Sarpi succeeded in defending the rights of the state against papal attack. He wrote an account of the affair in the *Istoria dell'interdetto di Venetia* (1624), in which he advocated a policy of rigorous jurisdiction over everything pertaining to the temporal interests of the church, anticipating in some respects the doctrine of the separation of the two powers.

Sarpi's most important historical work is the *Istoria del Concilio tridentino*, in which the vicissitudes of the Council of Trent are treated with accurate knowledge of the complex theological questions and policies behind the scenes. Sarpi traced the gradual process of transformation through which the council, originally sought by the Protestants to bring about the reformation of the church, supported by Emperor Charles V as a means of healing the schism in his states and accepted by the bishops as a means of restoring the autonomy of their apostolic ministry, finally became the organ of the Catholic Counter-Reformation, which made the schism irreparable and ended by consecrating the abso-

lute power of the Roman pontificate and reducing the bishops to greater servitude. Such a change, Sarpi held, would not have been possible unless the papacy had followed a Machiavellian policy, which, by taking advantage of changing political events and monopolizing the majority of the votes of the council through threats, favors and the admission of persons in sympathy with it, succeeded in winning all its points. By utilizing abundant diplomatic material Sarpi was able to present a precise and thoroughgoing examination, which aroused the ire of the papists.

Sarpi ranks with Machiavelli and Guicciardini as one of the great historical writers of the sixteenth century. He excels in the art of presentation, in psychological analysis and in conveying to the reader the sense of immediate contact with the personalities and events described. His scientific objectivity has, however, been seriously questioned. He shows decided partiality to the Protestant cause, and some writers have gone so far as to claim that he had been converted secretly to Protestantism; others have held that he falsified documents and was biased in his selection of materials.

SARS, JOHAN ERNST WELHAVEN (1835-1917), Norwegian historian. Sars was the first to propound and develop a general theory of the inner continuity of the different and often contrasting periods of the history of Norway. He was influenced by the philosophies of Auguste Comte and Herbert Spencer as well as by the examples and ideas of Guizot, de Tocqueville and Buckle. His early researches were devoted to the history of Norway during the "Danish" period, while his theory of Norwegian

history was developed fully in his *Udsigt over den norske historie* (View of Norwegian history, 4 vols., Christiania 1873-91). Sars attributed the rise, decline and resurgence of the Norwegian nation to the original existence of a strong aristocracy which contributed to the development of a high civilization during the viking age, but which also prevented the growth of a new aristocracy able to assume the political and intellectual leadership of the nation in the centuries following. In this absence of an effective nobility Sars found the reason for the loss of political independence and intellectual activity which befell the Norwegian nation at the end of the Middle Ages, and in addition the reason for the rise of a democracy able at last to lift the nation to political freedom and creative intellectual life. In developing this theory he formulated historical laws of general importance; at the same time he was a brilliant essayist, particularly clever in his character portrayals. Through his writings he became an intellectual leader of his nation, impressing upon the young generations the idea of national independence. He took a personal part in the fight for political and intellectual freedom, and it was by special appropriation of the Storting that in 1874 he was appointed to the chair of history at the University of Christiania.

HALVDAN KOHT

Works: Samlede vaerker, 4 vols. (Christiania 1913).

Consult. Koht, Halvdan, in *Nordmaend i det 19de aarhundrede*, ed. by Gerhard Gran, 3 vols. (Christiania 1914) vol. III, p. 69-98, and in his *Norsk vilje* (Oslo 1933) p. 24-39.

SARTORIUS VON WALTHERSHAUSEN, FREIHERR GEORG (1765-1828), German economist. In 1797 Sartorius became professor extraordinary of philosophy, and five years later full professor, at Gottingen, where he had earlier been a student of theology and history. After 1814 he widened his field of teaching to include constitutional and administrative law, political science, modern history and economics. The continuity of his professorial career was interrupted only by two transient excursions into public life, once as political expert at the Congress of Vienna, where he was sent by the grand duke of Weimar upon the recommendation of Goethe, and again as member of the Hanoverian Estates (1815-17).

Sartorius' indisputable contribution to economic science consists in the fact that he was one of the first German professors to grasp the

significance of Adam Smith's system. At a time when German academic and political life was still dominated by the cameralist tradition, he enthusiastically undertook the propagation of the Smithian doctrine, using the lecture hall as his principal forum. His selections from the *Wealth of Nations*, published as early as 1796 "for use in academic lectures," revealed a capacity to present the principles and implications of laissez faire in a manner suited to the tastes and needs of German students. As indicated by the titles of his *Von den Elementen des National-Reichthums und von der Staatswirthschaft, nach Adam Smith* (Göttingen 1806) and *Abhandlungen, die Elemente des National-Reichthums und die Staatswirthschaft betreffend* (Göttingen 1806), he separated the treatment of national wealth from that of economic policy as carried out by governments; and by this useful innovation he brought about the subdivision of economic science into *Volkswirtschaftslehre* and *Volkswirtschaftspolitik*, a distinction which is still recognized in the curricula of German universities. The *Abhandlungen*, his most original work, constituted a critique and in certain respects an emendation of Smith's ideas, undertaken with the objective of correcting some of the weaknesses which had recently been emphasized with particular trenchancy by Lauderdale. In opposition to the labor theory Sartorius offered a doctrine of value based on the consumption of goods. He attacked the view that a complete harmony exists between the general welfare and individual interests and from this premise deduced the necessity of state intervention to restrict free competition, especially in the sphere of foreign trade. Extremely interesting from the point of view of the theory of crisis is his paper on saving, in which he inquired as to whether there are limits to the profitable investment of capital.

Sartorius also wrote a number of works dealing with institutional and particularly economic history. These include titles so diversified as *Versuch einer Geschichte des deutschen Bauernkriegs* (Berlin 1795), *Essai sur l'état civil et politique des peuples d'Italie sous le gouvernement des Goths* (Paris 1811) and *Geschichte des hanseatischen Bundes* (3 vols., Göttingen 1802-08; new ed. 'y J. M. Lappenberg with title *Urkundliche Geschichte des Ursprunges der deutschen Hansa*, 2 vols., Hamburg 1830), the last being probably the most noteworthy. It cannot be said, however, that any of these works bears a direct relation to his economic doctrine, nor did they

exercise any influence upon the historical school of economists.

SAVIGNY, FRIEDRICH CARL VON (1779-1861), German jurist. Coming of an ancient and noble Lorraine family and very wealthy in his own right, Savigny was probably the first member of the ruling classes of his time to enter upon an academic career, thus enhancing greatly the social position and influence of the German professor, which until then had been rather modest. With unparalleled success he taught Roman law first in Marburg, then in Landshut and finally in Berlin (1810-42). He helped to organize the new Berlin University as a place of scientific research according to the principles of German idealistic philosophy, and he was elected its first rector. It was unfortunate, however, that he accepted, at the entreaty of his royal pupil, William IV, and in contradiction to his own sociologico-legal theories, the post of Prussian minister for the revision of legislation.

Savigny's theories were first expressed in his celebrated pamphlet *Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Tübingen

1814, 3rd ed. Heidelberg 1840; tr. from 2nd ed. by A. Hayward, London 1831) and in the introductory article to his newly founded *Zeitschrift für geschichtliche Rechtswissenschaft* (1815-50). Here he denied the "vocation" not only of his but of any age for legislation proper on the ground that every nation's law, like its language, customs and songs, is an emanation of the *Volksgeist*. It will thus naturally correspond to the needs of a nation as long as it is not subjected to arbitrary interference by legislation. This exaltation of customary law was inspired not only by the philosophy and historical *Weltanschauung* of the romantics, especially by Schelling and Savigny's great disciple Jacob Grimm, but also by Montesquieu and Burke. In order to explain away the obvious fact of the reception of Roman law in Germany Savigny invented the fiction that in higher stages of civilization courts of law and learned jurists act as "representatives" of the *Volksgeist*. In practise Savigny's doctrine was directed on the one hand against the popular demand for a civil code on the pattern of the Prussian, the French and the Austrian codifications and on the other hand against the "revolutionary" doctrine of natural law, to which it opposed the historical study of positive law, holding that such study was necessary and sufficient to make possible not only the scientific comprehension but the "organic" progress of the law. Thus Savigny founded the older, or romantic, branch of the German historical school of jurisprudence, which dominated the German universities until the middle of the nineteenth century and for a long period influenced Anglo-Saxon, French and Italian legal science.

Savigny himself contributed a great work to legal history, his *Geschichte des römischen Rechts im Mittelalter* (6 vols., Heidelberg 1815-31; 2nd ed., 7 vols., 1834-51). This monumental study, never approximated before or since, is one of the foundations of his sociological theory and at the same time provides its most important application. In the first two volumes, covering the period from the sixth to the eleventh century, he attempts to prove that in Italy the Roman organization of the courts of law and the municipal constitutions had survived the Germanic invasion; and he does in fact succeed in showing that the Roman codes had been constantly administered as customary law, although they lacked scientific treatment. In the last four volumes, which still constitute the standard work on the subject, he traces to the end of the

Middle Ages the history of the universities and the newborn science of Roman law, whose teachers now represented the Roman *Volksgeist*. Savigny's minor historical writings, mostly on the subject of ancient Roman law, were collected in his *Vermischte Schriften* (5 vols., Berlin 1850).

The third group of his writings consists of dogmatic treatises on modern Roman law, including his first work and his last. *Das Recht des Besitzes* (Giessen 1803; 7th ed. by A. F. Rudorff, Vienna 1865), published when he was twenty-four years of age, and *System des heutigen römischen Rechts* (general part, 8 vols., Berlin 1840-49; and the general part of the law of obligations, 2 vols., Berlin 1851-53). Together the parts do not form a real system but a collection of monographs; yet every one of Savigny's theories has rightly or wrongly displaced the older views and led to new departures in jurisprudence. This is especially true of the study on possession, of the first book of the *System*, which contains the best formulation of the traditional methodology of the system of the Pandects, of the theory of error in the third volume; and most of all of the eighth volume, in which Savigny expounded his famous theory of private international law. It is the first modern systematization of this important branch of law, based upon the idea of the international community of law, and has had great influence on English and American jurisprudence.

The evaluation of Savigny's work has not been uniform. At first he was considered in Germany and elsewhere as the greatest of German jurists, and certainly he was the most influential. His mastery as a legal historian has never been and never can be questioned. But opposition to his dogmatic and philosophical doctrines has also been strong from the beginning (Gonner, Thibaut, Feuerbach and the Hegelians), and after his death the younger historical school became more and more critical. In more recent times Savigny has been attacked for his archaistic endeavors to put ancient Roman law in the place of *usus modernus Pandectarum*, which was the valid form of Roman law in his time; for the divergence between legal theory and practise and between the Romanists and the Germanists, for his formalistic methods, which neglected the social needs and led to a legal conceptualism so efficiently combated by Jhering; and, finally, for his conservative opposition to legislation and conscious progress. The rise of National Socialism in Germany, however, favors the doc-

trine of the *Volksgeist*, which of course had a powerful influence on the evolution of the nationalistic spirit among the influential classes of the professors of law, the civil servants and judges. The doctrine is even now being transformed into a theory of the "racial" origin and character of the law so that it may be used as an instrument for the extirpation of Roman law from German life.

SAVILLE, GEORGE. See HALIFAX, FIRST MARQUIS OF.

SAVIN, ALEXANDR NIKOLAEVICH (1873-1923), Russian historian. Savin studied under Paul Vinogradoff at the University of Moscow, where he was appointed *Privatdozent* in 1903 and professor of history in 1907. When in 1921 the Institute for Historical Research was created in Moscow he was elected its first vice director.

Savin's researches elucidated many intricate problems in the social history of England. He analyzed the remnants of bondage in the sixteenth century, and by comparing the position of the villeins and the copyholders in several manors of the sixteenth century with that prevailing in the thirteenth and fourteenth centuries he established a direct connection between mediaeval villein tenure and copyhold. His detailed analysis of the legal status of copyhold in the sixteenth century and of its protection by the courts of common law and of equity has thrown much light on the obscure problem of the disappearance of the English peasantry. Most valuable are his statistical studies in the economic conditions of English monasteries before their dissolution and his researches in the history of the alienation of the monastic lands by the

crown, in which he established the fact that the officials of the crown and not the nobles, merchants or manufacturers were the chief incumbents of the secularized land. In a series of brief monographs dealing with histories of individual manors Savin initiated the study of the almost unexplored field of English agrarian development in the seventeenth century and traced the process of acquisition of freeholds and copyholds by gentry and nobility and the consequent penetration of the landed aristocracy among the English tenant class.

SAVING. The original meaning of saving is keeping or preserving something for future use. The term has gradually been extended, however, to cover a number of different but related activities. Once a postponement of consumption is decided upon, it is found profitable not to keep the actual consumers' goods but to produce them by methods which will make them available at a later date when delayed consumption is to take place; for by such methods a greater output is usually obtained from a given quantity of resources. A temporary transformation of the resources into new forms is here involved, a fact which affects the meaning of the term saving and makes it difficult to determine whether a particular decision to postpone a possible act of consumption constitutes new saving or the maintenance of old saving. Even more important, the resulting increase in the quantity of consumers' goods will induce a repetition of the process, so that ultimately the amount saved will be treated more as a source of permanent revenue, or capital, than as a reserve for future consumption.

The real distinction between saving and investing thus becomes apparent. It is applicable in an isolated individual economy and is even more important in a money economy. Here it is still possible to keep *in natura* the goods to be required in the future; but since the income of

The potential saver consists in the first instance of money, the practical choice lies between holding this money and investing it in order to get a return. Savings which are neither invested nor kept *in natura* but take the form of money hoards assume a special significance and have figured prominently in all discussions on saving. The possibility of hoarding likewise constitutes one of the reasons for distinguishing between saving (and also capital) from the point of view of the individual and saving in the social sense. The latter is really a separate phenomenon—the increase of wealth or the formation of capital—of which individual saving is merely the most important cause.

Saving, however, can be usefully discussed only in conjunction with much that properly belongs to the wider concept of capital formation. To begin with, saving cannot be defined without reference to some concept of the process of reproduction of capital. It is difficult moreover to draw the line between that source of the new capital supply which can be described as saving proper and that which cannot; nor is there an established usage as regards terminology.

Probably the most convenient classification of the sources of new capital supply is that proposed by Wilhelm Ropke. In the rather loose terminology which has become customary, he may be said to distinguish between saving *in natura* and money saving and, within the latter group, individual saving, corporate saving, collective saving and compulsory monetary saving, better known as forced saving. Of these only individual voluntary saving is generally meant by the more familiar use of the term. Corporate saving refers of course to the reinvestment of the undistributed profits of corporations and differs from the former in that the voluntary character of the decision to save on the part of those who might otherwise consume these profits is here somewhat doubtful. The contrast between collective saving, or the investment of funds raised by taxation, and what is ordinarily understood by saving is even more marked. The peculiar characteristic of compulsory monetary saving is really the fact that the money for investment is not provided by any kind of saving but is created for that purpose; the use of the word saving in this connection can be explained only by the misleading practise of treating it as equivalent to formation of capital.

While saving proper is one of the sources of new capital, saving in the sense of withdrawing

from consumption some portion of the proceeds of old investments is involved also in the maintenance of existing capital. It has become customary, however, to consider as saving proper only saving out of net income, after allowance has been made for the maintenance of capital, a usage which has sometimes led to the dangerous confusion of the supply of new free capital with the total free capital available for investment. It is extremely difficult to draw a clear line of demarcation between the two, for this would require, particularly under conditions of technical progress, a satisfactory definition of what is meant by maintaining capital intact. This limitation applies to saving for an individual and still more to saving in the social sense. In the latter case the gross total of individual savings has to be reduced not only by the amount of old savings which have been deliberately used up for consumption but also by the involuntary capital losses which have taken place. It is only net saving in this sense which constitutes the supply of new free capital.

In a historical treatment of saving attention must be paid not only to the distinction between saving and the creation of capital, or the increase of wealth, but also to that between saving and the concentration of wealth among individuals. As to the first, it should be noted at the outset that the regular investment of savings is a comparatively recent development. Except for the public storage of grain and similar precautions against famine the keeping of consumers' goods *in natura* has never been very considerable. The hoarding of precious metals, however, has been regarded as the normal form of saving throughout most of history and is still customary among most people of non-European stock. The growth of hoarding was not due to the introduction of money; on the contrary, the fact that the precious metals were a particularly suitable "store of value" made them generally acceptable as a medium of exchange. Until the industrial revolution money hoarding remained the normal form of saving in all cases where the saver himself was not in a position to use additional productive equipment. In other words, throughout antiquity, the Middle Ages and for a long time thereafter the investment of savings did not as a rule involve a separation of saver and investor; and where individual savings were not employed by their owner as productive capital, either because they were too small or for other reasons, he normally had no alternative but to hoard them. Even entrepreneurs, seeking to provide

for a time when they should have ceased to use the capital goods which yielded a return, often accumulated hoards; as late as the eighteenth century some well to do Englishmen retired from business with chests of gold coins from which they intended to live for the rest of their lives.

Until the industrial revolution new capital came mainly from the reinvestment of profits by entrepreneurs. Long distance trade was the most important source of the accumulation of capital in the sense of new productive equipment. The other sources generally mentioned in this connection, particularly landed property, had probably more to do with the concentration of wealth than with the creation of capital. The most important early instrumentalities of profitable investment for the non-entrepreneurs, which offered a permanent source of income to new classes of savers and thus encouraged the development of the saving habit—government loans, annuities and mortgages—represented investments only from the point of view of the individual; their proceeds were normally used for consumption purposes and did not result in the formation of new capital. It is probable that even in the earlier stages of modern manufacture—in England of the second half of the eighteenth and the first quarter of the nineteenth century—relatively little of the capital required came from outside savings, although the growth of banking institutions had provided an agency for their collection. It was only with the development of the modern capital market during the railway booms of the 1820's and 1830's and with the simultaneous and subsequent growth of banking and other investing institutions that the modern relation between the individual small saver and the entrepreneur-investor was established. In the second quarter of the century the desire to collect and fructify not only current savings but also old accumulated hoards of money became one of the leading ideas of economic policy and the main cause of repeated waves of credit expansion. In the period preceding the World War hoarding of coin, except as a temporary phenomenon during depression, had disappeared from modern industrial societies.

The above statement is true at least of the hoarding of hand to hand money. It was generally assumed that since people tend to bring any sum saved to a bank or similar institution, all savings would soon be invested. But in so far as people already hold their normal balances for current expenditure in the form of bank de-

posits, saving may simply mean that they will leave these deposits unused or at best that they will transfer them from a checking (current) to a savings (deposit) account. As both A. C. Pigou and D. H. Robertson have pointed out, saving in this case will not necessarily result in additional investments by the banks; only if the form of deposits is changed and if, as in the United States, reserves held against time (savings) deposits are smaller than those against demand deposits, will at least a part of the new savings be used for new investments. Unless the banks create additional credits for investment purposes to the same extent that the holders of deposits have ceased to use them for current expenditure, the effect of such saving is essentially the same as that of hoarding and has all the undesirable deflationary consequences attaching to the latter.

The effects usually imputed to saving are, however, imputed not to savings which are hoarded but to those which are invested. Such investment means, if the capital created by it is to remain intact, that a quantity of intermediate products, corresponding to the amount of factors invested, will be permanently withheld from consumption and that with the help of this additional capital the output of consumers' goods will be augmented but their cost per unit decreased. In a situation where all factors are already employed when the new investment is being made, i.e. the mean investment period lengthened, fewer consumers' goods must be produced during the transition period and less can therefore be consumed. Because of the decreased expenditure on consumers' goods, the prices of consumers' goods will tend to fall; thereby the necessary curtailment of the output of consumers' goods is brought about and the factors of production required for an increased output of capital goods are set free. Even where saving leads not to an increase in the average period of investment (i.e. an increase of capital per head) but only to the provision of equipment for factors previously not employed, those factors which were already employed and which provided the savings out of their income must reduce their consumption in order to remunerate the new factors until the product of the latter is ready. While in this case only consumption per head—and not total consumption—must be reduced, in a case where saving leads only to the investment for longer periods of factors already employed, the absolute rate of consumption will have to be reduced temporarily in order to spread the existing output over a longer period,

after which the product of the factors now being invested will become available.

The second effect of new investment, the reduction of cost per unit, is important because it shows that the increase in output at a later stage is due not to the fact that the product of a greater quantity of factors then comes on the market but to the fact that, with the help of the additional capital, the original factors produce more than before. The income of all these factors is therefore still equal to the cost of production of the current output and sufficient to take it off the market at remunerative prices. Serious disturbances, however, may follow large and unforeseen fluctuations in the rate of saving and, in consequence of the relative increase in the demand for consumers' goods, an increase of investment in excess of saving proper by means of additional credits.

Because of a misunderstanding of the process through which the temporary reduction of consumption brings about a permanent increase in current output (or a reduction of cost per unit), saving has since early times been persistently blamed for causing trade depressions. "Underconsumption" or "oversaving" explanations of trade slumps were at the basis of many of the earlier discussions of unproductive expenditure and of luxury consumption. Since Malthus and Lauderdale these theories have always had some following, particularly among socialist thinkers, and have gained wide popularity during depressions. In recent years they have been reflected mainly in the notion of "maintaining purchasing power" of consumers and in this form have been strongly supported by groups advocating stabilization of the price level of consumers' goods. It is becoming increasingly clear, however, that these theories are false and that there are only the three special cases—hoarding, violent fluctuations in the rate of saving and forced saving through credit expansion—in which excessive saving may be said to cause depression. Apart from these cases it is doubtful whether there is any sense in which the rate of saving may be absolutely too high or too low. A "general glut" in consequence of too ample a supply of means for investment cannot occur so long as there are still unused opportunities for investment which offer a positive rate of interest. And even if the demand for capital in the form of new productive equipment were not very elastic, the demand for durable consumer goods is practically inexhaustible. What is commonly meant by overinvestment is not an excess of investment

relative to the demand for the ultimate product, but an excessive launching of new undertakings which need for their completion more capital than is available; in other words, "overinvestment" implies not too much saving but too little. Nor can it be said that oversaving may reduce the value of the product of the investment below the point where it justifies the sacrifice involved in the act of saving. This thesis, frequently advanced, offers a curious contrast to the equally current proposition that "underestimation of future wants" prevents an increase of saving to the point where the rate of interest would fall to zero. Both views imply the existence of a normal scale of preference between present and future goods, by which the actual preferences of the individuals can be gauged. There is, however, no other basis for the determination of the relative utilities to an individual at different moments of time but his actual preference, shown at the moment when he decides either to consume or to postpone consumption.

While there is no "just balance between saving and consumption" in the usual sense and while saving at any stable rate can be absorbed without real difficulty, it is very likely that in a dynamic economy—a society with a growing population, advancing technology and a modern banking system—saving at a continuously high rate is an important safeguard of stability. This will not only facilitate the absorption of additional population, and minimize the friction connected with technical progress and shifts of demand, but will probably also tend to mitigate disturbances arising from fluctuations in credit. In the absence of a sufficient supply of new capital any unusually profitable opening for investment will tend to attract capital from other uses and so to enforce extensive readjustments; the introduction of labor saving inventions may lead also to a lowering of wages. With a rapid increase in the capital supply, such readjustments can be effected much more smoothly or obviated altogether. Similarly, the greater the investment based on voluntary saving, the smaller will be the relative variation in the total rate of investment caused by a given rate of credit expansion. Even the inherent instability of capital created by forced saving might be counteracted if sufficient voluntary savings became available to provide a real basis for this capital.

What the actual volume of saving is depends upon willingness and capacity to save. The factors which affect an individual's willingness

to save are the regularity and certainty of his income, the security of the investment opportunities available to him and the possibility of investing in his own business. It is worth mentioning here that the systems of social insurance which guarantee incomes and provide for some portion of the payments out of current revenue instead of from accumulated reserves are undoubtedly a very potent force decreasing the aggregate supply of savings. In the short run the willingness to save varies very little. It is not much affected by changes in the rate of interest: while a rise in the rate of interest offers some people an increased incentive to save, others who wish to accumulate a definite amount need to save less than before. On the other hand, the capacity to save of the different sections of the population, and thereby the aggregate supply of savings, may be very considerably influenced by changes in the rate of interest. In general people with a given attitude toward saving will save a higher percentage of a larger income than of a smaller one; a transfer of income from low to high income groups, such as may be brought about by changes in the interest rate, is therefore likely to increase the supply of savings. A rise in aggregate incomes will of course have the same effect.

SAVINGS BANKS. The outstanding type of conservative investing institution, the savings bank gathers savings from various channels and applies them to the needs of industry and government. Thus it is at once an agency to promote thrift and an organization to mobilize savings for capital investment. It acts as the intermediary through which its depositors take part, by proxy, as it were, in a process of indirect rather than direct investment.

The savings bank developed out of benevolent organizations formed to promote thrift among wage earners and thus to improve their welfare. It followed the French Revolution and the accompanying social upheaval as well as the inception of the industrial revolution and the formation of a permanent wage earning class. The earliest savings banks were formed in Germany in the latter part of the eighteenth

century, in most instances under princely patronage. In England the church sponsored the establishment of savings institutions at the turn of the century. The first real mutual savings bank, self-sustaining and catering to a wide public, was founded in Scotland in 1810. The idea was rapidly taken up, and by 1817 abuses and fraudulent operations had made it necessary for Parliament to regulate such "trustee" savings banks. The banks spread to the British colonies and enjoyed a most remarkable growth in the United States. In 1816 New York City made the first proposal regarding the organization of a savings bank, Philadelphia was the first to put it into operation and Boston the first to incorporate savings banks. In the following years savings banks were established in most of the important towns in the New England and North Atlantic states. In France, where legislative provision for the establishment of a national savings bank was enacted in 1793, the first savings bank was established in 1818. Savings banks were organized in Austria in 1819, in Denmark in 1820, in Norway in 1822 and in the course of the century spread to practically all civilized countries.

With the passage of time the savings bank has tended to lose the aspect of benevolent thrift promotion which characterized its early development and to become instead merely one of a number of agencies supplying capital. It has also encroached gradually upon the activities of commercial banking; thus in 1909 the savings banks in Germany were given permission to receive checking accounts. The tendency became particularly pronounced during the inflationary developments after the World War, which for a time completely undermined the ordinary functions of savings banks and forced the latter, particularly in Germany and Austria, to extend their activities to include a number of banking services catering to the credit needs of the small trader and the professional and salaried man. On the other hand, institutions such as commercial banks, building and loan societies, investment trusts and insurance companies have absorbed the savings of the public to an increasing extent, thus reducing considerably the significance of the savings bank as a depository; while the rise of specialized mortgage institutions has tended to restrict the role of savings banks in the supply of mortgage credit—one of their primary functions. Moreover to an ever greater extent the investor has preferred to make his own direct investments rather than to rely

upon indirect investment by a savings bank or other institution.

Public banks operated by the government must be distinguished as regards ownership, from private banks operated by individuals. Public banks, whether they are postal savings banks (*q.v.*), state banks or municipal banks, are far more important abroad than in the United States. Apparently they were instituted in many countries as a means of providing a check upon existing private institutions. Postal savings banks have spread particularly in Italy and France, while municipal savings banks are most common in Germany, France and Austria. In 1916 Great Britain enacted legislation authorizing the founding of municipal savings banks, and the first such institution was set up in Birmingham in 1919. Where long established, they have made a substantial place for themselves; but where they are of comparatively recent origin, they have tended to play a minor role. The deposits in the British system, established in 1861, are double those of the trustee savings banks. The postal savings system of the United States was a haven for small savers for about two decades after its establishment in 1910. Disturbed banking conditions following the depression which set in in 1929 caused its deposits to mount tenfold, but the permanency of this change is often doubted.

There are several classes of private banks. The mutual savings bank possesses two distinctive features: it is a quasi-mutual institution and it is non-profit making in character. It merely aggregates the funds entrusted to it by depositors and invests them, together with any earnings not distributed to these depositors. The assets belong to the depositors, who receive the entire earnings after payment of expenses and gradual creation of a guaranty fund or surplus designed to protect the depositors against loss through shrinkage in assets. But the depositors have no share in the management, which devolves upon a self-perpetuating board of trustees selected by the organizers. The trustees represent a group of substantial citizens with a sense of civic responsibility who are willing to undertake the task in the interest of the community. Conditions favorable to the formation of mutual savings banks existed during the nineteenth century in England and Scotland and in the northeastern United States. In 1932 there were 594 mutual savings banks, with deposits amounting to \$10,000,000,000, in 17 states of the United States; of these 379 banks, with

\$3,300,000,000 deposits, were in the 6 New England states and 195, with deposits aggregating \$6,300,000,000, in the 5 eastern states. With changing conditions mutual savings banks are no longer being established in substantial numbers even in these states.

The guaranty savings bank receives special deposits which are junior to general deposits; such banks exist only in New Hampshire. In certain sections of the United States there are a few stock savings banks, which like mutual savings banks receive only savings deposits. They are, however, operated for the benefit of a body of stockholders, who receive all the earnings remaining after expenses and a stipulated rate of interest to the depositors have been paid. In general stock savings banks are indistinguishable from commercial banks and trust companies. Not only do the latter operate savings or thrift departments in non-mutual savings bank states, but since the World War they have given the mutual banks strong competition in their home states. A similar situation prevails in England, where the joint stock banks have multiplied the facilities for savings accounts. These commercial institutions also receive a considerable volume of time deposits representing temporary surplus funds of individuals and business undertakings, held pending use, rather than true savings.

Since savings banks were originally designed to accommodate persons of moderate means, the size of accounts has been restricted in some countries. In the mutual savings banks of New York state the maximum is \$7500, raised from \$5000 in 1926 and from \$3000 in 1920. In savings departments of commercial banks, however, any limit set is imposed by the bank. The deposit is almost universally evidenced by a pass book, and the bank reserves the right to require specified notice of withdrawal, generally 30 or 60 days, on the theory that the nature of the funds does not require absolute day to day liquidity. In practise the deposit is ordinarily payable on demand. No general notice was required by mutual savings banks after 1907, but in 1933 banking supervisors temporarily limited withdrawals. British trustee savings banks have two classes of deposits: the ordinary deposit, which is invested with the National Debt Commissioners, who guarantee a fixed rate of interest and the repayment of the principal; and the special investment deposit, which is open to depositors having a minimum of £50 to their credit in the ordinary department and which is not guaranteed by the government, although the

latter prescribes the type of security in which such funds may be invested. On November 20, 1932, half of the £155,000,000 cash due depositors was in special investment departments, yielding a higher return than that in the general, or ordinary, department. In addition the trustee savings banks like the postal savings banks offer facilities for the direct purchase of securities by depositors. Another important savings institution in England and Scotland is the National Savings Committee, through which savers can place their funds in savings certificates, which in turn are invested in government obligations.

With the passage of time the savings appeal has changed. Formerly saving for old age was stressed, and the virtue of thrift as a character building form of self-restraint or discipline was urged. Since the war saving has been represented to be a means to an end attainable in the not too distant future. This is special purpose saving, related more closely to the family's financial program. Instead of serving merely to accumulate an indefinite sum for old age, saving is aimed at definite sums for particular purchases or at the piling up of a cash reserve.

In addition there are systems of industrial saving whereby an employer arranges for periodic deposits, at times when wages are paid, from workers who desire to participate. The plans are termed either voluntary or compulsory; under the latter plan the amount set by the worker is deducted from the pay envelope by the employer. School savings, designed to train children in the saving habit, were established in France as early as 1834 and were fostered in the United States after 1885. Many systems are used; the stamp system is simple but too mechanical, while the pass book system involves extra work for the teacher.

Finally, there has been developed extensive advisory service, covering in particular family budgets and investments; it seeks to aid the depositor in planning his financial affairs wisely and, when he outgrows the savings bank, to guide him. Mutual savings banks also provide safe deposit vaults, and in Massachusetts in 1908 such banks began to furnish life insurance and annuities under state supervision. In that state 20 banks have insurance departments and 100 others act as receiving stations for them.

Since savings banks are designed to serve persons of limited means, most countries attempt to regulate their investment policies. In some countries the bulk of savings deposits is

located in government securities. In the United States in about half of the 19 states which provide for mutual savings banks the investments are closely restricted by law to the more conservative and seasoned securities. In order to qualify issues must meet specified tests, while diversification is sought by restriction of the maximum percentage of assets which may be placed in particular forms and in the securities of one issuer. The state of New York, which is among the more conservative in its requirements, may be considered for purposes of illustration. On December 31, 1932, its savings banks showed total assets (at estimated market value, as set arbitrarily for some classes by the superintendent) of \$5,897,089,000, distributed as follows: real estate mortgages claimed 59.8 percent with an allowable maximum of 70 percent; other bonds including United States bonds, municipal, railroad, public utility, land bank and Port of New York Authority bonds constituted 31.4 percent; cash accounted for 4 percent and promissory notes for 0.1 percent. The distribution of assets indicates that the mutual savings bank is in considerable measure a local real estate financing organization. It is an important source of urban mortgage money. In addition it provides substantial sums for railroad and, to a lesser extent, public utility finance, although it avoids general manufacture and merchandising as too hazardous. It supplies government financing in considerable degree but only as a means of achieving liquidity. In the field of personal finance, however, its activities are negligible. It may accept promissory notes representing advances to building and loan associations or secured by marketable eligible collateral or savings bank pass books. A few states also admit other classes of investments, in particular mortgage loans on property outside the state, foreign bonds and bank stock. The distribution of assets indicates at once the strength and the weakness—the service and the limitations—of the savings bank, to the depositor as an investing institution and to the community as a financing institution. First, the savings bank cannot achieve full diversification in its investment portfolio. It is limited to fixed income bearing securities, and any factors which affect such securities adversely, such as rising interest rates, will impair their value; the depositor is protected against this contingency only by the surplus, built up by the withholding of part of the earnings. In the second place, if savings banks are limited to a relatively small

number of investments, the market prices of these legal investments are raised relatively to other good but non-legal securities. In the third place, the restrictions tend to lag behind changing investment conditions; they reflect past figures rather than present conditions and future prospects. Twice in a decade adverse railroad conditions have made it necessary for the New York legislature temporarily to suspend the requirements as to rail earnings. Meanwhile, as in the case of commercial banks and insurance companies, bondholdings show substantial depreciation below book value—10 percent at the arbitrary valuations in the above statement.

The general canons underlying savings bank investment have long been recognized as safety, liquidity and yield. The first is basic and is ordinarily sought through the restrictions previously mentioned, while liquidity is distinctly subordinate. The New York law does not require mutual savings banks to keep a minimum cash reserve but does limit them to a maximum available fund (consisting of cash on hand and deposits with other banks), which remains uninvested. Since 1929 in fact investment problems have shifted with amazing rapidity. At one time savings banks had to search for profitable investment outlets, as a result of rapid growth of assets in the face of declining security markets and unsatisfactory real estate conditions. In 1933, however, liquidity was a prime consideration, since pressure from depositors had increased while bond prices had been depressed and real estate had continued largely "frozen."

In the United States legislative protection of deposits in savings departments of commercial banks has been the exception rather than the rule. National banks are merely required to record savings accounts in separate ledgers, and to group open time accounts and time certificates of deposit so that these may readily be distinguishable from other classes of accounts if carried in the same ledger with checking accounts; there is no complete departmentalization. Savings funds are mingled with the general assets of the bank and are invested in the same manner as demand deposits—in regular loan operations, bond purchases and real estate loans. The bond list is not specified or limited to savings bank legals. About half the states follow the National Bank Act in granting no special protection to savings depositors in state banks and trust companies.

After 1907 and again after 1920 heavy bank failures brought forth protests against the posi-

tion of the savings depositor in the commercial bank. It was claimed that the savings depositor was entitled to more favorable treatment than the demand depositor, since the former's deposit was more important to him and his ability to select a sound bank and keep in touch with its affairs was slight. As a result a postal savings system was instituted, and in certain states guaranty of bank deposits or special protection for savings depositors was established.

The mutual savings bank states, on the whole, have taken the most elaborate protective measures. But even in these states no uniformity exists. California makes the most drastic requirements: the bank must be completely departmentalized, while assets must be segregated in each department, which must have its own separate capital and surplus. The principal protective devices involve: keeping of separate records; segregation of assets, so that funds received from savings depositors constitute a trust fund to be used to pay them—this prevents withdrawal by demand depositors in event of a "run" but weakens the bank's general ability to meet heavy withdrawals; prescription of investments, to supplement segregation by insuring the continued soundness of the savings assets, efforts to insure continued sufficiency of savings assets by granting a lien on the general assets to make good any impairment of the former, holding of separate capital and/or surplus in the savings department or restriction of interdepartmental relations; and auxiliary devices, such as limitation of amount of deposits in relation to capital and surplus or restriction of rate of interest paid. Many bankers believe that adequate management can insure well run institutions which will protect all depositors equally. They hold that the safety of the banking system would best be promoted through supervision and education of bankers rather than through special protective devices. The serious bank failures in the United States after 1929 finally resulted in 1933 in the creation of the Federal Deposit Insurance Corporation, whose guaranty of demand as well as of time deposits has apparently stilled the clamor for special protection for savings deposits. At the same time it has created entirely new problems, particularly with respect to the relation of savings banks to the banking system.

A statistical setting for savings banking cannot easily be provided. The savings deposit has become inextricably bound up with the time deposit. Some time deposits represent pure sav-

ings, but others do not. Despite their form the latter are, at least in spirit, akin to demand deposits. American banks wished to take advantage of the 3 percent reserve against time deposits which Federal Reserve member banks were permitted to keep, while depositors on their part wished to receive the higher interest that such deposits bore. Thus during the 1920's there occurred a wholesale shifting of deposits from the demand to the time category. In the period of depression which began in 1929 many individuals desiring safety and yield resorted to the savings bank, expecting to withdraw their funds as soon as investment conditions improved. It is impossible exactly to break down the time deposit figures into pure savings and other deposits. The steady growth in total time deposits and in their relative importance in American banking is shown in Table I.

TABLE I
SAVINGS AND TOTAL BANK DEPOSITS IN THE UNITED STATES, 1913-32
(In \$1,000,000)

| YEAR | SAVINGS DEPOSITS* | TOTAL INDIVIDUAL DEPOSITS | PERCENTAGE OF SAVINGS TO INDIVIDUAL DEPOSITS |
|------|-------------------|---------------------------|--|
| 1913 | 8,548 | 18,122 | 47 |
| 1920 | 15,189 | 32,361 | 47 |
| 1921 | 16,501 | 34,233 | 48 |
| 1922 | 17,579 | 36,336 | 48 |
| 1923 | 19,727 | 40,491 | 49 |
| 1924 | 21,189 | 41,664 | 51 |
| 1925 | 23,134 | 45,464 | 51 |

The growth in time deposits is by no means as remarkable as at first appears, when prices or growth in national income, especially after 1925, are considered. The banks had to face many competitors for the individual's dollars. Prominent among them were the instalment system, intensive salesmanship, real estate development, employee and customer stock ownership plans, the stock market, life insurance companies and building and loan associations. While no accurate statistical measurement can be made, it appears that the banks did not take the lead during the boom period. Adversity since 1929

has caused the pendulum to swing the other way.

Among the several classes of banks receiving savings deposits there has been considerable shift and relative displacement as shown in Table II. Evidently other classes of institutions

TABLE II

DISTRIBUTION OF SAVINGS DEPOSITS AMONG THE BANKS IN THE UNITED STATES, 1911-32
(In \$1,000,000)

| YEAR | MUTUAL SAVINGS BANKS | STATE BANKS, PRIVATE BANKS, AND TRUST COMPANIES | NATIONAL BANKS |
|------|----------------------|---|----------------|
| 1911 | 3,459 | 3,024 | 1,480 |
| 1915 | 3,945 | 3,541 | 1,321 |
| 1920 | 5,058 | 6,667 | 3,463 |
| 1925 | 7,152 | 10,172 | 5,810 |

enjoyed far more rapid growth after 1915 than did the mutual savings banks. In fact between 1920 and 1930 the mutuals held less than one third the total time deposits, in contrast to somewhat less than one half in 1915. But after 1930 there was a radical change. Whereas the mutual savings banks continued their slow growth, other institutions, in particular those chartered by the state, showed a considerable drop in their time deposits. Undoubtedly this reflects the heavy bank failures and their effect upon public confidence in different classes of banks. As a result the mutuals again attained a relative position approximating that of pre-war days; but other state chartered institutions declined relatively to the national banks.

A problem which has come to the fore with particular urgency since 1929 is that of organizing savings banks into a system and of determining its relation to the commercial banking system. Membership of American mutual savings banks in the Federal Reserve system, often proposed, was finally permitted by the Banking Act of 1933. Previously the banks had had indirect access through rediscount with their depository banks, which were themselves members, and through sale of United States government obligations to the Reserve Banks in the open market. In March, 1932, Massachusetts incorporated a Mutual Savings Central Fund for a five-year period, which received funds from savings banks and lent to them. In July, 1933,

New York created two institutions: the Savings Banks Trust Company was to become a member of the Federal Reserve system, and thus indirectly give New York savings banks access to the Reserve Banks, while the Institutional Securities Corporation was to deal in mortgages with savings banks. Emergency in nature, both relied heavily upon the Reconstruction Finance Corporation for funds to supplement savings bank contributions. Neither can be regarded as definitive in its present form.

In 1934 the outlook for savings banking is confused. Depression has tended to reduce bank receipts, if not to accelerate withdrawals, although recently a deposit rise has been noted. Moreover lack of monetary stability militates against the use of the savings bank. The threat of inflation encourages spending or direct investment in commodities or equities rather than in fixed money claims. The effect of instability upon savings banking was brought out in marked degree in Germany, where deposits fell from 19,700,000,000 marks in 1913 to 3,100,000,000 in 1926. As yet moreover while regulation of savings bank competitors, such as building and loan associations, has progressed, no clear cut program has emerged to determine the several fields of service of the various classes of institutions. Despite their long history savings banks have not yet attained a definite position and their operation is still far from perfect.

SAVONAROLA, GIROLAMO (1452-98), Italian Dominican friar and preacher. Savonarola, a native of Ferrara, was driven by the political confusion and pagan immorality of Renaissance Italy to renounce the world. At first he was content to devote himself to theological studies, in which he became deeply versed; but his consuming passion for religious and moral reform eventually impelled him to become a preacher. Success did not attend his efforts until he was transferred to Florence, then the center of the new pagan culture. Although attached to the convent of St. Mark's, of which the Medici were the founders and patrons, he refused to have any dealings with Lorenzo. His business was to call the people to repentance; and such was the fervor of his plea that his followers grew into a multitude. When after the death of Lorenzo, Charles VIII of France invaded Italy in 1494 and the Medici were expelled by a popular uprising, Savonarola became automatically the most influential, because the most trusted, person in the city.

Sitting on no government commission and giving his counsels exclusively from the pulpit, the friar so completely swayed the people that all his political proposals were enacted into law. His three leading political principles, the general reconciliation of all citizens, the largest possible measure of popular sovereignty and equitable taxation falling in the main on the owners of real property, were incorporated into the new constitution, which Machiavelli and Guicciardini afterwards declared to have been the best Florence ever had. But Savonarola's major objective had always been religious and moral regeneration, without which, he realized, political reform would prove a house built upon sand. By preaching and example, if not by legislation, he achieved remarkable results also in this field. As if by magic the colorful Florence of the Renaissance was converted into a drab puritanical commonwealth foreshadowing in many ways John Calvin's Geneva. Savonarola won his greatest success with the children. Organized as a Christian militia, they replaced the lascivious carnival of Lorenzo's time with the religious

bonfires to which the faithful brought their "vanities." Although a strong undercurrent of opposition to these rigors developed, the fall of the reformer was due rather to the complicated Italian political situation and more particularly to the clash between Florence and the papacy. When Pope Alexander VI failed in his attempt to bribe Savonarola and thereby to break the resistance of Florence, he resolved to destroy him. The dauntless friar openly defied the pope and was excommunicated. The people now deserted him and he could be brought to trial as a heretic, hanged and burned.

SAX, EMIL (1845-1927), Austrian economist. Sax' main contribution lies in the fact that he extended the marginal theory of value to the field of public finance and transportation. In his *Grundlegung der theoretischen Staatswirtschaft* (Vienna 1887) he elaborated a theory of public economy to complement the ordinary theory of individual economy and attempted to prove that the same laws of value regulate the economic phenomena in both branches. This book represents one of the outstanding contributions to the economic theory of the period and exerted a stimulating influence on the theory of taxation, especially in Italy. Sax' followers have, however, in general criticized his social psychology and his view that members of a community should distribute the expenditure of their income between their collective and individual wants in accordance with their respective degrees of intensity. Disappointed over the slight recognition of his views in Austria and Germany and the difficulties he encountered in his academic career, Sax early resigned from his professorship at the University of Prague and retired to his country house in Italy, where he spent the rest of his life. After a silence of two decades he resumed his literary activity and

published among other works *Der Kapitalsins* (Berlin 1916), a highly controversial and difficult treatise on the theory of interest, and a completely revised and enlarged edition of *Die Verkehrsmittel in Volks- und Staatswirtschaft* (2 vols., Vienna 1878-79; 2nd ed., 3 vols., Berlin 1918-22), a book which is regarded as the standard work in the field of transportation and is perhaps the best achievement of Sax' versatile genius.

SAY, JEAN-BAPTISTE (1767-1832), French economist. Say found himself involved in both the English industrial revolution and the French political revolution. Too independent long to serve Napoleon, although in 1814 he was sent by the government to study economic conditions in England, he was by turns industrialist and professor. In 1819 the chair of industrial economy was founded for him at the Conservatoire des Arts et Métiers, and in 1830 he was made professor of political economy at the Collège de France.

In large measure Say's work consisted in a vulgarization of *The Wealth of Nations*. The disorderly presentation of the English work was replaced by a logical exposition, of which the tripartite division—production, distribution, consumption—introduced by Say in 1814 in the second edition of his *Traité* remained the traditional treatment throughout the nineteenth century.

In addition, however, Say made an important original contribution to economic science. This is contained in the famous *loi des débouchés*, or law of markets, according to which money is only an intermediary which drops out in such a way that not only are "products exchanged for products" but, further, products are exchanged for services, those "immaterial products" which Smith did not recognize. Thus the law of markets implies the law of economic equilibrium. Between the sale of products and the sale of services there stands the new person unknown to Smith, the entrepreneur, whose profit is to be distinguished from salary, interest and rent.

Say's optimistic productivism was not shaken by the economic crises of the early nineteenth century. He held that all overproduction could

be only partial. Either certain products are too abundant in one place only because in another men have not produced enough to purchase them or, if products pile up everywhere, it is because of artificial hindrances to their exchange. An economic crisis is therefore in large part a social and political crisis. Were customs barriers, which obstruct the exchange of products for products, and privileges, which hinder the exchange of products for services, wiped out, subsequent crises would by this one stroke be reduced materially.

Would they then be radically suppressed? It is at this point that Say's theory seems insufficient to contemporary political economy. For Say, who viewed society as a biologic organism, the only problem was that of doing away with artificial political and social arrangements and returning to *laissez faire, laissez passer*. The tendency today is to go a step further: since crises seem to be due less to natural causes than to a false direction of economic effort, the remedy must be sought less in *vis medicatrix naturae* than in the substitution of new for obsolete institutions. Free exchange may remain the ideal but it must be attained by different means. And this general truth—identical ends, new means—furnishes the key to present relations with that classical economics of which Say provided one of the happiest expressions.

ERNEST TEILHAC

SAY, LÉON (1826-96), French political leader and economist. Grandson of Jean-Baptiste Say and well known in his own time as a writer on economic subjects, Léon Say was nevertheless more important as a political figure than as an economist. Before 1871 he opposed the empire. From 1871 to 1883 he went over to the government and devoted his energies to consolidating

the new republic. First appointed minister of finance by Thiers in 1872, he held this office under different ministries until 1879 and again in 1882; his greatest achievement during this period was the liquidation of the payment of the war indemnity to Germany long before the prescribed time. His general policy was directed toward a decrease in public expenditures and the removal of barriers to internal commerce. He fought in vain for the abolition of the *octrois*. After 1883 he returned to the opposition and conducted an unsuccessful campaign at once against protectionism, which triumphed in 1892, and against socialism, which was striving for an increase in public expenditures. His quite uninspired economic doctrines derived from a mediocre liberalism, the golden mean between monarchy and socialism.

(Paris 1890-97), in collaboration with Joseph Chailley; *Les finances de la France sous la troisième République*, ed. by A. Liessc, 4 vols. (Paris 1898-1901). *Consult* Michel, Georges, *Léon Say* (Paris 1899); Picot, Georges, "Léon Say" in his *Notices historiques*, 2 vols. (Paris 1907) vol. II, p. 1-53.

SAYYID AHMAD KHAN, SIR (1817-98), Indian Moslem reformer and educator. Sayyid Ahmad Khan received the traditional Moslem education and for many years served the British government in India. He was the author of an important work on Indian antiquities. His *On the Present State of Indian Politics. Speeches and Letters* (Allahabad 1888) contains some of his political and social ideas.

Ahmad Khan was the first Moslem reformer to reflect the impact of western civilization upon India. A pious Moslem, he was profoundly impressed by European culture and attempted to introduce modern education among his coreligionists in order to counteract their reactionary obscurantism and fanaticism. With the naïveté characteristic of liberal reformers he regarded education as a panacea for all ills, but he valued it especially as a means of bringing about a closer understanding between the British rulers of India and their Moslem subjects, and of securing for the latter a proper share in the British administration. In 1864 he founded in Aligarh a scientific society for the translation of western scientific books into the vernacular. In 1869 he visited England and upon his return published a monthly periodical, the *Tahzibul Akhlāk* (Ethical reformer), which despite violent

opposition fought against the isolation and rigidity of Islam. From his Committee for the Better Diffusion and Advancement of Learning among the Mohammedans of India there developed in 1875 the famous Moslem Anglo-Oriental College in Aligarh, the present Aligarh Muslim University. Modeled after Cambridge, it was designed to give an English gentleman's education to the sons of the Moslem aristocracy and at the same time to encourage loyalty to their religion.

Sayyid Ahmad Khan declared that the guiding principle in his life was his loyalty and gratitude to the British government for the benefits it had conferred upon India. But the movement of enlightenment he helped to inaugurate led not to an organic assimilation of new influences with a living and continuous tradition, as he had hoped, but rather to a period of restless doubt and to a break with the past. Sayyid Ahmad Khan remained until his death entirely aloof from the Indian national movement and from its then very moderate opposition to some aspects of British rule. As a representative of the conservative Moslem landed nobility, he opposed and distrusted the rising educated middle class composed of Hindu intelligentsia and Bengali merchants, who together had created the Indian National Congress. His progressive and even courageous program of education was in essence indicative of nothing more than a very conservative reform tendency.

SAZONOV, SERGEY DMITRIEVICH (1861-1927), Russian diplomatist. As counselor at the Russian embassy in London from 1904 to 1906 Sazonov acquired a friendly feeling toward England. After two years as Russian representative at the Vatican he was appointed assistant minister of foreign affairs under Izvolsky in May, 1909. When Izvolsky went as ambassador to Paris a year later, Sazonov took his place as foreign minister, serving until his own resignation in 1916.

Of a mercurial and emotional temperament,

slim and rather small of stature and nervous and abrupt in manner, he gave the impression of being frail in body and changeable in mind. Even his French allies felt that he was lacking in frankness and clearness of purpose, so that it was often difficult for them to follow him. Sazonov desired peace, but he was easily influenced by Russian militarist circles and was very sensitive to the criticisms of the chauvinistic Russian press. He was also an ardent patriot, anxious to carry forward the Russian policy of getting control of the Bosphorus and the Dardanelles. By 1914 he had become convinced that this could be accomplished only as a result of a European war.

Sazonov at first sought to cooperate with Germany; in November, 1910, without consulting France and England, he talked with Bethmann Hollweg of connecting projected Russian railways in Persia with the Berlin-Bagdad Railway. Gradually, however, he came to share Lvolsky's aims of strengthening the Triple Entente against Germany and Austria. Alarmed at Austria's ultimatum to Serbia and influenced by the Russian military authorities, he persuaded the czar on July 30, 1914, to order the general mobilization of the Russian army which made a European war virtually inevitable.

SCARUFFI, GASPARO (1519-84), Italian economist. Scaruffi was a merchant and banker; for a time he was assayer and later he served as contractor of the mint at Reggio, his native city, where he held various other public posts as well. He profited by his practical experience to publish a book on money, *L'altimonfo* (The true light, Reggio 1582). The book is generally considered the most excellent and advanced early Italian work on money. Its importance, however, lay not in any systematic theoretical analysis but in its clear exposition of certain prac-

tical proposals. It recognized correctly the functions of money as a measure of value and as a general means of exchange. In order that it might perform these functions more effectively Scaruffi proposed that money should no longer be regulated in a variety of ways from country to country but that a uniform international regulation should be established, each coin to bear an indication of its value, its alloy, or fineness, and its weight, which must never be modified; thus each person could calculate with certainty how much fine metal he received in payment of debts due him. Equality in the value of money and metal was to be maintained by free interchange of coined and uncoined metal, except for the expense of coinage, which was to be borne by the private individuals who brought their metal to the mint. The coinage, however, was not to be utilized as a source of revenue for the monarch. Scaruffi erred in maintaining that the variations which had occurred in the ratio between the values of gold and silver resulted from the disorder of the monetary system and that once his proposal was adopted it would remain fixed at the divinely ordained ratio of one unit of gold to twelve units of silver. He was unable to perceive the effects of bimetallism. His merit lies in his having advocated a stable monetary unit in terms of fine metal and having proposed international monetary unification. After his death this last proposal was pushed with great zeal by his countryman Pratusoli, who maintained that it would not be difficult to have it adopted by a diet or congress of all the rulers; subsequently, however, the proposal was entirely forgotten.

ULISSE GOBBI

Works *L'altimonfo* is included in *Scrittori classici italiani di economia politica*, ed. by P. Custodi, vol. II (Milan 1804) p. 71-322, and in *Economisti del cinque e seicento*, ed. by A. Graziani (3rd ed. Bari 1913) p. 1-140.

Consult. Pratusoli, Bernardino, *Considerazioni sopra l'Altimonfo del S. Gasparo Scaruffi* (Reggio 1604), Balletti, Andrea, *Gasparo Scaruffi e la questione monetaria nel secolo XVI* (Modena 1882), Supino, C., *La scienza economica in Italia dalla seconda metà del secolo XVI alla prima del XVII* (Turin 1888) p. 63-67, Gobbi, U., *L'economia politica negli scrittori italiani del secolo XVI-XVII* (Milan 1889) p. 152-58.

SCHAFFER, DIETRICH (1845-1929), German historian. The son of an artisan of Bremen, Schafer rose to a leading position among German historians. In the main his historical works deal with the Middle Ages and with the development of the Hanse, and one of his most valuable

contributions is the two concluding volumes of the *Geschichte von Dänemark* (Gotha 1893-1902) begun by Dahlmann. In addition to numerous monographs Schafer published a series of distinguished general treatises. His popular two-volume biography of Bismarck has been superseded by later research, but his *Weltgeschichte der Neuzeit* (2 vols., Berlin 1907; 11th rev. ed. 1922) and his *Deutsche Geschichte* (2 vols., Jena 1910; 9th rev. ed. 1922) went through many editions and are still read widely in Germany. Schafer was distinguished by a wealth of knowledge, a phenomenal memory and a gift for clear and concise presentation of essential events and basic ideas. An ardent patriot and monarchist, the German catastrophe of 1918 was a painful experience which he never overcame.

Schafer was the outspoken champion of political history as opposed to the *Kulturgeschichte* of Gothein and Lamprecht. In his *Staat und Welt* (Berlin 1922; 2nd rev. ed. 1923) he summarized his basic ideas: the state is superior to all other cultural realms, which are, with rare exceptions, dependent upon it; never has a great idea unassisted by state leadership exerted any general influence on humanity. In a certain sense Schafer was a follower of Treitschke; perhaps even more arbitrarily than the latter he disregarded the other spheres of historical existence. Yet the very limitations of his conception of history may be responsible for his lasting influence in Germany.

WILHELM MOMMSEN

Consult: Schäfer, Dietrich, *Mein Leben* (Berlin 1926); Wolf, Gustav, *Dietrich Schafer und Hans Delbrück* (Gotha 1918), *Dietrich Schafer und sein Werk*, ed by Kurt von Jagow (Berlin 1925), Meyer, O. A., in *Deutsches biographisches Jahrbuch*, vol. xi (1932) 268-75.

SCHAFF, PHILIP (1819-93), American church historian. Schaff was born in Switzerland and prepared himself for an academic career under the guidance of F. C. Baur, Tholuck and Neander at Tübingen, Halle and Berlin. He came to the United States in 1843, where he became one of the leading American theologians and churchmen in the nineteenth century. He taught at the seminary of the German Reformed church in Mercersburg, Pennsylvania, until 1863, and from 1870 until shortly before his death he was a member of the faculty of Union Theological Seminary in New York. Schaff was primarily a church historian. His *Geschichte der apostolischen Kirche* (Mercersburg 1851; tr. by E. D. Yeomans as *History of the Apostolic*

Church, New York 1853) and *History of the Christian Church* (3 vols., New York 1858-67; rev. ed., 7 vols., 1882-1910) were influenced by the Hegelian conception of development, so that he regarded the manifestation of the church as the unfolding in time of the divine idea. The emphasis upon the church and the implied tolerant attitude toward Roman Catholicism brought Schaff into conflict with ultra-Protestants but fostered interest in church history and in oecumenical movements looking toward Christian unity. Through the foundation of the American Society of Church History and the promotion of the American Church History series he stimulated interest in the history of religion in the United States. Schaff took an active part in oecumenical activities and contributed largely to the liturgical movement in the churches. In his critical edition of *The Creeds of Christendom* (3 vols., New York 1877; 6th ed. 1931), as editor of the translation and revision of Lange's *Commentary* (25 vols., Edinburgh 1866-80), of Hauck and Herzog's *Realencyklopaedie* (*New Schaff-Herzog Encyclopedia of Religious Knowledge*, 13 vols., New York 1908-14), of the *Select Library of Nicene and Post-Nicene Fathers* (28 vols., New York 1886-1900) and of many other works and as chairman of the American committee on Bible revision he combined his scholarly work with his oecumenical interests.

SCHAFFLE, ALBERT EBERHARD FRIEDRICH (1831-1903), German sociologist and economist. Schaffle was at first a teacher and later a journalist, but he rose rapidly to a professorship at Tübingen and to membership in the Württemberg diet. Later he occupied a chair at the University of Vienna, resigning in 1871 to serve for a few months in the cabinet of Count Hohenwart. He retained a keen interest in politics also upon his return to Stuttgart, where he edited the *Zeitschrift für die gesamte Staatswissenschaft*. He was disappointed, however, in his justified expectation of a university appointment and in his hopes for high political office under Bismarck.

It is difficult to fit into conventional categories Schaffle's contributions to science. His central work, *Bau und Leben des sozialen Körpers* (4 vols., Tübingen 1875-78; 2nd ed. in 2 vols., 1896), is an ambitious attempt to construct a

unified system which would include all natural and social sciences. The underlying organismic conception of social life and the multiplicity of specific biological analogies contained therein seem to support the view that it is a restatement of positivist sociology. Nevertheless, Schaffle was much closer to German idealistic philosophy than to ontogenetic monism. Like Hegel and Schelling, he sought a spiritual interpretation, endeavoring to establish the values which human life should serve. This idealistic strain is more clearly discernible in his posthumous *Abriss der Soziologie* (ed. by Karl Bucher, Tübingen 1906).

Although his economic sociology, like his general sociology, is apparently self-contradictory, Schaffle's thought in this field is marked by certain fundamental characteristics, from which he rarely deviates. Most important among these is the anti-individualistic approach; he proceeds consistently from the whole to the parts, from the community to the individual. A forerunner of modern universalism, he was by no means a romantic; although he advocated a social organization based upon occupational estates, he found constructive forces also in capitalism. A second characteristic is his belief in progress, more concretely his optimistic faith in the eventual socialistic transformation of capitalism. Yet his "rational social state" is no rationalistic utopia; his zeal for reform was rooted in and circumscribed by familiarity with history. This dual base—rationalistic and historical—of his thought constitutes the third characteristic of his economic sociology.

Schaffle's work in economic theory represents a critique of the chrematistic orientation of the classical school and an attempt at a reformulation in line with an "ethical-anthropological" viewpoint. In many specific doctrines he anticipated later developments. Thus he regarded rent as a differential income accruing to workers as well as to property owners and interest as the compensation of a special group of social functionaries, the capitalists. He saw in the phenomenon of value the supreme exemplification of the ethical-volitional nature of economic life, and in analyzing factors determining value he foreshadowed the later synthesis of cost and utility theories. He offered a new classification of the economic functions of the state and propounded the theory that taxation should aim at a proper balance in the satisfaction of individual and collective wants. In *Die Grundsätze der Steuerpolitik* (Tübingen 1880) and later in his stimulating treatise *Die Steuern* (2 vols., Leipzig

1895-97) he developed the science of taxation into a politico-economic discipline in the full sense of this term.

Schaffle's program of social action is no more consistent than his social theory. *Die Quintessenz der Sozialismus* (Gotha 1875, 25th ed. 1920; tr. by Bernard Bosanquet, 7th ed. London 1901), suppressed by the Prussian government upon its first appearance, gave him the reputation of a vigorous ally of the socialists; but *Die Aussichtslosigkeit der Sozialdemokratie* (Tübingen 1885, 4th ed. 1891; tr. by A. C. Morant, 2nd ed. London 1911) alienated all radical sympathy. Yet in the second edition of *Bau und Leben*, published in 1896, the socialistic overtones are more pronounced than in Schaffle's earlier writings; and the economy of the "rational social state" is described in minute detail, as though its realization were an immediate prospect. Ostensibly sympathetic to capitalism, Schaffle nevertheless regarded collective ownership as a superior form of property holding and contemplated a planned organization of production to accord with estimated needs. The social product was to be distributed among individuals in proportion to their labor services, for which they should receive credit in the form of currency certificates, similar to the labor notes proposed by Owen and Proudhon.

FRITZ KARL MANN

Mann, *Sozialwissenschaftliche Bausteine*, no. 4 (Jena 1932) p. 1-78; Bristol, L. M., *Social Adaptation*, Harvard Economic Studies, vol. xiv (Cambridge, Mass. 1915) p. 123-28.

SCHANZ, GEORG VON (1853-1931), German economist. An offspring of the historical school, Schanz early became interested in economic history; he wrote on the history of journeymen's unions in Germany, on phases of industrial history of Franken (Bavaria) and above all on the development of commercial policy in Tudor England. But he soon turned to public finance and became one of the outstanding fiscal writers in Germany. Two years after his appointment to a professorship at the University of Würzburg in 1882 he founded the *Finanz-Archiv*, the first and for a long time the sole periodical devoted to public finance, and remained its editor until his death. Of his fiscal writings he published in book form only *Die Steuern der Schweiz in ihrer Entwicklung seit Beginn des 10ten Jahrhunderts* (5 vols., Stuttgart

1890), a comprehensive study on the development of taxation, particularly property taxation, in the Swiss cantons in its relation to constitutional change.

The chief interest underlying Schanz' fiscal writings was the development of direct taxation. In a series of studies published in the *Finanz-Archiv* he traced the transition in the German states from impersonal direct taxes, like the yield tax (*Ertragsteuer*), to general personal taxes, like the income tax. He summed up the results of his minute researches in "Der Einkommensbegriff und die Einkommensteuergesetze" (in *Finanz-Archiv*, vol. xiii, 1896, p. 1-87), a stimulating essay in which he proposed not to base the concept of fiscal income, as had hitherto been the case, on individual elements of income traceable to specific sources, but to treat it simply as a net accretion of wealth between two points of time, regardless of the nature and source of the accrued wealth. He pointed to the accountants' practise of ascertaining the annual profits of a business enterprise as the prototype and confirmation of his view. While it is admitted that the adoption of the procedure advocated by Schanz would no doubt eliminate difficulties in some instances, in most cases the complete separation of the fiscal concept of income from the stream of specific elements of income would complicate rather than simplify the determination of fiscal income. The concept in fact was adopted in the German income tax law of 1920 but was soon abandoned. Schanz' other fiscal writings include: "Zur Frage der Überwälzung indirekter Verbrauchssteuern auf Grund des bayerischen Malzaufschlages" (in *Schmollers Jahrbuch*, vol. vi, 1882, p. 563-603), which in combining the theoretical approach with inductive investigation occupies a distinctive place in the literature on the shifting of taxes; the article "Budget" in the *Handwörterbuch der Staatswissenschaften* (vol. iii, 4th ed. 1926, p. 84-118), presenting a combination of his vast historical information and his practical experiences as a member of the Bayerische Reichsratskammer; and, finally, "Zur Frage der Steuerpflicht" (in *Finanz-Archiv*, vol. ix, 1892, p. 365-438), in which he developed the idea of economic allegiance, a most helpful concept in the analysis of the problems involved in inter-local and international double taxation.

SCHAR, JOHANN FRIEDRICH (1846-1924), Swiss educator and cooperative leader. Schar was a pioneer in the teaching of commercial science, principally at the Basel Oberrealschule from 1882 to 1903, at the University of Zurich from 1903 to 1906 and at the newly founded Handelshochschule at Berlin from 1906 until his retirement in 1919. In his educational work and in his numerous treatises and books Schar stressed continually that in order to render the greatest possible public service, instruction in this field should be devoted not to training in profit making but rather in the most rational methods of business operation, whether in cooperative or private enterprise.

In the history of Swiss cooperation among both producers and consumers Schar was of outstanding importance as initiator, director and educator. His activity began in 1875 when he founded and supervised the first cheese marketing cooperative at Bischofszell, where he was then teaching and where the following year he helped in the creation of a consumers' society which is still functioning successfully. During his residence at Basel he held several important offices, including the directorship of the consumers' society, and was one of the organizers and leaders of the Union of Swiss Consumers' Societies founded in 1890 to unite the previously unaffiliated groups. Under his directorship the cooperative wholesale purchasing division of this central body was established in 1892. Schar was instrumental in the formation of the league uniting the agricultural and the industrial consumers' societies and served on the governing council of the International Cooperative Alliance from 1896 to 1908.

C. MUTSCHLER

SCHARLING, HANE WILLIAM (1837-1911), Danish economist. Born into a family of university professors, Scharling was destined from boyhood for an academic career. He studied law and political economy at the University of Copenhagen and after two years of travel in 1869 was appointed professor of political economy at Copenhagen, a position which he retained until his death. Scharling was a prominent member of several important government committees dealing with questions of monetary and social policy. He was elected by the conservatives to membership in the Copen-

hagen County Council (1873-81), was representative in the Folketing from 1876 to 1898 and in 1900-01 served as minister of finance. Although as professor Scharling never succeeded in establishing intimate contact with his students and was by no means a brilliant lecturer, his diligence and uncompromising loyalty to his calling could not fail to impress the succeeding generation of Danish economists. In his many and varied writings painstaking scientific accuracy and eclectic restatement are more apparent than profound thought and creative originality. He was confronted with the task, neglected by his predecessors, of presenting to Danish readers the doctrines of the classical economists at a time when criticism of their methods and results was well under way elsewhere, and it is but natural that his works should have suffered from a sort of dualism. Curiously enough, the liberal ideas seem to have come to Denmark mainly by way of France; Scharling was deeply impressed by the lucidity of Bastiat's *Harmories économiques*, although he did not share Bastiat's narrowminded opposition to all innovation. Personal aptitudes and sympathies turned his interest toward the German historical school, and he was familiar with the work of the Austrians but too conservative to accept their conclusions. Since Scharling recast his main works over and over again, most of them did not appear in print until he was advanced in years. Consequently they show the marks of age in much the same way as do Marshall's later works, and in certain respects they were antiquated at the very date of publication; it is typical that as late as 1900 Scharling undertook a moderate defense of the free banking principle. Scharling's chief interests were the theory of value, exchange and commerce, money and banking and international trade. Of greatest lasting value are perhaps his contributions to V. Falbe-Hansen's *Danmarks Statistik* (5 vols., Copenhagen 1878-87, supplement 1891), a comprehensive description of economic and social conditions in Denmark; notably in the historical parts of this work Scharling reveals remarkable understanding of the phenomena and institutions of the past. Scharling considered as his main political accomplishment the purchase by the government in 1880 of all the private railways then existing in the country. As minister of finance he framed a tax program containing several interesting features, some of which were adopted and carried through by later governments. Although he approved of moderate protection Scharling did not favor the agri-

cultural duties which were being advocated at the time by his party.

SCHECHTER, SOLOMON (1850-1915), Jewish scholar and theologian. Schechter was born in Rumania of a Chassidic family, from whom he derived the mystic strain which characterized much of his later thinking. He went in 1875 to Vienna, where he studied under Isaac Hirsch Weiss and Meir Friedmann, and later to Berlin, where he came in contact with Israel Lewy and Moritz Steinschneider. In 1882 he went to England, where he did intensive work in the field of rabbinic literature; he was appointed reader in rabbinics at the University of Cambridge in 1890.

Schechter's great achievement in the literary field was his discovery in 1896 of a fragment of the original Hebrew text of the book *Ecclesiasticus*, previously known only in Greek translation. In an abandoned synagogue in Cairo he also found a treasure house of old Hebrew and Arabic manuscripts. This discovery has necessitated the rewriting of many a chapter of Jewish history and has contributed to the enrichment of almost every branch of Jewish learning.

In 1902 Schechter came to the United States, where he became president of the reorganized Jewish Theological Seminary of America in New York City. He made the seminary a postgraduate institution, attracted men of renown to its faculty and built up a large library, so that it soon became one of the most important institutions of its kind in the world. In 1911 he organized the United Synagogue of America, a union for promoting traditional Judaism, in which were gradually included most of the modern orthodox and conservative congregations of the country. Schechter's dominant position in contemporary Jewish history must be credited largely to his work in adjusting Jewish beliefs and practices to the contemporary environment.

He repudiated the allegation that he was creating a new party in Jewry, insisting that his intention was primarily to consolidate the forces inherent in traditional Judaism and to make them workable under modern conditions. He was a bitter foe of the reform movement in Judaism and was still more antagonistic to the school of the "higher critics" of the Bible. Despite his efforts, however, there still exists a distinct cleavage between Schechter's disciples, usually designated as conservatives, and the great body of orthodox Jews. This cleavage manifests itself not so much in the form of the liturgy or in the beliefs and observances as in the outer approach and attitude. Schechter's idea of Catholic Israel, a phrase invented by him and widely used, shifts the basis of Judaism from abstract creeds to the concrete practices of the people. The final arbiter of Jewish thought is the cumulative conscience of the Jewish people, a theory which has been carried by some of his modern followers to much greater lengths than he would have approved.

JULIUS H. GREENSTONE

Important works *Studies in Judaism*, 3 vols (Philadelphia 1896-1924), *Some Aspects of Rabbinic Theology* (New York 1909).

SHEEL, HANS VON (1839-1901), German statistician. Von Scheel studied law and economics and in 1867 won a docentship at Halle in economics and statistics with an essay on the economic principles of the *Corpus juris*. From 1871 to 1877 he was full professor at the University of Berne. In this period he published several works on social reform, dealing especially with the theory of the social problem and of property and inheritance laws. As a social reformer von Scheel was one of the most outstanding representatives of that scientific current which in Germany was called socialism of the chair. As an outgrowth of his interest in social reform he also produced while he was at Berne financial studies which dealt with inheritance taxation and progressive taxation. In 1877 von Scheel was called to the German imperial statistical bureau and in 1891 he became its director.

In his statistical work von Scheel was concerned primarily with economic statistics: he

promoted the collection and organization of statistics of foreign trade to an extraordinary degree and exerted a considerable influence on the organization of the vocational and trade census of 1895 and of the population census of 1900. He was the founder of German criminal statistics and played a major role in the imperial commission for labor statistics, which gathered and analyzed material for the enactment of labor legislation and for the study of its effects; these investigations were conducted under von Scheel's personal direction. He looked upon statistics as an essential instrument of administration and only secondarily as an auxiliary of science. Its aim must be to obtain, by means of systematic collection and classification of data, statistical series which will aid the administrative organs in making decisions on the basis of objective knowledge of conditions. The art of the administrative statistician, according to von Scheel, lies in achieving this end with the smallest possible expenditure of labor and money. He advocated the widest possible popularization of statistical studies and in his *Die deutsche Volkswirtschaft am Schlusse des 19. Jahrhunderts* (Berlin 1900) provided a model for such statistical work.

RUDOLF MEERWARTH

SCHELER, MAX (1874-1928), German philosopher and sociologist. With his teacher Eucken, Scheler rejected both intellectualistic transcendentalism and naturalistic psychology as inadequate to interpret personal activity and its spiritual content. In the theory of Brentano and Husserl that certain mental acts intend universal or essential objects as their correlates he saw a more promising approach and became thenceforth a leading participator in the phenomenological movement. It was his particular interest to characterize that large class of emotional-intuitive acts which he believed had essential values of life as their objective correlates. In his studies of sympathy, love and hate he aimed not only to distinguish the main types of these emotions and their respective objects but also to combat solipsistic doctrines of experience by showing that there are vital bases of shared awareness. Scheler's chief work in ethics criticized Kantian formalism and its resultant ab-

stract, equalitarian conception of the worth of every rational being. Instead Scheler proclaimed the worth of personality as a bearer of value syntheses and revived the Catholic-aristocratic idea of a hierarchy of personal worths according to the grade of values predominant in the individual synthesis. The principal grades of value in ascending order Scheler held to be those of sensual gratification (*Gemuss*), organic (*vital*), cultural (*geistig*) and religious (*heilig*) values.

In his ethics Scheler also attributed personality to certain groups, such as the nation, and during the World War he wrote and labored actively as a German propagandist, but not without hope for the wider unity of European culture. His conception of the latter was linked with his adopted Catholicism, which became significantly articulate for a time during and after the war, when he published a quasi-Augustinian characterization of religious consciousness with a transcendent, personal God as its objective correlate. He expressed increasing antipathy toward bourgeois society, capitalism and democracy as inimical to this apprehension of the highest religious values. He associated himself with Prince Rohan, Ortega y Gasset and others who looked to a European and world wide cultural élite rather than to political dictatorships and mass movements to produce a higher type of life.

Scheler's thought on cultural and social questions underwent further transformation in the last years of his life and led to very significant intellectual developments, which unfortunately failed of completion because of his early death. His mental horizon expanded beyond Europeanism and Catholicism. He became interested in the social conditions of higher culture and more especially in the sociology of knowledge (*Wissenssoziologie*). His ideas in this field involved at once a rejection and emendation of Comte's "law of three stages," of historical materialism and of anthropological pluralism. Due regard for the diversity of cultures does not, he claimed, disprove the unity of human nature and its essential values. "Real factors" (e.g. biological, military and economic powers) promote or oppose the actualization of "ideal factors" (imaginative, moral, intellectual, religious values and structures) but do not determine the character and content of the latter. The three main forms of knowledge (religious, philosophical and scientific, or technical) do not succeed each other in a universal, historical progression. Each has its own permanent ground in life. But in par-

ticular cultures a shift in control from blood to political and thence to economic groups involves a shift in preeminence from religious to philosophic and then to technical knowledge. The ultimate grounds of these views were to receive unified theoretic statement in a "philosophical anthropology," of which some portions only were completed.

SHELLING, FRIEDRICH WILHELM JOSEPH (1775-1854), German philosopher. Schelling was born in Württemberg and studied at the University of Tübingen, where Hegel and Holderlin were his schoolmates. From 1798 to 1803 he taught at the University of Jena as Fichte's follower and successor and while there was intimately associated with the group of romanticist authors and artists who sought to make Jena and nearby Weimar a German Athens. In these years Schelling assumed a leading place in the development of German idealism, especially through his speculative philosophy of organic nature. Differences within the romantic school, among the post-Kantian philosophers and in religious circles as well as the cantankerous nature of Schelling himself account for the polemical character of much of his voluminous writing. Particularly his resentment toward Hegel is generally believed to have been responsible for the abrupt cessation in 1815 of Schelling's publications.

Schelling's philosophy was essentially romantic and absolutistic. In his earlier writings he shows clearly the influence of Fichte, both in his emphasis on the determinative function of the "ego" and in his acceptance of the principle of the identity of subject and object in an absolute essence. Individual spirit and objective

nature are regarded as aspects of absolute reality in which both have their being inseparably and are indeed ultimately identical. In his "philosophy of identity" and in his "transcendental idealism" Schelling acknowledges his obligation to Plotinus and the neo-Platonic tradition of intellectual mysticism as well as to Spinoza. The increasing mystical characteristics of Schelling's thought, in which the influence of Jacob Bohme and German antirational theology is discernible, were furthered by Schelling's intimacy with Franz Baader. In Schelling traditional Protestant mysticism emerged for the first time on the elevated plane of official philosophy.

In none of his systematic works is there a developed social theory or philosophy of politics and jurisprudence. These subjects engaged his attention only incidentally. His philosophy of history exemplified the same principles as were manifest in his metaphysical writings. As nature is to be conceived in its organic evolution, so historic institutions are to be viewed organically; as there are definite stages in natural development, so specific stages are to be distinguished in history. There are the Greek, or pagan, stage, in which the infinite is in the finite; the Christian stage, in which the finite is stored up in the infinite; and a third synthetic stage beginning with romanticism, in which the finite gains new importance although the Christian transcendence is preserved in it. Schelling turned away from practical and political activity and evaluated history primarily as offering material for a quasi-mythical revelation of the world of essence. He thus reenforced the traditional Lutheran dualism of freedom in inner devotion combined with outward obedience to the state. In his earlier writings religion, history and politics are submerged in aesthetic intuition; the state is a work of art, statesmanship of poetic genius. Later a more activist note appears in the thought that both God and the sovereign must be persons, because abstractions are inadequate to move the will, whether in religion or in politics. Schelling's thought may be called the philosophy of the Holy Alliance; indeed in 1841 Frederick William IV called Schelling to the University of Berlin to strengthen the religious background of the reaction. At Berlin Schelling still encountered the fierce opposition of the Hegelians and felt that the work of the last half of his long life had made little impression on the world.

JAMES GUTMANN

Works: Sämtliche Werke, 14 vols., ed. by K. A.

Schelling (Stuttgart and Augsburg 1856-61); *Werke*, ed. by M. Schroter, vols. 1-vi (Munich 1927-28), still incomplete; *Schriften zur Gesellschaftsphilosophie*, ed. by M. Schroter (Jena 1926), *Aus Schellings Leben, in Briefen*, ed. by G. L. Plitt, 3 vols. (Leipzig 1869-70).

Bergmann (Heidelberg 1917), Stefansky, G., *Das hellenisch-deutsche Weltbild* (Bonn 1925), Jost, J., F. W. J. von Schelling: *Bibliographie* (Bonn 1927).

SCHIFF, JACOB HENRY (1847-1920), American banker and philanthropist. The son of a Jewish merchant of Frankfurt, Schiff emigrated to the United States in 1865 and engaged in the brokerage business in New York. In 1875 he was invited to become a member of the international banking firm of Kuhn, Loeb and Company, and ten years later he became senior partner; for the next thirty years Schiff was an outstanding figure in the development of American finance capitalism. Because of its connections with other Jewish banking houses in Germany, Holland and England Kuhn, Loeb and Company became a leading agency through which European capital was invested in American railroad enterprises, particularly those of the south. In 1897 Schiff joined his destiny with E. H. Harriman, and the successful reorganization of the Union Pacific Railroad which followed made his firm the chief banking house for American rails. In the struggle with the Hill-Morgan interests for control of the Chicago, Burlington and Quincy and the Northern Pacific Schiff worked closely with the Rockefeller dominated National City Bank and became a director of that institution. Kuhn, Loeb and Company also helped finance the Illinois Central and Southern Pacific (Harriman lines) and the Erie, Baltimore and Ohio, Chesapeake and Ohio and Pennsylvania railroads. With the turn of the century the firm applied itself increasingly to the financing of American industrial corporations and the flotation of foreign government securities in the American money market; one of its signal achievements was the raising of upwards of \$200,000,000 for Japan during the Russo-Japanese War.

As a result of his large benefactions Schiff became the outstanding leader of Jewish communal activities in the United States. He was particularly interested in religious and cultural

institutions and through his gifts made possible the firm establishment of the Jewish Theological Seminary, the Hebrew Union College and many lesser institutes for teachers and young people. He also endowed the Jewish division of the New York Public Library and the Semitic Museum at Harvard; and he helped finance the *Jewish Encyclopaedia* and the Jewish Publication Society. Schiff was consistently an assimilationist—he refused to have anything to do with Zionism because it was a nationalist movement—and he therefore regarded organized charity among Jews largely as a device for Americanizing Jewish immigrants and helping them through the initial stages of adjustment to a new environment.

SCHILLER, JOHANN CHRISTOPH FRIEDRICH (1759–1805), German poet, dramatist, historian and writer on aesthetics. Schiller came of a lower middle class family in Württemberg, and his entire life was marked by a struggle against economic hardship and the threat of tuberculosis. His early storm and stress dramas, such as *Die Räuber* (1781), *Die Verschwörung des Fiesco zu Genua* (1783) and *Kabale und Liebe* (1784), assailed in the spirit of Rousseau the suppression of individual liberty and prejudice among social castes. In Schiller's classical period, when he wrote *Don Carlos* (1787), this revolutionary insistence upon political freedom became tempered into a demand for a purely ideal freedom or freedom of thought.

His historical works, which reflect most clearly the influence of Rousseau, reveal a similar championship of spiritual liberty. In his *Geschichte des Abfalls der vereinigten Niederlande von der spanischen Regierung* (1788) he took sides with the Dutch in their revolt against religious oppression, and in his *Geschichte des dreissigjährigen Krieges* (1793) he hailed Gustavus Adolphus and Protestantism as the defenders of religious and "German" liberty. Schiller brought to his interpretation of historical events a warmth of human sympathy which was in decided contrast to the cold analyses of the humanists or the pragmatic utilization of history by the men of the Enlightenment.

Schiller's classical period reflects the quietistic influences of his friendship with Korner, Hellicnic art, Goethe's calm reserve and the philosophy of Kant. These forces helped to shape

Schiller's attitude toward the French Revolution, which at first he welcomed but later attacked, notably in his *Briefe über die ästhetische Erziehung des Menschen* (1795), because of its violence. Schiller argued that significant social changes are dependent on the existence of individuals who are pure of heart. The development of such moral character is conditioned upon education in aesthetics, for art serves as a link between natural brute force and ethical human freedom. In the last sections of this essay he modified the Kantian ethical approach and held the aesthetic category to be an end instead of only a means. Schiller now envisaged as the ultimate goal "the aesthetic state" wherein the individual pursues the path of righteousness by virtue of his inherent goodness. Beauty, defined as "freedom incarnate," resolves all metaphysical, ethical and social antinomies, and "play" is man's highest activity. Schiller's conviction that aesthetic harmony as the end is posited upon its being also the means (freedom through freedom) lent support to German and English romanticism and, translated into ethics, helped later to influence Dostoevsky. This ethico-aesthetic emphasis was widely received especially during the period after 1848, when the Schiller cult was at its height.

Schiller's appeal to art as a solvent for social ills and his view of it as both a means and an end can best be understood in relation to the feudal Germany of his time. The German middle class, then weak and disorganized, demanded liberation of the spirit. In Schiller the ideal end was saved by being stored away in a Platonic realm. Although Schiller was aristocratic in his personal reactions and although his protracted illness as well as his continued dependence on dukes and state officials had a bearing on his later social philosophy of aesthetic quietism, it is nevertheless true that he waged a determined struggle against social and spiritual oppression and against slavishness. He remained an internationalist throughout, and if it cannot be said that his *Wilhelm Tell* (1804) urges thoroughgoing social change, still it exhales something of the free air for which Schiller's class gasped in vain during his century.

HARRY SLOCHOWER

Works: Sämtliche Werke, ed. by Karl Goedeke, 15 vols (new ed. Leipzig 1885), *Werke*, ed. by L. Beller-mann, 15 vols (2nd ed. Leipzig 1922); *Works*, tr. by N. H. Dole, 5 vols. (Boston 1902).

Consult: Minor, J., *Schiller*, 2 vols. (Berlin 1889–90); Kuhnemann, E., *Schiller* (7th ed. Munich 1927);

SCHIPPEL, MAX (1859-1928), German socialist and publicist. Schippel studied political science at Leipsic, Berlin and Basel. He devoted himself to journalism and in 1886 became a member of the editorial staff of the *Berliner Volksblatt* and the following year editor of the *Berliner Volks-Tribüne*. He was also a regular contributor to Karl Kautsky's review, the *Neue Zeit*, writing on agrarian problems, the economic conditions of the peasants and agricultural workers, problems of colonization and protective tariffs as well as on currency problems in different countries.

Originally a disciple of Rodbertus, Schippel early came under the influence of revolutionary Marxism. He was particularly impressed with Marx' prognosis of the catastrophic collapse of capitalism and at first adopted a skeptical attitude toward those socialists who looked to parliamentary activity as a means of bringing about socialism in a peaceful manner. Continued study of the political and economic processes, however, led him to discard some of his early views; he rejected the socialist thesis of the disappearance of the peasantry and of increasing misery of the proletariat and saw in the trade union movement a powerful factor making for a higher standard of living for the working classes.

In 1890 Schippel was elected to the German Reichstag from the city of Chemnitz. He continued as deputy until 1905, but his frequent disregard of the resolutions of the Social Democratic Reichstag faction prevented him from obtaining a position commensurate with his abilities. His divergent position on a number of issues aroused the indignation and sharp criticism of the socialist press on numerous occasions. When in 1904 he continued to advocate in the press and in public meetings tariff duties on foodstuffs, he was sharply reprimanded at the Social Democratic party congress held in Bremen in that year. As a result Schippel retired from active political life and accepted a position as secretary of the division on social policy of the German trade unions. After the close of the World War he was appointed by the Saxon

government as professor in the Technische Hochschule of Dresden.

HEINRICH CUNOW

Works: Die Währungs-Frage und die Sozialdemokratie (Berlin 1896), *Grundzüge der Handelspolitik* (Berlin 1902, 2nd ed 1902), *Sozial-demokratisches Reichstags-Handbuch: ein Führer durch die Zeit- und Streitfragen der Reichsgesetzgebung* (Berlin 1902), *Zuckerproduktion und Zuckerpremen* (Stuttgart 1903), *Amerika und die Handelsvertragspolitik* (Berlin 1906).

SCHIRMACHER, KÄTHE (1865-1930), German feminist. As a young woman Kathe Schirmacher, whose interests were at first academic, went to Paris to study. There in 1887 she passed the state examination for teachers of French and German. After a year of teaching in England she returned to her native city of Danzig, where she gave instruction in the *Realkurse* for women. In 1893 she had attended as a member of the German delegation the World's Congress of Representative Women held in 1893 in Chicago on the occasion of the Columbian exposition. The delegation returned home with plans for a German federation of women's associations, which was duly formed as the Bund Deutscher Frauenvereine (1894-1933). When the German woman's suffrage association effected its organization in 1902, Kathe Schirmacher was one of the charter members.

The woman's movement was only one of her many interests. She wrote, apparently with equal readiness, on literature, politics and social economy. Among all the older feminists she undoubtedly had the broadest horizon. Her travels took her as far east as Egypt. For almost twenty years she resided in France, and she wrote much of her work in French. She traveled and lectured also in the United States. But the World War seriously affected her international outlook and concentrated her attention on domestic politics. As an East Prussian she was naturally conservative, her liberalism being rather a matter of education. Now her native tendency reasserted itself. Her writings after 1914, among them one advocating the conscription of women in national crises, show a marked turn toward nationalism. As a member of the constitutional assembly at Weimar in 1918-19 she had her share in reconstructing Germany; but, unlike most of the forty-one women elected to that body, she with the two other women representatives of the Nationalist party found herself in opposition to the trend of the times.

HUGH WILEY PUCKETT

SCHLEGEL, KARL WILHELM FRIEDRICH VON (1772-1829) and AUGUST WILHELM VON (1767-1845), German men of letters. The Schlegel brothers are the two most famous figures in the German romantic movement. They not only formulated more thoroughly and systematically the ideas of the romantic school but served more actively to propagate these ideas throughout Germany and the rest of Europe. They were born in Hanover, the sons of a Lutheran pastor August Wilhelm studied at the University of Göttingen, served as a tutor at the home of a merchant in Amsterdam, taught at the University of Jena, was in the service of Madame de Staël, acted as secretary to the crown prince of Sweden during the last years of the Napoleonic wars and from 1818 until his death was professor at the University of Bonn. Friedrich studied law at Göttingen and Leipzig but in 1797 went to Berlin, where he entered the circle of Schleiermacher, Tieck and Dorothea Veit. He traveled and lectured widely, engaged in many journalistic ventures, of which the *Athenäum* (1798-1800) and the *Deutsches Museum* (1812-13) were the most important, and was active in the employ of the Austrian government.

No writer reveals so typically as Friedrich Schlegel the manifold influences which went into the composition of the German romantic movement. The classical tradition of Greece and Rome, the historicism of Herder and the *Sturm und Drang*, the emotional primitivism of Rousseau, the literary currents of Shakespeare, Osian and the English tradition, the philosophic and ethical ideas of Kant and Fichte, the over-

powering effect of Goethe's *Wilhelm Meister*, the mysticism of the Orient, the political conservatism of Burke and the French traditionalists and the feminine influence of Caroline—all these currents combined to fashion the richness of Schlegel's personality as well as its contradictions. No other writer represents so characteristically the wide and divergent strains of German romanticism. From the unbridled individualism and worship of pure aesthetic enjoyment of his *Lucinde* (1799) Schlegel came to feel in his later years the need for a strong ethical feeling of social attachment; an ardent republican democrat and enthusiastic admirer of the French Revolution in his youth, he later became an agent of Metternich in his fight against Napoleon and a leading exponent of political reaction; from a cosmopolitan and citizen of the world he became a passionate German patriot hoping for the restoration of the glories of the mediaeval German empire; and from the antireligious and atheistic unrest of his youth he sought solace and peace in the bosom of the universal Catholic church. At the basis of all these apparent contradictions and transformations was a yearning for some objective force, some all embracing principle which should bring calm and unity to his turbulent spirit. This Schlegel found in a strong Catholic traditionalism which looked back to the Middle Ages for an ideal social order. In his later writings he advocated a corporate organic and authoritarian state based upon Christian principles and dominated by a strong hereditary landowning aristocracy. He attacked the principle of equality and the onset of capitalism and urged a regeneration of agriculture with far reaching state socialism and supervision of the economic organization of the country. His theoretical works on language were important for the elaboration of the theory of the connection between language and racial ancestry, and his researches into the languages and literature of the East stimulated the development of the science of oriental studies.

August Wilhelm Schlegel outlived his brother, but his influence was not as far reaching. His activities were restricted largely to the cultural field. His translations into German of the great literary masterpieces of other nations broke down the narrow provincialism of German culture and made Shakespeare one of the powerful forces in nineteenth century Germany. August Schlegel in turn stimulated interest in the old Germanic literature and traditions, and his lectures on German literature spread the knowl-

edge of Germany throughout Europe. The history of his *Vorlesungen über dramatische Kunst und Literatur* (2 pts. Heidelberg 1809-11, 2nd ed. 3 pts 1817; critical ed by G. V. Amoretti, 2 vols., Leipsic 1923, tr. by John Black, 1 vol., London 1815), which was translated into most European languages, is, in the words of Fritz Strich, the history of European romanticism.

SCHLEIERMACHER, FRIEDRICH ERNST DANIEL (1768-1834), German philosopher. Schleiermacher was born in Breslau. He was a pupil at the Moravian schools of Niesky and Barby and studied theology and philosophy at the University of Halle. In 1796 he went as preacher to Berlin, where he came into contact with the leading figures of the romantic movement. In 1804 he went to Halle but returned to Berlin in 1807 to occupy the pulpit at the Dreifaltigkeitskirche and a professorship at the University of Berlin. During the period of Napoleonic rule and the War of Liberation he was extremely active in arousing and maintaining Prussian patriotic enthusiasm.

Schleiermacher sought to establish the science of the state on an empirical basis. By this he understood, however, not a mere generalizing of empirical facts but rather a consideration of the historically developed human societies and their explanation in terms of the fundamental psychic functions of human consciousness. He thus aimed to unite empirical with speculative

elements. Just as he rejected every abstract, normative and formalistic construction in ethics on the ground that it passes over the individual and neglects the actual dynamic force of moral behavior, so he also repudiated any sort of "metaphysical politics," in the sense employed by Plato and Fichte, which undertook to regulate all political activity by categorical imperatives.

Like his general philosophy Schleiermacher's political philosophy is oriented around the problem of the individual. His great advance over the abstract idealism of Fichte is the recognition of individuality as the most important criterion of evaluation of all spiritual and intellectual life. He at the same time recognized, however, that the problem of individuality also involves the social factor as its complement and that the individual and the community represent a polar principle of life which is indissoluble. Community without individuality is reduced to a mere schema, just as individuality without social communication bears the stamp of an unmoral character. In this way the principle of individuality became for Schleiermacher a social principle which permeates all forms of society as a sort of "greater individuality." His political philosophy therefore involved the concepts of organism and personality. The basis of the state is the "common peculiarities" of all active individuals and their combination into a higher unity characterized by national customs, national education and national character. The state, like the individual, possesses an inner and outer nature. Its inner character is expressed in the relatively permanent national peculiarities manifested in its process of development. Its outer physiognomy is revealed in the community of language and the relation to a territory.

Schleiermacher's educational theories were most profoundly determined by the activism which dominated his entire philosophic system. The essential character of spirit is conditioned by two functions, reception and creative activities (receptivity and spontaneity). The soul is active also in the receptive process. Individual character is determined by the various relations between the two functions. If the development of the individual is identical with the unfolding of his self-activity, this activity is moral only when it results in interconnection and reciprocal influences with society. The object of education is therefore to bring individuality to its highest development and at the same time to regulate the relations of the individual to the whole

community by the stimulation of his social instinct.

RUDOLF ODEBRECHT

Works. Sämtliche Werke, 30 vols. (Berlin 1835-64); *Werke*, ed. by Otto Braun and D. J. Bauer, 4 vols. (Leipzig 1910-13), *Monologen* (Berlin 1800, new ed. by F. M. Schiele, Leipzig 1914), tr. with introduction by H. L. Friess as *Soliloquies* (Chicago 1926), *Der christliche Glaube*, 2 vols. (Berlin 1821-22), tr. by H. Mackintosh and J. Stewart (Edinburgh 1928)

Consult. Dilthey, W., *Leben Schleiermachers* (new ed. by H. Mulert, Berlin 1922), Mulert, H., *Schleiermacher* (Tubingen 1918), Gundolf, F., *Romantiker* (Berlin 1930), Holstein, G., *Die Staatsphilosophie Schleiermachers*, Bonner staatswissenschaftliche Untersuchungen, vol. VIII (Bonn 1923), Musebeck, E., *Schleiermacher in der Geschichte der Staatsidee und des Nationalbewusstseins* (Berlin 1927), Strobel, Anton, *Die Pädagogik Schleiermachers und Rousseaus* (Munich 1928), Natorp, P., and others, *Schleiermacher, der Philosoph des Glaubens* (Berlin 1910), Pinson, K. S., *Pietism as a Factor in the Rise of German Nationalism* (New York 1934).

SCHLESINGER, BENJAMIN (1876-1932), American Jewish labor leader. The son of a Russian Jewish rabbi, Schlesinger came to the United States in 1891 and entered a cloak factory in Chicago. He immediately became active as an organizer, served as treasurer (1892-93) of the short lived national union of cloak makers and in 1900 helped to found the International Ladies' Garment Workers' Union. He became president of the union in 1903 but was defeated the following year by the antisocialist native born groups representing the skilled crafts. When he regained the presidency in 1914, the now predominant Socialist element had built up a militant organization as a result of a series of remarkable strikes against the sweat shop. His dramatic temperament and his experience as manager (1907-12) of the Jewish Socialist daily, the *Forward*, provided him with a keen sense of the issues which would appeal not only to the union membership but to the liberal public. Schlesinger, who had always stressed the need for the education of trade unionists, took over for the international union the pioneer experiments in labor education and recreation inaugurated by the dress-makers, encouraged the founding of a Union Health Centre and headed a Needle Trades Alliance, including unions outside the American Federation of Labor. Under his leadership the union played an important role in the Socialist movement and was the outstanding representative in the A. F. of L. of the "new unionism." In the years of wartime prosperity the union membership included an amazingly high proportion

of the workers in the industry whose wage scales and hour standards were well ahead of those in most organized industries. When subsequently these gains were threatened by the depression and by the internal strife between Communist and non-Communist elements, Schlesinger's always uncertain health began to fail and he resigned his office in 1923. He returned as vice president in 1928 and the following year, upon the resignation of Morris Sigman, assumed the presidency, which he held until his death.

ELSIE GLUCK

SCHLETTWEIN, JOHANN AUGUST (1731-1802), German physiocrat. Schlettwein is known to have subscribed to cameralist views in his early career; later, however, he came under the influence of the physiocrats and in time became the leading exponent of physiocracy in Germany. While adopting the economic theories of Quesnay, like all German physiocrats he went beyond the original French physiocratic principles in bringing into sharper relief the moral-philosophical basis of the doctrine. Influenced especially by the views of the Scotch moral philosophers with their emphasis upon the altruistic instinct of men and professing the theory of the perfectibility of mankind as expounded by the philosophers of the German Enlightenment, Schlettwein saw in the physiocratic principles of natural rights, laissez faire and cosmopolitanism the surest means of achieving universal happiness for mankind—the supreme goal of all individual and social effort. In the spirit of German rationalism he believed in the power of reason and developed a theory of "rational" conduct according to which man has a right not only to strive for the minimum of existence to which he can lay claim by virtue of his "natural rights" but also to reach out for as large a share of worldly goods and opportunities as he can possibly utilize, provided he contributes thereby to the general elevation of mankind. For this task of raising mankind to higher levels of civilization Schlettwein wished not only to mobilize educational and cultural institutions, such as schools and churches, but to transform the whole *Polizeiwissenschaft*, a discipline corresponding to political science in modern times, into a preceptorial system to teach the "science of happiness." He believed, however, that any effective application of such educational

effort must be preceded by the introduction of political and economic reforms along physiocratic principles, especially through the establishment of freedom of enterprise and through the removal of all trade barriers, which alone would increase the supply of goods and thus provide the material basis for individual and social progress.

Schlettwein's name is linked with the sole attempt at carrying out the physiocratic principles. Acting on behalf of Margrave Friedrich of Baden he endeavored to introduce the single tax in several villages in order to improve their economic status and stem the process of depopulation. The net income was calculated by the arbitrary deduction of operating costs and interest charges from gross income. The experiment failed because it was found impossible to calculate net income, a concept having meaning only in a mature money economy, under the feudal conditions which still prevailed in that area.

LOUISE SOMMER

Consult: Krebs, A., *Schlettwein der deutsche Hauptphysiokrat* (Leipzig 1909), and "Schlettwein und die physiokratische Versuche in Baden" in *Zeitschrift für die Geschichte des Oberrheins*, n.s., vol. xxiv (1909) 601-27; Sivers, F. von, "Johann Georg Schlosser und Schlettwein" in *Jahrbücher für Nationalökonomie und Statistik*, vol. xxiv (1875) 1-15; Roscher, Wilhelm, *Geschichte der Nationalökonomik in Deutschland* (Munich 1874) p. 488-92.

SCHLOSS, DAVID FREDERICK (1850-1912), English economist and government official. Educated at Manchester Grammar School and Corpus Christi College, Oxford, Schloss was called to the bar in 1875. He took an active part in efforts to improve social and industrial conditions of the poor in London, particularly among the Jews. As a consequence of his study of sweated labor he supported and promoted trade unionism with the object of increasing the bargaining power of the workers, especially women, in sweated trades, and in 1881 he became treasurer of the East London Tailoresses' Union. His interest in raising standards of living led him to make a detailed study of methods of remuneration, and he is best known for his work in this field, notably for his book on *Methods of Industrial Remuneration* (London 1892, 3rd rev. ed. 1898). From 1893 onward he took an active part in the work of the newly formed Labour Department of the Board of Trade, of which he was appointed a permanent investigator in 1899; in 1907 he became director of the first Census of

Production, although ill health prevented him from completing the census. Among valuable reports which he prepared for the Board of Trade that on conditions of immigration into the United States, which he had visited in 1893, deserves special mention; other official reports dealt with profit sharing, collective bargaining and copartnership. Schloss also wrote *Insurance against Unemployment* (London 1909) when national legislation on this subject was imminent. His interest in the problem of unemployment led to his appointment as one of the British commissioners to the International Congress on Unemployment held at Paris in 1910.

J. H. RICHARDSON

SCHLOSSER, FRIEDRICH CHRISTOPH (1776-1861), German historian. Schlosser studied theology at the University of Göttingen and was a candidate for the ministry. His universality of interests and his striving for encyclopaedic knowledge led him, however, to devote himself to history. In 1812 he was appointed to the chair of history at the Frankfurt Lyceum and in 1817 he became professor of history at the University of Heidelberg.

Schlosser was a product of the German Enlightenment. His historical writing was greatly influenced by his study of Voltaire and his general thought by the moral philosophy of Kant and Rousseau. In all his numerous historical works, which covered the wide range of universal history, he exhibited a characteristic didactic and moralistic tendency. He considered it the task of the historian to act as a judge of the events and personalities of history and to elevate his readers to a more noble conception of life through ideal models from history. Schlosser was a decided opponent of the newer critical tendencies in historical writing developed by Niebuhr and Ranke. He attacked the premise of a science of history free from preconceptions and declared that every reader as well as every author brings to the consideration of historical problems his own philosophic and political ideas and systems.

One of the last German universal historians, Schlosser was favorably disposed to the cosmopolitan, liberal and democratic currents of his time. He did not restrict himself merely to the history of wars and princes but devoted some attention also to the lower classes. His work is significant moreover as one of the first attempts

to correlate literary currents with general political and social history. These characteristics had more far reaching influence than the pedantic and moral stringency which made his work so attractive to the German bourgeoisie. He founded no historical school, however, and of his famous pupils only Gervinus may be said to have carried on some of Schlosser's traditions.

HEDWIG HINTZE

Works: Abälard und Dulcin (Gotha 1807); *Leben des Theodor de Beza und des Peter Martyr Vermilt* (Heidelberg 1809); *Geschichte der bildersturmenden Kaiser des oströmischen Reichs* (Frankfurt 1812); *Weltgeschichte in zusammenhängender Erzählung*, 7 vols (Heidelberg 1815-41); *Universalhistorische Übersicht der Geschichte der alten Welt und ihrer Kultur*, 9 vols. (Frankfurt 1826-34); *Geschichte des 18ten Jahrhunderts und des 19ten bis zum Sturze des französischen Kaiserreichs*, 9 vols. (Heidelberg 1836-49, 5th ed. 1864-66), tr. by D. Davidson, 8 vols (London 1843-52); *Zur Beurteilung Napoleons* (Frankfurt 1835); *Dante* (Leipzig 1855); *Weltgeschichte für das deutsche Volk*, 18 vols. (Frankfurt 1844-56, 5th ed. by O Jäger and F Wolff, 20 vols., Stuttgart 1901-04).

SCHLÖZER, AUGUST LUDWIG VON (1735-1809), German historian, statistician and publicist. Schlozer studied theology at the University of Wittenberg. In 1755 he went to Stockholm and later to Uppsala; while in Sweden he worked as a tutor, wrote on Swedish history and began his journalistic career as the correspondent of the *Postreuter* in Altona. After a brief period of studies at the University of Göttingen he went to Russia in 1761; here he became attached to the Russian Academy of Sciences and was appointed professor of Russian history. In 1769 he was named professor at the University of Göttingen, teaching history and later, as Achenwall's successor, statistics, jurisprudence, politics and journalism. Except for several prolonged leaves of absence for purposes of travel he remained in Göttingen until his death.

Schlözer is one of the most interesting personalities of the period of the Enlightenment. His researches in early Russian history and its sources laid the foundations for Russian historiography, and his emphasis on the cultural unity of Slavs exerted considerable influence on the

pan-Slavist movement. He was perhaps the first to emphasize the demand for a universal history; advancing beyond the traditional method whereby history was regarded as a succession of kings and rulers, he insisted on the treatment of cultural factors and their interrelations in historical development. As a statistician he was essentially a follower of Achenwall, but he progressed beyond his master by pointing out the possibilities and importance of gathering statistics of the past and by placing greater stress upon statistical data pertaining to economic and social welfare. He defined history as statistics in motion; and statistics as history at a standstill. As an economist he leaned heavily on mercantilist doctrines, although he did not subscribe to the emphasis upon large populations. He rejected the theory of divine rights of kings but favored monarchy; the state he regarded as a man made institution designed to promote universal welfare. Finally, as publisher of the *Briefwechsel meist statistischen Inhalts* (Göttingen 1775), of the *Briefwechsel meist historischen und politischen Inhalts* (10 vols., Göttingen 1776-82) and of *Staats-Anzeigen* (18 vols., Göttingen 1782-93), Schlozer was one of the pioneers of German journalism and an outstanding champion of the freedom of the press. Indeed his contribution to the formation of public opinion in Germany may be considered his most important single achievement.

SCHMIDT, AUGUSTE (1833-1902), German feminist. After an educational preparation which was thorough for a girl of her time Auguste Schmidt became a teacher, for a time in her native Breslau, then in Leipzig. In the latter city she attained distinction as director of a girls' school. Here she joined with Luise Otto-Peters in founding in 1865 the Allgemeiner Deutscher Frauenverein, the first feminist organization in Germany. These two pioneers also initiated in 1866 the publication of *Neue Bahnen*, for many years the leading journal of feminism. In 1890 Auguste Schmidt was again cofounder, this time with Helene Lange, of a very effective organization, the Allgemeiner Deutscher Lehrerinnenverein.

Auguste Schmidt was the first of the German feminists to use the rostrum to further the woman's movement. During the early years when public meetings were the chief means of feminist propaganda, her oratorical talent was much in demand. Because of her ability as a speaker she became for the time the key figure of feminism, maintaining for more than a generation her position as the outstanding platform representative of the movement.

Like the other German feminists of her generation, Auguste Schmidt did not agitate for the vote. Her interest in politics went only so far as the hope of effecting, by persuasion and petition, legislation directed toward a better social status for women. With Luise Otto-Peters she held that woman's position in society could be improved only if she became economically independent, and together they set up and defended the principle that women of the middle class be given work. Perceiving that better education was a prerequisite, they strove to secure proper secondary schooling for women so that they might qualify for professional training. It was in fact this aspect that first attracted her as a teacher to feminism and led her eventually to join forces with that valiant educator Helene Lange.

HUGH WILEY PUCKETT

Important works: *Aus schwerer Zeit. Erzählungen für Jung und Alt* (Leipzig 1895, 2nd ed. 1902); *Louise Otto Peters* (in collaboration with Hugo Rösch, Leipzig 1898); *Veilchen. Novellenstrauß* (Leipzig 1868).

rinnen der deutschen Frauenbewegung (5th ed. Leipzig 1907) p. 27-35, Schmidt-Gosrau, Martha, *Auguste Schmidt* (Leipzig 1933).

SCHMIDT, JOHANN KASPAR. *See* STIRNER, MAX.

SCHMOLLER, GUSTAV VON (1838-1917), German economist Schmoller was the leader of the "younger" historical school. As professor of political science in Halle from 1864, in the newly established University of Strasbourg from 1872 and in the University of Berlin from 1882 he was the preceptor and prototype of many generations of students and administrative officials. He organized scientific studies, such as the volumes of the Verein für Sozialpolitik und *Staats- und sozialwissenschaftliche Forschungen*, edited the *Jahrbuch für Gesetzgebung, Verwaltung und Volkswirtschaft im Deutschen Reich* in 1880 and supervised the publication of the *Acta borussica* and the *Forschungen zur brandenburgischen und preussischen Geschichte*.

Originally a student of the English school of classical economics and of the older German historical school, particularly of Roscher, Schmoller early sought to cultivate the inductive method of the accumulation of historical and descriptive factual material and to develop the science of economics into a social science by bringing it into close interrelation with psychology, ethics, history, political science and sociology. Under the influence of the idealistic German philosophy, the "ethical pathos" of Fichte and Schiller, he conceived of political economy as a normative science of society (*Gesellschaftswissenschaft*) which should study the relations not only between man and material goods but also between man and his fellows. The economic order was to be regarded as only one aspect and integral part of the entire social life and as such was to be evaluated from an ethical point of view. The aim of social scientific studies was for Schmoller the causal and systematic explanation of social phenomena. Theory, however, required particularly a historical foundation, to be supplied by the collection and evaluation of empirical and historical facts; on the basis of such knowledge it could exert an increasing influence on the future course of events.

"Justice in the economic system" was to be realized through a paternalistic policy of social reform furthered by the state and all social groups. In his first study, in 1864, Schmoller already turned against the individualistic consideration of economic phenomena which looked

upon labor merely as a means of production exposed to exploitation. The labor problem, the existence of which was questioned by the "harmony dogma" dominating public opinion at the time, is an ethical as well as an economic problem. If the modern age is to avoid the ruin which terminated earlier epochs as a result of class conflicts, then egotism must be combated and the lower classes must be given an increasing share of cultural benefits. Since economic development can be directed by man, such a solution is possible. There are, to be sure, systematic laws of economic life; but they are not natural laws and there is no constant and normal form of economic organization transcending space and time. The idea that besides natural-technical factors there are above all psychological and ethical causes which determine the progressive advance of the economic order Schmoller developed notably in his famous polemic with the historian Heinrich von Treitschke, *Über einige Grundfragen des Rechts und der Volkswirtschaft* (Jena 1875; first published in *Jahrbuch für Nationalökonomie und Statistik*, vols xxii-xxiv, 1874-75), in which he presented the basic demand of a more equitable distribution of income as the guiding principle of social reform. Social science was to illuminate the path and provide the guide for the attainment of the objectives of social policy. This was the goal of the Verein für Sozialpolitik founded in 1872 by Wagner, Schmoller and others and directed by Schmoller from 1890.

In order to provide an empirical basis for economic theory Schmoller and his pupils initiated numerous historical studies. While Schmoller, at least in the later period, did not deny the necessity of deduction, he preferred the inductive method, believing that out of the empirical investigation of the manifold variety of events there would arise the general and typical science of economics which would supply the concrete basis for national policy. Schmoller's own studies in economic history include: *Zur Geschichte der deutschen Klein-gewerbe im 19. Jahrhundert* (Halle 1870); the studies on the guild and municipal organizations of Strasbourg; the studies on Prussian constitutional, administrative and financial history; and the collection *Zur Sozial- und Gewerbepolitik der Gegenwart* (Leipzig 1890). While their over-emphasis on historical research led the adherents of the historical school to neglect theoretical work in Germany, the model historical monographs contributed by Schmoller and his

followers added greatly to the knowledge of economic history.

Schmoller's opponents are not justified in accusing him at once of relativism, historicism and dogmatism, although in his work there may frequently be noted a substitution of teleological values for empirical explanation of cause. It should be borne in mind that the ethical value judgments and political demands raised in the name of science are not the products of science. Furthermore Schmoller did not take into account the distinction set up by Windelband and Rickert between the monothetic principle which set out to state the general and the ideographic principle designed to depict the unique. The deductive psychological theorists, particularly of the Vienna school, called attention to the fact that the accumulation of facts was insufficient. Schmoller himself, however, was free from this onesidedness, although he often lacked systematic and theoretical precision. Max Weber, his superior in matters of theory, remarked the fact that the increased attention later devoted to economic theory would have been impossible without Schmoller's historical work.

SCHNEIDER, JOSEPH-EUGÈNE (1805-75), French industrialist. In 1836 Schneider bought the old but not very successful Creusot iron-works and developed them into what is still the largest metallurgical establishment in France. He foresaw that railroads and steamships would provide large markets for materials and immediately set up new plants and kept abreast of technical advances. By 1850 Schneider and Cie

was an integrated enterprise, manufacturing among other products rails, locomotives, steam engines and munitions. Its resources were revealed during the Crimean War, when Schneider was able to supply all the material needs of the French fleet. When in 1860 an Anglo-French commercial treaty established free trade between the two countries, Schneider reorganized his plants to meet the new competition; he was successful not only in this but also in invading the English market for locomotives and other products. Not the least important factor in Schneider's advance, in view of the close relations between government, munitions and the steel industry, was his political activity. He entered politics in 1845, served as minister of commerce in 1851, accepted the coup d'état of Louis Napoleon and was president of the Corps Législatif until the emperor's downfall in 1870. The Franco-Prussian War revealed that in the manufacture of munitions Krupp had outstripped Schneider.

Schneider introduced welfare work among his employees, including company houses, a savings bank and a primary school before the compulsory education law. In addition to its present dominance over the French iron and steel industry Schneider et Cie is closely allied with several of the great banks and has large interests in many other European countries.

SCHOLASTICISM. Since the Renaissance the term scholasticism has been restricted to the philosophic and theological systems of the Middle Ages. During the fifteenth century it was applied only to the movements of ideas originating in Europe, but more recently it has been extended to include other mediaeval philosophies and theologies—Jewish, Arab, Moslem, Hindu. Scholasticism as thus viewed is a phenomenon which appears at a particular stage of civilization when philosophy and theology are subjected to very rigorous systematization and logical exposition. From the point of view of internal order and clarity the theological and philosophical *summae* of the thirteenth century are models of their kind. Technical systematization, effected chiefly under the influence of Aristotle's *Logic* and *Metaphysics*, was developed not only in the West but also among the

mediaeval Arabs of Bagdad and Cordova and among the Jews who lived under the enlightened rule of the Arabs. The rediscovery of the Aristotelian treatises produced the same effects everywhere. It was Aristotle who taught the neo-Latins, the Anglo-Celts and the Teutons how to discipline their thought. The present article, however, will be concerned chiefly with the scholasticism of the West.

For most historians the scholastic character of mediaeval philosophy is found in the subordination of philosophy to theology; this was characteristic of the mediaeval philosophies of western Christendom and of the Jews but was less marked among certain Arabic philosophers who assumed a freer attitude toward the Koran. Although the subordination of philosophy to Christian theology was real, it was nevertheless subject to very precise limits and did not hinder scholastic philosophy from developing a rational explanation of reality.

Before the ninth century philosophic writers, among whom Boethius was the most important, were merely continuing the traditions of Greece and Rome. In the ninth century there first appeared those authors who, even though they still remained under the influence of the ancients, were touched by the new mentality of the Celtic and Germanic peoples. The first and most distinguished of these was John Scotus Erigena (c. 800–877), author of *De divisione naturae*, a presentation of strong neo-Platonism accommodated to the doctrines of Catholicism. Scotus' fundamental principle is that there exists only one being that deserves entirely this name. It is God. All other beings are related to Him, as shadows to light, and hence are called *non entia*. Notwithstanding the ambiguous terminology which he uses, recent historians rightly refuse to consider Scotus a pantheistic monist. But his contemporaries and followers looked upon his system as integral monism, and this explains the opposition and condemnation to which he was subject.

From the ninth century on there was little preoccupation with the synthesis of Scotus. All attention was concentrated on the problems of logic posed in Porphyry's *Isagoge* and Aristotle's *Logic*. These texts occasioned the famous quarrel concerning universals and the extent to which universal notions corresponded to reality. After 1141, when Aristotle's other treatises became known, the discussions acquired greater scope and the scholastics occupied themselves not only with logic but also with metaphysics

and psychology. The protracted contests concerning universals throughout the tenth, eleventh and twelfth centuries were gradually brought to a moderate solution in the formulations of Abélard. This solution proclaimed that only individual beings are endowed with existence (*nihil est praeter individuum*) and that abstract notions are true but not adequate to embrace the individual. Abélard's formulae, taken up universally in the thirteenth century, were of considerable significance in that they proclaimed the pluralism of reality in metaphysics and intellectualism in psychology. They appeared at a time when feudal customs, chivalry and the growing bourgeois spirit were extolling the value of the individual and they were in perfect harmony with Christian morality, which recognizes the personality of each human being. Another form of pluralism was developed by Anselm of Canterbury at the end of the eleventh century in his doctrine that God, the Supreme Being, is transcendent to and in substance distinct from the created world. The name of Anselm has become associated also with the celebrated demonstration of the existence of God based on man's idea of a perfect infinite Being. The individualistic and pluralistic tendencies which invested each human being with distinct and autonomous individuality were embraced by the great majority of scholastics; this explains the cool reception accorded to monistic and pantheistic solutions.

Several essays in political philosophy also survive from this period. The most important of these is the *Policraticus* of John of Salisbury. Following Augustine, John made an ideal table of the qualities which a ruler should have; and although he did not speak of a pact between king and people, he did hold that the people were empowered to depose an unworthy ruler. Although dogmatic theology and canon law did not proceed directly from these philosophic currents, it is important to note the systematic works of the twelfth century, such as those of Peter Lombard in theology and of Gratian in canon law.

The thirteenth century was the golden age of scholasticism. The prodigious development of philosophy had its stimulus in the creation of the universities of Paris and Oxford, in the rise of the mendicant orders and above all in the introduction into the West, through Greek-Latin, Arabic-Latin and Hebrew-Latin translations, of the great treatises of Aristotle, which were unknown during the first period, the works of

Proclus and those of Avicenna, Averroes, Avicbron and other masters of Arabic philosophy. The philosophic works of Avicenna, Averroes and Avicbron, inspired as they were by Aristotelianism, helped to insure the uncontested domination of Aristotle in mediaeval thought.

The culmination of mediaeval scholasticism was reached in the great philosophical syntheses of Albertus Magnus (*q.v.*) and Thomas Aquinas (*q.v.*). Aquinas fashioned Aristotelianism into a grandiose philosophic synthesis marked by balance and doctrinal solidarity. The independence of philosophy is here fully recognized and metaphysics is accorded first place. In this metaphysics, which proceeds from the pluralism of Abélard, the central theory is that of act and potency, or that of "being determined and being determinable." Individualism determines morality: every man has his end; he seeks his well being, which can be found only in the full development of his personality and formally in the expansion of his superior faculties of knowing and willing. The greatest of the theologians, Thomas Aquinas, gave to Christian dogmatics its rigorous systematization. He was interested in more than apologetics, for he showed that philosophy is adapted to the teaching of dogma. He held that there is a perfect equilibrium and a remarkable accord between reason and faith, philosophy and theology. Reason cannot contradict faith, for truth cannot reverse truth and the suprarational is not antirational.

This individualism is revealed also in the political and social ethics which are fully developed in such treatises as the *De regimine principum*. Since the group has no other *raison d'être* than to aid individuals in realizing their ends, it follows that the state exists for the good of its members and not vice versa. The state is made up of the combination of individuals. The people therefore are the depositories of sovereignty, which is divine in its origin; but they delegate this sovereignty most often but not necessarily to a prince who is to govern for the common material and spiritual welfare, and who may be deposed if he fails in his task. In the thirteenth century the citizens, because of insufficient organization, were unable to defend themselves against the failings of the kings. Papal intervention in domestic and foreign affairs was based in principle on the idea of popular guardianship which these circumstances made necessary.

Besides Thomas Aquinas there were a score of other noted personalities: Henri de Gand, Godefroid de Fontaines, Richard de Middleton

and above all Duns Scotus, who created a scholastic Aristotelianism *sui generis*.

A general view of the philosophy of the thirteenth century must take account of an important set of doctrines which were accepted by the great majority of thinkers through a sort of implicit accord. These include the distinction between philosophy and theology, compulsory subordination of the former to the latter, the pluralism of substantial beings, the ideas of actuality and potentiality and matter and form, the transcendence of an individual God, the distinction between sensation and thought and the dominance of the abstract notion. These doctrines form a *sententia communis*, or common philosophic heritage, in harmony with the basic tendencies of an age which affirmed its need of unity, uniformity and internationalism in all domains and which under the omnipotent direction of the Catholic church accepted one faith and practised one religion.

In the world of philosophy the outstanding event of the fourteenth century was the emergence of new trends in scholasticism in the form of nominalism, or terminism, called *via moderna* in opposition to *via antiqua* (Thomism and Scottism) Stemming from Thomas Aquinas and Duns Scotus these systems, despite the fact that they were hailed by large groups, were not able to rival the nominalism inaugurated by Durand of Saint-Pourçain and developed by William of Ockham (*q v*). They were extreme in emphasizing the real value of individual beings. William of Ockham shook off completely the scholastic metaphysics and paved the way for idealism. If abstract notions do not attain reality, then the notions of moral law, of obligation, of virtue, have no further bearing on real conduct and morality ceases to be rational. If the principle of causality is reduced to a fiction, it cannot serve to reach God. The existence and attributes of God are thus matters of faith and not of reason. The links between theology and philosophy have been severed, and philosophy can no longer render any service to theology. With William of Ockham the doctrinal heritage built up during the thirteenth and fourteenth centuries begins to be dissipated.

The political, religious and social events of the fourteenth century, which included the insurrection of the Germanic emperors and kings against the papacy, the rise of national sentiment and the Great Schism, provided an impetus for vigorous discussion concerning the organization of state and church. New political and religious

ideas began to be circulated. They did not overthrow the principles of the thirteenth century as crystallized in the works of Thomas Aquinas, but they did offer new and daring applications of these principles. Thus emancipation from papal tutelage was justified by the new situation. For the sovereign people, becoming aware of their prerogatives in each state, no longer needed the protection of the papacy against the royal abuse of authority. It was held that the pope had no right to participate in international affairs and defenders of empire definitely broke with the thirteenth century notion, expressed notably by Dante, of an entente of the two supermonarchs, spiritual and temporal. The thesis of the national monarchy and royal rights advanced by the jurists and the discussions occasioned by the Great Schism were all developments of the Thomist theory of the state. For just as sovereignty in the state was held to rest with the people, so the faithful and not the pope were regarded as the sovereign power in the church. The fact that none of the agitators of the fourteenth century denied the moral character of sovereignty and the necessity for rulers to care for the spiritual needs of their citizens indicates that the nationalist doctrines of the fourteenth century were mediaeval still in spirit. The same approach is revealed in the social doctrines of Antonino of Florence, who was inspired by the new economic developments, particularly the rise of Italian commerce.

Other movements of ideas apart from nominalism helped to weaken the scholastic tradition. The most important of these was Averroism, which made some progress in Italy. Speculative mysticism, either in the individualist expression of Tauler, Suso, Ruysbroeck and Gerson or in the pantheism of Blomhardine, engendered vast movements of ideas which tended to divert attention from the controversies of the schools, focusing all interest on the direct relation of the soul with God and paving the way for the rupture of Protestantism with the ecclesiastical hierarchy.

For a variety of reasons scholasticism became discredited in the Renaissance of the fifteenth and the Reformation of the sixteenth century as well as in the period of the great astronomical and physical discoveries of the sixteenth and seventeenth centuries. The Renaissance philosophers, notably the humanists, turned against the barbaric language and subtleties to which William of Ockham's nominalism had given rise. Inspired by various manifestations of national-

ism, there emerged a new public law opposed to the mediaeval conceptions. Machiavelli extolled the humanist theory of the state while disregarding the spiritual welfare of the citizens. Thomas More and Grotius proclaimed the religious indifference of the state and advocated the toleration of all religions. The new Protestantism broke with scholasticism in the sense that individual interpretation of dogma and Scripture was brought into harmony with philosophies totally different from scholasticism, such as neo-Platonism, stoicism or pantheism. It was in Protestant centers that the theory of the divine right of kings first took shape. This theory was irreconcilable with the mediaeval theory of the delegation of power from the people to the king. As for the men of science, they heaped ridicule on the scholastics and the Aristotelians, who despite all the new discoveries still sought to preserve the false conception of the universe as formulated by Aristotle and accepted for many centuries.

Either through ignorance or through weakness the scholastics did not defend themselves against the assaults of their adversaries. Not only were they unaware that their metaphysics was a thing apart from Aristotelian physics or astronomy, but they neglected to acquaint themselves with the philosophy of their opponents so that they could meet them in discussion. Furthermore, with the exception of some brilliant neoscholastics in Italy and Spain, they became increasingly ignorant of their own philosophy. Void of metaphysics nominalism, or terminism, disappeared forever. On the other hand, Thomism and Scotism, which retained very many doctrinal reserves, were never abandoned. During the seventeenth and eighteenth centuries they led a desultory existence in ecclesiastical circles, awaiting the day when they should once more come into their own.

The renaissance of scholasticism came about in the nineteenth century. It received a vigorous impetus in Catholic countries when Leo XIII in his famous encyclical *Aeterni Patris* recommended the study of Thomism and traced the outlines for a neoscholasticism. The words of the pope did not create the movement, they merely accelerated it. If scholasticism had not preserved some values, it could not have been a *philosophia perennis*. Two factors assured its success. On the one hand, while it remained faithful to the old spirit of scholastic Aristotelianism, which was always a philosophy of facts, it accepted as its foundation the observations of the new natural

and social sciences. On the other hand, it was alert in following the contemporary systems in its attempt to keep up with them and to show that it did not hesitate to place its own solutions alongside those of its antagonists—Kantianism, positivism, neorealism, idealism. The University of Louvain became one of the principal centers of neoscholasticism and Cardinal Mercier its guiding spirit. Other groups were formed in Paris, Rome, Fribourg, Bonn, Munich and in the New World.

SCHONBERG, GUSTAV FRIEDRICH VON (1839-1908), German economist. Schonberg belonged to the "younger" historical school of economics, which under the leadership of Gustav Schmoller (*q v*) combined historical investigation with the treatment of concrete economic problems, emphasizing especially problems of social policy. Schonberg saw the goal of all scientific endeavor in social reform, which, as indicated in his *Die sittlich-religiöse Bedeutung der sozialen Frage* (Stuttgart 1876), he conceived not merely as an economic but as an ethico-religious problem whose solution constitutes the chief task of the state. In his *Arbeitsämter: eine Aufgabe des Deutschen Reichs* (Berlin 1871), for instance, he argued that the complex of relations between employer and employee transcends the private interests of the individuals concerned and urged the establishment of government organs charged with the task of supervising the

whole field of industrial relations. Schönberg's historical works include *Zur wirthschaftlichen Bedeutung des deutschen Zunftwesens im Mittelalter* (Berlin 1868), in which he formulated, but not very successfully, a theory that the organization of guilds was a reaction to competitive abuses of a previously existing system of free private enterprise; and *Die Finanzverhältnisse der Stadt Basel im XIV und XV Jahrhundert* (Tubingen 1879), an elaborate study of the financial relations of the city of Basel which, followed by a study of its commercial development by Geering and of its monetary history by Harms, provided the key to the study and understanding of the economic history of other German cities. At a time when systematic and theoretical treatment of economics was being neglected and when the rapidly mounting volume of specialized factual information exceeded the capacity of the individual scholar, Schönberg was the first in Germany to bring together the accumulated knowledge bearing on all problems of economics in the *Handbuch der politischen Ökonomie* (2 vols., Tubingen 1882; 4th ed., 3 vols. 1896-98), which he edited and which, besides his own articles on problems of trade and social policy, contained contributions from the outstanding authorities in Germany.

SCHOOLS, PUBLIC. See EDUCATION.

SCHOPENHAUER, ARTHUR (1788-1860), German philosopher. Schopenhauer was the son of a prosperous Danzig merchant. He traveled widely in his youth and studied at Gottingen, Berlin and Jena. After an unsuccessful attempt at teaching in the University of Berlin he settled in Frankfurt in 1831, where he lived in solitude until his death.

Schopenhauer's condemnation of life is the key to his entire system. His condemnation is based on a subjective theory of knowledge joined to a voluntaristic metaphysics. Time, space and causality are the veil of Maya behind which is an eternal Will that makes for unappeasable yearnings and endless sufferings. The recognition of the nature of the Will, however, can lead to its denial and thus to liberation. Aesthetic experience and philosophic contemplation offer to the exceptionally gifted momentary escapes from the tortures of the Will. A more general denial of the Will can be brought about by sympathy and especially by asceticism. If these solutions can be viewed as flights from life's prac-

tical problems, then the uniqueness of Schopenhauer's philosophy may be seen in that it incorporates both the theoretic and the practical shades of pessimism.

Schopenhauer's social and political philosophy follows from his pessimism. Since time and space are illusions and human striving is futile, no development is possible, history is meaningless and there is no science of history. In the age of Darwin, Hegel and Marx, Schopenhauer denied evolutionary development and significant social change, declaring that all struggle is fruitless. Because of the inner dissonance of the Will human nature is ineradicably evil and egotistic and the affirmation of the Will produces a condition of *bellum omnium contra omnes*. This same egotism leads to the formation of the state. The state is merely a protective institution against the more disastrous consequences of egotism. Opposing Hegel's notion of the state as the divine expression of justice Schopenhauer argues that the state exists because there is injustice. Poverty, slavery, unemployment and wars, Schopenhauer admits, are due to luxury enjoyed by the few. Yet luxury makes culture and technical development possible. The large masses remain eternally immature and require a leader. Women too are both intellectually and morally inferior. Schopenhauer argues therefore for the values of an absolute, hereditary monarchy and defends the system of private property. No government, however, can do away with all evils; evils are due to the very nature of existence.

Schopenhauer's philosophy belongs definitely to the period of reaction after 1848. This perhaps explains the fact that his work was not hailed until the 1850's (thirty years after publication). The unhistorical, pessimistic and quietistic temper of his philosophy was unsuited to a rising bourgeoisie and to a period dominated by Hegelian ideology. After 1848, when Hegelian evolutionary optimism lost its appeal to the frustrated middle classes, Schopenhauer's subjectivism and pessimism offered the consolation that life was but a dream and that unhappiness was not due to individual or social factors but was an inevitable issue of a world ruled by an inescapable metaphysical demon. To the tired radical and philistine Schopenhauer held out the attraction of passivity and repose, to the aesthete the idea of release in contemplation, to the devout the solace of sympathy. And asceticism in the form of frugality could be shown as a means of alleviating economic hardship. While Schopenhauer termed Kant's categorical imperative

a slave morality, his own ethics called for acceptance and acquiescence. Schopenhauer himself did not practise what he taught. Likewise he suggests that the philosopher and genius must have material security to be able to preach chastity and poverty. The practise of the latter is left to the "saint" and to the masses, who are the "clockworks of nature." Thus Schopenhauer was able to unite the idea of voluntary poverty with a defense of private property and economic exploitation.

Schopenhauer left no school of philosophy behind him. His influence was much more diffuse. He became in time one of the most widely read philosophers and he left his impress on such widely divergent writers as Hartmann, Mainländer, Bahnsen, Nietzsche, Wagner, Tolstoy, Richard Dehmel and Thomas Mann.

HARRY SLOCHOWER

Works: Samtliche Werke, ed by Paul Deussen, vols. I-VI, IX-XI, XIII-XV (Munich 1911-33), Schopenhauer's *Die Welt als Wille und Vorstellung* has been translated by R. B. Haldane and John Kemp, 3 vols (6th ed London 1907-09)

Consult Volkelt, J. I., *Arthur Schopenhauer* (5th ed Stuttgart 1923), Hasse, Heinrich, *Schopenhauer, Geschichte der Philosophie in Einzeldarstellungen*, vol. xxxiv (Munich 1926), Whittaker, Thomas, *Schopenhauer* (London 1909), Ruyssen, Théodore, *Schopenhauer* (Paris 1911), Damm, Oskar, *Schopenhauers Rechts- und Staatsphilosophie* (Halle 1900), Simmel, Georg, *Schopenhauer und Nietzsche* (3rd ed Munich 1923), Petraschek, K. O., *Die Rechtsphilosophie des Pessimismus* (Munich 1929).

SCHOULER, JAMES (1839-1920), American historian and legal writer. Schouler graduated from Harvard College in 1859, taught for a year at St. Paul's School at Concord, New Hampshire, and after having served for a brief time in the Northern army took up the practise of law at Boston in 1863. He specialized successfully in war claims, which he made the subject of his first essay in legal literature. Schouler promptly became a prolific author of legal treatises and in 1871 began the publication of the *Jurist*, a quarterly law journal. He lectured on law subjects at the Boston University Law School, the National University at Washington and at Johns Hopkins.

Schouler was early attracted to history and in 1873 began to write his *History of the United States of America under the Constitution*, his seven-volume magnum opus (New York 1880-1913). His high ideals and painstaking methods are revealed in various essays published in his *Historical Briefs* (New York 1896) and in the

"Biography" printed in the same volume. Equally significant was the wide range of his historical interests, exemplified in two biographies, *Thomas Jefferson* (New York 1893) and *Alexander Hamilton* (Boston 1901), as well as in countless papers and articles. He covered American political history penetratingly but largely from a legal point of view, neglecting the social and economic forces, which only recently have begun to receive the attention they merit. His conclusions were often colored by his close attachment to his father, who as a Whig and Republican editor and a Civil War adjutant general of Massachusetts lived in the thick of the stirring political events of the period. Like others of the New England group of historians Schouler often disregarded the institutions and forces that operated in the South. Yet he worked zealously to be both thorough and fair and, when the Andrew Johnson papers were at length made available, added his concluding volume, in which he sought to present a better and more favorable understanding of the statesmanship of the Tennessee tailor.

ARTHUR C. COLE

Other important works. A Treatise on the Law of Domestic Relations (Boston 1870, 6th ed by A. W. Blakemore, 3 vols, Albany 1921), *The Law of Personal Property* (Boston 1872, 5th ed Albany 1918); *A Treatise on the Law of Bailments* (Boston 1880, 3rd ed. 1897), *A Treatise on the Law of Husband and Wife* (Boston 1882), *A Treatise on the Law of Wills* (Boston 1887, 6th ed by A. W. Blakemore, 4 vols, Albany 1923), *Constitutional Studies* (New York 1897), *Eighty Years of Union* (New York 1903), *Americans of 1776* (New York 1906), *Ideals of the Republic* (Boston 1908). *Consult* Stanwood, Edward, "Memoir of James Schouler" in Massachusetts Historical Society, *Proceedings*, vol. lv (1922) 283-88.

SCHRADER, EBERHARD (1836-1908), German Assyriologist. Schrader was born in Brunswick, studied at Göttingen under Heinrich Ewald and taught at the universities of Zurich, Giessen, Jena and Berlin. His first writings, *Studien zur Kritik und Erklärung der biblischen Urgeschichte* (Zurich 1863) and a revision of De Wette's *Lehrbuch der historisch-kritischen Einleitung in die . . . Bücher des Alten Testaments* (8th ed. Berlin 1869), were concerned exclusively with Old Testament history. During his stay in Zurich, however, Schrader became interested in cuneiform studies. Although such studies had originated with Friedrich Grotefend in Germany, they had been carried over to England and France and were completely neglected in Germany. Schrader brought Assyriology

back into Germany and all German Assyriologists are either directly or indirectly, through his great pupil, Friedrich Delitzsch, indebted to him. The first fruits of his work with cuneiform inscriptions were two important studies which appeared in the *Zeitschrift* of the Deutsche Morgenländische Gesellschaft, "Die Basis der Entzifferung der assyrisch-babylonischen Keilschriften geprüft" (vol. xxiii, 1869, p. 337-74) and "Die assyrisch-babylonischen Keilschriften, Kritische Untersuchung der Grundlagen ihrer Entzifferung" (vol. xxvi, 1870, p. 1-392), in which he collected, sifted and elaborated the results of the researches of Hincks, Rawlinson and Oppert. His important contribution consisted in the fact that, unlike the work of most of his predecessors, his texts were accompanied by a scientific transcription and a glossary. As a theologian he was most interested in the light which these inscriptions shed on the Old Testament. This was the main theme of his most famous work, *Die Keilschriften und das Alte Testament* (Giessen 1872; 3rd rev. ed. by H. Zimmern and H. Winckler, Berlin 1903; tr. from 2nd ed. by O. Whitehouse, 2 vols., London 1885-88). His *Keilschriften und Geschichtsforschung* (Giessen 1878) was a decisive answer to the assault on the new science of Assyriology by Alfred von Gutschmid in 1876. In this work Schrader not only effectively answered the attack of his opponents but also presented some very valuable special studies on the geography, history and chronology of the Assyrians. In collaboration with several friends and pupils he published the *Keilschriftliche Bibliothek* (Berlin 1889-1915), consisting of six volumes of translations of historical, legal and religious texts.

SCHREINER, OLIVE EMILIE ALBERTINA (1855-1920), South African writer and feminist. Olive Schreiner, daughter of a German missionary and an Englishwoman, passed most of her life in Africa, although she lived for some years in England. In her youth she was influenced especially by the writings of Mill and by Herbert Spencer's *First Principles*. She made her name with *The Story of an African Farm* (London 1883), and in that early work may be

found evidence of her large hearted idealism and her respect for human dignity and the rights of the individual as well as the expression of ideas—agnostic, feminist and liberal—which she later developed more fully. Her disbelief in a personal God and her natural clearheadedness made her from the first approach the problems of life and society in a scientific and unconventional spirit, at that time most exceptional in a woman. In London she joined the Fellowship of the New Life, which counted among its members Edward Carpenter and her most intimate friend, Havelock Ellis. In *Woman and Labour* (London 1911) she asserted that a general attempt on the part of the women of any society to readjust their position in it implies that change is necessary and desirable. Important in the history of feminism, this book preaches that men and women should be equal and equally recompensed for labor and that woman must claim "all labour" for her province. Olive Schreiner's feminism and her talent as a writer find their highest expression in the unfinished novel *From Man to Man* (published with an introduction by S. C. Cronwright-Schreiner, London 1926). In political matters she invariably took the side of the weak and oppressed. She protested against persecution of the Jews, pointed out that if justice and mercy were denied to the natives of South Africa the union might in the end prove dangerous, sympathized with the Boers in their struggle against British imperialism and in both the South African War and the World War was a determined pacifist.

WILLIAM PLOMER

Other works: *Dreams* (London 1891); *Dream Life and Real Life* (London 1893); *Trooper Peter Halket* (London 1897); *The South African Question* (Cape Town 1899), *Thoughts on South Africa* (London 1923).

SCHRÖDER, RICHARD (1838-1917), German jurist. Schröder taught successively at Bonn, Würzburg, Strasbourg, Göttingen and Heidelberg and was one of the leading Germanists of his time. His fame rests upon two great works. The first is his *Geschichte des ehelichen Güterrechts in Deutschland* (2 vols. in 4 parts, Stettin 1863-74), based upon a tremendous collection of sources, which Schröder

employed to trace the history of the law of marital property as it existed in Germany in all its bewildering variety in the period both of the folk laws and of the law books. He sought to show that the oldest system of marital property was that of the so-called "administrative community," in which the husband had the administrative control and beneficial enjoyment of the wife's property, a system which has been established as the statutory regime under the present German Civil Code.

Schroder's second great work is his *Lehrbuch der deutschen Rechtsgeschichte* (Leipzig 1889, 6th-7th ed. by Eberhard von Kunssberg, Berlin 1932), the most complete account in German legal literature of the development of German law, public and private, in its entirety, from the early Germanic period to 1870. Schroder was especially qualified to make this synthesis by virtue of his previous publication of extensive studies of many phases of Germanic law, particularly as revealed by Frankish and Saxon sources. Apart from his work in maritime law and the marital property law of the German Civil Code, Schroder did not evince much interest in the dogmatic exposition of modern German law.

HANS FEHR

Consult: Stutz, Ulrich, in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Germanistische Abteilung*, vol. xxxviii (1917) vii-lviii.

SCHROEDER, FREIHERR WILHELM VON (1640-88), Austrian cameralist. In 1673 Schroeder, a convert to Catholicism, entered the service of Emperor Leopold I, on whose behalf he made his second trip to England to study economic conditions and to establish a market for Austrian goods. He succeeded Becher as director of the government factory on the Tabor in Vienna and eventually became ministerial adviser in the Hungarian cities of Szepes and Pressburg. Schroeder ranks with Becher and Hornigk among the outstanding formulators of Austrian mercantilistic policy. His general political views, so extreme in their endorsement of absolutism that the University of Jena banned his *Dissertatio de ministrissimo* (Jena 1663) and denied him the doctor's degree, were strongly influenced by Hobbes, although he rejected the contract theory in favor of divine right. In his principal economic treatise, *Fürstliche Schatz- und Rent-Kammer* (Leipzig 1686), he insisted upon the subordination of all economic activity to the interests of prince and state but stressed

no less vigorously the interdependence between the wealth of the prince and that of the people. He accepted the common mercantilistic identification of wealth with the quantity of gold and silver in the country and in order to enhance this quantity advocated the artificial production of gold and the complete exploitation of mines, even when unprofitable. Although he had an inkling of the idea of balance of payments, he subscribed essentially to the theory of the balance of trade, according to which the import and export of gold must be balanced with goods. He opposed all foreign loans and followed Thomas Mun in condemning the policy of prohibiting exports of money. It was also under the English influence that he became the first German to support the free coinage of gold and silver.

Schroeder was aware that in addition to the quantity of money the natural fertility of the soil and the industry and ingenuity of the inhabitants were factors in national wealth. As aids in the regimentation of national resources he suggested an inventory of all manufactures and a kind of statistical tabulation of all enterprises. His specific schemes included the promotion of agriculture, if need be even by enforcing slavery; the stimulation of industry by the destruction of the guilds and creation of a governmental factory; and the facilitation of trade by the establishment of fairs, warehouses, emporiums and exchanges, an efficient postal system, a bureau of information and a news bulletin in which merchants and artisans could advertise their wares. He also faced the problem of insuring a plentiful supply of money and credit for productive purposes, drawing up a scheme for a bank, which should issue against pledge merchandise promissory notes partaking of the nature of banknotes and warehouse certificates.

SCHUBART, JOHANN CHRISTIAN, EDLER VON KLEEFELD (1734-87), German agronomist. Schubart first occupied various minor posts in private and governmental service, but upon his acquisition of the Wurchwitz estate in 1769 he devoted himself entirely to agriculture. His model estate soon became a center of attraction for agronomists and landowners, and he himself acquired a reputation as the outstanding practical agriculturist of his times; his essay "Abhandlung uber die verschiedenen Eigenschaften und den vorteilhaftesten Anbau der Futterkrauter" (in Akademie der Wissenschaften, *Praktische Anleitung zum vorteilhaftesten Anbau der Futterkrauter*, Berlin 1783) was awarded a prize by the Prussian Royal Academy of Sciences in 1783. Schubart held that the greatest fault of contemporary German agriculture consisted in the one-sided development of the three-fallow system. He sought to get an increased supply of fodder and manure by the planting of red clover and other types of fodder plants on the fallow land. He looked upon the prevailing field system with its compulsory pasturage services and its *Flurzwang*—that is, the practise whereby landowners of a particular area were obliged to plant the same crops and maintain a uniform period of sowing and harvesting—as the "greatest defect and pest of agriculture" and sought to remedy them by proposals for gradual improvement leading eventually to their complete abolition; he initiated the practise of summer stall feeding of cattle and sheep. Schubart was an ardent champion of peasantry and frequently pleaded with the landowners and authorities to improve the status of German peasants.

SCHULZE-DELITZSCH, HERMANN (1808-83), German cooperative leader. He was born Hermann Schulze in the small Saxon city of Delitzsch, of which he was later to become deputy, and he added to his family name that of his birthplace. The son of a judge, he took up a legal career. In 1848 he represented his city in the Prussian National Assembly and as one of the leading liberals was repeatedly disciplined

by the Prussian government, which dissolved the Assembly by force in 1849. The economic distress of the years preceding 1849 and the failure to secure any remedy by political means turned his attention to methods of relief through voluntary association. His first activities in 1847 were in the field of welfare organization: he founded a friendly society for sick relief and an organization to help the artisans of his city in the cooperative purchase of raw materials. In 1850 he established the first of the loan banks, which within two years became completely self-supporting. Thereafter he devoted himself wholly to the founding of cooperative credit societies, which multiplied rapidly. In 1859 he founded a central organization of cooperatives, of which he served as director and counselor until his death. His legal training, his ability as administrator, writer and orator and his great popularity fitted him for the role of founder of the German cooperative movement.

In making the transition from welfare societies to cooperative self-help associations Schulze-Delitzsch took almost no guidance from the theories of cooperation current outside of Germany. The English cooperative consumers' movement was little known or esteemed prior to 1850, and Schulze-Delitzsch rejected the better known schemes for producers' cooperatives of the early French socialists because of their dependence on state aid or direction. Instead, in the spirit of humanitarian liberalism, he advocated the cooperative as an instrument to aid the needy and at first regarded as a cooperative every form of organized self-help, including the trade unions and workers' cultural societies. Although he intended the cooperative organization which he fostered to include all vocations and sections of the population and to comprehend eventually consumers' and producers' as well as credit societies, the movement which he headed drew the greatest part of its membership finally from the urban petty bourgeoisie. After 1860 under the influence of Lassalle, who as a disciple of Louis Blanc advocated state aided producers' cooperatives and sharply attacked Schulze-Delitzsch's economic liberalism, the socialists among the working class held aloof from his societies. The rural classes were drawn to the Raiffeisen societies, which, although they owed much to the program of Schulze-Delitzsch, introduced innovations to meet the particular needs of the small peasantry.

Nevertheless, Schulze-Delitzsch not only furnished the initial impetus and the commercial

foundation for the German cooperative movement as a whole but also secured the legislation that gave it legal status. In 1867 he obtained from the Prussian government the first cooperative law, which in 1889 was converted into an imperial law permitting limited liability to all forms of cooperative societies. As a liberal member of the Prussian Chamber of Deputies from 1861 to 1875 and of the imperial Reichstag from 1881 until his death, he defended from government attacks not only the cooperative societies but the movement for popular culture and trade unionism.

ERNST GRUNFELD

Works *Schriften und Reden*, ed by F Thorwart and others, 5 vols. (Berlin 1909-13), with biography by F. Thorwart, vol. v.

SCHULZE-GÄVERNITZ, FRIEDRICH GOTTLÖB (1795-1860), German agriculturist and economist. After a juristic training at the University of Leipsic and practical experience as agriculturist on his ancestral estate of Obergavernitz in Saxony, Schulze-Gavernitz in 1819 began to teach cameralistics at the University of Jena, where he soon became full professor. In 1826 he founded an agricultural institute attached to the university, which was the first of its kind in Germany. From 1835 to 1839, while he was professor at the University of Greifswald, he established a similar institute.

Schulze-Gavernitz is significant not so much for his purely scientific researches as for his fruitful activity as a university teacher and above all for his work in shaping the organization of higher agricultural schools in Germany. Contrary to current tendencies to create separate technical schools, he gave impetus to the movement to make agricultural instruction an organic part of the universities. He believed that agricultural science should strive to perfect the economic life of the people not only in respect to their material needs but also as regards the higher aims of human life, and consequently he held that the agriculturist should be equipped with the same amount of general education as the members of the academic professions. He insisted that higher agricultural instruction should provide for instruction in political economy, which he considered a "psychological and ethical science," as well as in the applied natural sciences.

AUGUST SKALWEIT

Important works: *Über Wesen und Studium der Wirtschafts- und Cameralwissenschaften* (Jena 1826);

his series, *Deutsche Blätter für Landwirtschaft, Nationalökonomie und Politik*, comprises *Über den deutschen Kornhandel und die deutsche Volksbildung*, vol. 1, pt. 2/3 (Jena 1845), *Thaer oder Liebig?*, vol. 1, pt. 4/5 (Jena 1846), *Die Arbeiterfrage nach den Grundsätzen der deutschen Nationalökonomie*, vol. 11, pt. 1/2 (Jena 1849), and *Die deutsche Zuckerfrage*, vol. 11, pt. 3/4 (Jena 1850), *Nationalökonomie oder Volkswirtschaftslehre, vornehmlich für Land-, Forst- und Staatswärter* (Leipsic 1856), *Lehrbuch der allgemeinen Landwirtschaft* (Leipsic 1863)

Consult: Schulze-Gavernitz, Hermann, *Friedrich Gottlob Schulze-Gavernitz . . . ein Lebensbild* (new ed. Breslau 1888), Roscher, W., *Geschichte der Nationalökonomik in Deutschland* (Munich 1874) p. 832-40, Goltz, Theodor von der, *Rede zur Feier des 100. Geburtstages von Fr. Gottlob Schulze* (Jena 1895).

SCHURTZ, HEINRICH (1863-1903), German anthropologist. Schurtz studied under Ratzel at the University of Leipsic, where he began his professional career in 1891 as a *Privatdozent* in geography and ethnography. Two years later he became assistant at the Städtisches Museum für Natur- Volker- und Handelskunde in Bremen, remaining attached to this institution for the rest of his life. Schurtz did no field work in anthropology; his many books were prepared through literary research.

While, as a disciple of Ratzel, Schurtz could not ignore the arguments in favor of diffusion, he was still to some extent under the influence of a schematic evolutionism and he did not clearly recognize the resultant inconsistency. His main contribution to anthropological thought is embodied in *Altersklassen und Mannerbunde* (Berlin 1902) This was the first work to recognize the very significant part played in primitive societies by clubs, age grades and secret organizations, thus it supplemented earlier treatises on primitive society which had laid stress exclusively on the family and clan as the social units of ruder levels. Contemporary anthropology has revised his judgments that the age grades of the uninitiated, of initiated single men and of elders were potentially universal and were the earliest forms of age gradings from which more numerous gradings were subsequent elaborations, but the book has lasting value as one of the classics in theoretical ethnology. Schurtz' *Urgeschichte der Kultur* (Leipsic 1900), although based largely on data which are now antiquated, can still be consulted with profit, since an equally comprehensive survey of culture has not yet been published.

ROBERT H. LOWIE

Other important works: *Grundzüge einer Philosophie der Tracht* (Stuttgart 1891), *Das afrikanische Gewerbe*

(Leipzig 1900); *Grundriss einer Entstehungsgeschichte des Geldes*, Beiträge zur Volks- und Völkerkunde, vol. v (Weimar 1898).

SCHURZ, CARL (1829-1906), American political leader and reformer. Schurz was born in the Rhineland, took part in the Revolution of 1848 and came to the United States in 1852. In 1856 he settled in Wisconsin, where he at once threw in his lot with the young Republican party. His skilful canvass for Lincoln among the German-Americans of the northwest gained him national attention, and despite his youth he was rewarded with first the Madrid legation and then the command of a brigade in the northern armies. In 1863 he was made a major general. Schurz' refusal to remain a party regular, however, prevented his rise to eminence in Republican councils. He led the Liberal Republican revolt against Grant in 1872, was an outstanding figure in the Mugwump attack on Blaine in 1884 and supported Cleveland in 1892 and Bryan in 1900. His public offices were limited to the United States senatorship from Missouri (1869-75) and the secretaryship of the interior under Hayes (1877-81). In an age when American political morality was at its lowest, Schurz' devotion to the cause of reform was all the more striking; and for more than a generation, using as his media the popular lyceum platforms of the day and the columns of the various journals which he edited, he was always the first to sally forth against every oppressive force and evil faction in American public life. Schurz was the inspirer and leader of the movement for the establishment of the merit system in the civil service; he was the first public protector of the Indians; he could justly lay claim to being the father of the conservation movement; he fought the pension clamor of the Grand Army of the Republic; and he was a champion of oppressed nationalities in the American oversea possessions. Although Schurz always was the foe of political corruption, he was silent, however, on the question of social and economic exploitation. He evinced no interest in the cause of labor and never attacked the monopolist policies of organized industry; the unrest of the western and southern farmers he viewed as merely a misguided agitation for soft money.

SCHWARZENBERG, FREIHERR JOHANN VON (1463-1528), German lay judge and penal law reformer. Schwarzenberg, a descendant of a prominent family of Frankish knights, was one of the finest representatives of his period, which was one of transition in law, culture and faith. He was an ardent supporter of the Reformation. He was outstanding also as military leader, as statesman, especially in connection with the decisive assemblies of the Reichstag of 1521, 1522 and 1524, and as popular moralist. His greatest fame, however, rests upon his work as a legislator.

As the highest secular official of the court of the bishop of Bamberg he presided over his judicial tribunal from 1501 to 1524. In this capacity he became acquainted with the legal uncertainty and arbitrariness of the period of the reception, in which the invading Roman-Italian-canonical law was contending for supremacy with the native mediaeval Germanic law, and also with the inability of the lay judges to cope with the situation. Schwarzenberg was thus led to create in 1507 the *Halsgerichtsordnung* for the bishopric of Bamberg (*Constitutio criminalis bambergensis*), a unification of criminal law and procedure. In a masterful manner he succeeded in reconciling the Germanic with the foreign law so as to meet the necessities of the time and in embodying the result in clear and vigorous language comprehensible to the layman, especially the lay judge.

For centuries Schwarzenberg pointed the way for the development of the German criminal law. The *Bambergensis* was widely disseminated in Germany and met with great practical success. When in 1521 the Reichstag at Worms determined to formulate a unified imperial criminal law, the *Bambergensis* was the model which made successful execution of this project possible. The new imperial law, the *Peinliche Gerichtsordnung Karls V.* (*Constitutio criminalis carolina*) of 1532, is no more than an improved version of the *Bambergensis*. Thus Schwarzenberg in reality became the creator of the first and

only German imperial criminal code to be enacted until 1870, when a penal code was adopted for the whole territory of the newly established German Empire. His work still stands as the great and unique legislative monument of the old Reich at the point of its transition from the Middle Ages to modern times.

SCHWARZENBERG, PRINCE FELIX VON (1800-52), Austrian statesman. Schwarzenberg entered the army in 1818 and the diplomatic service in 1824. He saw service in St. Petersburg, Lisbon, London, Paris and at several Italian courts and returned to Vienna shortly before the October Revolution of 1848. He was named prime minister on November 21, 1848. The major tasks which confronted him were to lead the struggle against the revolution, to revise the Austrian constitution, to strengthen the position of Austria in the empire and to assert its rank as a European great power. The struggle against the revolution was carried to a successful conclusion in 1849. His goal as to Austria's position in the empire was the incorporation of the entire Austrian state with its German and non-German territories into the German Empire. Austria was to become the leading power in the new empire, the head of a strong politically and economically united central Europe which could assert itself on an equal plane with all other great powers and work with them for the cultural and economic development of Europe. He wished to organize the new Austria as one undivided unit, discarding all political and economic boundaries and constitutional variations. During his struggle against the revolution in Hungary he proceeded cautiously in the German question and sought to join with Frederick William IV against the aspirations of the Frankfort National Assembly. This attempt failed. The relations with Prussia became more tense despite Frederick William IV's decline of the imperial crown, since Prussia refused to admit Austria's superior position as maintained by Schwarzenberg. As soon, how-

ever, as the revolution in Hungary had been suppressed, Austria's position in Italy had been made secure and the National Assembly had lost its significance, Schwarzenberg pushed forcefully his plan to bring the entire Austrian state into the German Empire. He put forth various proposals as substitutes for the formation of a narrower German Confederation. All these plans, however, met with the opposition of Prussia and the smaller states as well as with the hostility of the western powers, especially France. Although his plan of a greater Germany under Hapsburg leadership was not realized, he was able for some time to prevent the formation of a smaller German union, and Austria's leading position in the German Confederation was restored. Schwarzenberg thereupon turned to Austria's internal problems. As long as he had worked for the inclusion of all the Austrian possessions in the German Empire he considered it useful to give Austria a constitutional system of government. Now, however, he turned to absolutism. Schwarzenberg considered absolutism as an indispensable weapon against all foreign and domestic enemies of the Hapsburg rule. At the end of 1851 the constitution of March 4, 1849, which had never been put into effect, was formally suspended and the unrestricted imperial power proclaimed.

SCHWEIGAARD, ANTON MARTIN (1808-70), Norwegian jurist, economist and politician. Schweigaard studied in Norway, Germany and France and taught law and economics at the University of Christiania, where he held a professorship from 1840 until his death. Except for an early philosophical treatise in which he attacked German philosophy, particularly that of Hegel, his writings were concerned with juridical and economic problems. As a jurist he eschewed system building and philosophizing and always endeavored to give a concrete factual treatment of the problems concerned. As an economist he may be considered an adherent of the classical school, although he did not subscribe to the one-sided theories on distribution

current in the later writings of the school. His best contributions to economics are in the field of monetary and banking problems; some of his earlier writings contain a brilliant defense of monetary devaluation.

Schweigaard's greatest achievements, however, are in the field of economic policy. From 1842 until his death he represented Christiania in the Storting, where as the leading authority on economic matters he initiated important economic legislation. He was the most outstanding figure in the free trade movement and in 1842 successfully sponsored the first liberal tariff in Norway. He took a most active part in the general economic development of his country and through his guiding influence made the largest single contribution to the expansion of Norwegian industry and commerce.

Gran, 3 vols (Christiania 1914) vol. 1, p. 322-52, Lochen, Arne, "A M Schweigaard's Filosofi" in *Edda*, vol. xii (1919-20) p. 1-36. A complete list of works by and about Schweigaard is given in *Norsk forfatterlevikon 1814-18*, vol. v (Christiania 1901) p. 199-211.

SCHWEITZER-ALLESINA, JOHANN BAPTIST VON (1833-75), German politician. Schweitzer, a member of an aristocratic Catholic family of Frankfurt, was trained by the Jesuits and studied law. Drawn into the struggle for German unification, he at first turned for leadership to clerical Austria but soon came to rest his hopes in the revolutionary initiative of the entire German people. This change was signaled by the composition of his chief work, *Der Zeitgeist und das Christenthum* (Leipsic 1861), in which he supported the thesis that both Catholicism and Protestantism were incompatible with the democratic spirit of the age and must perish with monarchy. Siding with the anti-Prussian, democratic faction against the Nationalverein (founded 1859) Schweitzer sought to strengthen his position by winning the support of the working classes. The swerve to the left thus initiated was completed when the bourgeoisie ostracized him for immoral conduct. He then aligned himself with Lassalle and with the latter's approval founded in Berlin the first Social Democratic daily, the *Sozialdemokrat* (1864-71). As editor of this paper Schweitzer achieved a commanding influence over the labor

movement during the years of tumult and internal division which followed Lassalle's death in 1864. He kept alive and welded into a strategic force the *Allgemeiner deutscher Arbeiterverein* and became its president in 1867. In the same year he entered the North German Reichstag as the first Social Democrat to sit in a German parliament. His acceptance of the Bismarckian process of unification became the ostensible pivot of his struggle with Liebknecht and Bebel, who continued but with greater fanaticism the anti-Prussian policy which had been characteristic of Schweitzer himself in his pre-Lassalle period. Liebknecht and Bebel opened a campaign to destroy the *Allgemeiner deutscher Arbeiterverein* and its dictator, Schweitzer, and thus to prepare the way for the creation of a socialist party in harmony with their own conceptions. By a vigorous propaganda presenting him as a hireling of Bismarck they gradually so undermined his influence that he withdrew from political life and became a writer of successful comedies. Schweitzer may, however, be regarded as the creator of the parliamentary method of the Social Democratic party as it was finally consolidated. By descent an Italian, he had derived his early training as a political thinker from the writings of Machiavelli and was a strategist of unusual ability. He was, however, by nature a *condottiere* and in directing the workers' movement he was motivated more by personal ambition than by conviction.

SCIALOJA, ANTONIO (1817-77), Italian economist and statesman. Scialoja was born in the Kingdom of Naples. After considerable study on his own initiative he came under the direction of his uncle, the economist Matteo de Augustinus. His first important scientific work, *I principi della economia sociale, esposti in ordine ideologico* (Naples 1840, 3rd ed. Turin 1848), published when he was only twenty-two years of age, won him sudden fame both in Italy and abroad. It did not expound new theories but displayed a firm grasp of the classical doctrines and a logical and terse language and arrangement. The book was influential in introducing the ideas of Ricardo and Malthus into Italy. In 1846 King Charles Albert of Sardinia called Scialoja to the reinstated chair of economics

at Turin, where he was a very successful teacher.

Scialoja's political career began when he became minister of agriculture and commerce during the brief constitutional interval in Naples in 1848. With the reaction he was kept in protective arrest for three years and then sentenced to nine years' imprisonment, but on the intercession of Napoleon III the sentence was commuted in 1852 to perpetual exile. Cavour then gave him a legal post in connection with the government of Piedmont. In his pamphlet *Carestia e governo* (Turin 1854) he defended Cavour's unpopular policy of free trade in grain as a curb on high prices. His celebrated pamphlet *Note e confronti dei bilanci del Regno di Napoli e degli stati Sardi* (Turin 1857) compared the two governments in various respects, notably in their financial systems, to the complete disadvantage of Naples.

With the liberation and unification of Italy Scialoja assumed a prominent place in public affairs. He was minister of finance for Naples under Garibaldi's dictatorship and again under Victor Emmanuel. He represented Italy in the negotiation of the liberal commercial treaty of 1863 with France. From 1865 to 1867 he was finance minister of Italy. Although he had always condemned paper money, the financial pressure of the war with Austria forced him to abandon the gold standard and institute legal tender paper money. He attempted to replace the land tax by a capitalized redeemable tax on land and an income tax to apply to income from land as well as from all other sources, but he failed because of the strong opposition of the landed interest. From 1872 to 1874 he served as minister of education, resigning over the opposition to his proposal for free and compulsory primary education. His last work was his attempt, begun in 1876, to reorganize the corrupted public finances of Egypt.

SCIENCE. By etymology the term science is generally applied to any discipline of knowledge or body of systematic principles and more espe-

cially to disciplines whose principles are universally accepted or have reached the greatest perfection, as, for example, the physical sciences. This definition does not permit one to speak of science as a unity but only as a generic name for a number of independent and highly diverse disciplines. Fortunately it is possible to frame another definition based on a historical analysis of the development of the various sciences in human culture; and this definition, which greatly limits the denotation of science, does make it permissible to regard science in a certain sense as an organic unity, expressing the same method in all its branches and manifesting its effects on social and cultural life as a single force. Historically the great development of mathematics and the natural sciences and the subsequent application of some of the features of these sciences to the analysis of social facts reveal a natural community between these branches of knowledge, which does not extend to other disciplines, sometimes also called sciences, such as theology, ethics, metaphysics and philosophy. It is thus possible to limit the term science to the first named group of disciplines and to attempt to characterize the unity of nature and purpose which lies behind them.

The characteristic outlook of the selected group of sciences is not merely the quest for knowledge in any sense of the term but the quest for a certain type of knowledge. These sciences, or this science, may be said to look for knowledge in terms of which man may envisage the future course of phenomena unrolling themselves or capable of unrolling themselves before his perception and on the basis of which he may alter future arrangements of phenomena to suit his practical interests. Science may be defined as a far flung system of knowledge couched in terms which allow it to serve as a theoretical basis for practical technique. It was in practical physical technique that man first came to appreciate the need of a grasp or representation of the universe of perception in terms of fixed entities and relations which could be relied upon to stay put in time. What science has done is to develop this cognitive, or theoretical, moment of technique on its own account, independently of the practical moment of action which in technique follows the theoretical grasp of the situation. The term mechanism which is generally used to characterize the scientific representation is a tell-tale reminder of the identity of the scientific outlook with the cognitive moment of practical technique. Needless to say, the scope of science

is not limited to the theory required by man's immediate practical interests or even his immediate practical perspective, first, because all theoretical research, as the very condition of its utility for practise, must transcend the immediate practical perspective and, secondly, because the amenability of the universe to this quasi-technical or mechanistic analysis has encouraged man to build up a vast structure in which he takes pride for its own sake.

The inclusion on the one hand of mathematics and on the other hand of the social sciences in the same category with the natural sciences requires a certain explanation. Mathematics is often regarded as dealing with the timeless logical world of essences and therefore as belonging in a class quite different from the sciences which deal with the laws of nature. However, the definition of science here given has stressed the character of science as a representation, or schema, for anticipating the future course of phenomena and not at all as a body of laws directly governing reality. And when science is considered as a methodological system of approach, it is obvious that mathematics becomes an integral, although highly specialized, part of that system of approach. The same methodological—as opposed to ontological—interpretation of science is calculated to remove the difficulties in the way of putting the social sciences under the same roof with the natural or physical sciences. In the endless controversies that have been stirred up in recent years on this subject the real problem has hinged on the fact that the natural sciences, conceived as embodying the absolute laws of reality, have been characterized by mechanism and deterministic predictability, whereas people have hesitated to consign the field of human and social sciences on an exclusive basis to ontological mechanism and determinism. But on a methodological interpretation of science, and hence of scientific mechanism, it is not necessary to force all aspects of social reality into scientific mechanism as if it were a bed of Procrustes into which all must fit and nothing hang out. Scientific mechanism may be applicable to social reality so long as there is a static, stable factor in that reality to support it; but the application of scientific mechanism does not ipso facto exclude the existence of other manifestations of social reality not intelligible in terms of mechanism or the existence of other approaches and disciplines which have developed from these non-mechanistic aspects.

These implications will become clearer upon

analysis of the epistemological conditions and limitations governing the scientific approach to reality, as well as of the relation of the scientific approach to other approaches which the human mind can and does take toward the same reality. This type of analysis is popularly branded as "metaphysical" and is regarded as distasteful; but if one accepts the naive belief that science represents an absolute and exclusive view of reality, it becomes manifestly impossible to speak of the social or cultural relations of science, since everything true is inside science and the false is irrelevant. It is only when it is recognized that science is not all embracing and that it represents but one among several human activities, all conditioned by the structure of the human endowment and by the structure of the universe in which the human endowment functions—only then is it possible to speak of the place of science in human culture, both historically and in the present.

Human experience as a whole may basically be divided into the consciousness or experience of percepts, that is to say, sense images reflected on a perceptual screen, and the consciousness or experience of subjective activity. Correlative with the latter is the consciousness of trans-subjective activity, or activity in other subjective centers, elicited in the fundamental fact of social communication. Both of these types of data—the perceptual and the subjective, or spiritual—are given in the relation of emanating from an underlying reality not present as such in immediate consciousness. In a clarified and reflective human experience it comes to be realized that there is one section or field of this underlying reality for which man possesses only one peephole, that through sense perception. This is the field of inanimate physical reality. On the other hand, as man turns first to the field of biological reality and then to human reality, he observes the development of a second peephole in addition to the perceptual which provides data of a different order. In the biological field the second peephole and its type of data are found only in a very rudimentary fashion: it is just barely possible for man to enter into social communication with animals and to appreciate the existence of a limited factor of subjective dynamic activity in them. But in the human field the second peephole and its data become overwhelmingly important, overshadowing the significance of the perceptual peephole and its data.

In the field of physical experience or reality the regularity of the sense images causes man to

qualify the underlying reality as static and material and ultimately leads him to the constitution of mechanistic schemas as the best way of anticipating the sense images or phenomena which emanate from that reality. Although in loose speech these mechanistic schemas are called the laws of that reality, a faithful examination of the scientific process reveals that they fall far short of the mark. What one actually beholds is a dualism consisting of the shifting panorama of sense experience and a set of scientific schemas seeking to anticipate important characteristics of the sense panorama. The schemas are never confirmed or rejected once and for all in experience but have to be referred to experience as the very condition of their growth and development. All in all one may say that these schemas, never proof against the surprises of future experience, provide an important grip on the future, and one which moreover it seems still possible to extend in many directions.

As one turns to the biological field, one is forced to recognize that mechanistic schemas developed from perceptual data, while still applicable and capable of further development, manifest a certain loss of grip. The ability to extrapolate schemas for considerable periods of time without reference to experience is lessened; the complication of empirical phenomena is so great that schemas cannot be made so comprehensive that they do not omit important conditions. These facts are indeed disputed by many scientists, but only because, sharing as they do the ontological conception of science, they are afraid to admit such evidence lest it be regarded as rendering biological science impossible. On the other hand, a sober philosophic examination of the case would recognize that the loss of grip on the part of mechanistic schemas in biology correlates itself with the revelation of a second type of factor (absent in physical reality), that of dynamic subjectivity.

From the same viewpoint it is only to be expected that in dealing with human beings mechanistic schemas although applicable and relevant would have even less grip than they have in biology. Only a dogmatist would expect a schema of external behaviorism to be applicable with complete prediction to the human individual's outward manifestations. Moreover it must be pointed out in this connection that the field of the human and social sciences is far from being limited to the application of a loose mechanistic physiology or physics to individual human beings. Most of their subject matter de-

rives from psychological acts and acts of trans-subjective social communication. These, while they have a physical-sensory side, by means of which they are identified in space and time, are basically unintelligible without reference to the internal psychological context. An act of economic exchange, the signing of a contract, is of course meaningless if taken as a purely sensory perception. On the other hand, if such acts are perceived in their psychological relation, they may form the material for the application of the same formal type of mechanistic schemas as is utilized in the physical sciences. Economics as a mechanistic science is sometimes said to rival physics in the grip of its prediction as well as in its abstract mathematical development. However, what is forbidden to the physicist is certainly not permitted to the economist or the psychologist: he cannot erect his schema of deterministic prediction into an ontological determinism. For in human and social phenomena it is possible to go behind the scenes of reality (as is not possible in physical experience) and examine into the conditions behind the production of phenomena. Such an examination reveals that the psychological forces which create the phenomena in question by no means behave always in the static and stable fashion necessary to make the resulting sciences completely predictional. The human psyche, which represents a disturbing dynamic factor by reference to the stability of physical experience and material facts, itself breaks up into a relatively stable phase and into a superdynamic spiritual phase, which whatever else it does certainly troubles the stable and regular order of psychological and socio-psychological phenomena.

From this spiritual phase of the human psyche, or rather from the whole dynamism involved in the polarization into two phases, there derive all the so-called "value" activities of man: ethics and the social organization of human activities, religion, aesthetics and even science itself, taken from the purely human and intellectual side. But while science, reflecting as it does the disciplining of the cognitive need manifested in physical technique, develops static or material concepts, the other activities, when they undergo an intellectual development, create concepts of a different order: spirit, ideal, purpose. Since both sets of concepts often point to the same reality, although to different aspects, it is obvious that great care has to be exercised to prevent confusion of thought and intellectual working at cross purposes. This has to be

guarded against not only in the case of opposing disciplines, like economics and ethics, but even more so in the case of those mixed social disciplines—jurisprudence, for example, and other disciplines pertaining to social administration—where the static scientific approach and the normative moral approach have to be utilized alternately by the same person in the same course of study.

On the basis of this analysis of the place of scientific thought and scientific approach in the human psychological endowment it is possible to trace intelligently the historical development of science and its interplay with other phases of culture. At the very outset one is confronted with the great puzzle as to why science should have had such a late development. Although religion, social organization, material technique and even the fine arts have a continuity reaching back perhaps hundreds of thousands of years into the past, the thread of science does not go back more than four or five thousand years at the very most. And even the greatest part of this history pertains primarily to mathematical and astronomical science. As applied to natural and physical phenomena science cannot be said to have become constituted before the seventeenth century; and its era of intensive development dates only from the nineteenth century, from which period, approximately, also dates the development of clearly crystallized scientific methods in the social fields. It is not a question of a slow accumulation of scientific facts in the early stages of culture with an increasing acceleration of progress in the later stages: primitive culture reflected an antiscientific tendency, an inherently false approach, which had to be outgrown before science and scientific progress could begin.

The late development of science finds its explanation in the complexity of the human mental instrument, in the multiple facets of approach toward experience which it contains and in the inevitable confusion in the early attempts to articulate this remarkable endowment of man. The gift of consciousness did not come down from heaven with explicit directions for its use, and anthropologists have therefore wisely remarked that under the precarious conditions of primitive life consciousness was not an unmixed blessing for man. If consciousness extended man's technical grip on the physical world, it did so only in specific concrete problems where man could lean to a great extent on the subconscious guidance of his instinctive endowment.

Removed from this earthly support consciousness operated to spread an atmosphere of fear and hallucination about the outside world—with its inevitable reaction in the development of a sense of intimacy with the fictitious creations of the subjective imagination.

Instead of primitive technique developing rapidly from invention to invention and later breaking up into a specialized theoretical science and an applied science, or technology, one finds in primitive life technique developing in its more ambitious phases into magic, which may be characterized as an illusory technique resting upon a fallacious knowledge. Its leading ideas are often designated under the headings of mana and animism. The first reflects the inability on the part of primitive man to make a clear distinction in his conscious experience between the subjective and the objective: the magician believes that by sheer effort of will and without spatial manipulation he can constrain not only his own muscles and his own body but the objects of external perception as well, and he believes also that these objects themselves possess a non-mechanical, "mystical" causality. Animism, which seems to come at a later stage in primitive thought, after success in the technical manipulation of external phenomena has crystallized the sense of an objective world with static material properties, exists for the savage both in the conception of indwelling spirits, with dynamic and capricious properties, inhabiting all objects—sticks and stones as well as men and animals—and in the belief in disembodied spirits roaming the world at large and manipulating phenomena like a puppet show. It is easy to see how these ideas suggested themselves from psychological and psycho-sociological experience, in which the interest of the primitive like that of a child is more keen and intimate. But the application of such ideas to the physical world could not be more unfortunate in its results. Not only are such ideas basically unsuited to the characteristics of physical experience, but they deprive the mind of the possibility of attaining true ideas by creating the illusion of being confirmed by experience. It is part of the essence of mystical causality that its effects are uncertain and unpredictable, and it is similarly in the nature of spirits that unseen they can always interfere with the plans of mice and men. Thus if a magician's experiments did not produce the material effects looked for, the fault was not ascribed to his theories but to the mystical contamination of some of his materials,

the capriciousness of some evil spirits or the malevolence of other magicians. It took humanity a long, long time to come to the realization that not only were mechanistic principles, principles of spatial causation with entities whose properties stay fixed in time, the ones appropriate to physical experience, but that in problems of detail they alone laid themselves open to verification or rejection in experience, and in case of rejection, to the revision of the detailed structure in the light of the suggestions of experience.

In addition to the vicious circle involved in the fundamental presuppositions behind magic it must be remembered that there was an all important institutional force which served to perpetuate these ideas, although with a different end in view. This is religion, whose historical function has always been to exalt the higher subjective energies of men and to maintain the social fabric by emphasizing the participation of the individual in an invisible world from which the collectivity depended.

Primitive religion of course can scarcely be said to have had a very clear conception of the spiritual, either intellectually or morally. Its intellectual stock in trade represented the same confounding of the objective and the subjective, the material and the psychological, which characterized magic, and its program hardly differed from magic save in its social aims. Religion sought to constrain and wheedle the spirits and invisible forces for the benefit of the group, the magician for the benefit of the individual. At the same time religion as the guardian of social safety became the censor of any new ideas or activities which might conceivably offend the invisible spirits or gods. Thus the religious institution, although always hostile to magic as an illicit individualistic communication with the extraordinary forces of the universe, served to perpetuate the mentality on which magic depended. This relationship continued as late as the Middle Ages, when the scholastic philosophers took an attitude not of condemning the belief in magical powers but of condemning the resort to them for magical aims.

Before a scientific mentality could emerge, there was required a long and slow transformation of the physical and institutional conditions of culture. The accumulated progress of the technical arts, necessarily slow not only because it took place without the aid of science but also because it took place under the shadow of magic, eventually effected a certain translucency in the

intellectual atmosphere. At the same time the progress of social organization, effected with or without a development of religious ideas and always subject to sudden interruptions and reversions as a result of wars, created a class with sufficient leisure and curiosity to carry on disinterested inquiry at least in certain directions. This state of things corresponds to that of the great civilizations of Egypt and Babylonia. In both of these civilizations in the midst of a general magical mentality there existed a highly developed mathematical science, which went far beyond the needs of practise and which above all, whether used in practise or not, was intellectually effective. It is interesting to analyze the sources of this mathematical science, embracing not only arithmetic but also geometry. Both of these phases of mathematical science, which was one day to become the corner stone of the whole vast intellectual transcription of experience, have their roots in technique not only in the sense of representing problems suggested by technique and solutions that may be utilized therein but in the very special sense of being intellectually guided by a skeletonized type of technique. The history of the number concept reveals its roots in concrete numeration: in the telling off of objects in a one to one correspondence against a set of standard objects. Because of the simplicity and uniformity of these operations, the play of cognitive consciousness could follow them and assimilate them in such a manner that it could carry them forward in imagination with full confidence that the results of the imagined action would correspond with the results of physically repeated action. A similar development was operative, although at a much later stage, with regard to the tracing of lines and figures which could be superimposed on concrete objects to determine their size and shape. These too became subject to imaginative mental analysis and gave birth to geometry. The extent of development of numerical and geometrical analysis, once the start was made, depended of course on conditions of leisure and interest in the subject. One is amazed to find that Babylonian priests as early as 2500 B.C. had advanced in the analysis of numerical operations to the point where they were carrying on a regular algebra with solutions of simultaneous quadratic equations in two unknowns. As regards geometry their science embraced at least an implicit knowledge of the properties of the Pythagorean theorem—two thousand years before Pythagoras.

All this extraordinary mathematical development in Babylonia (and the lesser but equally significant development in Egypt) failed to have any rational repercussion on the prevailing general mentality. In Babylonia it may be said to have combined with magical and superstitious ideas to foster an intense development of star omens, or astrology. Thus curious discipline developed a remarkable core of positive astronomical science within a framework of gross superstition. Both were passed on to Greece and the European tradition after the entry of Alexander the Great into Babylon. The astrological tenets continued to flourish throughout Roman and mediaeval times. They helped to preserve the interest in mathematical astronomy—but at the price of contributing to the degradation of the general mentality.

The type of scientific contribution represented by Egypt and Babylonia has been repeated several times, in China and Japan, India and among the Mayas of North America. It serves as concrete evidence to show that the potentialities of science are not confined to any one people but may properly be regarded as belonging to the patrimony of the whole human race. In actual historical fact, however, only one civilization has been able to produce a fully developed scientific tradition, and this is the so-called western civilization which traces its origin to Greece.

The historic importance of the Greeks from the point of view of science lies in two directions. In the first place, they laid down the program and formal outline for the whole encyclopaedia of knowledge, including not only the positive sciences, which form the subject of the present article, but the philosophical and intellectual disciplines as well. In the second place, they built up and developed to marvelous perfection geometry as a rational and at the same time positive and intellectually effective science, preparing it unconsciously for its vital role in the modern scientific structure and applying it consciously but timidly to the motions of the heavens and to rudimentary problems of mechanics. The relationship of the general philosophic program of Greek thought to the modern scientific edifice is complex. Greek philosophical thought has contributed an element which has gone into the making of modern science and without which science could not have developed as it has. On the other hand, it may also be said that modern science constituted itself by reacting against some of the tenets of Greek philosophical

thought. Finally, it should be noted that the place and meaning of science as a whole in modern life and thought can be understood only by reference to the modern philosophical tradition, basically Greek in character although transformed by a number of forces, of which not the least is the development of science itself. For these reasons a brief glance at the program and outlook of Greek philosophy is necessary.

Under the impact of a number of secularizing and humanizing forces, including the cumulative advance of the technical arts, the decadence of the religious institution in Greece and the efflorescence of the plastic arts and literature, there developed a novel way of looking at the universe and man's relation to it. In place of the mythological stories of the adventures of the gods in heaven and earth, which were hitherto the only vehicle for expressing man's curiosity and wonder at the nature of things, there was now a bold inquiry by human reason without reference to the nominal masters above. This inquiry, which at first embraced only questions of cosmic structure and later included problems of human conduct and affairs, was of necessity speculative, being an attempt to systematize the general features of experience as they presented themselves to the interest of the thinker. It was also dialectical in the sense that each thinker hazarded his own theory or system and attacked that of everyone else. If in the prephilosophic stage of culture mythological beliefs had been propagated under the anonymous banner of collective traditions without the individual's daring to assert his own ideas, now with the awakening of the reasoning faculties of the individual things went to the extreme of individualism and sometimes, under the influence of rhetorical practise at the law courts, to the point of sophistry.

By and large the Greeks did not minimize the importance of experience as the starting point of knowledge. The truth is rather that their general attitude toward knowledge was radically different from that which prevails today. What the Greeks sought from knowledge was in the nature of a theoretical, contemplative *Weltanschauung*, which made no organic distinction of approach between problems of human ethics and problems of physics. The idea of a science that represented power over natural forces and over the course of phenomena and that was to be constituted as a universalization of the theoretical moment in technique was quite lacking. Although the philosophers pressed into their serv-

ice all the accumulated common sense knowledge born of the progress of the arts and occasionally performed experiments to prove disputed points, none of the branches of philosophic inquiry, none of the sciences, was carried on in correlation with the corresponding techniques. These were despised as representing an inferior level of activity having no relation to disinterested knowledge. The only case where there was an attempt to bring together the learned approach and the approach of practise was in the medical sciences, but here the results were relatively barren because the necessary preliminary sciences were lacking.

The good and evil of the Greek philosophic contribution, from the viewpoint of modern science, are well represented in the system of Aristotle, which came at the close of the great philosophic era and which imposed itself on subsequent generations by its confident encyclopaedic sweep of all knowledge. It was characteristic of Aristotle's doctrine that it articulated all phases of reality, all branches of knowledge from physics to "first philosophy" or theology into a single architectonic whole, moved by dynamic teleological principles. These were suggested to Aristotle by his special preoccupation with biology, where indeed there is an inherent justification for a teleological viewpoint, even though such a viewpoint does not provide the type of controlling knowledge of phenomena which modern science seeks; and also by the latent animism involved in common sense knowledge of physical phenomena and embodied in language concepts. The proximity of this viewpoint, for all its intellectual breadth, to the religious mentality of the semibarbarian peoples of the Middle Ages helps to account for the tremendous hold of Aristotle's system on the mediaeval schools of all faiths, Moslem, Jewish and Christian. On the other hand, both the methodology of the system and its alliance with a theological hegemony of thought resting on sacred books made it a powerful encumbrance to the development of physical science in the modern sense.

Aristotle's system and the Greek philosophic contribution in general stood for a dispassionate intellectual interest in physical, natural and social phenomena. They provided moreover a rich store of facts and documentation which outside of physics could be taken over bodily and utilized in a corrected scientific methodology. It is the presence of this theoretical interest and this documentation in the western cultural

tradition and their absence in the oriental cultural tradition which seem to account for the crystallization of science in the West and its failure to develop similarly in the East.

The other important phase of the Greek contribution to science was the constitution of a demonstrative geometry. In view of the implicit kinship between geometry and the mechanistic approach to physical phenomena it seems a bit strange that the Greeks should have failed to make the transition to physics. But the explanation lies in the fact that geometry faces two ways. If by its origins it recalls the world of technique, by its amenability to deductive development it suggests a world of pure eternal truths to be contemplated along with the rest of the cosmological speculative system. Nevertheless, the historian must record two extensions of pure mathematics to physical problems; and while these were too slight to affect the dominant tone of ancient thought, they were important for the future in creating the nucleus of a new tradition. One of these is the application by Archimedes of the methods of geometrical deduction to the principle of the lever and of other simple machines, and it is perhaps significant to note that this occurred during the Alexandrian epoch when the Greek philosophic aversion to technique had receded somewhat under alien influences. The other is the rather curious and timid application of geometry to an analysis of the motions of the heavenly bodies, which was begun by Eudoxos in the time of Plato and completed by Ptolemy about 150 A.D. It is significant that in both systems the natural aim of the geometrical analysis—to chart the heavenly motions and simplify them if possible by changing the point of orientation—was frustrated by the same type of religious and commonsense prejudices as were afterwards to be arrayed against the Copernican theory. The mathematician was thus reduced to combining purely hypothetical circular motions to "save the phenomena," these artificial combinations being endowed subsequently by the realistic imagination with full physical reality. A heliocentric theory propounded by Aristarchus in a form identical with that of the Copernican theory eighteen centuries later was frowned upon by the mathematicians and denounced by the stoic Cleanthes as an act of religious impiety.

As regards the Middle Ages, it may be said that the older view that this long period was substantially barren of scientific achievement still prevails despite the efforts of mediaeval

scholars to rehabilitate the intellectual status of that epoch. The men of the Middle Ages preserved the intellectual heritage of antiquity and made it the possession of a pan-European civilization. But however much they affected the philosophic, moral and political disciplines, they made no significant contribution to the positive scientific phase of the Greek tradition, which they cultivated moreover only with a secondary interest. Even in algebra, the invention of which is popularly credited to the Arabs but which was really begun by the Alexandrian Greeks, the mediaeval contribution was slight, and the main work was left for the sixteenth century. There were, however, a number of practical inventions during the Middle Ages—the compass, lenses, gunpowder and Hindu-Arabic numerals—which were to have a revolutionary effect on both technology and science. It is important to note that side by side with the official scholastic culture, under which the intellectual traditions of Greek thought were resumed but given a religious and otherworldly emphasis, there was a practical, plebeian current, expressing itself in magic and the occult sciences and also, as the slow economic development permitted, in a rational progress of technique. In the architectural arts there was even a groping for the application of mathematics and scientific reasoning to problems of engineering, but the education of the masons was too limited to permit of much progress in this direction.

It is to the turbulent upheavals of the Renaissance that are due both the resumption of the mathematical sciences of the Greeks and their fusion with a practical, technical interest, which constitutes the differentiating character of modern science. The period witnessed two revolutions, brought about by relatively independent causes, and it was on the margin of both that the revival and transformation of science took shape. The first was the cultural revolution, the Renaissance in the proper sense, which was motivated by the desire to escape from the sordid conditions of mediaeval life and return to the glories and beauties of the classical past and which expressed itself in the revival of architecture and the plastic arts under classical inspiration and in the restoration of the monuments of classical literature and learning. The other revolution was economic, produced by such factors as the loss of population as a result of the Black Death and the incessant wars, the closing up of the customary trade routes and other economic and political changes. This revolution expressed

itself in an intense development of commercial and industrial capitalism and was accompanied by a rapid rise of technology and mining, to which moreover the costly and devastating wars of the northern powers in Italy also contributed. It was the synchronism of these two revolutions which produced the new scientific trends. Thus the humanistic Renaissance gave a mortal blow to scholasticism and at the same time stimulated the publication of Greek scientific texts along with literary and philosophic texts, although by itself it did not produce a modern scientific attitude: the closest approach was in the revival of a pagan biological naturalism. But meeting with the current of pragmatic interest emanating from technique it produced for the first time in history a union of theory and practise, mathematics and engineering. In the person of a genius like Leonardo da Vinci all these Renaissance tendencies united in an all embracing talent. Leonardo was at once an all round aesthetic type—architect, sculptor, painter and poet—and an investigator of the scientific, technological type, making important discoveries in mechanics, biology and natural history, which unfortunately did not see the light of day until the eighteenth century. In the lesser but more specialized careers, whose contributions built up the new scientific tradition and the new scientific spirit, there was the same cross fertilization of hitherto segregated cultural trends. Thus the astronomer Toscanelli prepared the charts which were utilized by Columbus and the Portuguese explorers. Writers on metallurgy, like Biringuccio and Agricola, helped to dissipate the fogs of alchemy and prepare the way for a scientific chemistry. The translators and followers of Archimedes were simultaneously mathematicians and military engineers, seeking to extend the Archimedean method to new mechanical problems. The need of increasing the effectiveness of artillery fire led Tartaglia to attempt to solve the problem of the path of a projectile, and he initiated a series of efforts which led ultimately to Galileo's successful solution, with its founding of modern dynamics.

Even the Copernican theory, often regarded as a creation of individual genius, was in fact a product of the trends of the time. The stimulus to the revival of astronomy, which was preserved during the Middle Ages largely through the aid of its disreputable daughter, astrology, came in the fifteenth century with the necessity of drawing up tables to correct the calendar. This had been agitated in vain for four hundred years.

but under the new intellectual conditions revised and accurate astronomical tables were prepared by Purbach and Regiomontanus. Their work in turn called attention to the parlous state of astronomical theory, and it was with this background that Copernicus went to Italy and found, through his humanistic studies of classical literature, the trail of the heliocentric doctrine, which he dared champion as a solution for the astronomical difficulties.

It was not until the seventeenth century, however, that the evolution away from scholastic doctrines and the accumulation of physical discoveries had proceeded to the point where the new science could perceive clearly its own perspective, synthesize its detailed researches and formulate a philosophic program and methodology. The numerous steps in the development of the scientific structure cannot be treated here, but certain generalities on those phases which have a cultural importance should be mentioned. First of all, the new science divorced itself from the unified intellectual perspective which had dominated Aristotle and the scholastics. Physics and astronomy were no longer harnessed in the same logical system with metaphysics and theology. This was the real significance of the struggle for the acceptance of the Copernican theory that was waged by Galileo. The Catholic church, although it constrained Galileo, could not constrain the earth in its motion or the evolution of scientific thought. Today, while scholasticism has been restored as the official philosophy of the church, that philosophy must accept the findings of physical science, which are based on a different approach; the church cannot command science to follow scholastic concepts.

Specifically the new methodology of science made it necessary to view the universe in terms of mechanism, both for the grosser mechanical phenomena and for the more subtle phenomena, such as light, heat, sound. This approach was at first literally and visually interpreted by Descartes and others as implying that the external universe was made up of nothing but extended mass and motion and that physical laws represented only the laws of the geometrical transmission of motions by contact. Almost immediately, however, a deviation had to be allowed in the case of universal gravitation, which operated at a distance, like an occult quality, but with effects so precisely traceable in terms of observable and measurable quantities that it could not be denied admittance into the edifice of science. In the course of the subsequent development of

physics the conception of mechanism evolved far more radically, until today it is nothing more than a metaphor denoting the quest for relations and laws of identity across time. This fact is of importance because for long men tried to join the new science to the rest of the cultural and philosophic tradition by the device of psychophysical (mind and matter) and metaphysical (God and the world) dualism, which the more irreverent abbreviated into a monistic materialism. Only with Kant was the attempt seriously begun to inquire into the relations between the form of science and the conditions of the human endowment, and then it was realized that science could not be considered even in its own plane as a direct and metaphysical view of reality but only as a special and progressive approach to experience.

It was indeed in the progressive building up of the scientific system along its chosen mechanistic pattern that both the experimentalism and mathematicism so characteristic of modern science found their application and meaning. Experiment was no longer an illumistic quest for the mysterious inner secrets of nature; either it represented a methodical cataloging of new phenomena, as in the case of electricity, or more often it was the putting to the test of a deductive prediction of experience. On the other hand, the basic mechanistic concepts put a premium on the deductive analysis of the functional variation of spatial and temporal magnitudes which was supplied by the mathematician. When Galileo worked out the law of gravitational acceleration he was handicapped by the absence of the differential calculus; but thereafter the development of mathematical analysis, initiated by Descartes' fusion of algebra and geometry, was always far ahead of physical needs.

The seventeenth century scientific development, vast and revolutionary as it was, did not succeed in imposing the new program on any field other than physics and astronomy. Chemistry, where the same type of approach, although with a somewhat different starting point, was needed, lagged behind, still following occult ideas derived from alchemy. In the biological field little was accomplished save in descriptive phenomena; and even the discovery of the circulation of the blood, important as it was, belonged to this class. The slowness of progress in these fields no doubt reflects a greater complexity in the problems, but it also indicates the lack of organized social support for the new scientific research. It was not until well into the nine-

teenth century that the universities became active centers of scientific research. Up to that time all research had been fostered by amateurs and by societies of amateurs, the so-called learned societies, which in their modern form arose in the Italian cities of the sixteenth and seventeenth centuries. Occasionally those who advanced the torch of science were members of the universities, but this was the exception rather than the rule. The newer branches of research, far from being actively encouraged by the university administration, were not even represented in the university curriculum.

As for the relations of the new science with the developing techniques of industry, it may be said that collaboration was most intermittent. After the first burst of community of interest in the Renaissance there was little to hold science and industry together until the development of chemistry, electricity and thermodynamics and the rise of the steam engine. The first great revelation of the practical power of science came with the French Revolution, when the chemists and physicists were hired by the revolutionary state to devise new processes and to systematize the weights and measures of the republic.

Of far greater importance during this period were the effects of science on social thought and action. The development of science had been accompanied from the beginning by an emphasis on the realistic, materialistic side of human nature. In the seventeenth century it had been counterweighted by the development of religious and moral thought with its opposite emphasis. In the eighteenth century, however, science became the carrier of a peculiar type of social rationalism—empirical and realistic in emphasis, moral and reformist in aim. The materialism of the French *encyclopédistes* and the subsequent English doctrine of utilitarianism were of this type. Side by side with these there developed a purer type of social science, that represented by economics. Here too the starting point was the desire for a realistic interpretation of human conduct, free from the snares of an abstract and utopian moral idealism. This found its application in a field of social experience which the institutional development since the Middle Ages had surrendered to the free play of materialistic instincts subject only to formal rules of market place exchange. Thus unknowingly social institutions had conspired to create a field of "social physics" in which mechanistic laws would apply, and it was these laws which the new science proclaimed. There was

less solid justification for the belief that in economic phenomena "private vices are public virtues" or that the play of materialistic self-interest works out always for the social good. But under the naïve interpretation of science both principles, the principle of mechanistic determinism and that of a teleological harmony or interests, were proclaimed as consequences of the same science and as resting on the same authority.

The later history of natural science, which begins with the founding of chemistry at the close of the eighteenth century, is difficult to trace in its technical scientific aspects, but its social repercussions are easy to follow. Three sets of phenomena coincide: the uncovering by physical science of facets of experience capable of practical and technical utilization; the flowering of capitalistic industrialism, under which scientific knowledge can be utilized rapidly; and the rise of the modern secular university, in which a dominant place is given to scientific research. Chemistry was from the moment of its birth a utilitarian science and was so recognized by Lavoisier, its intellectual father. It has affected almost every aspect of industry, it has revolutionized agriculture and food preparation, and it has become one of the principal weapons in man's fight against disease. No one would have suspected, however, the role that scientific research was to play in the transformation of power resources through its theories of energy and thermodynamics as well as through the marvelous science of electromagnetism, which not only opened up new methods of power production but led to the totally unprecedented boon of power transmission. Nor would anyone have dreamed that this same science of electromagnetism, which at the beginning of the modern era embraced only two unconnected phenomena, rubbed amber and the magnetic needle, could create a magician's paradise of applications in the fields of communication, lighting, medicine and the like.

In the second half of the nineteenth century the biological sciences came into their own. From a positive practical viewpoint the most significant developments were the rise of an experimental physiology and the sensational discovery of the role of microbes in contagious diseases and in putrefaction. The latter has revolutionized surgery and has been the largest single factor in the success of the modern public health program. It has initiated lines of research in immunity and immunization which are still far from complete but which have continually

yielded rich social dividends "on account." Of similar positive significance is the science of experimental genetics, begun by Mendel in the 1860's but lost to view until the turn of the century. It has put the biologist in a position to breed new agricultural and animal varieties almost as the chemist creates new compounds in the laboratory. It has moreover provided the scientific basis for a program of human eugenics, although such a program cannot be put into operation without an agreement as to the practical social aims, which can be had only in a more rationally directed social organization than exists in most countries today.

Far more philosophic in character was the doctrine of the evolution of species which attracted so much of the energy of biologists during the nineteenth century and which convulsed popular religious beliefs as they had not been convulsed by any scientific event in history. Founded on an induction from paleontological data, which had been patiently accumulated since the seventeenth century, the conception of a natural transformation of species gave a telling blow to that peculiar metaphysical compromise which had developed between scientific and religious beliefs, and which had surrendered the working order of the universe to science but had reserved the creative starting points and the world of souls to the kingdom of God and traditional religion. Under evolution there was little territory left to the supernatural kingdom, so all embracing had the kingdom of nature become. The clash was aggravated by the attempt on the part of Darwin to devise a mechanistic explanation of the evolutionary process in terms of the ambiguous concept of natural selection. Neither Darwin's work nor subsequent efforts on the basis of genetics have been crowned with positive success, and to the writer it would seem that there is a basic incompatibility between an evolutionary conception and a complete mechanistic explanation. But in the high Victorian period of evolutionism success was taken for granted and there developed popular systems of materialistic metaphysics which embraced all knowledge and all experience, from astronomy and the nebular hypothesis to human psychology and sociology, in one imaginative sweep.

The doctrine of evolution had an enormous repercussion on sociology and anthropology, largely, however, because it gave the erroneous impression that all social history could be conceived as a uniform, linear development and

subjected to a simple formula or law. When the smoke had cleared, it was seen that evolution was no open sesame that could simultaneously unlock the doors of theory and practice, of structure and history. The social disciplines fell back on more eclectic methods, and what they appeared to have lost in scientific dignity they more than made up in adequacy to their intricate subject matter. It is a relic of an outworn metaphysical conception of science to suppose that science can be carried on *sub specie aeternitatis*, without reference to practical viewpoints and interests. In the physical sciences a general practical interest is implicit in the very mathematics and methodology of these sciences. But in the social field, where fact and practical action alternate in the consciousness of every individual, a crystallized practical purpose must guide the specific selection of facts if the chase for facts is not to degenerate into sheer dilettantism.

These reflections on the practical character of science are relevant also with reference to the mooted "crisis in science" raised by the theoretical developments of the new physics. Notwithstanding the limitations of method which have surrounded the scientific quest from the moment of its formulation, there is no doubt that most scientists as well as the general public have tended to visualize the fundamental set of scientific concepts in space and time and thus to convert them into an ontology or metaphysics. It was this tendency which was seriously affected by the development of the relativity theories and virtually blocked altogether by the quantum theory. There is nothing remarkable about the relativity theory except that the character of high abstraction which was previously reserved for the mathematician's functional manipulation of the fundamental physical categories and concepts now entered the domain of the physical categories and concepts themselves. The bridge or rather the stairway to immediate psychological experience still remained, just as there always remains the possibility of ascent and descent with regard to the highest reaches of mathematical abstraction. Also, notwithstanding the curious covariant relationships between the spatial and temporal measurements pertaining to moving bodies, the object of science was still the same—the quest for a set of relations whose materials could be supplied in the present and which could be relied upon to predict the character of future experience. What was missing was the simple visual diagram of three Euclidean dimensions and of invariant material

masses as the basis for the more abstract relations. It was this visual diagram which had been identified with physical reality while the more abstract relations were identified with the laws of reality. However, a reference to the nature and movement of the scientific process is sufficient to dispel the belief that such a visual diagram should always attend the march of scientific theory, just as it dispels the presumption of the imagination to visualize numbers as "real" and "rational" entities.

Nevertheless, the realistic imagination had managed to accommodate itself by means of vague images to the paradoxes of relativity, when it was announced that in connection with atomic problems no precise charting of the space and time positions of individual electrons was possible under the human conditions of approach but only a charting within the limitations of statistical averages; and that for similar reasons only statistical predictions of electronic behavior rather than individually governing predictions could be made. The realistic imagination, which had for three hundred years raised the cry of a complete ontological determinism of reality, now raised the cry of a complete ontological *indeterminism* of reality. Theologians felt authorized to revamp the miracles and other *flatus vocis* of religion with the blessing of science; it would not be possible to enter here into a detailed refutation of the fallacy. It may be sufficient, however, to point out that the limited methodological determinism of science, which is all that science has ever been able effectively to establish with regard to physical experience, is in no way contradicted by the recent developments but rather receives a new expression in the statistical formulations with regard to atomic problems. The crisis is not in science but in the realistic imagination which has accompanied scientific work.

This psychological crisis is itself becoming an important factor in the changing social attitude toward science. Both intellectually and practically there are increasing manifestations of disappointment with science. Cultivated, especially since the nineteenth century, with an all embracing passion which recalls the mediaeval devotion to religion, science has not fulfilled the expectations of its devotees. They looked for a final *Weltanschauung*, a revelation of the structure of the universe and of man's place in it; and instead they have found an endless succession of technical mathematical formulae. And in its practical effects science seems even more to fall short of the hopes entertained for it. Men

expected an orderly progress of the arts designed to ameliorate human material conditions. Instead they find the Frankenstein of modern technology with its horrors of war and of technological unemployment.

As an expression of this disappointment many are urging a return to the Middle Ages, which take on all the allures of an Arcadia. But before western civilization proceeds to blow out the candle of science, would it not be fitting to inquire more closely into the causes of the disappointment with science? The contention has here been set forth that science is not and cannot be a metaphysics; it is the expression of one phase of the human endowment. Disappointment is inevitable if that phase be taken for the whole. But, on the other hand, if science is accepted for what it is, its value for the whole is incalculable. Science does not bring a total revelation or outlook upon the universe, but by virtue of its solidity in its own field it makes possible a clarification of the entire human outlook and a rational and directed progress in the development of all human powers. Similarly the technological powers of science, which are a curse when left to develop without reference to human needs and human practical controls, provide the material, for the first time in history, for a sane social and economic organization. Before the advent of science and technology religion despaired of ameliorating the material conditions of men in this world and preached a compensation in a mythical world to come. Science and technology make it possible—if moral and practical development can keep pace—for men to realize the kingdom of God here on earth.

SCIENTIFIC MANAGEMENT. The term scientific management is used to designate a body of theory and practice directed toward

more rational and efficient performance in industry. While it was used originally with reference to direct efforts to increase the productivity of labor, the application of the term has since been extended to include the basic factors in the process of production as a whole.

While scientific management was a gradual development, the term itself came into sudden use to designate an already existing phenomenon. In the fall of 1910, at hearings before the Interstate Commerce Commission, the request of certain railroads for increased rates to offset a rise in wages was being opposed by attorneys for northeastern shipping interests. The latter argued that costs should be reduced instead and offered in evidence the characteristics of a technique of management developed by Frederick W. Taylor, which was then little known but had secured striking results in a number of industrial plants. Desiring a definite term for this technique, they sought the aid of a committee of engineers, among them H. L. Gantt and Frank Gilbreth, who decided that it should be identified by its fundamental characteristic, which was the utilization of research as an approach to the solution of problems of management. From their deliberations came the term scientific management to replace various earlier designations, such as the Taylor system and task and bonus management.

The testimony at the hearings was impressive and aroused public interest, from then on the management movement was dominated and given logical integrity by the Taylor technique and principles. During the preceding twenty-five years the development of the management movement and of the Taylor technique had proceeded side by side, but with little influence of one on the other. The management movement appeared spontaneously in the early 1880's as the result of forces which made American industrialists conscious of problems of management: a new technology, whose introduction was speeded by the results of the Civil War; extension of markets by railroad construction and expansion of the frontier; enlargement and mechanization of plants in response to larger markets and greater fixed capital requirements; the difficulty of adapting native and immigrant labor to the operation of machines; the depression of the 1870's, which cut severely into profits. This consciousness of management problems received articulate expression from members of the American Society of Mechanical Engineers, organized in 1880. Henry R. Towne's

paper, "The Engineer as Economist," read before that society in 1886 is generally regarded as the beginning of the management movement. From then until the rate case hearings of 1910 the management movement was essentially a concern of engineers exclusively, and its scanty literature was to be found for the most part in engineering periodicals. At first it devoted particular attention to differential wage systems; then it stressed cost finding, its third and major emphasis, beginning about 1900, was on organization and system. These phases of management were not considered as fundamentally related; their significance was not generally perceived and they had only moderate influence.

As a gang boss, or assistant foreman, in the 1880's in the machine shop of the Midvale Steel Company Taylor made initial attempts to secure the desired output by imitating the then conventional pressure method of foremanship; the result was a conflict with the workers. He reached the conclusion that the causes of such conflicts were, on the one hand, workers' fear of economic insecurity and distrust of management and, on the other hand, management's ignorance of what it had a right to expect as a reasonable day's work. Opposition and waste, he held, were caused by use of force in place of knowledge in securing output. At first Taylor saw no farther than the individual workplace. His objective was measurement and specifications of a proper day's work for each operation. The unit of measurement was time per operation-unit; the tool of measurement, the stop watch. Experiment with all the variables under control—shafting, belting, machine adjustments, tools, disposition of materials—led to the discovery of a most productive condition for each element and for all combinations of them. This made possible two to threefold increase of output without additional effort, in fact, with less effort, on the part of workers. Taylor then perceived that the problem involved more than the workplace, that at all workplaces the specifications derived from a perfectly conditioned experimental machine should be utilized. Instead of following the line of least resistance and modifying the specifications to fit existing conditions, he sought a means whereby all machines could be tuned to the same degree of efficiency as that of the experimental machine and for this purpose appointed a specialist foreman to attend to their conditioning and maintenance. This made practicable the use of standard specifications for any operation on any machine and

marked the emergence of research, the substitution of known and constant for variable factors, and standardization and functional foremanship as elements of a technique of management. But more was to follow; Taylor soon realized that he was in a position to know in advance when work was due to come off machines and therefore could calculate prospective available machine capacity. This made it practicable to plan and prepare the drawings, materials and tools for future operations and thereby to eliminate the between operation wastes of idle machine and man time; in short, to effect a coordination of operations and a flow of work. He found it necessary to institute special training to secure most effective performance and coordination of all operations at each workplace and to maintain the interest and good will of operatives; for if these are lacking, any scheme of group performance dependent on coordination of complementary specialized efforts is impotent. Thus to measurement and standardization as elements of managerial technique were added planning, preparation, training and cooperation. These required extension of the use of functional (instructional) foremen, for by now the various managerial tasks had to be entrusted to trained and responsible specialists. Foremanship was thus transformed from the issuing of arbitrary orders to the teaching of standard practises.

Formulation of principles was not undertaken until after the technique had been tested and refined; but this embryo scientific management, developed in the production department in the 1880's, expressed all the principles which have since been applied in all departments of industry. It was the stimulation of contacts with the management movement which led to formulation of principles. Taylor's early statements of principle have been expanded with experience and may now be summarized as management research, standards, control and cooperation.

Research, investigation and experiment, with their processes of analysis, measurement, comparison and the like, constitute the only sound basis for determinations of purpose, policy, program, project, product, material, machine, tool, type of ability or skill, method and other factors and the coordination of these in purposeful effort. If the results of research, investigation and experiment are to be useful to an enterprise, they must be made available to executives and workers in the form of defined and published standards in management terminology which serve as common goals, facilities

SCIENTIFIC MANAGEMENT IN APPLICATION TO A TYPICAL INDUSTRIAL ENTERPRISE

| PRINCIPLES | APPLICATIONS TO | | | | | | |
|-----------------|--|--|---|---|--|--|--|
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| | WORKPLACES | PLANT AS A WHOLE | OFFICE | PERSONNEL | MARKETING | FINANCE | GENERAL ADMINISTRATION |
| RESEARCH | Studies in design, size and capacity of equipment, behavior of materials, skills, operation times, motions, methods and arrangements. | Studies of the relations of the various work-places and of the most effective co-ordination and proportioning of them under varying conditions of kind and quantity of orders flowing into the shop. | Studies of a nature similar to those at the shop workplace and in the shop, but concerned with the particular facilities and the particular operations pertinent to correspondence, recording, transcribing, filing and so on | Studies in mental and manual aptitudes, personality requirements of various jobs, fatigue, individual and group mental and emotional reactions, education and training, the development of good will. | Studies of markets, consumer demand, competition, channels of distribution, methods of selling, sales promotion. | Studies of capital market, trends of credit and collections, prices of speculative material., financial ratios and costs, securing many data from operating departments. | Studies of trends: social, general and of the particular industry, development, competition, financial conditions and pertaining to coordination of operating departments. |
| STANDARDIZATION | Specifications of product, materials, machines and tools, methods of their use, working conditions, procedures, times and wage rates for every operation. | Production schedules: specifications relating to coordination and sequence of operations and conditions of most effective use of available equipment and labor skills. | Specifications concerning clerical procedures and the uses of office equipment and different skills. | Specifications relating to personality requirements, hiring, assignment, training, promotion and discharge, personal and group relations and wage policy. | Sales schedules: specifications concerning quotas, channels and methods of selling (methods of distribution), sales promotion, prices and terms. | Specifications in terms of the standard financial ratios and standard costs. | Specifications of policy, projects, plans, master schedules and budgets, operating ratios and trade relationships. |
| CONTROL | A basic distinction is made, for the enterprise as a whole and in each constituent department, between the functions of planning and execution. The planning functionaries analyze every objective (orders to be filled or other objectives) and assemble the particular combination of specifications relating to product, quantity, quality, materials, machines, tools, skills and procedures, for most precise, effective and economical accomplishment of the objective. The executing functionaries carry on the activities called for by these specifications in accordance with detailed standards of execution. | | | | | | |
| COOPERATION | Cooperation is promoted by the combination of all factors in the total situation: understanding and acceptance of the common purpose; instruction and the understanding of details; acceptance and performance of complementary responsibilities; proper selection, assignment and promotion of personnel; provision of adequate facilities; just sharing of the joint economic rewards; cordial personal relations; steady provision of work to be done. | | | | | | |

and methods, replacing chance and variable factors by constants in terms of which calculations and plans may be made. There must be established a systematic procedure, based on the defined standards, for the execution of work, a procedure which directs the researches, sets the standards, initiates operations, controls work in process and generally maintains conditions that

facilitate each specialized effort and coordinate all specialized efforts, to the end that the common objective may be achieved with a minimum of waste of human and material energies.

Durably effective management requires recognition of the natural laws of cooperation: the integration of individual interests and desires with group interests and desires and of indi-

vidual capacities with the requirements of group purposes; the substitution of the laws of situation for individual authority, guess and whim; and the recognition and capitalization of human differences, motives, desires and capacities in the achievement of a common purpose.

All these factors require planning on an extensive, coordinated scale. Usually a separate planning department is needed in which the tasks are subdivided among different members of the managerial staff. The tendency is toward constantly greater specialization of functions.

As a consequence of the rate case hearings in 1910 scientific management promptly became a vogue in American industry. This was not without harmful consequences. Most industrialists conceived the new type of management as a mechanistic cost reducing device which could be bought and installed as is a machine; and this credulity made American industry a rich ground for superficial, inflexible systems of "efficiency engineers" whose historic place in management engineering is comparable to that of the quack and shyster in medicine and law. It has taken nearly twenty years for industry to learn that scientific management is not a mechanistic device ready for quick installation; that it is not so much a specific system of management as a mode of attack on the problems of a management situation. Although, because certain functions are common to all enterprises, analyses result in a common basic framework of management for all situations—research, measurement, standards, planning, preparation, inspection—in any particular managerial situation the research is adapted to its special problems, the resultant standards reflect the particular data and the control of operations must be designed to promote the application of the standards set. The integrated details of procedure resulting from the scientific management approach to any particular situation are seldom applicable to any other situation, for each has its exclusive elements which call for pertinent variation in procedure. Furthermore the system of management designed to apply to a particular situation cannot be "installed"; it must be developed by an educational process which takes time and which includes executives as well as workers.

Prior to the World War scientific management was concerned chiefly with production. This was a period of increases in population, wealth, consumption and prices; a sellers' market prevailed, in which the managerial problem was output. When the World War forced the United

States into a buyers' market with respect to most of its long established industries, other phases of management, such as marketing, labor relations and general administration, became dominant problems. In the post-war period, because of aggravated competition and lower profit margins, scientific management spread throughout industry. It broadened into a general movement for more rational utilization of materials, labor, machinery and apparatus and for the elimination of waste. There was a marked tendency for scientific management to become a matter of general principles, an approach to problems, rather than a fixed body of practise. Practise had to change because of the introduction of new techniques and processes, the increasingly automatic character of production and the tendency toward remote control; time and motion study itself became more and more a preliminary to the use of new machines and apparatus.

The mechanistic aspects of scientific management are not the same in all instances. In industries producing to individual specifications, e.g. conveying apparatus, the mechanisms of scientific management are numerous and visible, for operations in such industries have the largest number of variables to be standardized and controlled. In industries making successive lots of a standardized product variable only in minor details, as in the shoe industry, the mechanisms while less numerous are nevertheless apparent. In industries making a homogeneous synthetic product, such as canned food, or an analytic product, such as gasoline, on apparatus in series, mechanisms are barely noticeable; performance of their functions has been incorporated into specially designed machines which have a definite functional-capacity-time relationship.

Nor is this penetration of scientific management into all areas of management an indication of a corresponding penetration into all industries and establishments. As a research, educational and consequently an investment project it does not appear desirable to all owners. As a technique which brings executives as well as operatives under a "reign of law," it does not attract all executives. It does not appeal to owners and executives whose concept of the competitive process is the existence of variables for advantageous manipulation. For these reasons its influence on American industry has been uneven. It has had a profound effect upon the metal working industries but scarcely any upon coal mining and agriculture. It is used chiefly in production departments and only to a

limited extent in merchandising and general administration. Hardly a plant exists in which such mechanisms as time study and planning have not been utilized by production departments, but there are few plants which have incorporated scientific management as an integrated whole into all departments.

The associates of Taylor who contributed most to the technique of scientific management were Carl G. Barth, Henry L. Gantt and Frank B. Gilbreth. Barth, in close association with Taylor, had as much to do with the details of development, testing and perfection of mechanisms as Taylor himself, and the technique remains essentially as these two developed it. Gantt's greatest contributions were extension of the use of graphical method in recording performance and the task and bonus system of differential wage payment, accepted by many because it guarantees a day wage, pays a bonus for achievement of standard output but offers no incentive for excelling the standard. Gilbreth emphasized the study of motions and their classification into fundamental types and the use of the cinematographic method of motion and time study, which is superior to the stop watch for measurement of operations involving cycles of quick time units and for teaching manual skill. He also stressed the importance of fatigue. Harrington Emerson, although not an associate of Taylor or a significant contributor to the technique, was an outstanding expositor and popularizer of the philosophy and principles.

The social philosophy of scientific management, contrary to common assumption, has not changed essentially during the fifty years of its development, although the expressions of its philosophy have been modified *pari passu* with general change in perception of social values. Scientific management originated in a period of frontier striving for subsistence and competence, when the "full dinner pail" was the ideal of American effort and when the chief objective of scientific management was to increase the workers' earnings. It assumed leadership after the turn of the century in the growth of sentiment favoring more cooperative relations in industry, and scientific management plants were pioneers in developing personnel management and improved industrial relations. More recently its proponents have led in working out means of securing workers' consent and participation in management, a natural development after experience with a technique which is essentially a discipline in cooperation. The specific instances

in which management and labor have joined in the formulation of better procedures have generally been under scientific management auspices. In current discussions by those who advocate social regulation of investment and production under some form of national economic planning the scientific management principles of research, standardization and planning are carried over into the hypothetical mechanism of social control.

The controversies in scientific management have centered about the relations between management and labor. In plants where scientific management has been developed there is a notable absence of controversy. This cannot be said of the influence of "efficiency engineering." Conflict between labor and scientific management has been in the field of doctrine. Immediately after the rate case hearings of 1910 the American Federation of Labor, which had paid no attention to scientific management during the preceding thirty years, initiated violent opposition. This opposition was due in major part to misunderstanding; it was based on experience outside the field of scientific management with wage plans which resulted in speed-up and wage reductions. The unions charged that scientific management was a device for speeding up workers. Such charges gradually ceased, for later observation disclosed that the opposite was the fact, that scientific management really undertook the first plant studies of industrial psychology and made avoidance of fatigue one of its major concerns. There was, however, a substantial basis for the fear on the part of craft unions that the researches of scientific management would make knowledge of craft skills common property of managements and would weaken the strength of workers who had a monopoly of such knowledge. Scientific management and automatic and quasi-automatic machines and machine controls have indeed proved that this fear was well grounded. For while craft unions depend upon relative stability of industry and occupations, these are continually changed by modern technology, of which scientific management is an aspect. What the unions did not at first perceive is that a greater potential power for workers than possession of an exclusive knowledge of craft skills is presented by the dependence of scientific management upon exceptional cooperation, producing a corresponding vulnerability to sabotage. With the realization of this fact and as a result of the cordial relations between managements and

workers during the rapid extension of scientific management required for adequate production of material for the World War, opposition on the part of unions disappeared. Today some of them are utilizing time study and other research methods of scientific management to procure data for use in negotiating with employers concerning output and wage standards under the National Industrial Recovery Act.

Scientific management has made some progress in Europe, particularly in the post-war period under the stimulating influence of the upswing in American prosperity. With the exception of a few noteworthy individual plants, it is not general in England and France; but in Germany scientific management was made an essential part of the rationalization movement in the years 1920-30. The most extensive application is probably being undertaken in the Soviet Union. In line with Lenin's idea that while it had certain harsh features of capitalist exploitation, its fundamental principles were of a progressive character Soviet industry is employing the principles of scientific management on an ever increasing scale.

SCLOPIS DI SALERANO, CONTE FEDERICO (1798-1878), Italian historian, jurist and statesman. Sclopis studied law at the University of Turin and entered the Piedmont public service as an official in the Ministry of the Interior. In 1831 Charles Albert appointed him a member of the commission which was to reform and codify civil, criminal and commercial law; Sclopis was active particularly in the subcommittee concerned with the civil code. From 1844 to 1848 he served as advocate general and in 1848 was named president of the commission to draw up the organic law for the press. In the first constitutional cabinet of that year Sclopis held the post of minister of justice and from 1849 to 1864 he was a member of the Senate, where he represented the conservative element. In 1871 he was appointed president of the Commission of Arbitration to settle the Alabama affair between the United States and England. According to current opinion the arbitration in question had a much greater significance than the scope of the controversy seemed to indicate, because it appeared to mark the beginning of a new era in international relations, inspired by the principle of peaceful adjustment of disputes between states.

Sclopis achieved recognition not only as a political figure but also as a legal scholar and

historian and after 1848 turned to intensive study. In 1833 he published the *Storia dell'antica legislazione del Piemonte* (Turin), which served as a basis for his more extensive *Storia della legislazione italiana* (3 vols., Turin 1840-57; 2nd ed. 1863-64). The latter consists of three parts: the first deals with the origin and sources of legislation in the various regions of Italy; the second discusses the development of legal institutions and gives a concise history of the more important laws from the thirteenth to the eighteenth century; while the third treats of changes in Italian legislation between the time of the French Revolution and the reforms of the princes in 1846-47. In this book Sclopis pointed out the general similarity of legal development throughout Italy. He also wrote a number of works on political history, including *Relazioni politiche tra la dinastia di Savoia e il governo britannico (1240-1815)* (Turin 1853), a study of the modern history of Savoy. Sclopis served as president of the Deputazione di Storia Patria and of the Academy of Sciences of Turin and contributed to the *Antologia*, the *Revue de législation et de jurisprudence* and the *Revue de droit historique français et étranger*.

SCOTT, CHARLES PRESTWICH (1846-1932), English journalist. Scott in 1871 joined the *Manchester Guardian*, of which his brother-in-law, J. E. Taylor, was proprietor, became editor of the paper in 1872 and chief proprietor in 1905. He was actively in control until 1929. He sat in Parliament as the representative of the Leigh division of Lancashire from 1895 to 1906 but never held office and rarely spoke in the House. His reputation was entirely bound up with the great paper which he found an undistinguished provincial journal but which under his masterful domination became the most powerful exponent of the Liberal idea in England and perhaps in the world. Indocinated from the cradle with the "dissidence of Dissent" and the gospel of Cobdenite Liberalism, Scott brought to the sphere of journalism a high gravity that gave to the *Manchester Guardian* a severe, even slightly ecclesiastical air. He was not

indifferent to the business side of journalism, and no newspaper ever maintained a higher standard of technical and literary excellence. But he held that journalism was a public utility service that must be administered with austere disregard of private interest. Against the modern tendencies of the popular press he presented an implacable front. In a famous declaration of journalistic faith he said, "Its [the newspaper's] primary duty is the gathering of news. At the peril of its soul it must see that the supply is not tainted. Neither in what it gives, nor in what it does not give, nor in the mode or presentation, must the unclouded face of Truth suffer wrong. Comment is free, but facts are sacred. Propaganda, so called, by this means is hateful. The voice of opponents, no less than that of friends, has a right to be heard. Comment is also justly subject to a self-imposed restraint. It is well to be frank: it is even better to be fair." When large issues were at stake and what he held to be the cause of truth and justice was in one scale and that of business advantage was in the other, he never hesitated. Scott was so often on the unpopular side that it might have been supposed that he had a perverse love of opposing the general current. That was not so. He had no passion for conflict for the sake of conflict and was never happier than when the victory of reason over prejudice was won. He took great business risks, not under the spur of emotion but with calculating firmness and full appreciation of the possibility of unpleasant consequences. His resolute opposition to the Boer War made it necessary for his house and office to be protected by the police against violence, and his advocacy of Irish home rule in 1886 gravely imperiled his business. His spirit never lost its eager quest for new kingdoms of the mind and wider horizons for human liberty. Scott's influence was not measured by circulation figures but by his appeal to all the best minds of his time all over the world and especially by the weight of his authority with public men of all parties and with the best elements of journalism in all countries.

L., *The Life of C. P. Scott* (London 1934).

SCOTT, SIR WALTER (1771-1832), Scottish man of letters. Both as a novelist and as a personality Scott helped to establish the pattern of values known as Victorian conservatism. Without too obvious preaching the Waverley novels manage to uphold a conservative way of life: the right is always on the side of loyalty to king and aristocracy, devotion to tradition, simple acquiescence in a hierarchically organized society, distrust of schemes for political reform. Scott even more effectively than Disraeli translated Burke for the multitude. A great deal of sentimentality, an acceptance of parliamentary supremacy, a fairly conscious use of the past to provide emotional compensation for the inadequacies of the shopkeeping present, a nationalism both Scottish and British, all go to make up the nineteenth century Scott, so different in these respects from Swift and Johnson, his predecessors as literary Tories. Scott has even a touch of optimism, an acceptance of change if not of progress, which makes him a good Victorian. Hazlitt and George Sand both found in him a profounder knowledge of human beings and therefore a profounder democracy than in the utilitarians. Ruskin coupled him with Homer as a master of true torism. Mark Twain blamed what to him was the sentimental chivalrousness and practical slovenliness of the Old South partly on the vogue of Scott's novels. In England Scott's wide political influence, although varied, was no doubt chiefly on the side of conformity with prevailing middle class standards.

On the continent his influence made itself felt primarily in the field of historiography. His wealth of picturesque local color, carefully selected with an eye to both the region and the period under consideration, far surpassed the tentative beginnings made in this direction by Chateaubriand in his *Génie du christianisme* and *Les martyrs*. The tremendous popularity of the Waverley novels and their success in recreating the temper and atmosphere of various periods made a deep impress upon the generation of romantic historians headed by Thierry and elevated the formula of "local color" into a cardinal dogma of early nineteenth century historiography.

SCOTUS, JOHN DUNS. *See* DUNS SCOTUS, JOHN.

SCRIPPS, EDWARD WYLLIS (1854-1926), American newspaper publisher. Scripps was born on a farm near Rushville, Illinois. After a brief period of schooling he went to Detroit, where he worked in various capacities on newspapers owned by his older brother, James. In 1878 with money borrowed from the latter he founded the Cleveland *Penny Press* (later the *Press*), out of which grew the Scripps-McRae League (with Colonel Milton McRae), afterward the Scripps-Howard chain. The latter at one time comprised thirty papers, read by some twenty million Americans.

Scripps began with the perception that nine tenths of the American public were underprivileged and that papers edited for them would gain circulation and advertising profits. On this economic theory he built the biggest personal fortune ever amassed by a newspaper owner in the United States. In his earlier career he championed the working man, right or wrong, but later he became conservative. Following the Pulitzer tradition as a publisher he made his greatest contribution to journalism in putting facts of the physical sciences within reach of the masses. He founded Science Service and endowed a college and a scientific research branch of the University of California.

Scripps avoided the notoriety which his papers thrust on others and was little known. After he took into partnership Roy W. Howard, the emphasis of his chain was less upon liberalism and more upon popular news. As a competitor of the Associated Press the Scripps-Howard chain organized the United Press, which in seventeen languages served papers in thirty-eight countries. Ill health forced Scripps to relinquish active control of his papers in 1920. In his will he provided for the growth of his newspaper institution by the stipulation that one third of the profits should go into expansion.

SCROPE, GEORGE JULIUS POULETT (1797-1876), English economist. A distinguished geologist, Scrope wrote copiously on social and economic questions and was a member of Parliament from 1833 to 1868. His social philosophy

was fundamentally liberal, although he was critical of laissez faire, stressing the value of institutional control. He emphasized the importance of establishing "rules for the guidance of mankind." He vigorously opposed the Malthusian theory of population, urging the possibility of increasing production, defending the poor law in principle and proposing the erection of public works and the development of insurance as means of dealing with unemployment. He criticized the gold standard and urged the advantages of a silver and especially of a managed paper currency. He was one of the first English economists to advocate the construction of a "tabular standard" designed for use in mitigating the evils of fluctuations in the value of money. Faulty monetary laws, he believed, aggravate the business cycle, in reality caused by psychological influences. Scrope employed the concept of equilibrium in his penetrating treatment of demand and supply. He was sharply critical of his "orthodox" contemporaries, particularly of their failure to accord capital a proper place along with labor as a source of wealth. Influenced by Samuel Read, he was one of the first English economists to analyze profits, in which he recognized four elements: interest, his "abstinence" theory—an improvement on Read's—preceded and probably inspired Senior's; insurance against risks, perhaps now for the first time clearly declared ultimately to cancel out with losses; wages of superintendence; and monopoly gains, including rent of ability, arising from exclusive advantages. Scrope's influence on subsequent economic thought was slight.

SEA POWER. *See* NAVY.

SEAGER, HENRY ROGERS (1870-1930), American economist and social reformer. Seager studied at Michigan, Johns Hopkins, Halle, Berlin, Vienna and Pennsylvania universities and taught eight years at Pennsylvania and twenty-eight at Columbia. The individuals who most influenced his interests and thinking were Böhm-Bawerk, Ely and Patten.

Although Seager published a widely used text on economic principles, his enthusiasm was aroused principally by practical problems, and his chief contributions were in the field of labor and of trusts. The chapters on such problems in his elementary text are quite generally considered the best brief treatment available, while most students believe that no more persuasive statement of the case for social insurance can be found outside Seager's volume. The changes in public policy toward corporations and trusts for which he contended throughout twenty-five years are in process of incorporation in state and federal statutes.

Seager engaged in a variety of public and professional activities. He was organizer and third president of the American Association for Labor Legislation, vice chairman of the Wainwright Commission on employers' liability and workmen's compensation in New York, secretary of the Shipbuilding Labor Adjustment Board during the World War, secretary of the President's Second National Industrial Conference of 1919-20 and president of the American Economic Association in 1922.

Seager's painstaking devotion to his students' interests brought him a respect, admiration and love rarely equaled. Through them and through his public activities his influence on American economic thought and institutions would have been great and permanent had he never published a line.

SEAMEN. The seaman on shipboard forms part of a miniature society whose members are carefully organized for purposes of discipline, division of labor and centralization of authority and responsibility. All of these ends are furthered by the hierarchy of shipboard life, which progresses from a diversity of lower ratings, or positions, through a smaller number of petty officers and the several mates and engineers and finally terminates in the master, or captain, who wields supreme authority while at sea. A more elaborate division of labor is achieved, however,

by adding to this horizontal classification a vertical division of the ship's company into three departments; namely, deck, engine room and catering. Each department contains from three or four to fifteen or twenty ratings, depending upon the size and type of vessel, and in larger craft there are often many individuals under a given rating. Modern luxury liners also carry a miscellaneous group of persons including musicians, barbers, manicurists, retail shop attendants and the like; but these have small claim to consideration as marine workers.

Because of the peculiar conditions of his existence on both land and sea and the multiplicity of special labor problems arising from his occupation, the seaman has been regarded, both in fact and in fiction, as *sui generis*. With the exception of the past few decades, during which the advent of steam and oil has made possible shorter and more regular voyages and therefore an approach to a normal manner of living, the great maritime peoples of the world, no matter how far apart chronologically or geographically, have produced a seaman class differentiated unmistakably from the landsmen. Whether because of economic necessity or opportunity, these great seagoing groups have come for the most part from a relatively small number of geographical areas—witness the roles played in maritime history by Phoenicians, Greeks, Venetians, Genoese, Catalans, Basques, Scandinavians, English, Dutch, Portuguese, New Englanders, Japanese and the natives of Dalmatia, of Goa and the Chittagong coast in India and of Ningpo in China.

Throughout many centuries living conditions for seagoing labor were hard in the extreme. Voyages were long, uncertain and treacherous, beset with dangers and replete with tedium. Not only were storms particularly severe on the relatively small sailing vessels, but the possibilities of shipwreck, drowning, starvation, fire, stranding and capture by pirates, savages or hostile peoples had also to be faced. Even if none of these dread eventualities occurred, a voyage might bring accident or disease to the individual. Accidents were so common as to place the seaman near if not at the top of the list of those engaged in dangerous callings, and the surgical means of dealing with them were often appallingly primitive. Until the use of lime juice and other anti-scorbutics became common in the nineteenth century, scurvy was perhaps the most spectacular of seamen's diseases; but many other maladies, led by pulmonary, digestive and skin

disorders, were very common on shipboard. Venereal diseases belong in a separate category; but whether because of the seaman's recklessness or because of his peculiar circumstances they too were well represented in the forecastle and virtually untreated. Only since the so-called Brussels Agreement of 1924 have some of the leading maritime nations made international provision for the free, systematic and scientific treatment of venereal diseases in the merchant marine.

In some countries these hardships of seafaring life served as a challenge to whet the appetites of young, vigorous and ambitious men for adventure and a sight of strange places. But as in other trades poor jobs attracted poor workers, until many forecastles were filled largely with the scourgings of the earth. The frequent tyranny of the master and mates was another cause for this low caliber of the men before the mast, although it was to an extent an effect as well. The "packet rats" of the Atlantic sailing ships of the early nineteenth century may have been desperate characters, but they were certainly not softened by the "bucko mates" who kicked and bullied them into submission rather than discipline, and who not infrequently maimed and occasionally murdered them. Discipline in fact was sometimes mistaken by the bridge for cruelty and license. In certain mediaeval codes actual dismemberment was countenanced as a punishment for specified offenses; while flogging, one of the most barbarous punishments of modern times, persisted well into the nineteenth century.

At best the life of a foremast hand on a sailing vessel was a mixture of monotony liberally spiced with danger and hardship, poor food, cramped quarters, exposure, long hours and complete subjection to the wills and whims of the officers; at its worst it was hell afloat. It is small wonder, then, that during his relatively brief spells ashore between voyages the common seaman sought to forget the limitations of his workaday world in a mood of reckless irresponsibility and a round of wild dissipation. Being for the most part an untutored person, he might in any case have looked for low pleasures and amusements. But he was spared that trouble by the crimp and his associates, the runner, the prostitute and the boarding house and saloon keeper, who thrust before him temptations which appealed to his basest instincts. Under the commercialized organization of water front pander developed during the nineteenth century

the seaman on shore was systematically overcharged, cheated and robbed, and finally, when his accumulated earnings were gone, the crimp, acting as a self-appointed shipping master, would find a berth for him on an outgoing vessel.

As part payment for his alleged services in these matters the crimp would usually cajole or bully the seaman into signing an advance note and an allotment of wages, both preferred charges against anticipated earnings and both payable by the owners directly to the crimp. If these ordinary methods of recruitment proved insufficient, resort was sometimes had to shanghaiing, virtually a method of kidnaping. Any strong looking man seen near the water front might be overpowered, drugged or beaten into insensibility and delivered on board an outgoing vessel in need of hands.

When viewed from the standpoint of labor problems shipboard life presented difficult and peculiar aspects as well as many serious abuses. The twelve-hour day, in the form of "watch and watch," with rest as well as work broken every four hours, was well nigh universal. Forecastle accommodations, always small and ill ventilated, were at best inadequate and at worst degrading. Food, seldom passable even according to contemporary standards, often was fit only for beasts as regards quality, preparation and manner of serving. With the exception of whaling vessels, which required large crews for special purposes, undermanning was common; and until the spread of load line legislation in the nineteenth century, it was frequently accompanied by its twin evil overloading. Deck loading, especially common in the lumber trade, was a peculiarly hazardous form of overloading which constituted a grave menace to the safety of both ship and crew. In fact it is probable that the highly developed system of marine insurance, extremely desirable and on the whole socially beneficial in other respects, was in part responsible for the equanimity with which certain owners allowed their vessels to go to sea in spite of danger signals, which in addition to undermanning and overloading often included bad stowage, inadequate repairs and insufficient equipment.

Against these abuses the seaman had but scanty means of protection, aside from the frequently attempted but desperate and misguided remedy of desertion. True, in the leading maritime countries the law showed more and more concern for his welfare and chose to regard him in certain respects as a ward of the state, in-

capable of looking after his own interests. Provisions regulating the more important aspects of his work, such as those regarding engagement, dismissal, pay, discipline and repatriation, were embodied in articles of agreement which both master and crew were compelled to sign before each voyage; and courts and consuls were charged with certain special protective functions. But the law was hampering and restrictive as well as paternalistic, and judges were unfavorably impressed by the seaman's obvious ignorance and dislike of the ways of a court room; while consuls were often skeptical, suspicious and exasperated by his irresponsibility.

Collective self-help by means of the strike and collective bargaining presented even greater difficulties. Not only were the crews drawn from a jumble of races and nationalities, but they were constantly faced with the danger of unemployment as the result of economic pressure on the water front by low grade land labor. Only a small percentage could be in port at any one time, and then as a rule they were in no mood for sober consideration. And, finally, there was believed to be a certain incompatibility between the principles of labor organization and the necessity of maintaining discipline and undivided authority at sea.

Within the past three quarters of a century, however, the supplanting of sail by steam has revolutionized the entire technological and economic organization of the shipping industry; and this transformation, coupled with the far reaching effects of the industrial revolution on shore, has brought with it profound changes in the conditions of life and labor for the seaman. The use of steam has accounted for larger, faster and stancher vessels as well as for shorter and more regular voyages. These changes in turn have meant less danger, exposure and hardship, larger quarters with better ventilation and sanitation, greater variety and better quality of food and a more impersonal and less brutal relationship between bridge and forecastle.

On the other hand, steam, aside from having robbed seafaring life of certain vaunted qualities of beauty, adventure and romance, has displaced the old skilled and experienced sailors and substituted for them a multiplicity of specialized workers ranging from highly trained technicians to menials. Steam has been responsible also for the coal bunker and the dread stowchold. However, the recent growing shift from coal to oil has replaced the sweating, swarming firemen and coal trimmers with a smaller number of

machine tenders working under far cleaner and more comfortable conditions. But this improvement, in turn, has given rise to mounting unemployment around the shipping offices.

Wages for seafarers are still low. The following average monthly wages for certain selected American ratings on private cargo vessels were reported by the United States Bureau of Navigation for January 1, 1932: able bodied seaman, \$56; ordinary seaman, \$41; boatswain, \$69; carpenter, \$73; fireman, \$59; coal passer or wiper, \$49; chief steward, \$116; cook, \$95; second cook, \$72; messboy, \$39. In England, Holland and the Scandinavian countries wages were consistently lower, while those received by most other continental marine workers were still smaller.

Modern conditions have prompted more adequate provisions for the training and certification of maritime workers. Masters, mates and engineer officers are required to possess certificates which in most important countries are granted only after rather searching examination; and even the A. B. certificate for able bodied seamen presupposes a combination of skill and experience which gives its holders a recognized status. The merchant marine schools, established in modern times in order to aid candidates in preparing for these various tests, are sometimes private commercial ventures and sometimes institutions operated under governmental auspices or with a government subsidy. In some instances school ships for cadets or apprentices have been provided, for a growing recognition of the importance of merchant seamen as naval reserve auxiliaries has caused many governments to take an active interest in their training and working conditions.

A much stronger impetus along these lines, however, came from the seamen themselves, who finally succeeded, during the twentieth century, in creating a number of significant and occasionally powerful labor organizations. Noteworthy among these are the National Union of Seamen of Great Britain, which had a membership of 60,000 in 1928; the International Seamen's Union of the United States, which had a membership of 66,000 in 1920 but only 15,000 in 1931; and the closely allied Scandinavian unions and the French, Dutch, Belgian and Australian and New Zealand organizations. Most spectacular in its rise has been the Japanese Seamen's Union, which in little more than a decade has grown from a few loosely connected local groups to an organization including prac-

tically all eligible Japanese maritime workers. Out of approximately 120,000 Japanese seamen in the merchant marine in May, 1930, 89,000 belonged to the Japanese Seamen's Union.

In striking contrast is the position of other Asiatic seamen, who are still virtually unorganized. Bombay, Calcutta, Canton, Hongkong and Shanghai it is true have small seamen's unions: but the great mass of Lascars, Chinese, Filipinos, Javanese and Goanese are still untouched by trade unionism. In fact the conflict of standards between Asiatic and occidental seafarers promises to become one of the most troublesome maritime problems of the future.

Other problems are involved in the current struggles between the conflicting economic and political philosophies of fascism, socialism and communism. In the field of maritime labor fascism is aggressively represented by the Italian and German groups; socialism has been supported chiefly by the International Transport Workers' Federation, an influential organization whose seamen's section has been materially weakened by the defection of the German unions; while communist propaganda is being carried on among seamen the world over, in the hope of making converts amid the depressed and often desperate conditions along the water front. But in spite of some progress and an occasional spectacular if temporary success the Russian seamen still remain the only important group definitely subject to communist control. In certain respects the working and living conditions in the Russian mercantile marine represent distinct advances over those prevailing elsewhere. Perhaps the most important of these is the provision which empowers the members of the crew to elect ship's delegates, who are authorized to confer with the captain regarding a variety of shipboard problems and whose advice the master is required to seek under some circumstances.

In many countries deck and engine room officers have perfected separate organizations, which are often sympathetic with those of the seamen and sometimes cooperate with them; a number of such groups have formed the International Association of Mercantile Marine Officers. Shipowners too are usually organized along national lines; and in a few instances, notably in the national maritime boards of Great Britain and of Japan, formal provision has been made for periodic negotiations between the various groups representing owners, officers and seamen.

Conditions affecting the health and welfare of

seamen have long been so bad as to arouse the solicitude of numerous social, religious and philanthropic organizations. Missions to seamen, seamen's homes or seamen's branches of the Young Men's Christian Association exist in most of the large ports of the world. In recent years, however, emphasis has shifted from religious to educational and medical activities. Thus the Seafarers' Education Service of Great Britain is building up an elaborate system of carefully selected floating libraries, which are passed on from ship to ship, and is fostering both serious reading programs and definite educational facilities; and the League of Red Cross Societies and various organizations for combating venereal diseases, tuberculosis and other widespread maladies are showing more and more interest in both shipboard and water front conditions. These newer points of view were brought to a focus in 1929, when a special conference on the health and welfare of seamen was held in Geneva only a few days before the third maritime conference of the International Labor Office took up the same general topic as the third item on its agenda.

Undoubtedly, however, the most far reaching influence upon the working conditions of seamen is exerted by the elaborate structure of maritime law which has grown up in all important nations. Such legislation is both a hindrance and a protection; it restricts the freedom and bargaining power of the seaman, while at the same time it protects him against many abuses and sets important minimum standards for his safety and welfare. In their present form these maritime codes reflect the demands of seagoing labor, backed by relatively slight political power and a strategic use of the limited right to strike, the pressure of commercialized shipping interests, the necessities of navigation and the growth of humanitarianism. But essentially they represent also the modernized form of a long series of maritime codes which go back for many centuries and which have always emphasized the necessity and the right of special legislation for seafarers.

Four major lines of development may be discerned in tracing this evolutionary process. The Mediterranean codes began in antiquity, when the status of the foremast hand (or galley rower) was commonly that of the slave. The Rhodians developed the most important code of the pre-Christian era, and this was later taken over almost bodily by the Romans and given widespread jurisdiction under the title of the Rhodian

Sea Law. Still later the mediaeval Italian city-states managed to maintain and to enforce, under special legal officials known as consuls of the sea, separate codes, such as the *Ordinamenti di Trani* and similar legislation at Amalfi and elsewhere. Such city-state laws finally culminated in the widely respected *Consolato del mare* of fourteenth century Barcelona.

A second major concept emerged in the Baltic basin, where the manorial status of lord and serf was used as the model for a master and servant relationship on shipboard. Best known of the codes in this region were the maritime laws of Wisby, which evolved into the highly influential regulations of the Hansa towns.

Quite another point of view, differing fundamentally from the two preceding, developed along the Norwegian coast, where the seaman was regarded as a full fledged freeman who was a fellow voyager and often a fellow merchant of the captain-owner. In this region democracy in the affairs of shipboard life was carried as far as the safety of the cargo and the purposes of the voyage would permit, but this concept disappeared after about 1400, when the Danes imposed the master and servant relationship upon Norwegian seafarers.

The fourth and perhaps the most influential source of modern maritime law was found in the Rolls of Oléron, which contained interesting modifications of the leading ideas in both the Mediterranean and the Baltic codes as well as some traces of the Norwegian law. The master and servant concept and its implications, however, clearly predominated; and it was this fundamental relationship, shorn of some of its most barbarous mediaeval punishments for infractions of discipline, which lay at the base of all the national navigation laws which gradually supplanted the earlier regional codes during the era after 1500.

In spite of a slow process of amelioration and enlightenment it was not until the end of the nineteenth century that reasonably adequate national maritime laws came into operation. Perhaps the first to deserve such characterization were the essentially uniform Scandinavian laws of 1891-93 (extensively revised, again on a uniform basis, in 1922-24). These were followed closely by the monumental British Merchant Shipping Act of 1894 (amended in 1906) and the German Seamen's Act of 1902. Among the other recent national laws of particular significance were: the United States Seamen's Act of 1915, the French Code of Maritime Work

and the Disciplinary and Penal Code for the Mercantile Marine, both of 1926, and the Soviet special regulations issued by the Commissariat of Ways and Communications on March 20, 1924.

The Soviet code is naturally the most revolutionary. But within the framework of modern capitalism the other two both allow and encourage far reaching changes. The French code embodies the highly controversial principle of the eight-hour day at sea, although with qualifications which permit the postponement of its full enforcement until it has been accepted also by France's main shipping rivals; while the American seamen's act combines a number of the most advanced provisions known to maritime law.

Foremost in the American law are the two supplementary clauses which abolish arrest and imprisonment as a punishment for desertion, leaving only the lighter penalty of forfeiture of effects on board and of unpaid wages, and also empower the seaman to demand one half of the wages due him whenever his vessel is in a safe harbor. Still more significant is the fact that these radical departures from previous practise apply not only to hands on American vessels, wherever they may be, but also to all seamen on foreign vessels in the United States. Other noteworthy provisions require: that three fourths of the members of the crew be able to understand any orders given by the officers—an effort to prevent the shipping of foreign speaking hands, especially Asiatics, to whom orders are commonly given through an interpreter; that 65 percent of those in the deck department be able seamen, including a prescribed number of certificated lifeboat men; that advance notes be made illegal and that allotments of pay be restricted to near relatives; that corporal punishment be prohibited; and that elaborate regulations be observed for the safety of vessel and crew and for the improvement of food scales and of living quarters.

Provisions essentially similar to the last three items in this list are to be found in the modern codes of most important maritime nations; and definite governmental agencies are charged with the task of interpreting and enforcing legislation, which assumes more and more responsibility for the protection of the seaman and his interests. But since the problems of seagoing labor are peculiarly international in their implications, the International Labor Office has assumed, during the past decade, a position of outstanding

importance in this field. Three special maritime conferences have been held and have resulted, up to 1933, in seven draft conventions, each of which has been ratified by from twelve to twenty-five nations. These draft conventions are concerned with the fixing of a minimum age for the employment of children at sea, the establishment of facilities for procuring employment for seamen, unemployment indemnities for seamen in case of loss or foundering of their ships, the setting of a minimum age for the employment of youths as trimmers or stokers, compulsory medical examination of children and youths employed at sea, seamen's articles of agreement and the repatriation of seamen. Numerous recommendations and resolutions have also been adopted, including a proposal for the establishment of an international seamen's code, and much has been accomplished in gathering and publishing important documentary material. It is quite probable that Geneva will lead the way in attacking the great maritime labor problems of the near future: cyclical and technological unemployment, the eight-hour day, wage and manning scales, international competition, social insurance and the numerous requirements of health, education and welfare.

SEARCHES AND SEIZURES. The law of search for evidences of crime may be traced back to very early periods in the history of modern legal systems. Formalities governing the search for stolen goods—this at first was the only form of search—are to be discovered in Greek, Roman and Germanic law. There were indeed striking resemblances in these formalities among all the Indo-Germanic peoples. Since they were intended to safeguard the person whose house was being searched against a malicious planting of the stolen goods, various degrees of nudity on the part of the searcher were commonly prescribed. The search for a long time was a regulated private search. Private search supervised by some public official represented a transitional stage. Only after the development of a public criminal law did the search tend to become entirely official. With the spread of writing and printing the search for documents became as important as the search for stolen goods or other physical objects of crime.

Phases of this line of development may be followed in the history of English law, where the issue of searches and seizures became earliest a subject of constitutional struggle and led to the maxim that every Englishman's home is his castle. The early common law did not recognize search warrants, but they crept into the law, as it is said, by "imperceptible degrees" for the purpose of searching for stolen goods. With the growth of the inquisitorial procedure of the Star Chamber there grew up, however, a practise of

allowing the secretary of state to issue general warrants for the search of libels. The power was expressly conferred by the licensing acts, but it survived their expiration. The issue of searches and seizures came to a head in the 1760's when John Wilkes and certain others were arrested for seditious libel. Out of these proceedings two important rules of law emerged. The first concerned the validity of general warrants; the second the validity of special warrants to search for and seize private papers.

The warrant under which Wilkes was arrested was issued by Lord Halifax, principal secretary of state under George III, ordering all "His Majesty's officers, civil and military, and loving subjects whom it may concern" to "make strict and diligent search for the authors, printers and publishers of a seditious and treasonable paper" and to bring them in "together with their papers" for examination. A search warrant could scarcely have been phrased in more inclusive terms. The question of its validity was not passed upon in the Wilkes habeas corpus proceeding which followed, nor was it clearly determined, although it was discussed both by counsel and the justices, in the damage suit of Dryden Leach against three of the king's messengers. Shortly after these cases, however, the House of Commons by resolution declared all general warrants to be illegal "except in cases provided by act of Parliament."

In *Entick v. Carrington* [19 Howell's State Trials 1030 (1765)], on the other hand, it was emphatically held that a warrant in libel, even though it named the person to be arrested, was void if it directed the search and seizure of his papers. Lord Chief Justice Camden rejected the notion that such a search was assimilable to a search for stolen goods; and to the allegation that such warrants had been issued by the secretary of state without objection since the Revolution of 1688 he replied that uncontested practises were "precedents without weight" and that general submission by booksellers "had been a submission of guilt and poverty to power and the terror of punishment." The judgment in this case was likewise followed by a condemnatory resolution of the Commons.

James Otis' thundering condemnation in Boston in 1761 of the odious writs of assistance, "instruments of slavery on the one hand and villainy on the other," preceded by two years the arrest of Wilkes. The controversy over searches and seizures was therefore under way in the colonies before it came to a head in England.

But writs of assistance for the apprehension of smugglers and the seizure of customable goods were expressly authorized by act of Parliament, whereas the warrants involved in the English cases were sanctioned neither by the common law nor by statute.

The issue over writs of assistance was one of the flames that lighted the American Revolution. When therefore the state conventions that ratified the federal constitution in 1787-88 clamored for amendments that would safeguard individual liberties against the government, it was natural that protection against unreasonable searches and seizures should have been thought of. Hence the Fourth Amendment, which among others was proposed by the First Congress in 1789 and ratified by the states two years later: "The right of the people to be secure in their persons, houses, papers and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue, but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the person or things to be seized." Closely related to this declaration both in point of fact and in judicial interpretation is the provision against self-incrimination (*q.v.*) in the Fifth Amendment.

These provisions like others of the Bill of Rights protect the individual only against action by officers of the federal government. The United States Supreme Court, has, however, construed the rather vague and spacious guaranty of due process of law embodied in the Fourteenth Amendment, as applicable to state action, so that certain of the privileges and immunities that are contained in the first eight amendments to the constitution are now also protected against infringement by the states. But the right to be free from unreasonable searches and seizures has not as yet been expressly included under the expansive wings of due process. The constitutions of forty-seven states, however, contain somewhat similar, in many instances identical, provisions in their bills of rights. New York, where the guaranty is embodied merely in a statute, is the only exception.

"Unreasonable searches and seizures" is manifestly an elastic phrase, subject to no precise definition and therefore to considerable latitude in interpretation. The result is that American law upon this subject offers considerable diversity and tendency to vagary. Even where searches and seizures are admittedly illegal the problem of the best means of giving effect to the

constitutional guaranty presents itself. The federal courts as well as the courts of more than a third of the states have held the view that the only sufficient means by which the protection can be truly realized is by a refusal on the part of the courts to receive at trial evidence that has been acquired by the government as the result of an unreasonable search and seizure. This they hold is the only safeguard that will restrain over-zealous government enforcing officers.

A majority of the state courts, however, take a different view. They hold that evidence of crime is evidence no matter how it has been secured and that the culprit should not go free because his constitutional rights have been abused. As it has been put by Justice Cardozo, the criminal should not go free "because the constable has blundered" [*People v. Defore*, 242 N.Y. 13 (1926)]. The courts point out that the aggrieved citizen has other remedies against the offending officer. He may, for example, resist the officer who illegally invades his privacy or he may sue him for damages or prosecute him for oppression or ask that he be removed or otherwise disciplined by his superiors. But manifestly these are remedies that are ordinarily so remote from practicality that they render the constitutional guaranty very nearly nugatory in operation.

The federal rule itself is not free from contradiction. While the government may not use evidence which its own officers have "unreasonably" gathered, it may use evidence which anybody else has unreasonably secured, whether by theft or any other devious means. In this there is manifest inconsistency; for the protection is clearly intended to safeguard private persons and not merely to insure the integrity and discretion of officials. Of course a thief of evidence may be sued for trespass; he may also be prosecuted, but he is not likely to be if the government is availing itself of the fruits of his illegal venture.

Some searches are reasonable without warrants. Where, for example, a person commits an offense in the presence of an officer, incidental search and seizure are legal. A vehicle of transportation—a vessel or motor car—may likewise be searched without a warrant provided the searching officer has "reason" in advance to believe that the law is being violated. The theory is that such a vehicle, unlike a building structure, has a quick chance to get away and there is in consequence no time to waste upon securing a warrant. But the theory also is that the officer

must have had good grounds to justify his invasion. His search must not be merely exploratory. He must not act upon mere curiosity or even suspicion, and the fact that his search proves fruitful is insufficient to make it legal. In other words, he must have much the same grounds for action as would have been necessary to sustain his application for a warrant. But obviously this is legal theory that cannot with the highest of intentions be applied with exactitude or result in even handed justice. Apart from other considerations courts will disagree as to what furnishes reasonable grounds for searches of this kind, and there is no question that in practise many illegal searches are made and many searches are not made that probably should be.

On the other hand, even with a warrant there are searches that may not be made. Generally speaking, a distinction is drawn by the courts between contraband and non-contraband goods or articles. Gambling paraphernalia, prohibited liquor, burglars' tools, are put in one class. Papers that are of evidential value only are placed in another. The former may be searched for and seized, even destroyed. The latter, except in special circumstances, may not be. The theory here is that the former are evil in themselves—dangerous weapons, for instance. The latter are not. Here again there is a considerable element of fiction. Playing cards or even roulette wheels are not necessarily harmful. Private papers may result in greater harm to society than burglars' tools. The United States Supreme Court recognizes this by admitting that certain private papers may be sequestered under a warrant and used in prosecution—a contract, for instance, under which a fraud would be continued against the government.

National prohibition, in effect from 1920 to 1933, naturally resulted in vastly expanding judicial pronouncements on the constitutional guaranty against unreasonable searches and seizures. Indeed there were in that brief period an enormously larger number of cases on the subject than there were in the entire previous history of the United States. The result of the prohibition cases has been to make the law governing the guaranty about as muddled as it could be, which was probably inevitable. In a prohibition case the Supreme Court even held that wire tapping by the government did not violate either the Fourth or the Fifth Amendment [*Olmstead v. U.S.*, 277 U.S. 438 (1928)]. The issue, as in the case of most questions of

criminal procedure, involves the balancing of the interest in the general security against the interest in the protection of the individual.

The principle of inviolability of domicile has been accepted also by European democratic states. It was given currency by the French Revolution. Although no such general requirement as that of reasonable search is recognized and there have been few attempts to prohibit general warrants, other procedural safeguards have been enacted. These include such requirements as that a crime must have been committed before a search may be authorized, that only investigating magistrates or public prosecutors may institute a search, that the accused or his representative must be present at a search, that objects seized must be officially sealed, that warrants authorizing the search of the premises of parties who are not themselves involved in a crime must be specific, that privileged communications may not be seized in any search, that domiciles may not be searched in the nighttime. Such regulations are often buttressed by criminal penalties and when neglected may result in the nullity of the proceedings. Even in England in recent decades some exceptions to the issue of general warrants have been created by statute.

SECKEL, EMIL (1864-1924), German jurist. Seckel studied in Tübingen and Leipzig, and after several years of private research and visits to the libraries of Germany, Italy and Switzerland he settled in 1895 at the University of Berlin, where in 1901 he became professor. His chief interest, from the very beginning of his career, was the investigation of the manuscripts of the early mediaeval Roman and canon law. His numerous discoveries brought him recognition as one of the major authorities on mediaeval law.

In the field of the canon law Seckel devoted himself principally to Benedictus Levita, for the issue of whose work in the *Monumenta Germaniae historica* he worked thirty years and concerning whom he also published a long series of studies. He achieved fame as the result of the publication of the first volume of his *Beiträge zur Geschichte beider Rechte im Mittelalter* (Tübingen 1898), which is concerned with the role of the "popular literature" of the Roman-canon law in the period of the reception. His plan of an edition of the literature of the gloss was unfortunately made impossible by war and inflation. In the field of the classic Roman law his reputation rests upon his new edition of H. G. Heumann's *Handlexikon zu den Quellen des römischen Rechts* (9th ed. Jena 1907) as well as upon his co-editorship of Eduard Huschke's *Jurisprudentiae antequintimanae reliquias* (2 vols., 6th ed. Leipzig 1908-11). Although primarily a historian, Seckel was interested also in dogmatic studies and published a celebrated essay, "Die Gestaltungsrechte des bürgerlichen Rechts" (in *Festschrift . . . von Richard Koch*, Berlin 1903, p. 205-53), which dealt with the power to create legal obligations by unilateral acts.

In Seckel's time the investigation of the classic Roman law had been initiated primarily by means of the technique of interpolation. For this very reason, however, as Seckel perceived,

the study of the history of the Roman law in the early and late Middle Ages, which had been inaugurated by Savigny, was being neglected. Thus while assisting in the recreation of the classic Roman law, Seckel concentrated upon its history after the Justinianian codifications. His interest in both the Roman and the canon law as well as some phases of Germanic law was the result of his emphasis upon the close interdependence of all three systems in the mediaeval period. He aimed at the mastery of the whole mediaeval law, but his scientific ideals were so rigorous that he felt constrained to confine himself largely to the critical investigation of detail.

FRANZ SOMMER

Consult Genzmer, Erich, in *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte, Romanische Abteilung*, vol. xlv (1926) 216-63; Abraham, Paul, *Emil Seckel*, Bio-bibliographische Beiträge zur Geschichte der Rechts- und Staatswissenschaften, Abteilung Rechtswissenschaften, no. 1 (Berlin 1924).

SECKENDORFF, VEIT LUDWIG VON (1626-92), German cameralist. Seckendorff studied at Strasbourg and in 1646 entered the service of Ernest the Pious, duke of Saxe-Coburg-Gotha, holding various offices until his appointment to the chancellorship in 1663. Between 1664 and 1681 he served as chancellor under Duke Moritz of Saxe-Naumburg-Zeitz and eventually became privy councillor under Frederick III of Brandenburg.

In the eighteenth century Seckendorff's principal work, *Teutscher Fürsten Stat* (Hanau 1656; new ed. by A. von Biechling, Jena 1754), was the most popular manual of German politics, and even today he is commonly rated the most important of the German cameralists. It seems clear, however, that he is significant for his elaborate discussion of administrative organization rather than as a formulator of economic policy. In general approach a moderate absolutist, he viewed government as a patriarchal relationship between the people and the prince, who reigned by divine grace and was obligated to rule directly and personally. After discussing government under four major aspects—the preservation of power, the introduction of good laws, the maintenance of the judicial system and the utilization of all agencies of coercion—the *Fürsten Stat* proceeded to a systematic analysis of public finance. It explicitly denied the right of the prince to all wealth in his domain and drew a distinction between the regalia, which were owned exclusively by the prince, and

property belonging to the state. Taxes might be levied, but only to provide extraordinary income, and justice should be insured by the drawing up of a tax register and the observance of the principle of ability to pay. Seckendorff also advocated the establishment of a special bureau to control both princely and state revenues and expenditures.

Although an enthusiastic proponent of mercantilism and an antagonist of guild organization, Seckendorff still echoed the mediaeval solicitude for plentiful subsistence, stressing from this point of view the dangers inherent in the policy of promoting an unlimited increase of population. In denouncing the debasement of coinage he arrived, by an empirical process of reasoning, at the principle of Gresham's law. Characteristically he disapproved both of alchemy and of the export of money for luxury purposes.

Seckendorff's second important work, *Der Christen Stat* (Leipzig 1685, new ed. 1743), represented an indictment of atheism written under the strong influence of Pietism. Here he developed his defense of the Erastian doctrine concerning the subordination of church to state. In a supplement entitled *Unmassgeblich Bedencken von der Beschaffenheit und Gebrauch der Landes-Defensionier* he was the first German to embrace the idea of universal and compulsory military service. Seckendorff is notable also as the outstanding cameralistic advocate of general education; in the *Fursten Stat* he outlined a complete system of graduated national instruction.

SECRET SOCIETIES. In the light of recent data the assumption of the evolutionary and comparative schools of anthropology that the secret society represents a recurrent or unavoidable stage in the development of culture, among all ethnic groups, cannot be substantiated. The evidence points to three centers of occurrence and perhaps diffusion of the typical secret society, considered as an integral constituent of primitive life. These are respectively Asia (Melanesia, New Guinea and eastern Indonesia), the west coast of Africa, and North America, especially among the Zuñi and Pueblos of the southwest and the Kwakiutl of British Columbia. Related institutions among widely dispersed peoples exhibit parallelisms of great variety, such as clubs, bachelor lodges, guilds, initiation groups, bush schools, age groups and totemic organizations, to the degree that they are characterized by a surrounding cloak of secrecy, at least as regards other members of the same tribe, clan or other more inclusive unit of social allegiance and relationship. As a rule secrecy is employed for more effective control over non-members and the uninitiated or for more stringent maintenance of the internal solidarity of the group of individuals who have discovered or built up common interests. In this way the secret society eventually comes to represent unique and discrete interests which are in conflict with the traditional bonds of allegiance of the individual or with vested interests in the case of the more highly developed economies. Admission to the society is usually in the nature of a voluntary act for the individual, at least as compared with his inclusion in a consanguineous union as the basis of social organization. Rivers' theory that secrecy is necessarily superimposed upon groups entering alien cultures or practising prescribed rites has a limited application, as the esoteric is often the badge of defense of a challenged or expiring culture.

Secret societies take on diverse functions in different areas, depending largely upon the major orientation of the cultures. Frobenius and others posit magical or religious prepossession as the basic motivating force behind secret societies. The influence of the supernatural power of ancestors and of totems is, however, usually invoked only as a sanction or as a more potent avenue of approach to the solution or alleviation of more material and mundane problems, such

as the quest for food and the maintenance or restoration of fertility, health and general welfare. The ceremonial of the cult is introduced as a reinforcement to some more worldly concern of the members of the fraternity or as a prophylactic measure to insure success for its desires. Connection with magic and religion cannot be regarded therefore as unconditionally basic to secret societies, except in instances where charms, spells and the whole paraphernalia of the technique of magic become forms of wealth offered for sale and purchasable from the group which has surrounded its exploitation with jealously guarded secrecy. In the case of the Ibo of west Africa the blacksmiths have formed a guild which is hedged about with all manner of magical aperturances, but the prestige of membership inheres chiefly in the title of smith; many secure membership and the title without understanding the practise of the craft, but a unique, discrete interest still underlies membership and is the *raison d'être* of the group. In the case of modern fraternal societies, with their trappings of esoterism, the ceremonial becomes the chief function of the organization, because the latter has lost its position in the culture of the society in which it is found.

Van Gennep selected as the chief token and import of the secret society the rites and ceremonies of separation from the former social allegiance and the aggregation to the fraternity—a sort of death and resurrection of the personality. Hutton Webster somewhat similarly is led to identify this form of social organization as a lineal descendant of ceremonies of initiation into manhood which have lapsed into degenerate or rudimentary forms. In the majority of cases the outward form of initiation into the secret society is closely imitative of the maturity rites in its solemnity and in the sense of a definitive rupture with the nucleus of past social obligations. Both occasions are formalized by the *rite de passage*; yet the similarity in the initiation formalities hardly reveals the true functioning of the secret society, nor does it resolve the quandary of the common coexistence of initiation schools and secret societies in the same culture complex.

Secret societies are repeatedly organized by men to terrorize and intimidate the women and thus to secure prerogatives and a weapon of predominance over the other sex. Thus among California Indians the men used their fraternity to keep the women in subjection, to protect husbands' rights and to inculcate related virtues, such as chastity, obedience and industry. Wom-

en's secret societies are not unknown; they represent the affirmation of female rights and are presumably organized in response to the exclusion of their sex from the societies for men. In west Africa there are such groups which function in the maintenance of the vestal fires, the detection of thieves and the protection of wives against harsh treatment by their spouses. The ultimate decline of the secret society is held by Webster to be due to the inclusion of the women, while Briffault ascribes it to the subsequent inclusion of the men.

Secret societies seem to grant definite economic advantage or consequent political prerogative, the attainment or maintenance of which necessitates a constant resort to all the paraphernalia of esoterism. As Boas has pointed out, membership later creates its own added advantages through the hierarchical organization of degrees whereby the newcomer pays allegiance to the older. The economic privileges include such things as possession of trade secrets, exclusive knowledge of the art of writing, the handling of money, the collection of debts and the exacting of contributions. In the Banks Islands the right to private ownership of property may be secured, in the face of the traditional communal form of ownership, only through membership in the secret society. Among the Yorubas of west Africa, the society acts as a refuge for harassed debtors. The Duk-Duk society of New Britain prevents the women from acquiring too much wealth. The germs of government, at least of policing and maintenance of law and order sufficient to protect economic interests, are taken over as a function of the secret society. Often the societies serve as the principal instruments of power of the chief or as the foundation of an aristocracy. Through their power to invoke dread on the part of the uninitiated, they sometimes impose peace upon quarreling parties by means of fines and thus take over juridical functions; in New Britain, for instance, the Duk-Duk society acts as judge, constable and executioner. Among the Blackfeet Indians analogous associations maintain order on the march, in camp and in hunting parties. Occasionally these societies transcend tribal limits and approach a sort of Freemasonry, as in the Zambezi region in Africa. The power of the fraternities at times leads their members to practise oppression, extortion and terrorism upon excluded persons.

Subversive fraternities have been legion in all civilizations, historical as well as primitive, checking or challenging existing authority and

providing a nucleus of incipient dissidence or revolt. Conspiratorial clubs have revived in recent years as instruments of revolutionary or of reactionary groups. The preservation of coherence, the identification of loyalty and mutual aid in a dangerous task of upsetting authority, have led the minorities to resort to secrecy to attain their purposes. The symbolism of marks of identification, like the swastika, the esotericism of antique rituals and dress, especially the efficacy of masks, contain a compelling attraction which enhances the prestige of the individual in his own estimation and in that of his fellows, members and non-members alike. On the other hand, the popular use of ceremonialism and esotericism by modern fraternal, friendly and mutual aid societies indicates merely survivalistic forms and functionless trappings. In the case of college and purely convivial societies the rudiments of the psychology which govern the true secret society become irrelevant and gratuitous.

SECRET TREATIES. *See* TREATIES.

SECRÉTAN, CHARLES (1815-95), Swiss philosopher and social theorist. Secrétan came of a family which had long been prominent in Swiss political life. He studied philosophy with Vinet at Basel and with Schelling and Baader at Munich, but he was most influenced by Karl Christian Krause and through him by Fichte. He

taught philosophy in his native Lausanne from 1838 until 1846, when he was removed as a result of his criticism of the government set up after the Vaud revolution. In 1850 he went to the college at Neuchâtel, remaining there until 1866. He then resumed the chair at Lausanne, retaining it until his death. Throughout his life he was an active defender of political and religious freedom.

Secrétan in his writings sought to reconcile individualism with ethics without sacrificing that ethical autonomy which to him was identical with creative, progressive liberty. This he did by setting up as the subject of collective liberty the "we" of humanity, "a very specific [whole] not reducible to any other kind of totality," "a unity of communion in liberty" which "permits the simultaneous affirmation of both the substantiality of the species and the substantiality of the individuals." This attempt to produce a synthesis between universalism and individualism, on the basis of a specifically ethical union, led Secrétan to attack Hegel violently. "To seek to realize the unity of the moral being by restraint is the contradiction of contradictions, since the being unified by this means would no longer be a moral being."

In his application of these considerations to social problems Secrétan became the inspiration for the solidarist movement in France, which through Fouillée and Bourgeois utilized the ideas of Secrétan to a great extent. Secrétan sought to reconcile the justice of love with that of solidarity and to deduce social duties therefrom. These social duties are best realized not by the state with its coercion but by free and voluntary associations of a quasi-fraternal nature. In his last works Secrétan revealed himself as an advocate of a type of associationist socialism reminiscent of Fourier and Proudhon. The organized, or solidarized, economic society should consist of a vast confederation of producers' and consumers' co-operatives, which in turn would be confederations of "cells." Secrétan was very hesitant about advocating methods of introducing this regime: at one time he based his hopes upon intervention by the state; at another on the action of free contracts among individuals and among groups.

SECTARIANISM. *See* SECTS.

SECTIONALISM. *See* REGIONALISM.

SECTS. All of the great religions are represented by a variety of forms which in popular usage are called sects. Thus Pharisaism and Sadduceism, Essenism, Reform Judaism, as well as ancient Babylonian and Egyptian forms of Judaism, may be regarded as sect variations of a common faith. A similar process may be observed not only in the great division of Moslemism into Sunnite and Shute forms and the numerous subdivisions of the latter but also in the separation of Buddhism into Hinayana and Mahayana, with the division and proliferation of the latter into many divergent monastic groups and schools. The three great sections of Christianity—Roman Catholic, Eastern Orthodox and Protestant—and the numerous subdivisions of the last two are sectarian in the same sense. Sectarianism thus defined becomes only another name for differentiation. Its causes are multitudinous and while certain general patterns may be discerned, such as the adjustment of a religious tradition to a changing culture, a clear cut distinction between various types of such groups is a prerequisite to sociological analysis. For in such a broad sense sect is applied not only to churches but also to parties, schools of thought, associations and unorganized popular movements. A narrower use of the term limits it to those groups or organizations which although not recognized by an established church are still regarded as belonging to the same major religious tradition. Thus the established churches of Germany and England designated all dissenting groups as sects, while Roman Catholicism regards as sectarian all forms of the Christian faith which set themselves up independently of the hierarchy. Used in this way the term is derogatory and implies moreover that there is a standard and true form of religion to which all believers should conform. Furthermore it groups together widely divergent types of organization.

In recent years the sociological analysis of religion has led to adoption of the term *sect*

for one particular type of division and organization. It has come to denote a religious conflict society which arises in opposition to an institutional church: based on the definite commitment of mature individuals to a definite set of principles, such an association is a contract society rather than an institution. Whereas the church is inclusive, tending to regard all members of a parish, a community or a nation as its wards and serving as an educational and sacramental agency, the sect is exclusive, setting up definite requirements for membership and exercising missionary and disciplinary functions. While the church is either organically related to the state or closely identified in practise with the established social order, the sect tends to be critical of or antagonistic to prevailing political and economic institutions. The church accommodates itself to the mores of the community, while the sect is rigoristic. For the former a religious doctrine of salvation and the participation of individuals in the means of grace are primary; the latter emphasizes conduct rather than faith. To the priestly and professional leadership of the church and its hierarchical organization the sect opposes a lay leadership and a democratic organization. Whereas the former is usually allied, in its leadership at least, with the socially powerful classes, the latter finds its support most frequently among the politically disfranchised or economically weak. As a final and inclusive distinction it may be said that the church is always interested in the principle of continuity whereas the sect emphasizes discontinuity, whether between church and state, between the converted and the unconverted or between present and future.

While the study of the sectarian type of religious organization has been carried on principally with reference to Christian history, the same type is recognizable in the development of other faiths. The various secret societies with religious interests, exclusive membership and revolutionary programs of action which have arisen at frequent intervals in Chinese history seem to belong in this category. The Society of Heaven and Earth (Hung Society) is especially noteworthy; the Lung-hua, the White Lotus Society (Pai-lien) and the so-called "God worshippers" of the Taiping rebellion are other examples. The religious beliefs of these groups are syncretistic, arising out of a combination of Taoist and Buddhist or Christian ideas. Religious and moral discipline or, as in the case of the Lung-hua, elaborate ritualism is designed to

lead the adherents to an early salvation. Strict vegetarianism, derived from Buddhism, is a frequent requirement. Suspected of political designs and of revolutionary programs, these societies were subjected to vigorous persecution and were driven underground. Moslemism has given rise to numerous organizations of the sect type, notably the Wahhabis, the Druses and the Bahais. The first of these was a strongly rigoristic movement which arose in protest against the tendency of orthodox Moslemism to accept popular customs, while the last two groups introduced a messianic element. Messianic and mystic strains combined with ethical rigorism in the Jewish Chassids of the seventeenth and eighteenth century, who were characterized also by a dependence on the directly inspired leader.

The sectarian tendency in Christianity may be traced back to the origin of this faith as a separatist movement in Judaism. Beginning apparently as a party or free association the Christian sect found its primary authority in the sayings of Jesus and in the direct inspiration of the Holy Spirit rather than in the religious customs and Scriptures of the parent religion. Moreover it was strongly messianic in its outlook and developed a self-sufficient religious community within the nation. Economic communism of a sort, in consumption rather than in production, and indifference to the political life of the nation were also characteristic. Subjected to persecution, this association began at the same time to find adherents among gentiles as well as Jews and so increased the conflict between itself and Judaism. In the Roman world Christianity preserved its character as an exclusive society which not only forbade its members to participate in the popular worship and exercised strict discipline over their conduct but also tended to separate them from the political and economic society. The identification of social institutions with the "world," which was evil and which was soon to pass away, and the development of a rigoristic ethic and of close fellowship within the Christian group led to the formation of a relatively self-sufficient society within the empire: the resulting antagonisms increased the separation of church and "world."

Although the process of accommodation likewise began at an early time and led to the merging of church and state, the literature produced in the sectarian origins of the Christian movement, much of which was gathered in the New Testament, became the source of repeated revivals of sectarianism in later centuries. Mon-

tanists and Donatists early directed their protests against the growing power of the clergy, the relaxation of discipline and the substitution of doctrine for inspiration. Messianic expectations also colored their attitudes. From the third century to the eleventh sectarian tendencies in Christianity were in large measure absorbed by the monastic movement, which combined with a dualistic asceticism the sectarian protest against the secularization of church and priesthood as well as the sectarian interest in a rigorous morality, in exclusive membership based on voluntary commitment and in a self-sufficient Christian society. While monasticism remained largely individualistic and mystical in the east, its western form from the sixth century onward was social and missionary. Mediaeval Catholicism, however, was able to unite this sectarianism with the ecclesiastical movement and to place monasticism in the service of the inclusive church.

From the twelfth century there began to develop new sect movements which were less successfully integrated with the ecclesiastical system. Four main periods of this development may be distinguished. The first of these in the twelfth and thirteenth centuries was still largely under the influence of dualistic and monastic conceptions. Although the chief organizations resulting from it, the mendicant orders, became a part of the Catholic system, one group, the Waldenses, retained its sectarian character. The sectarian interest of this period came to expression in the Cathari, who professed doctrines derived in part from an extreme oriental dualism, sought individual perfection apart from the church, rejected the official clergy, abstained from oaths and from the use of force and attempted in general to reintroduce primitive Christian fellowship and apostolic poverty. This group and the closely related Albigensian sect flourished particularly among artisans in the towns of southern France and in Lombardy. Their protest was directed against the feudal system as well as against its ecclesiastical representatives, but instead of engaging in open revolt they aimed to set up within the framework of feudal and hierarchical society a partly independent religious, economic and political organization. Since the movement was directed against the secular and ecclesiastical territorial princes, it resulted indirectly in the strengthening of the papacy and the centralized church. The Franciscan and Dominican orders, which emerged out of the sectarian fermentation of the time, contributed to the same result. But in the so-

called "spiritual Franciscans" and in the Waldenses the revolt against the church continued. The latter maintained themselves in southern France and Italy despite repeated persecutions. They strove to realize the ideal of the primitive church, were devoted to the Scriptures, accepted the teachings of Jesus as a new law, emphasized poverty and equality in the fellowship and rejected oaths, capital punishment and participation in war and government. In both the French and Italian wings of the sect the urban, artisan class seems to have predominated.

A second manifestation of sectarianism, connected with the names of Wycliffe and Huss, occurred during the fourteenth and fifteenth centuries. While Wycliffe's opposition to the Roman church appealed to the familiar ideal of apostolic poverty and simplicity, it was free from those mystical and apocalyptic ideals which marked earlier and later sectarianism and was directed more toward the independence of the English churches than toward the organization of a separatist community of avowed Christians. The movement drew less upon the ideal of apostolic community than upon the ideal of the natural law derived from Roman stoicism. While the subversive doctrines of Lollardy did not issue directly in the formation of a sect, they combined with Waldensian practise in Bohemia to generate a movement directed not only to the reform of the church and to independence from Rome but also, in one of its phases, to the formation of a separatist Christian community. The Taborites, who formed the extremist wing of the Bohemian movement, constituted a party rather than a sect, in the strict sense of these terms; they sought the reform not only of the church but also of civil society in conformity with the gospel which like Wycliffe they explained in terms of "natural law." Demanding the abolition of private property, of class distinctions and of taxes, they continued to think in terms of the national society and to use the ideal as a program of general social reform rather than as the pattern for a separate Christian community. Consequently they could reject the gospel principle of non-resistance and counsel violence in the overthrow of the existing ecclesiastical and political organizations. Out of the defeat of this movement a definite sect, the Bohemian Brethren, or Moravians, emerged. This group accepted the ethics of the New Testament not as a program to be forced upon civil society but rather as the constitution of a separate religious community. It rejected all forms

of violence, required its members to withdraw from public life and trade, to content themselves with agriculture and manual labor and to develop among themselves a fellowship of love. The principle of individual commitment was not, however, consistently applied and when the birthright members entered into closer relations with the public life, doctrines and practise were largely accommodated to the new situation. In the eighteenth century as a result of persecution, migration and the influence of the Pietist movement the organization was reconstituted in Germany and in America. The American branch succeeded in establishing for a time a "general economy" in which all members participated in common property and common work, largely for the sake of supporting missionary enterprise.

The third period, in which modern Christian sects originated, coincides roughly with the time of the Reformation. At the outset a protest against the Roman system of government, doctrine and practise, the Reformation tended to display sectarian characteristics and its organization in the Lutheran and Calvinist churches embodied certain sectarian features, such as recognition of the priesthood of all believers. But orthodox Protestantism was not sectarian; it sought rather to organize national churches of the inclusive and institutional type, closely associated with the state. The sectarian movement of the time was more closely related to the revolutionary tendencies which were directed not only toward the reform of the church but also toward the radical reconstruction of the political and economic system. These tendencies were found among the lower economic classes, peasants and artisans rather than among the princes and the commercial groups who supported Protestantism. So long as the Reformation remained a protest, the revolutionary groups seemed to form only the extremist wing of the general movement; but as soon as the work of organization was undertaken, the divergence of interests began to appear and the conflict of the extremists with Protestantism became quite as severe as their conflict with Catholicism.

The radical, or Anabaptist, movement was by no means united and did not manifest uniformly sectarian tendencies. As in the earlier Taborite revolt, two divergent philosophies and strategies were present. Both were revolutionary, seeking a new society rather than a reformed church; both were directed primarily to the proletariat and the peasantry; and both were individualistic and mystical, although with a difference. After

a period of confusion the divergence between the two sets of interests and ideas made itself manifest in the period of organization and of persecution. One tendency came to expression in the Peasants' War (1524-25) and in the effort to establish the kingdom of God in Munster (1533-35). The leaders of this movement, Thomas Münzer, Melchior Hoffmann, Jan Matthijsz and John of Leyden, were millenarians who interpreted the New Testament in the light of its messianic hopes rather than of its ethics; they were visionaries whose mysticism was more a matter of direct revelation through apparitions than of communion with spiritual reality. Like the Lollards, they derived their ethics from the idea of natural law rather than from the New Testament and were able to ignore the counsel against resistance. The community of property which they sought was to be based upon the natural rights of men rather than upon the apostolic idea of love. The other, definitely sectarian, tendency appeared first of all among the Swiss Anabaptists. Opposed to all violence and rigoristic in their discipline, they were regarded as enemies of the church and state by both Protestants and Catholics on account of their opposition to the institutional church and their tendency toward communist principles.

Swiss sectarianism and German millenarianism were intermingled in the confused movement in northern Germany and Holland, but after the failure of various revolts and under civil persecution the sectarian tendency maintained itself and led to the formation of various independent groups. Led by Dirk Philips and Menno Simons, the non-resistant Anabaptists organized themselves into societies which held to the principles of believer's baptism, rejection of the sacraments as means of grace, rigoristic discipline, non-participation in war and government and refusal to take oaths. But they united with these separatist ideas the early Christian counsel of obedience to the civil magistrates. Extreme simplicity in costume and manner of life and the prohibition of marriage with non-members of the society were other features of the organization. Variations in the practise of local groups as well as the tendency of succeeding generations to relax the restrictions, because of persecution or increase of contact with public life, led to numerous schisms and to the founding of new communities in North and South America. In the course of time the Mennonites in Holland have lost much of the sectarian character. The lay ministry has been replaced by a

theologically trained, professional clergy; the principle of non-participation in war and government has for the most part been abandoned. Small groups of the sect, especially in the American communities, maintain a rigid discipline and resist the tendency to accommodation by confining their economic activities to agriculture and thus reduce their contacts with the public life. Besides Mennonites other minor sects, including Collegiants and Familists, grew out of the Anabaptist movement, while the Baptist churches in general trace their origin to this phase of the Reformation. It is characteristic of sixteenth century sectarianism that the principles of voluntary membership and of the separated community were symbolized in the practise of adult or believer's baptism and that this symbol has been retained while the more radical elements in the original system have been dropped or greatly modified.

Like the Protestant Reformation itself, sectarianism of the Anabaptist type did not appear in developed form in England until the seventeenth century. It arose partly under the influence of Anabaptist groups in Holland and England but more largely in response to conditions similar to those which had prevailed on the continent. In England also the sectarian tendency manifested itself first of all as a phase of the Protestant movement, then as an element in the revolutionary opposition to ecclesiastical and political institutions and only in the last stage as a separatist, community building movement. Sharing with Puritanism the antagonism to Roman and Anglican churches, Independency—to use this name for the amorphous movement—became aware in the civil war and Commonwealth that its interests were not identical with those of the Puritans. But Independency itself was composed of the two divergent strains, the revolutionary and the separatist. While both were interested in more radical reforms than Puritanism contemplated and both stood for the interests of lower economic classes, one of them, as represented by Levellers, Fifth-Monarchy Men and Diggers, was definitely millenarian. It emphasized equality, sought the reorganization of civil life as a whole on the basis of natural rights and natural law and interpreted the New Testament in this sense, rejecting non-resistance and demanding separation of church and state not for the sake of a free church but for the sake of a free state.

Other groups, Familists and Brownists among them, represented the separatist principle. Their

mysticism was of a less visionary type than that of the more extreme millenarians and their dependence upon the New Testament was greater. The Society of Friends emerged as the sectarian result of the double movement, including within itself the mystical groups and those who, disappointed with the failure of the revolt, reacted against the violent measures of the millenarians. In this movement the characteristic features of earlier sects were reproduced: simplicity, rigorous discipline, non-resistance, rejection of oaths, mutual aid, democracy and lay leadership. In the course of time, however, the usual process of accommodation set in with the usual consequences—schisms and revivals as well as institutionalization. In the Baptist groups of England and America which arose in the seventeenth century only the principles of separation of church and state, of voluntary membership and moral discipline were retained, while efforts to separate the individual members to any extent from political and economic society were abandoned. Finally out of the movement Congregationalism emerged as a church with certain sectarian characteristics. In so far as it emphasized the independence of the local church, it was no more than a home rule Presbyterianism; but it adopted in part the principle of voluntary membership and this feature, stressed anew and reinforced in the later period of the evangelical revival, gave to some of its groups, usually for short periods, a semisectarian character.

The fourth and last phase of sect organization was connected with the Pietist and Methodist revival in Europe and America. It differed from the previous movement, on which it was partly dependent, in its comparatively conservative attitude on political and economic questions and in the lack of radicalism in its opposition to the church. Neither millenarian revolt nor withdrawal from political and economic life were characteristic features. But although it showed little revolutionary temper in its attitude on social questions, it was greatly interested in the promotion of humanitarian reforms and its adherents in general supported the democratic movement in England and America. While Pietism and Methodism were critical of the institutional church, they endeavored to remain within it and separate sects were formed as matters of expediency rather than in conformity with a principle. Yet the movement was sectarian. In the sphere in which it was particularly interested, the individual life, it preached revolution rather than reform or improvement. The

idea of a radical break with the past in conversion was of primary importance. Furthermore it protested against the secularization of the church, particularly in the sphere of dogma and preaching, where it was offended by the accommodation of revelation to reason and philosophy. It sought to substitute for the theologically trained clergy converted and inspired leaders, whether ordained or not, and tended to replace the sacramental and teaching church with the society of converted, disciplined Christians striving after perfection. The interest in personal religious experience, as opposed to assent to dogma and participation in sacraments, was derived largely from mysticism. Jakob Bohme, whose writings influenced many of the leaders, must be regarded as a chief source of the movement. The mystic strain represented a sharp antithesis to the scholasticism of the Protestant churches and to the rationalism of the eighteenth century, which reduced religion to a set of valid propositions; but it was related to the latter in so far as it shared the interest in personal conviction rather than in collective authority.

In Germany Pietism organized conventicles in the churches for the sake of Bible study and the promotion of "practical Christianity," by which was meant the regular practise of prayer and meditation and the application of Christian ethics, in a rather patriarchal version, to the secular life. It did not affect the lower economic classes but was bourgeois and in part aristocratic in its appeal. Charitable, missionary and educational enterprises, including reforms of the traditional educational system, were promoted in a manner foreign to the spirit of the state church. Pietism achieved no definite organization, although its influence continued to manifest itself down to the nineteenth century. One of its by-products was the reorganization of the Bohemian Brethren under the leadership of Count Zinzendorf, a leading Pietist.

The Methodist movement in England, which in its origins was in part dependent on German Pietism, organized classes in a similar manner and concentrated also upon conversion, devoutness and religious discipline. But it was more energetic than the German movement in its prosecution of missionary activities, and it carried its appeal directly to the urban poor, who to a large degree had lost contact with the churches. Its effectiveness in arousing among these groups a sense of personal worth and dignity and in teaching them to practise a strict

self-discipline, of which moderation, diligence, piety and charity were the main features, is frequently said to have prevented the reproduction of the French Revolution in England. However that may be, the effect of Methodism was neither to found separatist communities practising non-resistance and some form of communism nor to foster millenarian hopes but rather to adjust men to existing society and to promote humanitarian reforms. While it did not seek separation of the new society from the church, the opposition of the latter and the exclusive character of the former led eventually to separation.

In North America the revival movement, which was the counterpart of German Pietism and English Methodism, issued in the organization of numerous new religious societies of a somewhat sectarian character. The first result of the great awakening in the eighteenth century was the strengthening and reassertion of the sectarian element in New England Congregationalism. Conversion was now required for church membership and the Half-Way Covenant and Stoddardism, which admitted the unregenerate to the sacraments, were rejected in many of the churches. It led in the second place to the organization of separatist religious societies closely akin to the Baptist groups. The major evangelical movement arose in the United States at the beginning of the nineteenth century. Influenced by Methodist preaching, it arose also as a direct reaction against rationalism and as a product of frontier conditions. Despite the difference in philosophy there was a close relation between evangelicalism and Jeffersonian and Jacksonian democracy. In a new area there developed an alliance and a differentiation not unlike the two tendencies in Anabaptism. Both movements, democratic and evangelical, stressed the priority of the individual to the social institution and both cultivated a mildly millenarian attitude in their expectation of the early realization of an ideal society and of individual perfection.

The prevalent panegyrics of democracy and promises that in the United States the ideal of history was to be realized received a decidedly religious coloring from the revival movement. Furthermore revivalism appealed particularly to those groups, both in the cities and on the frontier, in which the democratic sentiment was strongest. The conviction that the revolution had inaugurated a new era in which perfection might be attained was at least partly responsible

for the failure of evangelical sectarianism to develop any radical antagonism to social institutions, while the separation of church and state and the freedom to found new churches prevented radical antagonism to the religious institutions. On the social side the movement was directed into channels of humanitarian reforms. Societies for the abolition of slavery, for temperance, for peace propaganda, educational institutions, asylums for the care of defectives and dependents and missionary organizations sprang up in the wake of the revival and to some extent under its auspices.

The movement produced not only these organizations but also various religious sects. Some of these, notably the Cumberland Presbyterian church, the Church of the United Brethren, the Disciples of Christ and the Methodist Protestant church, were the result of conflicts and divisions within older churches. On the other hand, the Methodist Episcopal churches and the Baptist connections, recognizing the principle of exclusive membership based upon conversion and maintained by discipline, profited greatly by the movement. Two organizations of a more narrowly sectarian type and more closely akin to the Anabaptist and monastic developments also arose in consequence of the revival. The very names of the Shakers, or the United Society of Believers in Christ's Second Appearing, and the Mormons, or Society of Latter-Day Saints, indicate their millenarian character. The leaders of the former group were English Quakers, but the society received its definite form in the United States. In its celibacy and communal life it reproduced some of the features of mediaeval monasticism. In its pacifism and spiritualism it was like the Anabaptists. The Mormons, on the other hand, accepted neither the monastic nor the Anabaptist ideal; but in their organization of the common life, strict discipline and obedience to the superior and in their separation from the "gentile" world they showed their extreme sectarian tendency. Both Shakers and Mormons indicated, as some Anabaptists had before them, the extent to which revolt against the institution of the monogamous family formed a part of the sectarian rebellion against social customs. In both cases also the idea of direct inspiration or of vision was represented and in both the Christian tradition had been supplemented by doctrines imported from foreign sources. While the Shakers, in view of their rejection of the family, were able to resist the usual process of accommodation, they failed to

maintain their numbers and have well nigh disappeared. The Mormons, on the other hand, have adjusted themselves by sacrificing much of their sectarian character.

Among later products of pietist-evangelical sectarianism in England and America the Salvation Army, the Catholic Apostolic Church (Livingites), the Plymouth Brethren and the Pentecostal sects may be mentioned. A new form of sect is appearing in non-Christian lands in which the converts of Christian missionaries are organized in exclusive groups subject to the discipline of the society. Occasionally a separate economic life is provided for these groups.

The Christian sects of Russia require separate treatment. Although they were influenced by developments in Roman Catholic and Protestant countries, their history has on the whole been independent. Prior to the Russian Revolution they formed an active and numerous element in the religious and political life of the nation and helped to prepare the country for the reception of communist principles. One group of comparatively ancient origin includes ritualists who rejected changes in the official worship. Although not sectarian in principle, they were subject to sectarian and revolutionary influences as a result of their persecution. A second group, the spiritualist sects, comprises the Khlysty, the Skoptsy, the Dukhobors and the Molokany. Their common characteristic is their mysticism and rejection of the orthodox ritual and hierarchy. Dualistic principles seem to have influenced them, especially in their attitude toward sex relations, the Khlysty prohibiting all sexual intercourse and the Skoptsy practising castration. The Dukhobors reject the oath and every form of violence. A third group of Russian sects represents the Pietist movement. The Stundists were organized first among German Russians, but the movement spread rapidly among members of the Orthodox church. Under the influence of Baptist missionaries and of native leaders several branches of the sect adopted the principle of adult baptism and became known as Baptists. The members of this group are characterized by their dependence upon the Scriptures, with which they deal in very literal fashion, and by their interest, prior to the revolution, in a communism of economic goods. Minor sectarian movements of a similar sort arose in the latter part of the nineteenth century in reaction against the state church and in response to revolutionary political movements.

Sectarianism has been regarded as the inevi-

table product of Protestant individualism and as an evidence of the disintegration of Christianity. Its history indicates, however, that it is a recurrent phenomenon which is by no means confined to Protestantism. Furthermore the various manifestations of the sectarian spirit, in Christianity at least and probably in other religions as well, have led to a number of important social consequences. They have called back the church from its accommodation to existing social customs and conditions and have been more important in the indirect influence which they have exercised in this way than in the effectiveness of their own organizations. They have provided, in the second place, for the rejection of religious sanctions of social customs which had become onerous and thus have helped to pave the way for radical reforms. Finally, the sects have emphasized individual conviction in religion and ethics and have offered a counterbalance to the system of collective dogma and authority.

SECULAR TREND. See TIME SERIES.

SECULARISM. If secularism be defined as the attempt to establish an autonomous sphere of knowledge purged of supernatural, fideistic presuppositions, its modern origins are to be traced to the later Middle Ages of western Europe. The distinction drawn up by the scholastics between faith and knowledge, while it left room for revealed theology, was also capable of eventuating in a type of philosophical, or natural, theology, which placed its chief emphasis on the truths perceptible by the human reason—a broad category which subsumed not only all physical knowledge but even the metaphysical knowledge of God. Although the school of Aquinas, by interpreting reason as merely the preliminary to faith, minimized the antagonism between rational knowledge and revelation, the more radical contention of Duns Scotus and Ockham that all doctrines of faith are permeated with contradictions which the reason is incapable of accepting led to the conclusion that reason can operate only in the realm of verifiable experience and not in the supernatural world. In the eyes of the nominalists therefore a line of demarcation had to be drawn between the sphere of knowledge accessible to the human reason and the sphere of faith posited on ecclesiastical authority. It was no longer a question, as in the case of Aquinas, of a difference in degree as between natural and revealed theology but of a difference in kind as between theology and science. The distinction between faith and knowledge was given a new and even stronger emphasis by the Protestant reformer Luther,

who, in accordance with his conception of faith as an immediate relation between the individual seeker after salvation and God as revealed in Christ, rigidly excluded from the religious experience all knowledge even of supernatural matters and all metaphysical rational knowledge of God.

The increasingly pronounced divergence between religion, which sought to cut free from the confusion of rationalistic speculation, and scientific inquiry, which felt the necessity of discarding fideistic presuppositions, prepared the way for the development of modern science. While the success of the Reformation movements in the various countries of northern Europe served to strengthen the hold of non-rationalistic faith, the spirit of reasoned inquiry which Duns Scotus and Ockham had dimly foreshadowed was developed to a far higher point by the scholars and philosophers of the Italian Renaissance (*q v*). Their indefatigable interest in the manifold phenomena of the immediate world of nature and of man served to dim the prestige of theological otherworldliness and fideism. But in spite of the rich contributions of the Renaissance the advance of secularism was not permanently consolidated until the seventeenth century. The comprehensive metaphysical systems of Descartes, Hobbes, Spinoza and Leibniz represented the first sustained attempt to construct a rational picture of the universe on the basis of scientifically established knowledge. In perpetuating and amplifying this type of inquiry the eighteenth century gradually shifted the emphasis of secularism from explanation in metaphysical terms of universal ultimates to a more empiric and intensive quest of knowledge in its concrete practical manifestations. This striving to push back inch by inch the limits of knowledge found its fullest expression not so much in a comprehensive system as in the *Encyclopédie* of Diderot and d'Alembert.

If therefore secularism in the philosophical sphere may be interpreted as a revolt against theological and eventually against metaphysical absolutes and universals, the same trend may be charted in the attitudes toward social and political institutions. Aquinas, breaking away from the traditional Augustinian conception which regarded the state as at best a negative institution, insisted that on the contrary this institution was entrusted with the positive function of perpetuating in this world the particular social conditions that are necessary for the

attainment of religious salvation in the next. Moreover in the later stages of the protracted contest between *imperium* and *sacerdotium* a number of secularly minded thinkers, like Dante, formulated the thesis that the temporal ruler was entitled to exercise power in his own right. In general, however, the idea prevailed to the very end of the Middle Ages that the church, by virtue of its exclusive guardianship over the eternal welfare of man, was entitled to priority over the state, which regulated merely his transitory existence on this earth.

As in the philosophical sphere, so in the political, the Renaissance marked a distinct stage in the direction of secularism, while the Reformation tended to perpetuate older ecclesiastical and otherworldly attitudes. While Machiavelli and his numerous disciples emphasized the duty of the prince to rule independently according to his own canons, Luther advocated the subordination of temporal institutions to the religious, and Calvin, drawing upon Old Testament models, succeeded in reestablishing a theocratic type of government. The seventeenth century in turn was predominantly secularistic in its political as well as its metaphysical systems. The most powerful force in this direction was the revival and systematic elaboration of stoic natural law by Althusius, Grotius and Hobbes. According to the new rationalistic interpretation, which proceeded from more or less universalistic premises regarding the nature of man, the essence and function of the state is determined, in immanent rather than transcendental terms, by its own inherent characteristics and aims. Thus in place of the older doctrines of a universal mediæval empire existing as a counterpart to the universal church, there emerged the conception of an independent, sovereign state. The universally valid laws of nature are utilized by the state in the pursuit of its own particular aims, which are at marked variance with those of rival states. Therefore these national objectives are the crucial determinants in the actual application of rational political principles, in the sense that these principles undergo modification in the process of adaptation to the genius of a particular political system. This new approach eventuated, with Montesquieu, in a type of political relativism, which in striking contrast to the theological claims to absolute and universal truth declared that political maxims are valid only in so far as they take account of shifting and changing local variations. Thus, after a metaphysical-natural law period which witnessed the emer-

gence under secular auspices of rationally grounded philosophical correlations, of self-contained and self-evident political principles and of systematically formulated conceptions of the world, the forces of secularism, repudiating the universalistic formulae characteristic of mediæval thought and placing their reliance on a more precise methodology, turned to the investigation of individual phenomena and to a more specialized type of inquiry into particular social problems.

But alongside this particularism there emerged during the second half of the eighteenth century a new and secularized type of universalism known as the Enlightenment. Mankind was conceived as a unit, in pursuit of the same objectives and evolving under the influence of the same environmental factors. On the basis of this humanitarian philosophy the seventeenth century doctrines of natural law were developed into a systematic pattern of ideas and values, which proceeded from the basic premise of a set of legal principles valid for all peoples and applicable throughout the world. This juristic-humanitarian universalism was perpetuated in the socialistic theories of the nineteenth century, particularly in the attempts of the proletariat to build up an organization operating on international lines and including all mankind. At the same time the relativist and environmentalist doctrines regarding the basic disparities and inevitable rivalries between the different nation states were carried over into the theories of nationalism which have bulked increasingly large since the French Revolution.

The various phases through which secularism has passed, both in its intellectual and in its political aspects, must be correlated in sociological terms with the emergence of lay groups in the different countries and with the varying forms in which this process manifested itself. The clear cut distinction between the layman and the cleric as regards their status in the church goes back to Thomas Aquinas and the popes of the thirteenth century. The cleric as accredited teacher and expounder of church doctrine was in the nature of the case required to be intimately versed in the various dogmas. This was much less necessary for the layman, who was not expected to be overly learned in theological matters. So long as he was actually familiar with a few essential dogmas and in other matters, which exceeded his powers of comprehension, heeded carefully the voice of the church and gave "implicit" obedience, there was no

complaint. The comparative incompetence of the layman in spiritual matters was taken for granted.

This situation was radically altered by the Reformation. On the one hand, the contraction of church doctrine to the pronouncements of the Bible and the consequent elimination of the body of involved tradition brought the entire doctrine within the range of the average layman; and, on the other hand, the monopoly of the priests over the sacraments was entirely eliminated. The process whereby the interpretation of church dogma was taken out of the hands of a particular social group and turned over to the congregation as a whole is indicated most strikingly in the case of Calvin, who enjoined upon each and every member of the flock a thorough and precise familiarity with the articles of faith. The basic contrast in this respect between the Protestant and Catholic churches is indicated further by the fact that the theorists of the Counter-Reformation, particularly the Jesuit Suarez, reemphasized the traditional attitude that the layman could be content with a smattering of doctrinal knowledge provided he concurred implicitly in the broader truths proclaimed on the authority of the church.

Because of the contrasting attitudes of the church toward its laymen secularism in Protestant countries was different in form from that in Catholic. In the former there developed a new type of layman, who strove to carry over the Old Testament doctrines which he had absorbed as a member of the religious community into the everyday world where he moved as citizen and member of the social community. At the outset this process of identifying the ideals of the social and religious communities retarded the spread of secularism. Soon, however, as a result of the bitter struggles between the various sects and confessions it became imperative to discover certain basic elements of social control on which all citizens, whatever their ecclesiastical affiliation, could agree. In some cases these basic elements were found in the philosophical theory of a society based on natural law; in other cases, in a naturalistic-deistic religion; or again in a rationalized form of Christianity, in which all branches of the Christian church might acquiesce. Grotius evolved a set of general principles of jurisprudence, for which he claimed validity irrespective of religious convictions. Herbert of Cherbury formulated criteria for a universal rational religion. Sebastian Franck in Germany

and Coornhert in the Netherlands endeavored to isolate the essentials of the Christian faith and morality, so that Christians of every shade might find a common meeting ground. In all of these types of attempted compromise many of the same ingredients are present, particularly Renaissance humanism, stoic natural law formulae and the Erasmian conception of Christianity as primarily a system of ethics. By fusing these various elements into an integrated system Locke was able to provide a working agreement which was readily seized upon by his successors. Taking over his central premise that the real significance of the Gospels lay in the fact that they explained and substantiated the universally operative law of nature, they developed a spirit of genuine religious toleration which not only allowed hitherto antagonistic sects to work together peaceably in the common body politic but also extended to non-Christian religions.

In France and to a lesser degree in other Catholic countries secularism took a basically different course. Whereas the English layman carried over his sectarian convictions into the political and social sphere and gradually diluted them to the point where they did not offend the representatives of other sects with whom he was forced to deal in the new bourgeois economy, the French layman sought at the outset to create a more vital role for himself inside a church which was committed to a policy of ignoring him. Thus he aligned himself with the Jansenist movement and was an aggressive participant in the theological controversies which raged in the seventeenth and the early eighteenth century. The Catholic church, however, persisted in its refusal to accept a set of doctrines which would be as intelligible to the amateur as to the carefully trained priest; the body of explicit dogma might be whittled away, but that far larger body of implicit dogma which must be received on the authority of the church was held to be sacrosanct. Under the circumstances the only alternative for the Catholic layman who sought some form of individual self-expression was to transfer his questionings and activities to a sphere in which the church had no jurisdiction. Since in Catholic countries the older mediaeval dualism between the temporal and the spiritual had not been resolved, as was the case in England and other Protestant countries where the sectarian had carried over his religious convictions into secular life, the self-assertive Catholic layman turned to the social and political realm. And since the Catholic church had

denied him any part in theological matters, he was determined that the forces of clericalism should be rigidly excluded from participation in secular affairs. By way of final readjustment he refused to have recourse to theological preconceptions in the discussion of worldly questions. The development of secularism in France was profoundly influenced by the fact that the appearance of this worldly, antitheological, anticlerical point of view coincided with the rise of the middle class. The cultured bourgeois, unable to find a place for himself as a layman in the church and resenting the partiality shown by the ecclesiastical hierarchy to the clerical expounder of doctrine, broke away from the church altogether and became a prime mover in the increasingly radical attacks on the otherworldliness of the traditional theologians.

Up to a certain point the church, by virtue of its consciously perpetuated doctrine of the two spheres, could be tolerant of such secular movements. But as it became progressively more apparent that the new lay groups had no intention of respecting church dogmas and that the new secular science was casting doubts upon the most sacred tenets of religious tradition and revelation, a conflict inevitably arose. With the growing facility and precision of the secularists in their use of critical methods the most elementary presuppositions of Christianity, as they had been formulated, for example, by the English deists, were gradually attenuated into impersonal philosophical abstractions. Ecclesiastical and religious authority was powerless to prevent the spread of secularism into all spheres of thought and activity. But even in quarters where the laity did not resort to such aggressive measures the hold of the church was diminished. The more adept the members of the middle class became in regulating their lives according to fixed principles and the more they were made aware by their daily experiences in the economic realm that they could rely upon their own foresight, the less they felt moved to turn to the church for guidance or support. The traditional idea of an otherworldly sphere, over which the church exercised a divinely ordained monopoly, was gradually robbed of the bulk of its significance.

The spread of such secular attitudes frequently led to an exclusive emphasis on the practical and the immediately verifiable elements in life, as distinguished from the remote substances and modes of theology and metaphysics. Thus realistic philosophers, such as Fontenelle

and Montesquieu and Helvétius, confining their inquiries to the field of immediate experience, ruled out all idealism and utopianism of the type propounded by the church in its forecast of the life beyond. But side by side with this realistic secularism there developed also a tendency to carry over into the secular realm a number of the older idealistic elements which had been identified with religion. This type of worldly idealism, which grew up in France during the decades preceding the French Revolution and which has since spread throughout the world, derives ultimately from the philosophers of antiquity, who postulated an absolute natural law that in the beginning had been in force everywhere but had since been modified by the prescriptions of positive law. In taking over this doctrine in its stoic form the Catholic church had attributed the disparities, which were to be observed at every turn, between the institutions prevailing in this world and those postulated by absolute natural law to man's original sin. But with the revival in the modern period of stoic natural law doctrines by secular philosophers and with the gradual dwindling of the notion of original sin both among the laity and among such influential church groups as the Jesuits, the conception of a more equitable natural order began to take on a new significance. At the hands of Rousseau and Mably the doctrines of natural law were given a revolutionary emphasis, exerting a deep influence on the political theorists and leaders of the French Revolution.

The ideal of human and social happiness, as proclaimed by the prophets and leaders of the French Revolution, has continued in the intervening period to mold the temper not only of the French bourgeoisie but also of larger and larger groups in all countries, Protestant as well as Catholic, who are resolved that mankind shall strive by the most enlightened methods at its disposal to establish the maximum of social justice and welfare in this world. The power of this secularized type of idealism derives in large part from its close connection with science; and in this union of social and scientific secularism the movement which since the Middle Ages has been gathering increasing momentum finds its logical climax.

SEDDON, RICHARD JOHN (1845-1906), New Zealand statesman. Seddon was prime minister of New Zealand from 1893 until his death in 1906, and led the Liberal-Labour party which carried through the experiments in state socialism. Born at Eccleston in Lancashire, England, he emigrated at an early age to Victoria. Arriving in New Zealand during the gold rush in 1866, he gained local influence as a storekeeper and after much experience of local government he was returned to Parliament for Hokitika. Thereafter, from 1881 to 1906, he represented the gold mining constituency of Westland.

Seddon's strength lay in political tactics based upon a minute knowledge of the electorate. Although he rose from the laboring classes he was never a socialist or a member of the Labour party. The legislation passed under his leadership included tariff protection, taxation of unimproved land values, graduated income tax, labor regulation including compulsory arbitration, and compulsory repurchase of land for closer settlement. Seddon introduced direct construction of public works by cooperative

contracts of workmen, used government departments freely for social work and sponsored humanitarian policies, such as the provision of public maternity hospitals and old age pensions, which he regarded as his most important legislative effort. His attitude toward prohibition legislation and woman's suffrage, both carried through under his premiership, was one of doubtful assent. His share in the experimental program lay in judging political possibilities, securing popular support and driving through the legislation. He contributed little to economic or social thought but much to the art of politics.

From the Boer War Seddon became known as a strong imperialist. Having taken the initiative in sending contingents to South Africa, he played a leading role in the Colonial Conference of 1902. The following year he introduced imperial preference into the New Zealand tariff system.

SEDGWICK, WILLIAM THOMPSON (1855-1921), American biologist and sanitarian. After graduating from the Sheffield Scientific School in 1877 and receiving his doctorate in philosophy at Johns Hopkins in 1881, Sedgwick was in 1883 appointed professor of biology at the Massachusetts Institute of Technology, a position which he held until his death. As consulting biologist of the Massachusetts State Board of Health he played a leading role in the development and application of the new science of bacteriology to the study of water, sewage, milk and air and was a pioneer in the study of typhoid epidemics at Lowell, Lawrence, Springfield and other communities. These activities earned for him the title of "father of epidemiology" in the United States. His department of biology became the first important training ground for sanitarians in the United States, and in 1913 he was made chairman of the school for health officers created by joint action of Harvard University and the Massachusetts Institute of Technology. In 1914-15 he served as president of the American Public Health Association. Few works have exerted as significant an influence upon the teaching of the biological sciences in the United States as has Sedgwick's *An Introduction to General Biology* (published in collab-

oration with E. B. Wilson, New York 1886; rev. ed. 1896). His *Principles of Sanitary Science and the Public Health* (New York 1902) is one of the classics of the public health movement, and *The Human Mechanism* (Boston 1906, rev. ed. 1918), written in collaboration with Theodore Hough, is of major importance. Sedgwick will be chiefly remembered, however, through his personal influence on the men who have since become leaders in American public health.

SEDITION The term sedition has come to be applied to practises which tend to disturb internal public tranquillity by deed, word or writing but which do not amount to treason and are not accompanied by or conducive to open violence. Stephen questions whether sedition itself is an offense known to English law, but the English courts have recognized as misdemeanors at common law seditious words, seditious libels and seditious conspiracies. The use of the adjective signifies that the practises are accompanied by a seditious intent, the legal definition of which has changed, however, with the development of toleration and political rights.

Offenses now described as seditious were originally punishable as treason. Thus in the fifteenth century it was treason to accuse the king of murder, call him a fool and suggest that his horse might stumble and break his neck; to make astrological calculations to predict the time of the king's death; or to publish poems and ballads to the disgrace of the king and his council. By the reign of Henry VIII treason was confined to more dangerous offenses and was no longer charged when men were indicted, and presumably convicted, for saying, "I like not the proceedings of this realm, I trust to see a change of the world"; or for answering a fellow drinker's "God save the King!" with "God save the cup of good ale, for King Henry shall be hanged!"; or for remarking when shooting at the butts, "I would the King's body had been there as the arrow did light!" By the reign of Charles I it was definitely held not to be treason to call the king unwise and say, "He is no more fit to be King than Hickwright," a simple old shepherd; or to describe His Majesty as "the greatest whoremonger and drunkard in the Kingdom." Henceforth it was no more than a

misdemeanor to say, "Damn the Queen!" or to drink a health to the pious memory of an executed traitor. In Queen Anne's reign a tanner "in indifferent circumstances" was merely stood in the pillory twice for remarking that Charles I was rightly served in having his head cut off.

Trials for political libel were common in the sixteenth and seventeenth centuries and in the latter prosecutions for seditious words also took place frequently. During the eighteenth century the law governing seditious libel, which consisted of writing or printing matter found by the court to have been published with a seditious intent, became the chief weapon of the government against the advocacy of political reforms, and successful prosecutions were frequently directed against what would now be considered mild editorials in an opposition press. When Fox's Libel Act in 1792 gave the jury control over the issue of seditious intent, formerly decided by the judge, it was expected that ordinary political discussion would no longer be punished. However, during the excitement of the French Revolution and the Napoleonic wars juries showed themselves eager to convict men for urging parliamentary reform or for attacking flogging in the army. The first prosecution for seditious conspiracy took place in 1795.

Since the Reform Act of 1832 English prosecutions for seditious offenses have been very infrequent and usually unsuccessful. There were a few cases against the Chartists, and in 1886 John Burns, later a cabinet minister, was prosecuted for uttering seditious words at a large meeting of unemployed in Trafalgar Square which was followed by rioting. In his charge to the jury (*Regina v Burns*, 16 Cox Criminal Cases 355) Judge Cave adopted Stephen's definition of seditious intention, which was based essentially on that of an act of 1819 as "an intention to bring into hatred or contempt, or to excite disaffection against the person of, Her Majesty, her heirs or successors, or the government and constitution of the United Kingdom, as by law established, or either House of Parliament, or the administration of justice, or to excite Her Majesty's subjects to attempt, otherwise than by lawful means, the alteration of any matter in Church or State by law established, or to raise discontent or disaffection amongst Her Majesty's subjects, or to promote feelings of ill-will and hostility between different classes of such subjects." In Stephen's *Digest of Criminal Law* (new ed. London 1926) this statement is accompanied by a qualifying sentence by the edi-

tor, also adopted by Judge Cave, which shows significantly the influence of political development since the Reform Bill: "An intention to show that Her Majesty has been misled or mistaken in her measures, or to point out errors or defects in the government or constitution as by law established, with a view to their reformation, or to excite Her Majesty's subjects to attempt by lawful means the alteration of any matter in Church or State by law established, or to point out, in order to their removal, matters which are producing, or have a tendency to produce, feelings of hatred and ill-will between classes of Her Majesty's subjects, is not a seditious intention." Burns was acquitted, and the latter definition has since been regarded as authoritative. It is so loose, however, that guilt or innocence must obviously depend on public sentiment at the time of the trial.

The recent English tendency is to ignore the common law of seditious offenses. For example, when Edward F. Mylius was prosecuted in 1911 for a printed statement that King George V had contracted amorganatic marriage before he married the queen, the charge was criminal and not seditious libel. The only reported English case of sedition since 1886 occurred in 1909 when Aldred was convicted for proclaiming a Hindu assassin a martyr in the cause of political independence (22 Cox C C 1). Although the common law of sedition has become almost obsolete in England, statutes still make punishable certain specific offenses of a related nature. During the World War pacifists were imprisoned under Orders in Council authorized by the Defence of the Realm Act. The Seditious Meetings Act, passed in 1817 (57 Geo. 3, c. 19, sect. 23) and directed against meetings of more than fifty persons within a mile of the House of Parliament for the purpose of considering political changes, was invoked in 1932 against Mann and Llewellyn. The Unlawful Oaths Act of 1797 (37 Geo. 3, c. 123, sect. 1) subjects to seven years' imprisonment members of a society who are bound by oath to obey its orders or not to disclose its secrets, unless the society is authorized by Parliament. Under section 1 of the Incitement to Mutiny Act of 1797 (37 Geo. 3, c. 70) anyone who endeavors maliciously to seduce from his duty any person serving in His Majesty's forces or to incite any act of mutiny may be imprisoned for life. Section 3 of the Police Act of 1919 (9, 10 Geo. 5, c. 46) makes it a misdemeanor for any person to cause or attempt to cause disaffection among the members of any police force. Under

the Aliens Restriction (Amendment) Act of 1919 (9, 10 Geo. 5, c. 92, sect. 3) it is a misdemeanor for an alien to attempt to cause sedition or disaffection among the forces of the crown or the civilian population or to promote industrial unrest in an industry in which he has not been engaged for the two preceding years. Unlawful drilling and the sale of arms for illegal purposes are common law offenses. The Incitement to Disaffection bill pending in the House of Commons in May, 1934, will, if enacted into law, considerably widen the scope of sedition and give the government drastic powers for its suppression. The bill has aroused widespread opposition among liberal thinkers and even among conservative lawyers.

In the United States the common law of seditious offenses has probably been abolished by the free speech clauses of the federal and state constitutions. The only case suggesting that seditious libel is a common law offense was tried in Pennsylvania in 1805, but the defendant was acquitted (*Respublica v. Dennie*, 4 Yeates 267). In any event there are no common law federal crimes, so that seditious practices cannot be punished by the United States government unless they are prohibited by specific statutes. Conspiracies to overthrow the government or to commit any offense against the United States are punishable under sections 6 and 37 of the Criminal Code, but the use of seditious words if unaccompanied by an overt act is not a conspiracy, nor do these statutes apply to the conduct of an isolated individual. Seditious language was made a federal crime by the ill fated Sedition Act of 1798, which expired in two years, but its constitutionality was never passed upon by the Supreme Court. During the period following the World War, which was characterized by a pronounced fear of radicals, several sedition bills were introduced in Congress and supported by Attorney General Alexander Mitchell Palmer and other officials, but these bills were successfully opposed by large newspaper organizations and by Samuel Gompers on behalf of the American Federation of Labor.

The question whether a general federal sedition law would be constitutional has aroused considerable discussion. Although no clause in the federal constitution expressly gives Congress power to enact such a law, it seems probable that it falls within the general powers of the federal government to protect itself. At the same time the government is limited by the free speech amendment to the constitution, which was his-

torically directed against the existence of seditious offenses. It is possible also that the constitutional definition of treason, which was intended to prevent the punishment of minor acts as constructive treason, would prevent Congress from punishing the same minor acts under another category.

Although there is no general federal sedition law, some forms of sedition are punishable. By the Articles of War (U. S. Code, title 10, sects. 1538, 1539) any person subject to military law may be tried by court martial and sentenced to death if he attempts to create or causes or joins any "mutiny or sedition" in the armed forces or if he neglects to suppress such a "mutiny or sedition" or to communicate his knowledge of it to his commanding officer. The Espionage Act of 1917 (U. S. Code, title 50, sect. 33) as interpreted by the courts renders civilians severely punishable during a war for questioning its justifiability or the methods of conducting it. In 1918 this act was amended by a wartime sedition law; the amendment was repealed in 1921. In 1917 Congress made it a crime to threaten the life of the president (U. S. Code, title 18, sect. 89). A woman was convicted for saying in conversation, "I wish Wilson was in hell, and if I had the power I would put him there." This was held to be a threat to kill the president, because, as the court reasoned, he could not be in hell unless he were dead (*United States v. Clark*, 250 Fed. 449).

Besides these criminal statutes the federal government can control sedition by administrative measures. Postal officials can exclude from the mails matter which violates the Espionage Act during a war or at any time tends to incite arson, murder or assassination or advocates treason, insurrection or forcible resistance to any federal law (U. S. Code, title 18, sects. 334, 344). Postal officials can also deny the low second class mailing rates to a newspaper which has published non-mailable matter in some previous issue [*The Milwaukee Publishing Co. v. Burleson*, 255 U. S. 407 (1921)]. Immigration officials can deport aliens for language and opinions of a seditious nature, although the word itself does not appear in the statutes. On similar grounds naturalized citizens can be denaturalized and deported. Administrative officials determine guilt in these postal and deportation cases, and their decisions are for the most part not reviewable in the courts.

Although the states have not adopted the common law of seditious offenses, definite incitement to the assassination of officials or to the

serious destruction of government property seems punishable in all states under the common law or statutes penalizing criminal attempts, solicitation and conspiracy. In addition many states have legislation directed against various practices which would have been described as sedition under the English common law of the eighteenth century. Thus during the World War nine states enacted statutes making it a crime to use language opposing the war. Peacetime sedition laws of the states fall roughly into four groups. A common type comprises the criminal syndicalism (*q.v.*) acts passed in 1917-20. Criminal anarchy acts are directed against advocacy of "the doctrine that organized government should be overthrown by force or violence, or by assassination . . . or by any unlawful means." Membership in organizations teaching the doctrine as well as individual utterances is punishable. Such statutes were enacted in New York and New Jersey in 1902 soon after the assassination of McKinley, in Washington in 1909 and in Colorado in 1919. The New York statute remained a dead letter for twenty years, and then its definition of anarchists was found to be sufficiently broad to include several communists. The New Jersey statute was limited by the courts to its original purpose. A few prosecutions have been brought in Washington. Sixteen states and territories in 1917-20 enacted broad sedition acts, which do not follow a single model as do the criminal syndicalism and anarchy acts. For example, Connecticut punishes public advocacy of "any measure, doctrine, proposal or propaganda intended to injuriously affect the government"; New Jersey punishes inciting to insurrection or sedition or attempts to do so and also any book encouraging hostility to the government of the United States or the state; and Rhode Island punishes language intended to incite "a . . . disregard of the Constitution or laws." There have been very few prosecutions under these statutes. The New Mexico law and part of a New Jersey law were held unconstitutional on the ground that they violated the rights of free speech and assembly. The display of a red flag and other radical insignia was made criminal in at least thirty states in 1919-20. A similar Massachusetts statute of 1913 was repealed in 1915 because it made the Harvard banner illegal. The California red flag law was invalidated by the United States Supreme Court as a denial of liberty of speech under the Fourteenth Amendment [*Stromberg v. California*, 283 U. S. 359 (1931)]; this decision renders doubtful the

validity of most other red flag laws. On the basis of the Supreme Court decision the Appellate Term of the New York Supreme Court in 1934 held the state red flag law unconstitutional.

A few states have attempted other methods of controlling sedition besides criminal prosecutions. The New Hampshire sedition law allows injunctions against the importation, publication, distribution or possession of printed or written matter advocating the forbidden doctrines and also injunctions against the use of halls for unlawful meetings. New York in 1921 adopted the Lusk laws, requiring all public school teachers to obtain a certificate of loyalty and all private schools to obtain a license. Such certificates and licenses were not to be issued to advocates of specified radical doctrines. The statute also allowed unlicensed private schools to be enjoined. These laws were repealed in 1923 after being invoked to close the Rand School of Social Science in New York City.

The sedition law of important dominions in the British Empire differs at least in its administration from the English common law of seditious offenses. Sections 132 and 134 of the Canadian Criminal Code, against seditious words, libels or conspiracies, were harshly interpreted to suppress opposition in Canada to the World War. An Alberta judge remarked in 1916: "There have been more prosecutions for seditious words in Alberta in the past 2 years than in all the history of England for over 100 years and England has had numerous and critical wars in that time" (*Rex v. Trainor*, 27 Canadian Criminal Cases, 241). In recent years there have been a number of prosecutions of communists and other radicals for seditious offenses. Section 124-A of the Indian Penal Code, which punishes as sedition any attempt to excite disaffection toward the government of British India, has been invoked in recent years in a considerable number of cases. The Union of South Africa makes sedition a crime under the Roman-Dutch common law, but this law defines sedition more narrowly than does the English common law, and the offense must involve something in the nature of an insurrection.

SEDUCTION is distinguished from other offenses against female chastity in that it does not involve violence. The woman seduced has consented, although her consent may have been gained by allurements, false promises, deceptions, the deliberate rousing of sexual passion or the suggestion of advantages to be gained if she yields to illicit intercourse. Because of the effect on the victim's will it is assumed that she has suffered a definite deterioration of character and consequently of reputation. She is spoken of as "ruined," "corrupted."

In the Old Testament it is commanded that the seducer of a virgin must purchase her of her father as his wife at the price of fifty shekels of silver. This provision apparently was intended to protect the property right of the father rather than the purity of the woman. In Athens the concept of seduction arose as an extension of the offense of adultery. A law attributable to Draco (seventh century B.C.) sanctioned self-help against the seducer as against the adulterer but also allowed, instead, compensatory damages, which here more than elsewhere had the charac-

ter of ransom. In Rome an action of seduction seems to have developed from the right to recover damages for tampering with the loyalty of a slave, *actio de servo corrupto*, and this became the basis of the civil action in continental Europe. The Roman criminal concept of seduction was *stuprum*, based on the *lex julia de adulteris*, which punished the seduction of a free and respectable unmarried woman.

In England the action of seduction was derived from the relation of master and servant—apparently quite independently of Romanistic influences—in which the basis of the complaint was the loss of services, not the deterioration suffered by the woman or the impairment of her loyalty to her master. The father came into court as a man who had lost valuable services, but he was allowed to recover a great deal more than their value. In other words, although he was heard as a master, he was compensated as a father.

Thus the family was assumed to have a definable interest in the chastity of its female members distinct from the property interest which a husband in ancient times had in his wife's body and different again from the family's interest in the property of any of its female members. This last interest was secured by the laws of ancient communities giving the male kin the right to marry an heiress and by the severe penalties imposed in English law for the abduction of an heiress. Abduction was generally made a crime sooner than seduction, probably because as long as the movement of women in society was restricted the former was a necessary preliminary to the latter.

Family pride is closely connected with the sentiment of honor, which as one of the chief constituents of the system of chivalry was of enormous importance in Europe during the Middle Ages. Later, when a high sense of family honor was regarded as the distinguishing mark of the upper classes, seduction was treated as the worst conceivable offense against it. Vengeance on the seducer of a wife, sister or daughter, especially the last two, became a romantic convention. The factors of honor and family pride were fortified by the Christian emphasis on chastity as the characteristic virtue of women.

The development of seduction as a crime was, however, slow. Since the woman consented, the principle of *volenti non fit injuria* intervened. At present the basis of the penalty is either the fact that the woman seduced is very young or that at the time of seduction she was in a position of

dependence on the seducer. In the former situation the consent may be disregarded in view of the victim's inexperience and immaturity, so that the act may be treated as tantamount to rape. In the latter there is a suggestion of duress. A third point of view also assimilates the arts used in seduction to fraud. This is particularly the case when the seduction takes place under a promise of marriage which is in fact not kept, and which it may be assumed the seducer never meant to keep. The minority of the woman is here usually immaterial. Other forms of allurements are evidently in the same category, but the promise of marriage is chiefly in the minds of legislators because of the still existing vestiges of the widespread custom which treats betrothal as a kind of marriage.

The seduction of a woman in a position of dependence is strongly emphasized in continental law. The Italian law punishes seduction under promise of marriage only when the seducer is already a married man and his victim is a minor. The law of some continental countries, for instance France, is confined to the punishment of the seduction of youth. This is also the case in English law. Seduction under promise of marriage was not a crime at the English common law but it has been made so by statute in most states of the United States, where the seduction of youth is punished as "statutory rape." Many American statutes also punish seduction in relations of dependence, especially where the seducer is a guardian or teacher. The English law punishes only the seduction of a female lunatic in an asylum.

The introduction of the notion of fraud into the criminal law of seduction has affected the civil action. Since the fraud is practised on the woman and not on her family or her employer, it is she who should be heard to complain of it. Statutes in most modern countries—England is an important exception—have accorded the woman the right to sue her seducer directly, especially if there was a promise of marriage. Under these circumstances the woman will normally be adult and not a minor, and as far as the civil law is concerned that is taken for granted. The action for seduction became in France one of the means of qualifying the famous provision of the French Civil Code, *la recherche de la paternité est interdite*.

The interest which the action for seduction now seeks to conserve is the integrity of the family rather than its honor or its property rights. Whatever there may be of the factitious

and conventional in the association of honor with female chastity, there can be no question that seduction causes very real unhappiness both to the victim's family and to herself and that despite her consent much the greater responsibility for this unhappiness rests with the seducer. One of the elements involved, however, remains after all the community's interest in chastity as an independent moral value, since the right to recover is almost always dependent on the previous chastity of the woman, which is not to be taken to mean merely her previous reputation for chastity.

The social attitude toward the seducer has rarely gone as far as most legal and religious condemnations would suggest. The seduction of girls of the lower classes by gentlemen of the upper classes certainly seemed in English eighteenth century life almost a perquisite of their rank and, if the seducer was prepared to be generous, was not too harshly regarded by the class to which the victim belonged. The Don Juan might even aspire to the seduction of women of his own class. The great extension of the sexual freedom of women in modern times has not quite eliminated, however, the so-called double standard. On the other hand, it is coming to be recognized that enticement to sexual relations is not always the act of the man, although the Shavian paradox is not accepted in its extreme forms. At any rate, the complaint of seduction, where there are no really serious consequences, is not presented so often by mature women, and the "wronged maiden" has lost her importance in popular literature.

SEEBOHM, FREDERIC (1833-1912), historian, lawyer and banker. The son of Quakers and himself a member of the society, Seebohm was deeply influenced by their doctrines. His earliest historical studies were concerned with the development of Protestant and practical Christianity and the evidence of moral purpose in history. Seebohm's important contribution, however, was in the field of economic history. Although continuously active in business, local government and education, he produced three influential works: *The English Village Community* (London 1883, 4th ed. 1890), *The Tribal System in Wales* (London 1895, 2nd ed. 1905) and *Tribal Custom in Anglo Saxon Law* (London 1902), and was engaged upon a study of weights and measures at the time of his death. In the first, to the question "whether the hams and tuns of England with their open fields and yard-lands, in the earliest historical times were inhabited and tilled in the main by free village communities, or by communities in serfdom under a manorial lordship" (p. ix and 423), he gave the answer that they were "practically manors with communities in serfdom upon them." Here he challenged contemporary scholarship and dominant theories of the village community and promoted the detailed study of the origin of the manor. He made English history less provincial and identified it more clearly with general economic evolution. In the second work he gave as vivid a picture of tribal organization as in the first he had given of the open field system. He attempted to separate the elements of original tribal custom from the changes which came upon it almost everywhere in western Europe under Roman and ecclesiastical influence. The third was a study of the solidarity of the kindred under tribal custom. The lucid and concrete style of all his works added greatly to their effectiveness.

Seebohm's central idea was that the open field system of the village community acted as a shell under which the common village life of an agricultural people was kept alive through the period of anarchy which followed the break up of the Roman Empire. He was well aware of the dangers of his own method: "The method of enquiry from the known to the unknown is essentially a tentative method." His real fault was a tendency to accept as contemporary in the past

rules and customs collected from many different periods. Too frequently he ventured on inferences from analogies between facts which were often themselves little more than conjectures.

SEECK, OTTO (1850-1921), German classical historian. Seeck was born in Riga, studied under Theodor Mommsen and taught at Berlin, Greifswald and Munster. Under the influence of Mommsen he concentrated upon the political organization of late antiquity, beginning his researches with his dissertation *Quaestiones de notitia dignitatum* (Berlin 1872). His teaching activities and the need of acquiring a unified picture of the general history of antiquity led him to undertake critical study of early Roman traditions, of the origins of Greek history and of the development of ancient historiography. He wrote many articles on the history of officials, on political organization, on church history and even on numismatics and mediaeval painting.

Seeck's most important work, however, was his *Geschichte des Untergangs der antiken Welt* (6 vols., Berlin and Stuttgart 1897-1920), on which he was engaged for over thirty years. His investigations were carried out on a wide scale and he always sought to penetrate to the deepest roots of the culture of late antiquity. His contributions are most valuable for their minute detail, but his historical picture is one-sided. He was essentially a rationalist positivist who gathered impressions in extensive travels and who, attracted toward the theories of natural science as well as to the ideal of the later humanists, considered that the historical process had declined to the point of complete decay. The "extinction of the best," he held, was responsible for the disintegration of the ancient world. Seeck failed to comprehend the powerful movements leading to a reconstitution of the ancient world and its culture which were already operating in the second and third centuries. He lacked insight into the religious and philosophical transformations of the period, into the enormous

influence of the Orient and oriental religious culture on the Mediterranean world and into the force of Christianity, which can be understood only in relation to these currents. "Decline" meant for him the death of the rationalist culture of the upper layer of Greco-Roman society. He overlooked the fact that a new way of life was being fashioned by forces from the provinces, from the Orient and from the younger nations of the north and that this way of life permitted the continued existence of those forms of classical culture which still retained their vitality.

WILHELM WEBER

SEELEY, SIR JOHN ROBERT (1834-95), British historian. Although Seeley was a classical student, academic in his tastes and occupations, his reputation and his influence have sprung from three books, no one of which lies in the classical or academic sphere. The first, *Ecce Homo; a Survey of the Life and Work of Jesus Christ* (London 1866), presented a purely secular treatment and aroused an intense controversy, in which Gladstone, Newman, Stanley, Kingsley and other prominent men participated. The second, *The Life and Times of Stein* (3 vols., Cambridge, Eng. 1878), was one of the first sympathetic studies in England of the rise of modern Germany. The third and most famous was *The Expansion of England* (London 1883, 2nd ed. 1895), two courses of lectures given at Cambridge in 1881-82. The popularity and wide influence of this work in England and abroad were due largely to the rising interest in the idea of imperial unity. It coincided with awakening imperial sentiment, as revealed in Kipling's *Indian Barrack Room Ballads* (1892) and the *Seven Seas* (1896); in Dilke's *Problems of Greater Britain* (2 vols., 1890); in the formation of the Imperial Federation League in 1884; in the gathering of representatives of India and the dominions at the Queen's Jubilee in 1887; and in the first Imperial Conference of Colonial Premiers, held on that occasion. *The Expansion of England* was not only an indication of the changing attitude of Great Britain toward its colonies and dependencies but itself one of the most important influences in bringing about that change. It was a vigorous defense of British imperialism from the historical point of view. It was simple, clear, animated and well calculated to further a movement already under way.

Seeley's advocacy of the unity of the empire earned him in 1894 the honor of knight Commander of the Order of St. Michael and St. George.

Seeley had no compunctions about writing history with a preconceived purpose. The opening words of this work are: "It is a favorite maxim of mine that history, while it should be scientific in its method should pursue a practical object. That is, it should not merely gratify the reader's curiosity about the past but modify his forecast of the future." He was neither a profound historical scholar nor even a historical investigator. He took his history ready made, in its conventional form and its general statements. His interest was rather in skilful presentation and in making explanations and drawing lessons. In this spirit and still in the interest of imperial unity he devoted the later years of his life largely to the preparation of a lengthy essay, published after his death as *The Growth of British Policy* (ed. with memoir by G. W. Prothero, 2 vols., Cambridge, Eng. 1895; 2nd ed. 1897). Notwithstanding its excellence of style, originality of interpretation and insistence on imperialism this book attracted little attention.

Seeley" in *Revue des deux mondes*, vol. cxlvii (1898) 585-610.

SEGREGATION. In sociology segregation represents that form of isolation in which social distance is based upon physical separation. The physical barriers and spatial distances that set individuals apart from the mass and group from group are sociologically significant only to the extent that they become obstacles to communication and inhibit social contact.

Segregation is both a basis and a product of social isolation. Its most obvious function is taxonomic. Through competition and conflict natural and social selection goes on, and in its course each individual and group acquires a habitat, a function in the division of labor and a position in the social order. The selection proceeds on the basis of individual and group differences, and through the resulting speciali-

zation and segregation the distinctive characteristics of each are accentuated and reinforced. As a final result of this struggle social types emerge.

Unconscious selection and segregation based upon competition should be distinguished from deliberate attempts, arising out of conflict, to keep individuals apart. The former is represented by immigrant colonies or ethnic groups which in the course of their history have unwittingly and often voluntarily built up segregated communities. This process may be designated as passive segregation as contrasted with active segregation, which may be exemplified by the forced and often legal setting apart of individuals and groups, such as in leper and penal institutions and colonies; or by Jim Crowism in the southern United States. In a given case one or the other of these two types may predominate at different periods of historical development. Thus segregated vice districts have generally come into existence spontaneously, have subsequently been confined within legally prescribed boundaries under public supervision and have finally persisted unofficially, although no less visibly, in much the same areas even after their formal abolition by ordinances.

Segregation of differently specialized groups implies aggregation of similarly constituted individuals. Common and compatible characteristics tend to draw persons together, just as dissimilar and conflicting traits tend to set them apart. This suggests the distinction between positive and negative segregating factors. Mutual attractions, common interests and special but similar needs operate positively to draw individuals into segregated groups, even in the absence of any attitude of conscious avoidance of outsiders. Aversions, prejudices and conflicts are negative factors which through the influence of social distance and repulsion drive groups apart. Where segregation continues for any considerable period of time, both sets of factors operate.

Race, culture, religion, morals, status, language, caste, class, wealth, occupation, sex, physique and mentality, talent, taste, attitude, interest, in fact any set of characteristics in which the members of a group may be similar to one another and different from outsiders may become the basis of segregation. In the attempt on the part of a dominant racial or cultural group to live with a minority group segregation offers an alternative mode of adjustment to forcible incorporation on the one hand and to extermi-

nation of the subordinate minority group on the other. One of the most dramatic historic instances of this sort is the segregation of the Jews in the ghetto and the pale. At first voluntary, on the basis of social heritage, ritualistic need and preference, the ghetto in the late Middle Ages became compulsory, being imposed upon the Jews as a stigma and as a device to prevent contamination of Christians. In modern times the ghetto survives partly as a voluntary and partly as a compulsory form of segregation. It is voluntary in so far as it seems to offer a more tolerable and congenial habitat in view of the disadvantageous status of the immigrant, his need for distinctive communal institutions and the tradition and usage of old, which cannot be shaken off at will; but it is compulsory in that prejudice and antipathy toward the Jew prevent him from enjoying free contact with Christians.

A more thoroughgoing case of segregation is represented by the relations of Negroes and whites in the United States. Despite the caste system which developed during the period of slavery the separation between these two races was far from complete. Under the static, feudal order of the plantation system the Negro and the white group each lived within a separate and distinct social world, and each accepted the order which this world imposed. But the definitions and norms of conduct implicit in slavery did not prevent the growth of friendly and even intimate relations between the races, including interbreeding. In the course of the dissolution of this caste order, of which the legal emancipation of the slaves was merely the outward sign, the Negro was brought into competition with the white man. In the attempt to improve his condition and especially his social status the Negro aroused the prejudice and animosity of the whites. Out of these prejudices and antipathies, which represented the resistance of the dominant white group to the disorganization of the traditional social order, emerged the philosophy of the color line which assigns every Negro to an inferior position and insists on keeping him "in his place." The result has been the development of a biracial organization providing for the strict maintenance of race distinctions and separation in almost every phase of community life.

Despite federal constitutional amendments and civil rights bills, which were designed to secure for the Negro equality of citizenship, legal and extralegal formulae were found under which his rights of citizenship could be abridged and nullified. With his right to vote and to hold

office limited the Negro has been driven into a more distinctly segregated political grouping, and this in turn has been instrumental in paralyzing his effort to protect himself against discrimination. During the slavery epoch in the United States the economic interdependence of the two races and the lack of race solidarity and pride among the slaves, which may be attributed to their restricted opportunity to congregate and to the atomization of their African culture and tradition, may be considered responsible in large measure for the absence of a pronounced segregation policy. The breach between the two races widened after the Civil War and during the reconstruction period. Urbanization and northward migration of the Negro extended and intensified the white policy of discrimination and segregation.

A federal civil rights bill passed in 1875, ordaining that "all persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, advantages, facilities, and privileges of inns, public conveyances on land or water, theaters, and other places of public amusement; subject only to the conditions and limitations established by law and applicable alike to citizens of every race and color, regardless of any previous condition of servitude," was declared unconstitutional by the United States Supreme Court. Laws prohibiting miscegenation and permitting the separation of races in trains, street cars, schools and places of public assembly and amusement, hotels and restaurants, toilets, depots and public institutions were then enacted throughout the south. A law passed in South Carolina regulated the association of the races in industry and had the effect of barring the Negroes from the growing textile industry in that state. In 1932 intermarriage bans were in force in thirty states including all of the southern and many of the western states. In certain Pacific coast states some of the disabilities to which the Negro is subjected in the south apply also to orientals. Segregation in schools was in force in eighteen states in 1931. In Mississippi the advocacy of social equality between colored and white is subject to legal penalty. While these segregation laws were being passed in the south, a number of the northern states were enacting civil rights bills. Some of the legislation limiting the rights of citizenship and social equality was upheld by the courts on the doctrine of "reasonable classification," providing for separate but equal accommodations and facilities [United States v.

Buntin, 10 Fed. 730 (1882)]. In actuality, however, the effect has been to compel the Negro to pay first class fare for third class accommodations, to offer him inferior public schools and frequently to deprive him altogether of public facilities which the white citizen takes for granted, such as parks, playgrounds and bathing beaches.

Next to the struggle for the franchise the attempt to defeat residential segregation laws has perhaps been the most important racial issue in the courts. Beginning about 1910 laws forbidding either colored or white persons to move into a house or block inhabited in the main by people of the other race were passed in many southern border cities. In theory such laws—and most segregation ordinances are of this character—apply equally to both races, but actually they are enforced only against Negroes. In a unanimous decision in the Louisville segregation case the United States Supreme Court held unconstitutional legislation which would prohibit Negroes because of their color from purchasing any real property they might be able to buy and from occupying any property they could buy or rent [*Buchanan v. Warley*, 245 U. S. 60 (1917)]. Since this decision, however, various indirect methods have been employed to achieve the same end. One of them is the practice among white property owners of making agreements not to sell, lease or rent to Negroes and of writing such agreements into deeds and contracts. Where these measures of indirection have failed, threats and violence have sometimes been resorted to. Since residential segregation is general in some measure in all American cities, it has come to be one of the major issues in race relations. The Negro as a rule pays higher rent and lives in the least desirable quarters, frequently in rapidly deteriorating areas showing high morbidity, mortality and delinquency rates. His attempts, especially during the northward migration after the World War, to find suitable living quarters, have sometimes led to large scale unrest and bloody race riots.

Racial segregation is also found in some degree, although in diverse forms, in other parts of the world. In those regions of Central America and the West Indies where the Negro represents numerically the dominant group race separation has been introduced by white administrators and particularly by white employing corporations. There is one important distinction, however, between the United States on the one hand and Central and South America on the

other: while in the former the mulatto, or mixed, blood is regarded as a member of the Negro group, in the latter he generally belongs to the white group. In Central and South America furthermore the color line, where it is drawn, seems to represent economic and cultural differentiation and stratification rather than racial segregation. In west Africa the whites as a rule are not in competition with the colored group; for this reason and also because the whites are relatively few in number, the problem of racial segregation has not become acute. Legal provision for segregation is employed to prevent physical rather than social contact. For the latter the whites rely largely on custom, tradition and personal reserve, which seem sufficient to obstruct free racial intermingling. In South Africa race relations are complicated by the presence of five contending groups: the British, the Boers, the mixed blood Cape colored people, the Indians and the natives. In addition to civil and economic disabilities the natives are subjected to residential segregation and are confined to native reservations.

The caste system of India represents the classic instance of segregation rooted in and sanctioned by tradition. Membership in a caste is based on birth; and a society dominated by this principle tends to be more rigid in its social organization, to be more highly segmented and to give rise to a more thoroughgoing segregation of the population than a social order based upon a class or individual achievement. Since the members of a caste can live and eat with and marry only members of the same caste, segregation in such a society leads to inbreeding, residential separation, occupational differentiation and a minimum of social contacts between the members of different castes. Each caste avoids any relations with the one beneath it, and the out-caste is reduced to the state of a pariah. The untouchables of India suffer from the most severe civil, social and religious disabilities. They are regarded as impure and contact with them is considered a contaminating influence. Not only are they housed in separate quarters, restricted to the humblest occupations and deprived of the skilled services monopolized by the higher castes, but they are excluded from the temples, the highways and the village wells. The development in India of a factory system and the disintegration of the folk culture have made it difficult to maintain the caste lines intact. The emerging new urban and industrial order tends to weaken the ceremonial and ritualistic ob-

servance of caste distinctions and to engender social and political mass movements which seek to undermine if not to abolish the caste hierarchy and the segmented division of society.

A unique instance of segregation is presented by the extritoriality which foreign settlements enjoy in certain Chinese cities. In this case segregation has been sought as a special privilege. In the foreign settlements of Shanghai, for instance, the non-Chinese enjoy political autonomy and exemption from the jurisdiction of the native courts. This privilege has been wrested from the Chinese by armed intervention and is sanctioned by treaties. A comparable situation exists among the Indians in the United States, who, although segregation was imposed upon them by the whites through the reservation system, have had a certain measure of autonomy under the supervision of the Indian Office.

A segregation policy may spring from a variety of motives and causes. Aside from the voluntary withdrawal arising out of ethnocentrism, the desire to perpetuate an actual or fancied purity of racial stock or to avoid assimilation or contamination, the convenience or general wish to maintain an accustomed existence free from the intrusion of strangers, segregation may be and often has been rooted in the attempt to avoid or limit competition and conflict, in the fear of a subordinate group's retarding or disruptive influence, in the feeling of exclusiveness and superiority, in the striving to maintain a dominant status and in the desire to discipline, control, punish or humiliate a group toward which there exists a prejudiced or contemptuous attitude. Segregation policies have sometimes been reactions to the failure of a program of assimilation and forcible incorporation as well as to personal feelings of inferiority. The factors which account for the original development of segregation are not always identical with those which explain the perpetuation of the policy after its adoption.

Segregation is more likely to be resorted to if the minority group is relatively large and if it is in competition with the dominant group. It is more effective and probably more permanent if the group to be segregated has distinctly visible physical characteristics, such as color, than if its only distinguishing features are cultural. Acute group consciousness, established traditions, sentiments and mores are apparently more powerful segregating influences than transient interest groupings and formal laws.

The general effect of segregation has been to

create an ever widening gulf between the segregated peoples. The absence of social contacts has increased mutual ignorance, suspicion and social distance and has decreased mutual understanding, appreciation and the development of common interests. It has had a narrowing and stunting effect and has intensified the unique features of each group. It has frequently resulted in the development in the subordinate group of a feeling of frustration and resignation and in the dominant group of a condescending and patronizing attitude. On the other hand, it has sometimes led to an awakening of the minority into a racially or culturally self-conscious body either defiant toward the dominant group or tending to build up a separate world of its own. More frequently, however, it has led to sycophancy and servility, at least among the masses of a segregated group. Such a form of segregation as is found in the southern United States, which virtually calls for duplication of every facility of social life for the two races, has through its enormous cost been influential in retarding the cultural advancement of both groups. Segregation represents a segment of a vicious circle: group differences lead to separation and separation in turn accentuates the differences, thus resulting in intensified conflict, which gives further impetus to segregation. While segregation may have been a useful historical means of establishing a *modus vivendi* in a static social order, under modern conditions of life and communication it seems at best a costly and temporary makeshift in the struggle against an irresistible process through which peoples and cultures are blended.

SEGUIN, EDWARD (1812-80), French physician and psychologist. Seguin was the first scientific leader in work with the feeble-minded and an important forerunner of modern progressive education. A pupil of Itard, he was impressed, as Itard was not, with the educational results which had been achieved with an obviously feeble-minded boy by Itard's program of physiological education. Seguin intensively applied the principles of physiological education to the training of the feeble-minded with gratifying results. He did not succeed in curing feeble-mindedness, as he set out to do, but he secured remarkable improvements in numerous cases formerly regarded as entirely hopeless. Seguin's physiological method consisted of activities directed toward training the muscles and developing the senses of the defective child with a view to improving coordination and thereby stimulating the fullest use of his limited intellectual equipment. He was the first to show that feeble-mindedness could be dealt with constructively. The result was a significant change of emphasis from the sterile concept of custody to the more fertile concept of constructive training. This in turn reflected itself in the more humane and understanding treatment of the feeble-minded, first in institutions and much later, after Seguin's time, in the community.

In 1850 Seguin came to the United States as a political refugee, having incurred the disfavor of Louis Napoleon because of his support of the provisional government of 1848. Here he accepted the invitation of early leaders in institutional work with the feeble-minded who had already been inspired by his writings, to assist them personally in the development of their institutions. The rest of his life was spent in this country. It was the Seguin program which animated all of these early American institutions and which still animates in large part the best work now carried on with the feeble-minded. The methods which Seguin devised for the education of the feeble-minded have likewise had a wide acceptance in modern educational theory and practise as related to normal children.

SEIGNIORAGE. *See* COINAGE.

SELBORNE, FIRST EARL OF, ROUNDELL PALMER (1812-95), English chancellor and law reformer. As solicitor general from 1861 to 1863 and attorney general from 1863 to 1866 Selborne was the principal legal adviser of the British government upon the important questions of international law which arose during the American Civil War, and was counsel for the crown at the Geneva arbitration which followed the Treaty of Washington.

His greatest achievement was the complete reform of the judicial system. While attorney general he introduced legislation which transferred all the existing courts to a new building in the Strand, and in 1867 he obtained the appointment of the Judicature Commission to report on their reform. In 1873, having become lord chancellor, he introduced the Supreme Court of Judicature Act, which he himself had drafted on the basis of the commission's report. This act removed masses of ancient technicalities and inconveniences, fused law and equity and set up a logical system of courts. Selborne was, however, unable to prevent the passage of a later amending act (1875) which restored double appeals (abolished by his original project). He also reformed the official staff of the chancellorship and secured the passage of some cautious real

property reforms. One project he failed to realize: the reform of legal education by the establishment of a general school of law in London. At one moment he proposed the abolition of patents of inventions.

Selborne's strong convictions as a churchman led to his breach with Gladstone over the Irish church question; he was willing to see a moderate reform of the older universities but deplored the elimination of the religious tests. He wrote several works on ecclesiastical subjects, notably an able history of tithes (*Ancient Facts and Fallacies concerning Churches and Tithes*, London 1888, 2nd ed. 1892).

THEODORE F. T. PLUCKNETT

Consult: Atlay, J. B., *The Victorian Chancellors*, 2 vols. (London 1906-08) vol. ii, p. 377-432; *Memorials, by Roundell Palmer, Earl of Selborne*, ed. by S. M. Palmer, 4 vols. (London 1896-98).

SELDEN, JOHN (1584-1654), English jurist, historian and political theorist. Selden was perhaps the most notable of those English lawyers and parliamentarians who in the earlier part of the seventeenth century strove by means of scholarly investigation and political agitation to reconstruct a constitution which, while not democratic, should provide adequate safeguards against the prerogative. In common with his contemporaries he considered change not in terms of progress, but as a reinstatement of certain idealized elements of the past.

Born of yeoman stock in Sussex, he was educated at Chichester Grammar School and at Hart Hall, Oxford; later he was admitted to the Inner Temple and was called to the bar in 1612. He was returned to Parliament in 1623; but already he had served the Commons as a consultant in matters of historical and legal precedent. Among the occasions on which he argued on behalf of the subject against the policy of Charles I were the misconduct of Laud, the violation of parliamentary privilege, the arbitrary imposition of ship money, the imprisonment of the subject without cause and the muzzling of the press by the Star Chamber. His resolute conduct caused him to be imprisoned for a short period in 1629. But the more violent course of the opposition after 1643 and the intrusion of Presbyterian, Independent and Leveller elements served to dissociate Selden from public life and after 1649 he remained in scholarly seclusion. He was respected as much by the Lords as by the Commons, as much by the Stuarts as by their more respectable opponents;

at times he might have acted as mediator, but a certain aloofness of manner and dislike of publicity prevented him from playing a more prominent part in the politics of his time. By nature a scholar, he had more interest in books and manuscripts than in humanity; and he is one of the few Englishmen to have acquired fame by sheer weight of erudition, although his learning was generally greater than his acumen. Nevertheless, despite his lack of critical sense he rendered great service to the causes of constitutionalism and scholarship. By his advocacy he gave dignity and weight to the claims of the Commons, and by his antiquarian zeal he directed attention to the great wealth of original material available for the student of English institutions.

Most of Selden's extremely voluminous literary works are, however, obsolete; this is true of his oriental treatises, relating mainly to rabbinical law, and his *Mare clausum* (London 1635; tr. by M. Nedham, 1652), written in refutation of Grotius and containing historical "proofs" of England's claims to dominion in the narrow seas. There was a more modern note in his *History of Tithes* (1618), wherein he contended that the tithe is not of divine institution; and his *Of the Judicature in Parliament* (first published 1681) and *Privileges of the Baronage of England* (1642) as well as his *Titles of Honour* (1614) may still be consulted with profit by the antiquary. On the other hand, Selden accepted the semispurious *Mirror of Justices*—a curious mixture of fact and myth written by a London fishmonger of Edward I's reign who intended to demonstrate the rights of the subject against the crown—and ranked its authority with that of Bracton. Much of Selden's historico-legal material came from the great collection of mediaeval manuscripts housed by his friend Sir Robert Cotton, and many of his sources have been critically edited since his time by the society which is appropriately named after him. Selden appears to have been a good conversationalist, as may be seen from the pungent remarks collected by his secretary, Richard Milward, and published as *Table Talk* (London 1689).

SELER, EDUARD GEORG (1849-1922), German ethnologist. Seler, who was director of the American division of the Berlin Museum für Völkerkunde from 1891 to 1922, became interested in American ethnology as a result of his work in preparing a German edition of two books by Marquis de Nadaillac on European and American prehistory. His dissertation *Das Konjugationssystem der Maya-Sprachen* (Berlin 1887) was the first of numerous papers presenting the scientific results of his extensive studies and travels in South and Central America. Seler's researches and lectures covered the entire field of the aboriginal civilizations of America, including those of the northwest coast, the pueblos, the Sonoran nations, Mexico and Central America, Colombia, Ecuador, Peru and Bolivia, as well as the history of the Spanish discoveries and conquests. His study of Peruvian ceramics is recognized as an especially noteworthy contribution in this field. He was able through his command of the Aztec tongue to translate the difficult Sahagun text written about the middle of the sixteenth century. He also deciphered the most important Mexican picture writings, in connection with which he clarified the calendar and the complex system of divinities of Mexico. To Seler is due a significant share of present knowledge of Mayan hieroglyphs, the computation of the length of the Mayan year, of the Calendar-Round and of the synodical revolutions of Venus. He was able to establish Toltec influences in Mayan regions, and he recognized that the basic ideas of Mexican and Mayan religions are closely related and cannot be studied separately. He rejected vague hypotheses as to the origin of American civilization and strongly emphasized its independent development. By virtue of his application of philology and archaeology and his cautious methods of historical criticism, Seler may be said to have been the first to set the scientific study of Mexican history on a solid basis.

SELF-DETERMINATION, NATIONAL.

As a principle the right of peoples to determine their own sovereignty has underlain the entire history of the plebiscite (*q.v.*) and has long been invoked by subject nationalities for their own liberation; but the expression self-determination became current only during the World War. At that time numerous liberal and labor groups, particularly in Great Britain, France and the United States, advocated the principle as the proper basis for a just and permanent peace. President Wilson after his address of May 27, 1916, was looked upon as its leading exponent. It is clear from later events that the president had no intention of endorsing secession but meant merely to condemn conquest and to assert the right of national groups to autonomy within the state to which they belonged.

In the light of the known contents of the "secret treaties" the reply which the Allied Powers issued on January 10, 1917, to Wilson's request for a statement of war aims proved unsatisfactory to the supporters of self-determination, while the evasive response of the Central Powers strengthened the conviction that they meant to retain Belgium. Wilson's vigorous reaffirmation of the principle on January 22, 1917, had a profound influence on the subsequent statements of war aims by both sides. The first echo came on April 10 in the form of a declaration made by the Lwów government to satisfy the Petrograd Soviet. By its subsequent reassurance to the Allies that the engagements of the czarist government would be respected, the Lwów government gave Lenin an opening for his assault upon its power. The first official pronouncement of the Soviet government, the Decree of Peace of the All-Russian Convention of Soviets of Workers', Soldiers' and Peasants' Deputies, on November 8, 1917, endorsed both the principle of self-determination and the method of the plebiscite.

The Central Powers, forced by the entrance of the United States into the war, by pressure from certain sections of the German people and by the threatened exhaustion of war material to repudiate plans of conquest in more definite terms, assented to the Reichstag resolution of July 19, 1917, which declared for "a peace of

understanding" and against "forced acquisitions of territory and political, economic or financial oppressions." But the terms which the Central Powers dictated at Brest Litovsk aggravated the fear of neutrals as well as of the Allies that the Central Powers still had designs not only on parts of Belgium and France but also on Lithuania, Kurland and Poland. This distortion of the principle of self-determination, in which the Soviet government in its relations with the Ukraine and Georgia later showed itself an apt pupil, greatly augmented the prestige of the Allies with their own labor groups and with the neutrals. Prime Minister Lloyd George on January 5, 1918, declared that one of the three bases of the just and lasting peace for which Great Britain was fighting was "a territorial settlement . . . based on the right of self-determination." President Wilson, who, in his address on January 8, 1918, containing the Fourteen Points, had emphasized the rights of nationalities, on February 11 declared self-determination to be "an imperative principle of action, which statesmen will henceforth ignore at their peril," and reiterated the warning in his speech at Mount Vernon on July 4.

The declarations of Wilson, echoed by Lloyd George, Pichon and other allied statesmen, were effective in awakening opposition to the government in Germany and Austria-Hungary. The request of the German Republic for peace on the basis of the Fourteen Points and of the subsequent Wilson addresses was formally accepted, with reservations here irrelevant, by the Allies. Austria, Hungary, Bulgaria and Turkey, on the other hand, surrendered before receiving from the Allies a formal acceptance of their appeal to the Wilson principles. Hence in the case of the latter countries the European Allies recognized no legal obligation to follow the Wilson principles when they conflicted with the secret treaties, although the American delegation to the Peace Conference considered the principles binding on all the Allies toward all the belligerents. The Italian delegation made a reservation regarding Point ix of the Fourteen Points, which called for "a readjustment of the frontiers of Italy . . . along clearly recognizable lines of nationality," and while claiming Fiume under self-determination entered a reservation in principle regarding every plebiscite in the treaties.

The draft treaty with Germany made provision for plebiscites in Schleswig, Allenstein, Marienwerder and the Saar and accorded to the inhabitants of Eupen-et-Malmédy the right to

protest against cession to Belgium. The Allies held that self-determination was the principle underlying the cession of Alsace-Lorraine, which was made under Point VIII of the Fourteen Points, and that of Upper Silesia, Poznań and part of West Prussia (the Corridor) under Point XIII, the language statistics and pre-war votes for the Polish party being interpreted as showing the population to be "indisputably Polish."

The German delegation protested that the draft treaty disregarded the "new and fundamental law" of self-determination. Upon the insistence of Lloyd George the final text of the Treaty of Versailles provided for a plebiscite for Upper Silesia. Despite the strong demand of the Austrian delegation for plebiscites, only one—the Klagenfurt basin—was included in the Treaty of Saint-Germain, while the similar Hungarian and Bulgarian pleas were denied. Although Czechoslovakia based its national existence on the right of self-determination, its delegation opposed any fixing of its own boundaries by plebiscite. Efforts of Lloyd George and Wilson to secure from the Italians plebiscites for Fiume and Dalmatia were unsuccessful, as were those of Balfour and Lansing regarding eastern Galicia. Suggestions for votes in the Banat and in Bessarabia were also abortive. Possible plebiscites in Smyrna and Kurdistan were provided in the Treaty of Sèvres, but this was never ratified. More plebiscites would probably have been written into the Paris treaties had it not been for communistic movements, pressure of time and lack of troops to police the areas.

The plebiscite in Schleswig was held in the northern zone on February 10, 1920, and in the southern zone on March 14. In the first zone, where the treaty had called for a vote en bloc, there was a majority for Denmark. The second zone, where the vote was by communes, was retained by Germany, which won a majority in almost every commune. On July 11 the Allenstein and Marienwerder areas voted by communes, Germany winning almost all of the communes and retaining the areas with minor changes along the frontiers. On October 10 the vote was taken in the first zone of the Klagenfurt area; and since Austria obtained the majority, the vote in the second zone was abandoned, as the Treaty of Saint-Germain had provided. In Upper Silesia, where the plebiscite was held on March 20, 1921, Germany won 59.6 percent of the total vote and a majority in 844 communes as against 678 for Poland. The treaty had provided

Self-Determination, National — Self-Incrimination 651

that the vote be determined by communes; but so inextricably mixed were these communes, so important the political issues to the powers and so threatening was the third Polish insurrection in the area, that the Supreme Council appealed to the League of Nations for a recommendation as to the frontier, which was made and followed. While Poland was given large German enclaves, it had actually won the majority of the total vote as well as of the communes in the area allotted to it. Because Hungarian bands of patriots had prevented Austria from taking possession of Burgenland (west Hungary) in accordance with the treaties of Saint-Germain and Trianon, a plebiscite was finally arranged in Sopron under the Protocol of Venice. In the vote which was held on December 14-16, 1921, Hungary received a majority and retained the area.

The plebiscite arranged by the Supreme Council between Poland and Czechoslovakia in Teschen, Spiš and Orava had to be abandoned as well as that planned by the Council of the League of Nations to decide the Vilna dispute. The unsuccessful effort to hold a plebiscite in Tacna-Arica between Chile and Peru, under the Arbitral Award of President Coolidge, in 1925-26 marks the last attempt to apply the instrument. The only plebiscite now in prospect is that to be held in the Saar basin in 1935.

In spite of the many outright cessions, some indefensible under the principle of self-determination, the Paris treaties register greater respect for the principle and for the method of the plebiscite than any previous peace treaties. All the formal plebiscites under the Versailles and Saint-Germain treaties were held under the direction of the Conference of Ambassadors and mark a great advance in the neutralization of the areas involved, pending the outcome of the vote; the treaties stipulated that troops of both parties be withdrawn and that an international commission be given complete control over the administration of the area as well as over the vote. In each case except Klagenfurt the commission had a military force at its disposal to maintain order. In Tacna-Arica, while the president of the Plebiscitary Commission was a neutral, the other features of neutralization were absent. In all the post-war plebiscites the secret ballot was required. Except in Tacna-Arica women were qualified to vote. In the Versailles plebiscites and in Tacna-Arica the suffrage was granted to all native born whether resident or not.

Although the most convincing plebiscites were those of Schleswig and Klagenfurt, there can be little question that the results of the German-Polish plebiscites reflected the wishes of the inhabitants with a fair degree of accuracy. History since the Peace Conference has proved that as a means of applying the principle of self-determination the plebiscite is infinitely more exact than are language statistics or commissions of inquiry.

SELF-INCRIMINATION. The privilege of a witness or person accused of crime to refuse to give evidence on the ground that he would thereby be giving evidence of his own criminality, although firmly rooted in the American constitutional system, is of comparatively recent origin. In early criminal procedure there was great reliance on compurgation, an exculpatory oath taken by the accused assisted by a number of oath helpers. Compurgation was in no sense a procedure for giving evidence. It was rather the decisive act in the procedure. The accused having accepted the challenge and taken the oath, decision in his favor followed. With the rise of the jury system compurgation, or wager of law, even while dying of atrophy, came to be cherished as a privilege and it was so considered in various royal charters. But there is no trace of a historical connection between the privilege of wager of law and the modern privilege against self-incrimination. The antecedents of the latter must be sought in the field of ecclesiastical jurisdiction.

The thirteenth century marked the introduction of inquisitorial procedure into the canon law. With the adoption of a system for questioning the accused it became obvious that he would be sworn to speak truly. Thus there was introduced under Innocent III the oath *jurandum de veritate dicenda*. On the continent this coincided with the displacement of the system of private prosecution by public prosecution, and the canon law procedure *per inquisitionem* was quickly adapted to secular criminal procedure.

In England such adaptation was barred at the time by the flourishing state of the king's courts and by the conflicts over the limits of ecclesiastical jurisdiction. But by the reign of Elizabeth this jurisdiction had been effectively restricted to matrimonial and testamentary causes and the inquisitorial oath had already been incorporated into the practise of the newly created Court of High Commission and the older Star Chamber.

Throughout the next two reigns controversy centered about the method of administering the oath, there being no question of its legality. The canon law originally required either some form of presentment before the oath could be administered or else bad repute of the accused as a condition to administering the oath without presentment (i.e. *ex officio*). Inevitably the exercise of the power to administer the oath *ex officio* brought with it an increasing disregard of the preliminary conditions with the result that popular agitation against the oath in any form continued to increase. This agitation culminated in 1641 when the Star Chamber and the High Commission were abolished and the ecclesiastical courts were forbidden to administer any oath *ex officio* in matters penal. In the same year the claim of a privilege against self-incrimination in any court made its appearance. Although there had been no inkling of such a privilege in the procedure of the common law courts, the struggle against the administration of the inquisitorial oath *ex officio* had given rise to a new claim against compelling a man to convict himself out of his own mouth. Resistance to illegal testimonial compulsion had gone through a psychological transmutation by which it became resistance to any testimonial compulsion. By the end of the seventeenth century the privilege had become firmly established and had become available not only to the accused in a criminal cause but to ordinary witnesses in both criminal and civil causes.

The history of the introduction of the privilege into the American colonies is still unknown. Apparently it did not obtain in the earlier years of the Massachusetts Bay Colony; it is expressly mentioned, however, in the Virginia, North Carolina and Pennsylvania declarations of rights of 1776, and when the revolution ended it had become hallowed in constitutional bills of rights. At present a constitutional privilege against self-incrimination obtains in all but two states.

The scope of the privilege is very wide indeed. While it does not protect against exposure to civil liability, it does extend to facts in a civil

proceeding, which may incidentally involve criminal liability, as in the case of libel, adultery, fraud and bankruptcy. Some courts have extended it to acts which would be criminal under a foreign sovereignty; the recent tendency, however, is against such extension. An officer of a corporation may not refuse to produce the corporate books on the ground that it may expose the corporation to criminal liability, but he may refuse to do so if he would himself be exposed to such liability. It has long been settled that protection is to be given against facts which tend to incriminate. But while the earlier cases required these facts to be essential parts of the crime, the recent tendency has been to extend the privilege to cover any facts which may indirectly furnish a clue to crime.

Since the essence of the privilege is the denial of compulsion of testimonial utterance, it does not protect against compulsion to exhibit bodily movements or perform bodily acts (submission to fingerprinting or physical examination). Formerly in all jurisdictions the privilege was applied only to documents brought into court in response to a subpoena. The federal courts, however, have formulated a rule excluding documents illegally seized and this is now being followed by many state courts.

The most difficult problem involved is that of the inference to be drawn when the privilege is claimed. In the United States it is generally provided that neither judge nor counsel shall refer to a refusal to testify and sometimes the judge is required to direct the jury not to draw any inference unfavorable to the person refusing to testify. Nevertheless, such artificial precepts do not in fact prevent juries from drawing the inference.

A number of jurisdictions have adopted the rule that where an accused person takes the stand he should be held to have waived the privilege and should be open to any question. In others the waiver applies only to subjects dealt with on direct examination, and in a few jurisdictions the waiver extends only to the criminal acts charged. Supplementing the privilege against self-incrimination are the privilege against disclosing facts involving disgrace or infamy and the rule excluding involuntary confessions. Both of these principles arose independently, but they are often confused with the privilege against self-incrimination.

The fact that the privilege arose from the historical accident of resentment against the procedure of the Star Chamber lends a quality

of ex post facto rationalization to any attempt to establish a basis in policy. No one can deny the popular feeling that it is fundamentally unfair to compel a man to convict himself out of his own mouth. The more modern defense is based on the demoralizing effect on the police and prosecutors of the opportunity to secure evidence easily. Unfortunately the consequence in the United States has been to drive the police to the use of the "third degree" to secure evidence and extract confessions. Little can be said, however, in favor of the rule forbidding the drawing of inference from silence.

It has often been suggested that provision be made for preliminary examination of the accused before a magistrate, but continental experience has shown how easily this device may degenerate into an adjunct of the prosecutor's office. In the ordinary criminal trial the major evils of the privilege can probably be eradicated by permitting the court and counsel to comment on the refusal to testify. The greater evil lies in the destructive effect of the privilege on legislative and grand jury investigations of business practices and government corruption. This situation is usually met by statutes granting immunity from prosecution to testifying witnesses, which results, however, in permitting malefactors to escape prosecution. The only solution for such cases would be to limit the privilege to persons accused of crime. Such a solution would also aid litigants in civil cases, who are often hampered by the claim of the privilege.

Continental criminal procedure is often held out as a model by critics of the privilege. In France the inquisitorial oath *de veritate* incorporated into the Ordonnance of 1670 was abolished in 1789. Since 1897 the examining magistrate has been required to inform the accused that he may refuse to make any statement. In the trial itself, however, the privilege is of little consequence. In Germany it is expressly provided that the accused may refuse to testify, but the judge may draw an inference from the refusal. A witness may refuse to answer questions if an answer would expose him or a relative to the danger of criminal prosecution.

Although in the United States the privilege against self-incrimination has long been under attack, it is so firmly anchored in the constitutions that it seems hopeless to attempt to abolish it. Nor is its total abolition altogether desirable in view of the general feeling that the accused should have some measure of protection. It would be sufficient to limit the privilege only

to the accused in a criminal case, were it not for the fact that the assertion of the privilege by witnesses has been supported on constitutional grounds. Short of constitutional amendment the only desirable remedy lies in statutory provision of a right of comment by court and counsel.

SELF-PRESERVATION has been known to the cognoscenti of moral disputation, almost from the beginning of their discipline, as "nature's first law." The customary expression is "the instinct of self-preservation," and designates the endeavor of every living individual organism to maintain its existence in a world of change. The aboriginal instinct is the imputed foundation of the political idea that there is a natural right to life, and the ultimate premise of the legal convention acknowledging self-defense as the valid plea against the charge of murder.

The concept has its perceptual starting point

in generic modes of animal behavior, from simple reflexes to complexly patterned activities, with which there need go neither a sense of the unity of the body nor an idea of unembodied self. These behavior modes need be nothing more than physiological arrangements maintaining their relationships against centrifugal trends from within, or upsetting impacts from without, or both. In their light, self-preservation is of the same nature as the inertia of the physicists, and the philosophic tradition has on the whole assimilated the one to the other. In various language the stoics, the Christian fathers, St. Thomas, Hobbes, Spinoza, Darwin, Schopenhauer and others express the essential notion that whatever exists, be it mud or be it man, by the mere fact of existing tends to resist going or being put out of existence.

This, however, is only occasionally true of the self-preservation of human individuals. Not only do the activities which are often ascribed to it fail to resist change, or being put out of existence; they may seek precisely these ends. Instead of expressing inertia the instinctive drives suspend or overcome it. For they operate in a frame of reference which is sheerly human—that is, cultural and logical, implying, therefore, social inheritance and personal memory, and thence, a distinction between the self and the body.

The folkways and mores of primitive societies postulate much on this distinction. How the notion and name of a self other than the body—yet constant amid the body's changes, surviving its ultimate destruction in death—are arrived at is unimportant; the important thing here is its status as that which survives and is to be preserved in the activities of the daily life. Thus, death and the fear of death signify in quite other ways on the primitive level than on the civilized level. Since death is translocation and not destruction, killing cannot be murder. Suicide is an act like stepping from one room to another. Pain, hunger and other hurts have a sting. Not death.

Self-preservation acquires different meanings in those cultures where the prevailing mores evince a certain doubt about the existence of a self independent of the body, and thus a realization of physical death as personal annihilation. The doubt is signaled by two components of the mores: immortality cults with their elaborated symbolic ceremonials of the nullification of death and their myths of death and resurrection, and dialectically developed and refined proofs of

immortality. From Plato's day until Galileo's both these components tended to pervade the mood of European civilization. The mood was widespread in the Hellenistic world; and suicide was consequently not uncommon, especially among the intellectual classes. Two philosophic cults, Epicurean and stoic, gave it characteristic expression. The Epicureans acquired: "Death," they declared, "that most dreaded of ills, is nothing to us. For while we are, death is not; and when death has come, we are not; . . . the wise man neither declines life nor shrinks from death, since life is not distasteful to him nor does he think it an evil not to live." The stoics, on the other hand, generally supplemented the arguments of Socrates and his followers against self-slaughter, calling it cowardice, desertion of one's post, disobedience to God, robbery of the state and the like. Many, following Hegesias the Cynic, who found death to be no evil and life no good, permitted suicide. And generally, the mores of antiquity admitted suicide as an escape from pain or disgrace. The coming to power of Christianity, which was essentially a syncretic immortality cult preoccupied with death, led to a widespread indoctrination against suicide for any cause. It taught that suicide is crime against God, against self, precluding repentance, violating the Commandments, and thus in effect a self-exclusion from the salvation to which Christian burial is a *sine qua non*. Of course, saints and martyrs seeking death for the glory of God or patriots risking it for their country's victory commit suicide with "God's consent," and belong to the categories of the saved.

To what degree the church view affected European mores cannot be measured. The claim is made that little suicide is recorded during the Middle Ages, but the maxim "rather Death than Dishonor" expresses something sanctioned by the mores to this day, although attempted suicide is still punishable by statute in many places. With the Renaissance, certainly, the classical conceptions of self-preservation and self-immolation came alive again and received a new currency and a new meaning deriving from the compenetration of Galilean physics. The lives of men were seen, as by Thomas Hobbes, to consist in a constant struggle of all against all, until the state is organized to overrule personal force and fraud by the irrevocable and absolute authority of its social compact for law and order. The authority stops, however, where it menaces survival, and every man has a right

to defend his life even against the state. Spinoza declared that an individual's *conatus sese conservandi* is the foundation of his happiness, and such institutions as the state are but means for the preservation of this self (now reassimilated to the body but still different from it) and depend on its consent. This view became a commonplace of the Enlightenment of the eighteenth century. It was the ground of the disputations about self-love and social love, self-assertion, self-expression and self-realization of that century and the next. It was a primary postulate of the individualism, naturalism and revolutionism in which the eighteenth century culminated. It persisted as the premise of the laissez faire programs of the early nineteenth century, and received support from the biological investigations of Darwin and the speculations of Spencer, emerging in the doctrine of struggle for survival and the survival of the fit. So indisputable did the postulate of self-preservation become to the intellectual classes of the nineteenth century that Schopenhauer's observation to the effect that suicide is the final self-affirmation of the will to live or instinct of self-preservation, retains a certain vogue. The import of Nietzsche's observation that beneath the struggle for survival was a self-transcending struggle for power was hardly realized.

The prevailing sentiment regarding the self-preservation of individuals later suffused characteristic views regarding the rights and status of groups and institutions which the social struggles of the nineteenth century brought to birth. During the Middle Ages self-preservation was a struggle of an immortal soul for salvation; only the church was felt as a social reality different from its members and its instrumentalities. During the Renaissance the state was merely an appanage of the personal Prince, and what he did for its aggrandizement was a function of his personal life. The nineteenth century inverted this view. As a consequence of the Napoleonic wars, state and nationality were first idealized, then hypostatized like the mediaeval church, especially by German metaphysics. As a consequence of the too slow progress of democracy, impatient humanitarians hypostatized social classes and their struggles; and as a consequence of the general nineteenth century dislocation and degradation of aristocracies, race and heredity were hypostatized like social classes. Thus the preservation of any individual self was made identical with actual or imputed supremacy of a racial stock or language group, a nationality, a

form of government. Since the individual was presumed to live and move and have his being in and through one or another of these associative forms, he himself could survive only in so far as the hypostatic entity of which he was a part was supreme and victorious. Since he owed it, as formerly he owed God, his being, it was his duty to sacrifice to it everything: his life, his fortune and his sacred honor. To preserve it, everything forbidden might be required, including suicide. Its necessity knows no law.

This teaching is the governing principle in the conception of the insuperable paramountcy of institutions which the German sadiocracy, the Italian corporative state, the Russian Communist dictatorship, the constitution worship of certain classes of the United States of America, as well as the church universal and militant share equally. It fuses self-preservation and self-destruction. Which is which depends on how the self is conceived and by whom.

In terms of biology and psychology, self-preservation as a principle is an illusion. The organism is a cycle of changes; consciousness is a stream; the self is an integration of bodily activities focalized in a personality image whose incarnation is ever more an ideal, a gradient to follow, than a condition to maintain. The mere struggle to preserve the self—whether as body or psyche or both—so changes its inward qualities and outward conditions that, at the conclusion of the struggle, neither has remained what it was at its beginning. Diversification of individual character and social type is inherent in the activities conceived as self-preservation. That they are so conceived is due to a static illusion regarding the psychophysical self. The illusion is both magnified and intensified when it is transposed from the individual personality to the social group, and the issues it creates are correspondingly multiplied. The history of Egoismo Sacro not in Italy alone, but in any modern state, provides a sufficient illustration of this description.

HORACE M. KALLEN

See ETHICS, MORALS; INDIVIDUALISM; NATIONALISM; GROUP, PATRIOTISM; CONSCIENTIOUS OBJECTORS; PACIFISM, INTOLERANCE.

SELF-SUFFICIENCY, ECONOMIC. Self-sufficiency is originally a moral concept: a family living on its own estate, from which it draws all the necessities of life, is the ideal social unit; and the city composed of such units—which is thus independent of foreign commerce, while its citi-

zens lead a life of cultured leisure since their estates are worked by slaves—is the ideal form of the state. Such self-sufficient groups and commonwealths flourished in periods when means of communication were undeveloped; they claimed a kind of moral superiority over countries depending on economic intercourse with the outside world. Where sea borne or river borne trade was possible, the desire for wealth overruled the teachings of the moralists. As foreign trade stimulated the growth of population and the accumulation of riches, it served also to strengthen military power. As a country came to depend on oversea supplies, ethical standards changed, for naval supremacy and oversea territorial expansion now became essential to its security. The interplay of the desire for self-sufficiency and the trend toward interdependence based on foreign trade is brought out clearly in the history of Greece and of Rome.

Economically most mediaeval states were loose agglomerations of more or less self-sufficient units under a common political sovereign. Outside a few mercantile city-states provincial, even local, self-sufficiency was the order of the day. Local supplies were jealously guarded, but fear of famine prompted the encouragement of imports by all sorts of political measures. This striving for provincial self-sufficiency prevented a regular interprovincial grain trade in France until the eve of the revolution. There were, however, other factors at play. The trade activities of the Italian merchant republics, the crusades and the discovery of the Indies widened the range of available commodities, while the spiritual changes following the Renaissance removed the moral shackles which bound men's desires. As a result either the scope of self-sufficiency could be enlarged by the creation of an oversea empire, the component parts of which could satisfy one another's complementary wants, or the idea of self-sufficiency had to give way to that of a system of international interdependence based on foreign trade. While the Spaniards attempted to build up a closed world wide empire, jealously reserving the trade of the New World to the provinces of Castile and León, the Dutch and the English deliberately broke down its barriers in the effort to secure wealth from "the treasure of foreign trade." Mercantilist theory opposed the conception of international economic interdependence to that of national self-sufficiency. Thickly interlarded with elements of coercive manipulation, it could easily be converted into some sort

of exclusive economic imperialism. By the end of the eighteenth century the financial burdens of colonization, of trade wars and of colonial revolutions were leading to widespread revival of demands for territorial self-sufficiency. According to the physiocrats the normal state was one large enough to be self-sufficient, foreign trade a mere emergency measure for the disposal of its harvest surplus; its social organization, based on the free play of individual forces, could be counted on to secure the proper circulation of goods and services. This self-sufficient, "liberal" state of the physiocrats was transformed under the impact of the continental blockade into the planned, socialistic "closed state" outlined by Fichte.

With the industrial revolution, the rapid growth of population and the even greater increase in manufactures made mass emigration, the export of manufactured goods and the import of foodstuffs and raw materials essential to the well being of an industrial nation. For the ideal of intraprovincial and intra-imperial self-sufficiency, which in the British Empire had been destroyed by the American Revolution, the Manchester school substituted that of international trade interdependence through international division of labor. By offering profitable markets for foodstuffs and raw materials to new countries England might retard their industrialization. A foreign policy of peace and good will, naval disarmament and the freedom of the seas in time of war were to safeguard the permanent security of such intercourse.

The failure of the Manchester school to impress its theory of international trade interdependence on leading powers other than Great Britain led ultimately to a revival of policies aiming at some sort of self-sufficiency. International interdependence and division of labor were feasible only on the basis of naval supremacy, which obviously could not be enjoyed by all countries, or on that of properly safeguarded international agreements for the freedom of the seas even in time of war. As these guaranties were not forthcoming, other countries were forced to seek self-sufficiency, either by developing their industrial resources for purposes of defense (one of the motives frequently underlying the "protection of infant industries" argument from Alexander Hamilton and Friedrich List to the Soviet Five-Year Plan) or by raising their agricultural production in order to prevent starvation. The efforts of agrarian countries to balance their economic system by "add-

ing an industrial wing," in most cases through a highly protective tariff, deprived the manufacturing nations of their accustomed markets, a danger which many of them tried to obviate by straining after a "balanced economy" of their own in which the top heavy industrial structure was to be supported by the (artificial) strengthening of the agricultural basis. At the same time the pressure of population and the growth of manufactures led to a renewal of colonial expansion, to provide national homes for emigrants as well as markets for products, while the rise of modern nationalism added a new emotional note to schemes of a colonial empire based on economic self-sufficiency.

Notwithstanding these various developments international interdependence was the order of the day before the World War. Even a country like England, with its world wide empire, transacted most of its trade with foreign countries, sent most of its emigrants to foreign states and employed a large part of its capital resources in the development of non-contingent, non-dependent lands. The World War showed fairly conclusively that naval supremacy can enforce a starvation blockade on the enemy and yet fail to safeguard a nation's own supplies, and that the nature of economic security may be changed by submarine warfare and by aircraft development. The immediate reactions to these lessons were the establishment and the protection of national key industries, the various plans for the control of the continental iron ore supplies and Naumann's grandiose Mitteleuropa scheme. But the peace treaties, devoted to satisfying the principle of nationality, broke up the old empires of Austria, Turkey and Russia into fragmentary states; economic rationalism had to give way to economic nationalism, seeking to complete national independence by self-sufficiency in foodstuffs as well as in industries and armaments. This trend toward empire breaking (counter colonization) and economic disintegration was accelerated in the post-war period, even in empires like the British where political separation was successfully prevented. Disillusionment as to the results of international political cooperation drove countries like the United States into an attitude of political isolation, which must lead ultimately to a greater or less degree of economic detachment, while in Germany a new tribalism tried to fit a racially pure nation into a social system which aimed at economic as well as spiritual self-sufficiency.

These tendencies, resulting in the almost com-

plete cessation—or even reversion—of immigration and the necessity of finding food and work for increasing numbers at home, received a great impetus from the breakdown of currencies after the war and again during the crisis following 1929. For tariff protection is not half as effective in bringing about economic separation as is a depreciating currency, leading as it does to exchange control and to antidumping legislation abroad. A manipulated currency liberates a government from the trammels of international treaty obligations. International finance, which miraculously had survived the shock of confiscation of private property during the war and in the peace treaties, ceased to function as an economic tie between nations. Creditors were forced to submit to standstill agreements, moratoria and repudiations; debtors, liberated from their obligations, no longer needed to send goods abroad. The breakdown of credit and currency initiated a heavy decline of prices, which led in its turn to bankruptcy and widespread unemployment. The purchasing power of the world as a whole was greatly reduced; nations engaged in a deadly struggle for what remained, alternately forcing exports and preventing imports through improved governmental techniques. Since the safeguarding of home markets is easier than the control of foreign markets, necessity imposed a return toward autarchy, while nationalist sentimentalism discovered new beauties in this apparently inescapable penury.

The rise of Bolshevik power and the severing of Russia from the western world worked in the same direction. Repudiation of czarist debts destroyed the country's credit abroad, as far as investment loans were concerned, and compelled Russia to become fairly self-sufficient in the accumulation of capital. The resulting scarcity of capital forced the government to devise a system of priorities and to set up a plan for the development of the country's resources, in which the building up of an armament industry was accorded first place. The Five-Year Plan was originally a measure of national defense rather than a scheme for social reconstruction. It became a world wide advertisement for social planning and, incidentally, for self-sufficiency, which makes such planning necessary as well as possible.

A policy of self-sufficiency implies the cessation of migrations. Young countries may exclude immigration for racial or social reasons, thus retarding industrial development and raising labor costs and making necessary either pro-

tective measures against cheap imports or export subsidies for their too expensive surplus commodities, e.g. the white Australia policy and Australian sugar bounties. The cessation of emigration from a densely populated country, whether voluntary or compulsory, prevents its people from sharing directly and individually in the exploitation of the world's new areas. So long as such countries can export goods, thus providing employment and the means with which to buy cheap food and raw material, they can participate indirectly in such new found wealth. If these commercial outlets are closed by foreign tariffs or lost by a policy of protecting the home market to give more employment to the redundant population or to protect influential groups of products, they can still secure the necessary foodstuffs in foreign trade by spending a greater amount of labor and of capital on the production of fewer and less varied goods. But if population were to continue to increase rapidly, the struggle for existence might well become intensified until it led to a desire for annexation of neighboring territories. "We demand land and soil for the nutrition of our people and for the settlement of our surplus population. If it is not possible to feed the entire population of the state," the Nazi program declares, "the subjects of foreign states (non-citizens) must be expelled from the Reich."

In a technical sense the attainment of self-sufficiency is easier today than it has ever been in the past. War experience has shown the wide scope of rationing if control of consumption can be resorted to, and the chances of centralized coercive planning if it is supported by modern science with its ability to furnish substitutes (e.g. nitrate). For this reason natural advantages in the production of commodities are less important today than in the past. No perfect substitutes have yet been found for many commodities which play a large part in trade; but among them are items, such as coffee and tea, which are not indispensable and could be kept out of a country by rigorous control. The "divinely ordained" interdependence of countries variously endowed by natural bounty is becoming less and less significant.

It is not enough, however, to be able to produce certain goods; it must be possible to produce them in the quantities needed and at reasonable costs. In this direction too considerable progress has been made. As a result of modern agricultural technique countries like Germany have become almost self-sufficient in

cereal foodstuffs, although prices have had to be forced considerably above world levels. Such agricultural self-sufficiency, even if but partial, is achieved at the price of an appreciable rise in the cost of living and ultimately in the costs of production; a program aiming at self-sufficiency not only must compensate for a deficiency caused by the stopping of imports but must also dispose of a surplus which can no longer be exported. Restriction of agricultural imports narrows markets for manufactured export goods and necessitates the shifting of production from foreign to home markets. Even assuming an increase, not a mere transfer, of purchasing power at home equal to the loss of purchasing power abroad, this shift is not automatic. Home farmers cannot consume the services of grain ships or the rails formerly needed for opening up new wheatlands.

The readjustment of a surplus production which foreign markets are no longer willing to receive may imply a reconstruction of the entire economic system. The United States cannot, through the most efficient organization, transfer its export surplus of cotton to the home market. It must, if self-sufficiency be the aim, curtail areas and output and make commercial farms self-supporting; this can be done only if these farms are not encumbered with mortgages and thus involves the whole credit system. Industries whose productive capacity is far beyond possible home consumption must scrap part of their plant; their workers must be transferred to other trades, if there is room for them, or returned to the land as self-supporting farmers. If there were to be no intra-imperial oversea trade, the world merchant marine would have to be abandoned and the capital invested in it would be lost.

Self-sufficiency cannot be achieved as long as international capital transfers continue. Large international credits imply big movements of commodities. No creditor country can become self-sufficient and give up imports without renouncing its claim on payment (in goods) for former investments. It may postpone receiving those imports (payments) by selling claims and goods abroad and lending the proceeds afresh to old and new debtor countries; but ultimately it must cash in these deferred claims or accept repudiation. Undeveloped countries, on the other hand, may choose between self-sufficiency coupled with a very slow growth and foreign loans which quicken development and imply early imports and, later, exports. Few countries

can, like Russia, squeeze vast capital sums from their own farmers and laborers by means of a high rate of exploitation of labor. Having secured their new equipment by international trade, they might of course turn to self-sufficiency by refusing to remit payments. Since they would then not need an export surplus for the payment of debts, they would no longer have to fight for foreign markets. Creditor countries like the United States, in defending themselves by high tariffs against payments, have provided their debtors with an excellent pretext for repudiation; and the opportunity to rid themselves of foreign debts has been a strong incentive for the advocates of self-sufficiency in overburdened debtor countries like Germany. For a long time international financial transactions bridged the gap between different nations made by import and export restrictions, but overlending and purposeful bankruptcy have greatly strengthened the tendency to economic isolation and self-sufficiency.

With capital transfers at an end or greatly reduced, interest rates in self-sufficient new countries would be very high and economic development, because of scarcity of capital, very slow. On the other hand, highly industrialized countries might have very low rates of interest; they would have to scrap old plant, but they could scarcely invest capital on a very large scale in new labor saving appliances, since they must employ a redundant population.

Notwithstanding the difficulties inherent in a policy of self-sufficiency a return to a fairly unhampered system of international economic interdependence of the nineteenth century form is not very probable. The absence of political and economic security, the disturbed equilibrium of capacity and consumption in agriculture and in industry, resulting in low prices and widespread unemployment, have made people willing to accept, if need be, reduced standards of living, provided some sort of stability can be reached. As long as surplus produce, agricultural as well as industrial, can be excluded, more or less arbitrarily, from foreign markets and as long as home production seeks protection against low costs abroad, the demand for self-sufficiency will persist. No country can hope to attain complete self-sufficiency. Most will be satisfied with some sort of relative independence, safeguarding their most important or most powerful industries from foreign imports. Large continental countries like the United States and empires like England, and to a lesser degree France, with

possessions scattered throughout the world, might evolve some sort of continental or intra-imperial self-sufficiency. The strong regional tendencies toward a balanced economy in the dominions and the efforts of the mother country to achieve an artificial reconstruction of its agriculture have brought such intra-imperial complementary self-sufficiency into conflict with a narrower, more local concept of national self-sufficiency, to which some smaller European countries with colonial bases might aspire. Countries like Germany and Italy, both practically devoid of such bases, could achieve a large measure of self-sufficiency only by a severe restriction of their standards of living, qualitatively and quantitatively, and by a ruthless centralized reshuffling of agriculture and industry. And smaller political units could scarcely hope to balance agricultural and industrial wants successfully. Switzerland and the Scandinavian countries with their limited territories are not sufficiently diversified to undertake an experiment in self-sufficiency or strong enough for colonial expansion. Federation is a possible solution only where the states concerned complement each other's wants.

Results would differ with circumstances. But if some sort of permanent isolation could be attained by the various countries, the difference in the standards of comfort prevailing today would be greatly accentuated as international intercourse no longer reduced the wide margins in natural wealth existing between various nations. Technical progress would cease to be effective for raising standards, although it might offset further reductions. Ultimately the pressure on poor countries might be so strong as to lead to a new outburst of conquest, new shiftings of population, new efforts at empire making. In the meantime nationalistic coercive planning is likely to be resorted to; for without such planning a far reaching policy of self-sufficiency can scarcely be successful.

SEMBAT, MARCEL ÉTIENNE (1862-1922), French publicist and socialist. Sembat was born at Bonnières-sur-Seine, studied at the École de Droit and practised for five years as a member of the bar at Paris. He then turned to journalism and published in 1891 the *Revue de l'évolution*, a bimonthly political and literary review with socialist leanings. At the end of 1892 he became owner with Henri Pellier and Henri Turot of the newspaper *Petite république*, which had been founded fifteen years before by Gambetta, and made the paper outspokenly socialist. From 1905 to 1914 he collaborated actively on *Humanité*.

Sembat was a successful candidate on the Republican Socialist ticket in the legislative campaign of August, 1893; shortly after his election he joined the Comité Revolutionnaire Central, the Blanquist group directed by Édouard Vaillant. He was an active member of the Chamber of Deputies until his death and served at various times on the Budget Commission and as reporter on the postal budget. Although he had protested against the three-year term of military service and had published in 1913 *Faites un roi, sinon faites la paix*, declaring that militarism was incompatible with the republican regime, he participated actively in the war government as minister of public works in the cabinets of Viviani and Briand from 1914 to 1916.

After the unified *Parti socialiste* was formed in 1905 he took part in all its congresses. When the Communist split occurred in December, 1920, at the Congress of Tours, he took a vigorous stand against Bolshevik methods.

ALEXANDRE ZÉVAËS

Important works: Faites un roi, sinon faites la paix

(Paris 1913, 19th ed. 1916); *Perdons-nous la Russie?* (Paris 1917); *La victoire en déroute* (Paris 1925), translated by F. K. Turot as *Defeated Victory* (London 1925).

SEMENOV, PETR PETROVICH (1827-1914), Russian geographer and statistician. Semenov was well known as a geographer and as the first explorer of the Tien Shan mountain system in central Asia, when in 1859 he was invited by the government to assist in drafting the peasant emancipation law. This work, as well as the compilation for the Imperial Russian Geographical Society of the *Geograficheskoe-statisticheskoye slovar Rossiyskoy Imperii* (Geographic-statistical dictionary of the Russian Empire; 5 vols., St. Petersburg 1863-85), based on an exhaustive study of primary sources and still a valuable guide to mid-nineteenth century Russia, made Semenov the logical person to head the Central Statistical Office. The office, reorganized in 1863, was to compile and publish material collected by provincial statistical agencies, to exercise technical supervision over the statistical work of the ministries and to carry out statistical investigations for the minister of the interior. From 1864 to 1880, when Semenov was thus in charge of the administrative statistics of the whole country, he was in a position to raise its technical performance to a fairly scientific level and to enlist the services of the most competent workers.

Semenov organized the Russian system of crop reporting, which remained virtually unchanged until the World War, and prepared the textual introductions to the statistical tables on landed property in Russia (Russia, Tsentralny Statisticheskoy Komitet, *Statistika pozemelnoy sobstvennosti i naseleennykh mest Evropeyskoy Rossii*, 8 vols., St. Petersburg 1880-85), which has remained a classic. His major statistical contribution, however, is the census of 1897, the only exhaustive enumeration of the Russian population before the revolution. He raised this issue as early as 1870; and in the following decades he made several studies of general census principles and of their applicability to Russia, carried out preliminary surveys and submitted tentative projects. The census was taken under his supervision as vice chairman of the Chief Census Commission, but the tabulation of its results was turned over to the Central Sta-

tistical Office, with which Semenov was no longer connected.

P. I. GEORGIEVSKY

Consult. Kaufman, A., in *The History of Statistics*, ed. by John Koren (New York 1918) p. 469-86.

SEMEVSKY, VASILY IVANOVICH (1848-1916), Russian historian. In general outlook Semevsky was a populist of the 1870's; he repaid "the debt of the intelligentsia to the people" by an intensive study of the history of the peasantry during the century preceding the abolition of serfdom. Even before 1872, the year of his graduation from the University of St. Petersburg, he had begun an investigation of the conditions of the peasants under Catherine II which was completed only after many years of study in various archives. His *Krestyane v tsarstvovanie imperatritsi Ekaterini II* (2 vols., St. Petersburg 1881-1903; 2nd ed. of vol. I, 1903) was the first comprehensive treatment of the different categories of peasants in the several provinces of Great Russia in a period when serfdom was so oppressive that it was scarcely distinguishable from slavery; here he described the geographical distribution and the migrations of the peasantry, the amount of land held, the burden of feudal services, the manifestations of peasant discontent and their immediate causes. In another study, *Krestyansky vopros v Rossii v XVIII i pervoy polovine XIX veka* (2 vols., St. Petersburg 1888), he furnished an account of the numerous government measures and projects relating to the peasantry from the time of Peter the Great to the end of the reign of Nicholas I, recorded unofficial efforts to improve conditions and traced the development of public opinion as reflected in contemporary literature. Later he took advantage of an opportunity to study the position of labor in Siberian gold mines; the results, published in *Rabochie na sibirskikh zolotikh promislakh* (2 vols., St. Petersburg 1898), set a standard in labor history, a field neglected at that time by trained students. After the turn of the century he concentrated upon the history of the intelligentsia and the movements to bring about political and economic reorganization. Like his earlier works, Semevsky's *Politicheskiya i obshchestvenniya idei dekabristov* (St. Petersburg 1909), a study of the Decembrists beginning with Speransky, and two books, posthumously published, devoted to the Russian socialists of the 1840's—*M. B. Butashevich-Petrashkevsky i petrashetski* (ed. by V. Vodovozov, Moscow 1922) and *Kirillo-Mefodievskoe obshchestvo 1846-*

47 gg. (Moscow 1918)—were the product of laborious study of archive materials and broke new paths.

SEMPLÉ, ELLEN CHURCHILL (1863-1932), American human geographer. Coming under the influence of Ratzel in his early Leipzig days, Ellen Churchill Semple transplanted the authentic anthropogeography of Ratzel to the United States and with undiminished enthusiasm devoted her life to its propagation. In no other country did Ratzel's views find so active and successful an apostle. Through a wide range of stimulating lectures, given for many years at the University of Chicago and later at Clark University, she exerted an influence over virtually the entire living generation of American geographers and recruited to the field a large number of its present representatives. Prior to her time geography in the higher institutions of the United States was physical geography. She pioneered human geography so successfully that many geographers have completely dissociated themselves from physical geography, a result which Miss Semple always deplored.

The whole of her scientific philosophy is derived from Ratzel. She too dealt not with things but with a relationship between things; anthropogeography was a view of life. Her *Influences of Geographic Environment* (New York 1911) was undertaken originally as a translation of Ratzel's *Anthropogeographie*. The finished study differed from the original not in its concepts but in its illustrations; it was the master speaking through the pupil. Although it is the least original of Miss Semple's contributions, its effect was great because few Americans had read Ratzel.

Miss Semple defined her objective as "the study of the influence of geographical conditions on the development of society." This end is clearly expressed in her *American History and Its Geographic Conditions* (Boston 1903, rev. ed. by C. F. Jones, 1933). The volume broke new ground in American history and became the model of historical geography in the United States. It develops with spirit and skill the theme that the historical event is to be understood in terms of its physical environment. Miss

Semple was never concerned with the origin, content and succession of culture areas as the *Siedlungsgeographier* have been.

Her final work and most fully documented study, *The Geography of the Mediterranean Region* (New York 1931), is more strictly anthropogeography than historical geography. It deals with the ancient Mediterranean area without regard to historical sequences. Such themes as barrier boundaries, geographic conditions of ancient tillage, templed promontories and their relation to navigation are developed from a broad knowledge of classical literature. Miss Semple remained true to Ratzel in making no restriction as to kinds of cultural data taken under observation but in being interested in whatever data could be related to environmental conditioning. She did no more than Ratzel in solving the methodological difficulty as to how such a relationship could be evaluated scientifically.

CARL SAUER

SENATE. See LEGISLATIVE ASSEMBLIES.

SENECA, LUCIUS ANNAEUS (c. 4 B.C.—65 A.D.), Roman philosopher. Seneca was tutor and then for five years chief minister of the emperor Nero and was the leading literary figure of his age. His tragedies, greatly admired in his day and after, influenced Elizabethan drama and especially French classical tragedy. His *Dialogues* and the *Letters to Lucilius*, essays in epistolary form, are mainly ethical in content, while the *Natural Questions*, composed toward the end of his life, shows his deep interest in physical phenomena. His philosophy is an eclecticism in which stoic doctrines predominate. His condemnation of paganism, his theory that mankind had declined from a primitive state of innocence which was followed by the development of human institutions—a doctrine that could easily be extended to mean that human institutions were the result of sin—and a humanitarianism unique in his age and seen, for example, in his condemnation of gladiatorial shows, slavery and war won the approval of the Christian fathers. Regarded in the Middle Ages as a sage who had been almost if not quite a Christian, Seneca attained his greatest popularity during and after the twelfth century. Quotations from his writings became frequent, while longer extracts found a place in chrestomathies. His vogue lasted on into the seventeenth century. Seneca's ethical works, deeply admired by Montaigne and

a consolation in misfortune to Sir Philip Sydney, directly inspired the neostoic movement, whose chief exponent was Justus Lipsius (1547—1606). Even in the eighteenth century, when a strong reaction against his thought had set in, Seneca still had ardent admirers in Rousseau and Diderot. His importance as a moralist and political thinker has again received wider recognition in more recent times.

SENIOR, NASSAU WILLIAM (1790—1864), English economist. Senior was the most brilliant of those economists who in the quarter century after Ricardo's death made important innovations in the classical system. In contrast to that of his better known contemporary, John Stuart Mill, Senior's approach to accepted theories was essentially critical, based on an attempt at exact definition and classification, which led to highly significant results particularly in the field of value theory and the relation of costs to value. In effect Senior, as Jevons acknowledged, evolved a marginal utility theory of value, generalized the theory of rent to all cases of factors fixed in amount, including natural abilities, and hinted at the nature of quasi-rents. In this connection it is interesting to note that he perceived that the classical statements of the laws of increasing and diminishing returns were not logically symmetrical. He was less successful in dealing with wages; although he realized that Ricardo omitted to explain how the size of the wages fund was determined, he himself failed to supply the missing link. Senior's best known contribution to economic theory, the abstinence theory of capital, which was the direct result of an attempt to find a definition of capital coordinate with that of labor in the explanation of costs

of production, once and for all cleared up the Ricardian confusion on this point.

During his first tenure of the Drummond chair of political economy at Oxford (1825-30) Senior published the famous lectures on money and during his second occupancy (1847-52) five lectures on methodology, which have received little attention but which are remarkable for their attack on the hypothetical economic man of Ricardo's imagination. There are still other examples of his work scattered through contemporary periodicals, one of the most important being the review of J. S. Mill's *Essays and Political Economy* in the *Edinburgh Review* (vol. lxxxviii, 1848), which was based on the methodology lectures. Senior never fulfilled his ambition of systematizing his work into a comprehensive treatise, and much of his most penetrating analysis exists only in the form of unpublished lectures. His only book, *The Outline of Political Economy*, is a badly arranged collection of some of the first group of Oxford lectures hastily thrown together into the form of an essay. Undoubtedly this accounts for his comparative lack of influence, but it does not explain why the abstinence theory was the only contribution which passed into the general corpus of economic thought through Mill.

Senior was appreciated by his contemporaries more as a social reformer than as an economist, and he was far from being a strict supporter of laissez faire, as is commonly supposed. He was an active member of the commissions on the poor laws (1832), factory conditions (1837), hand loom weavers (1841), Irish poor laws (1844) and national education (1857) and an ardent advocate of government interference in matters of health, housing, education and colonization.

SEPARATION OF POWERS. A comprehensive statement of the doctrine of separation of powers and of its implications under the Constitution of the United States has been given by the United States Supreme Court: "It is believed to be one of the chief merits of the American system of written constitutional law, that all the powers intrusted to government, whether State or national, are divided into the three grand departments, the executive, the legislative and the judicial. That the functions appropriate to each of these branches of government shall be vested in a separate body of public servants, and that the perfection of the system requires that the lines which separate and divide these departments shall be broadly and clearly defined. It is also essential to the successful working of this system that the persons intrusted with power in any one of these branches shall not be permitted to encroach upon the powers confided to the others, but that each shall by the law of its creation be limited to the exercise of the powers appropriate to its own department and no other" [*Kilbourn v. Thompson*, 103 U. S. 168, 190-91 (1880)].

As is usual in political theory, the doctrine was the product of a long evolution, and it was only toward the close of this evolution that it received clear formulation. Together with the related theory of checks and balances it may be considered implicit in the theory of mixed government stated by Polybius in his attempt to generalize from the Roman constitution upon the basis of the classification established by the earlier Greek philosophers. But only the western Christian world, starting from its preoccupation with law as valid generalization upon established matter of fact, undertook to analyze political processes from a functional point of view and in so doing hit upon the distinctive features of certain basic functions or "powers." In the definitive form which Locke gave it, it was an attempt to generalize the results of the struggle of the English Parliament for an equality of status with the crown. To be sure, the governments of some of the great city-states, like Strasbourg, had evolved a fairly subtle separation of powers between three councils, each charged with more

or less distinct functions (see Schmoller, Gustav, *Deutsches Städtewesen in älterer Zeit*, Bonn 1922, p. 214 ff.); for a while territorial states were moving in the same direction, but the religious disturbances of the sixteenth century led to a concentration of powers in the hands of the monarch.

In England and Sweden the development followed a rather different course. In the former the function of interpreting the law in a high court of Parliament was transformed by a very gradual process into the function of making the law. Early statutes were conceived of as stating what the old law was rather than as creating new law. From the time of Fortescue, who, in the fifteenth century, praised the rule of law as the outstanding feature of English government, this function of creating the law became increasingly important. The efforts of James I to challenge explicitly the supremacy of the law—in itself a reasonable challenge, since the law was rapidly becoming man made legislation instead of eternal custom—gave rise to a violent opposition which claimed absolute parliamentary supremacy and divided the prerogative. The rapid succession of royal and parliamentary absolutism, Cromwellian dictatorship and a return to royal absolutism, which marks the phases of this struggle, impressed upon English minds the need for some harmonious balance between those who make the law and those who execute it. This harmony the Glorious Revolution of 1688 tried to achieve, and in the fashion of the age Locke's essay gave it the halo of general and eternal truth.

When Montesquieu came to rewrite the doctrine, the Act of Settlement of 1700 (para. 3) had already undertaken to guarantee to English judges tenure during good behavior. Since Montesquieu himself was, as a result of the contemporary situation in France, primarily interested in the problem of securing an independent status for judges, it was natural for him to rename Locke's executive power judicial power, inasmuch as the executive's function as described by Locke had been to execute the laws. This transformation was accompanied by another, whereby Locke's federative power emerged as the executive power with Montesquieu. By elaborating the importance of maintaining internal as well as external peace and by thus assimilating the police functions to those of defense and foreign policy, Montesquieu constructed the modern executive power, which included also the prerogative that English lawyers had always

carefully kept apart for special purposes. In this wise there arose a picture of the ideal balanced state, guaranteeing liberty, which fascinated the eighteenth century with its passion for dynamic symmetry and constructive speculations. It was of the greatest moment that these constructions happened to fit the constitutional experience of most of the American colonies, where a governor, a distinct colonial legislature and a fairly independent judiciary had come to constitute the essential organs of government and where after the Declaration of Independence a brief experiment with legislative supremacy leading to majority tyranny had made the people ripe for a practical application of the celebrated theme.

While many American state constitutions contain explicit statements of the doctrine, the federal constitution refers to it only by its designation of a legislative, an executive and a judicial establishment. The Supreme Court, however, has correctly derived therefrom the doctrine, which it has repeatedly called a fundamental tenet of the constitution. A persistent opposition to this principle has existed in the United States for some time. The development of administrative agencies, such as the Interstate Commerce Commission, which Justice Holmes has characterized as performing "legislative, judicial and executive acts, only softened by a *quasi*," has served as a point of departure for the attack, which has charged the doctrine with being impracticable and even absurd. Many who today belittle the doctrine in their clamor for governmental and administrative efficiency seem scarcely aware of the fact that the fusion of powers, which is the alternative, leads easily to a one-party dictatorship and therefore threatens constitutional government. The most important argument advanced against this point of view is the example of England, where an increasing fusion of executive and legislative powers does not seem to have destroyed the foundations of free government.

In the first place, this argument omits the judicial power, although the separate status of this power appeared to Montesquieu the most important feature of the doctrine and the recent tendency of administrative agencies to invade the judicial field has given rise to heated controversies. While some maintain that a new tyranny has arisen, others point to the inherent need for such administrative justice. Both sides agree, however, as to fundamentals, for the latter simply anticipate the extension of the

"judicial attitude of mind" to new domains. They agree also on some ultimate coordination through more or less extensive judicial review.

As regards the fusion of the other two branches in England, the consequent monism and relative absolutism have been endurable because of a constitutional safeguard which no one clearly envisaged until long after Montesquieu's time: the regular alternation of two large parties in controlling this broad power. These parties are a traditional growth built upon human groupings, usually of long standing, in each local district. It is in this connection that the distinctly aristocratic organization which English society has retained exerts its deepest influence upon political life. And it is upon the neglect of this traditional basis of English parliamentary government that the failure of European systems presumably modeled after the English pattern is at least partly to be blamed. On the continent the confusion of small parties militated against clearly recognizable leadership and contributed in some countries to the development of one-party systems. Under a presumably growing threat of an allegedly impending communist dictatorship, a complete fusion of governmental powers occurred, without either the safeguards for the judiciary or the constitutional practise of a recognized opposition, safeguards which had been won by centuries of human sacrifice and bloodshed, hardly less on the continent than in England and America.

For it is often forgotten that the doctrine was as important, if not more important, in molding the constitutions of nineteenth century monarchies in Europe as in shaping the fundamental law of the United States. Following the solemn declaration of the *Charte constitutionnelle* of Louis XVIII (1814), most of these constitutions were built upon a separation of powers in fact, although they denied it in theory, until by the middle of the nineteenth century it could be considered one of the most prevalent European institutions. Everywhere there prevailed a more or less unstable yet subtle equilibrium on a dualistic basis. In France, however, the fusion of legislative and executive powers progressed steadily along the lines of English development; but since the firm rock of the two-party system was lacking, this transformation, so admirably traced by Barthélemy, produced repeated upheavals and ended in Caesarism, later abandoned for a republican scheme once more modeled at the outset upon the separation of powers, but tending toward parliamentary monism.

A rather unique development occurred in Sweden. There experience with parliamentary as well as royal absolutism during the seventeenth and eighteenth centuries led to the elaboration in 1809 of a constitutional system based upon a dualism of king and representative assembly which even the evolution of cabinet responsibility to parliament did not abolish. In a sense, an administrative power became separated from the executive power. The administrative bodies conduct the great public services with a great deal of independence. This arrangement holds out considerable promise as a model for constitutional government, for there is a strong indication that some sort of separation of powers remains the only effective guaranty of government according to law.

If the theories of Locke and Montesquieu are examined, it is found that the doctrine of separation of powers has an implicit double meaning. On the one hand, it contains a generalization, theory or hypothesis; on the other hand, it contains a practical suggestion, a proposal for the organization of the government. For the doctrine declares that governmental powers can be separated into three categories: executive, legislative and judicial; it also holds that the exercise of these same powers should be entrusted to three separate persons or bodies.

The theory that there are three major divisions of governmental power would seem to be a valid generalization. It may be assumed that political theorists, when speaking of power, mean function. But this is by no means evident. Montesquieu and *The Federalist* give no definition of power at all, while Locke operates with two diametrically opposed concepts of power (as comparison of paragraphs 3 and 99 of the second essay will show: *Two Treatises concerning Government*, London 1690). For the present purpose it is sufficient to realize that wherever there is power there is the right to command and therefore the right to decide in a situation requiring decision. The number and variety of such situations are infinite, but there are two primary kinds of command and decision: those directed toward one particular given instance and those which involve an indefinite number of instances. If two basic types of command can be distinguished, powers or functions also can be so classified. These of course are the executive (administrative) and the legislative. As for the third, or judicial, function, Locke did not speak of it specifically but he may be said to have meant it when he spoke of the internal administration of

justice. Montesquieu made this explicit by working out the judicial power as such, but he was rather uncertain about this power, calling it *dans une facon nul*. When a general command is given or a general decision has been made, there still remains the further decision as to whether a given, concrete situation is to be subsumed under this general command. Here then is involved a decision of still another type, more intellectual, less active than the other two. This decision, no longer a command, is the prototype of the judicial power. It is needed in order that the general decision may be transformed into a concrete decision.

The practical proposal contained in the doctrine of separation of powers requires that each of these powers be attributed to a separate person or body of persons. It was, however, never proposed that the exercise of all of each power be entrusted to one person or body. The doctrine of checks and balances requires, on the contrary, that after the main exercise has been attributed to one person or body care should be taken to set up a minor participation of all in all, by way of budget and impeachment, judicial review of ordinances and laws and, finally, pardon (see CHECKS AND BALANCES).

Those critics who cite the Interstate Commerce Commission and similar bodies as proof of the disintegration of the doctrine overlook a number of important points. In the first place, the practical proposal which the doctrine contains is in no wise affected; for in order to split up the "power" of government, it would be quite feasible to distinguish pragmatically between agriculture, railroads and the like and then to attribute the power over each to separate bodies. What is more important is that, in the second place, these bodies operate on the basis of a separation of powers, in that their personnel is subject to the president's power to remove individual members, their rule making and other functions to change by Congress and their judicial decisions to constitutional review. As a result investigation of the inner working of these bodies would reveal that they evolve an administrative, a legislative (rule making) and a judicial branch. In other words, the Interstate Commerce Commission is itself organized according to the doctrine of separation of powers.

In short, the proposal that the making of rules and their application and the adjudication of controversies regarding the applicability of rules should in the main be entrusted to different bodies or hierarchies of bodies is still pertinent,

although possibly it is modified by the older English doctrine of the prerogative, which would keep a separate person or body charged principally with the representative function and therefore with foreign relations as well. At any rate, the distinction between the executive and the administrative functions will have to be clarified and perhaps broadened by a recognition of the distinction between government and administration which the Conseil d'État has taken such pains to elaborate. Such a recognition of a governmental function exercised in common by the legislative and the administrative branch would insure the degree of integration which must be maintained for the safety of the state, without leading to a complete fusion of all powers. On the other hand, experimentation with such concentrated power may prove to those nations now attempting it that the obvious short range advantages of such concentration are more than offset in the long run by strategic losses. As to those other and more fortunate nations which have already achieved a measure of lasting order and unity and some balanced scheme of separated powers, perhaps the Roman precedent will persuade them that it is best to retain such separation as the true guaranty of their freedom and well being.

SERFDOM is a very general type of hereditary half free status existing in combination with peasant tenures, which despite variations as to details are more or less typical; the cases of half free status independent of tenure are not numerous or important enough to warrant treatment in the present context except as they throw light upon the decline of serfdom. The term itself arose in mediaeval Europe, but it can be applied without serious extension of meaning to many different regions and times. As a rule serfdom has been rural, flourishing in periods marked by the absence of strong central governments, of organized legal systems and of any considerable trade or monetary circulation. It has generally been a feature of feudal societies.

Rural labor organization in economies emphasizing status rather than contract has tended on the whole toward slavery rather than serfdom where conditions were unfavorable to the widespread use of draft animals, and vice versa. For example, the settled agriculture of the ancient Mediterranean leaned heavily upon hand labor, the long summer droughts militating against

large numbers of livestock particularly in densely populated areas, where because of plowing fallow was made useless for pasture. Transalpine Europe with better distributed rains was suited to a combination of grain and stock farming. In a deep belt along the Atlantic even the winters are not cold enough to curtail livestock production very seriously. Farther inland the problem of wintering was gradually solved by the storage of hay and feedstuffs. European serfdom reached the height of its development not only in connection with feudalism but also in a geographical environment favoring the use of animal power. As frontier conditions disappeared and the low grade economy improved, this factor made for a swing toward freedom rather than toward the ancient Greek division into freedom and slavery.

Explanations of serfdom vary in accordance with the countries and times on which they are based and also in accordance with the amount of stress which is placed upon ruling class legal theory on the one hand or upon customary practice on the other. Mediaeval jurists like Azo and Bracton took the extreme theoretical position of identifying the unfree with the slaves of the Roman law—men must be *aut liberi aut servi*. However useful this classification may have been to lawyers and judges in analyzing cases so as to satisfy the landed and literate classes, it had little in common with the customs which still mainly controlled status and tenure in thirteenth century rural Europe. Of more consequence in the historical development of serfdom was the ruling class assumption that all customary rights originated in grants from lords. This implied the lords' right of cancellation, to "recover" the use of land either at will or for alleged breaches of the unwritten conditions.

Of the many distinctions between serfdom and slavery the most illuminating would seem to be the fact that whereas characteristically serfdom is group servitude regulated by custom, personal servitude is dependent upon the whim of an owner. Attachment to the soil is not a reliable criterion. Many of the late Roman coloni who were forbidden under severe penalties to move were not subject to the kinds of dues and fines accepted then or in later feudal times as marks of servile status and tenure. Social classes regarded as free in the Middle Ages were restricted as to displacement. The *vilains francs* and sokemen who lived in French and English manorial villages were rarely allowed to commend themselves to other lords or to leave, at least with such property as livestock. Yet, on the

other hand, where an economic shortage of laborers existed, a powerful lord might induce even serfs to desert other manors under his protection, and with specific improvements in their status. By and large, serfdom has been the mark of low grade economies, where the ruling classes were more anxious about the labor supply than the land supply. Feudalism, transplanted by conquest, tended to simplify peasant class structure at the expense of its privileged elements. For example, the Normans in England practically eliminated the *alodium*, reduced most of the free *villains* to serfdom (the word *villain* in English is nearer in meaning to serf than to *villain* in French) and gave the manorial lord a tight grip on local justice. The inheritance of the lesser customary rights was not so secure as on the continent.

From the point of view of the practise rather than the upper class legal theory of mediaeval serfdom, it is apparent that the lord's exactions were not so much arbitrary as customary, even where he managed to infringe upon and wear down the rights of peasants. Since the ruling classes were composed of fighters and priests and not of business men, it was important to them that the agricultural village should largely manage itself. Managers or foremen from each side of the social class line protected the interests of their own groups and of the whole mainly by observance of the customs. The servile class did not lack rights but was at a disadvantage when these had to be enforced or interpreted. In practise the serf generally held some personal property, which he passed on to his heirs without interference. Even his rights to farm and pasture certain areas, subject to village regulation and dues to the lord in work and in kind, were generally inherited in fact. This was the critical point in serfdom as tenure. By inheritance fines the lords kept alive the fiction that they were the authors of servile tenure, which therefore depended upon their prior rights. The classes above the serfs in the village were exempt from some particularly onerous labor dues and some considered degrading—categories which were not always identical. Perhaps the commonest mark of servile status was the inability to give a daughter in marriage without permission of the lord and payment of a fine.

Notions of both status and tenure were combined in the serf's inability to sell an ox without the lord's permission. The *virgate*, or full peasant holding, was inseparable from the plow team and useless without it. *Wainage* suits for the

recovery of the plow team were the only court actions against their lords which unfree peasants were permitted to take. Otherwise the individual serf had no legal standing as against the lord, whereas he could sue another serf or a freeman for any breach of the customary law by which he was damaged or threatened with damage. Collectively the village had many rights against the lord, which he usually observed. Gifts of land by lords to the church often specified that they were made with the consent of the bondsmen. Until the growth of population and money economy and the revival of Roman legal ideas began to undermine the manor, the enclosure of common lands required the consent of the village. In some cases the records state which woodland or other property was given as compensation.

Shadings of status under serfdom are often hard to distinguish and harder to explain. It is probably safe to classify the cotters as poor serfs. They lived in mere huts with little or no cultivable land and livestock and worked for the more fortunate classes. In many cases they were people who had lost their open field holdings and stock through incompetency, bad luck or breaches of custom. Population increase often outran expansion into new lands and improvements in farming, overflowing into classes which were unwanted and destitute rather than definitely oppressed or exploited. Where good land remained on the fringes of manors, energetic younger sons of serfs or free *villains* often cleared patches for cultivation, borrowing plow teams or exchanging work for their use. This border class sometimes included refugees from other manors, settled with or without the connivance of the lord or his agents. If the holdings were small, the services were likely to be correspondingly light. The mere designation "*bordar*," or "*borderer*," does not indicate whether the condition was better or worse than that of an ordinary serf.

Serfdom spread eastward with the expansion of the Germans against the Slavs. Yet in the mediaeval period it was not particularly harsh or exacting. Many Slavs were transported as slaves (it is interesting to note that the two words have the same root) and the peasants brought to the frontiers from the west were generally given special inducements. Some even escaped serfdom, which became general only in a later age when money economy, well organized central government, international trade in agricultural product and full property in land gave the

relationship a curiously hybrid character. The more a serf's position is protected by well knit legal codes enforced by central governments, the more it tends to resemble that of the ancient coloni. Serfdom being characteristically a group status, the ease of moving serfs about as individuals or conjugal families in parts of eastern Europe in early modern times is suggestive of slavery. In Russia particularly but also in other continental countries servile labor dues were transferred from agriculture to manufacturing, often involving the movement of the serf himself. Nobles hired out their serfs to manufacturers. Kulischer has pointed out the error of supposing that any considerable percentage of the continental "factories" of the seventeenth and eighteenth centuries were even central shops, workhouses being the chief exception; but as time passed there was an increasing amount of seasonal migration of serfs from rural communities during the dead season of agricultural operations.

Other illustrations make some of these border line distinctions clearer. The slow transition from pre-Spanish serfdom in Mexico to peonage (*q.v.*) has been traced in several localities. Schmieder noted the early existence of serfdom among the Mixtecs of southwestern Mexico together with a strip system of fields and a feudalism suggestive of mediaeval Europe. One of the clearest cases is that revealed in Simpson's documents, some as yet unpublished, concerning the village of Huejotzingo in the state of Puebla. A few years after the conquest of this region the ruling caste (*caciques, principales*), describing the old serfdom in detail, complained to the Spanish authorities that the dues in labor and kind no longer sufficed since the peasants had been given some land. The Spaniards allowed the *principales* to accompany further cessions of land with contracts restoring many of the old services. Since the lower class Indians had to till, mine, transport and construct public works, including monasteries and churches, for the Europeans as well, the growth of the country kept the castes apart, and the serfs became peons in the course of the shift from a feudal to a commercial society with a money economy and a regime of contract.

European conquerors found well defined serfdom in America only in conjunction with settled and largely self contained agriculture. In most cases there were evidences of previous conquest, such as differences of physique, language or culture between the upper and servile classes.

The classic case of serfdom by the intrusion of a new ruling class is that of the older Aegean peoples after the arrival of the Greeks. Serfdom occurred locally over and over in the western Sudan after the introduction of the camel into the adjoining desert laid the agricultural fringe open to invasion; but the numerical weakness of the invaders, the softening effects of the climate and the high export prices of slaves prevented the rise of a real system. The great nomads of the western Sahara generally left oasis cultivation to other peoples darker than themselves—sometimes serfs and sometimes slaves. All of the great desert salt works were in barren regions and exploited by slaves. The Sanhaja Tuaregs are divided into serf and noble classes. As in Europe, hereditary nobility is a degenerate residue of military groups formerly based on demonstrated personal merit as soldiers. India has been invaded many times, and its history is strewn with examples of servile status derived in part from race.

China reached the height of its feudal age so long ago that many points concerning village organization are disputed, although not the fact of serfdom. In Japan prior to 701 A.D. a sort of manorial system developed out of an earlier type of village organization based on kinship. Still the village elder was as yet hardly a lord, nor were the lesser people serfs; land was moreover plentiful enough for generous fallowing and periodic redistributions. In 701 a new system, partly modeled on that of China, tried prematurely to establish a strong imperial government with national taxes. With the gradual lengthening of tenure and the rise of powerful families real manorial serfdom developed about the tenth century and was in flower until about the thirteenth. Then, as in Europe, money economy began to undermine the system by commutation. By the seventeenth century the slow disintegration was extremely marked. As in Europe, serfdom had flourished in a period of inadequate public order, the decay of commercial farming and of slavery, a great extension of the cultivated regions, extreme economic localism and inefficient use of the land. As these conditions improved serfdom declined; but this decline was less rapid than in Europe during the same period, perhaps because Japan was not going through any such commercial expansion by sea.

Serfdom came late into the Baltic countries, eastern Germany included, coinciding with a rising export demand for grain. This is certainly

an exceptional linkage, and very likely a better form of labor organization for the purpose could have been found. In the long run at least, serfdom condemned itself on practical grounds. Cultivation could not be improved to meet the competition of distant grainfields worked with more machinery and brought closer by improving transport media. Under serfdom the peasant was unprepared for industrialism as producer or consumer; moreover he was an inadequate soldier in mechanized warfare and an unsatisfactory citizen in an age of change. The rise of citizen armies during the French Revolution influenced the convictions of statesmen in central and eastern Europe; but the need for mobilizing labor and land in the new economy was also patent, and something more than lip service to the "rights of man" had to be conceded. Serfdom was as inconsistent as slavery with the nineteenth century notion of "progress."

In western Europe the first great movement toward the break up of serfdom took place in the closing centuries of the Middle Ages. Every serious disturbance of the customary order, such as a crusade or a plague, resulted in the freeing of some individuals through escape or formal manumission. The crusades stimulated commerce, money economy and the growth of central governments which needed taxes and were inclined to play one group against another to the destruction of class stability. As population increased, public order improved and commerce developed, open fields and common pastures were great obstacles to the improvement of crops, stock and methods. By 1400 serfdom as a combination of status and tenure was decaying rapidly. In England the upper classes attacked servile tenure in their own interest, enclosing a good deal of land for pasture. The status was largely meaningless without the tenure. Commutations of record finally became legal and equivalent to full title. Suits for the collection of obsolete servile dues, such as the merchet, or marriage fine, from people whose ancestors had been free in fact for generations were more and more thrown out of court.

Germany was less fortunate than England in systematizing the old customary law into an orderly body of common law. After the unsuccessful peasant uprising of the sixteenth century and the devastating Thirty Years' War of the next much of central Europe lapsed into a degenerate form of serfdom with centralized governments and money economy. In Russia also, beginning with Peter the Great in the seven-

teenth century, a similar quasi-serfdom with resemblances to slavery and peonage was imposed from above in connection with an increasingly commercial agriculture and a forced development of manufactures.

The withered vestiges of serfdom in France were swept away by the revolution. Some of the multitude of central European states had already taken the step, and the others were forced to see its necessity by the Napoleonic wars and the mechanical revolution. Russia fared better at the hands of Napoleon, and its contacts with the North Atlantic nucleus of modern capitalism were less developed. The Crimean War showed the fatal weakness of a state founded on economically low grade agriculture with servile status and tenures which put a premium on ignorant conformity to outlived customs. Serfdom was soon abolished in name here and in southeastern Europe, but the problem of giving the emancipated peasants sufficient land and the individual incentives to improvement demanded by a capitalistic world economy was not faced courageously. Hence it continued to plague the governments even in the twentieth century. Mechanical power applied to transport created real world competition; and the competition of low grade combinations of man power and animal power with rationalized machine production was fatal to serfdom, as to slavery.

SERGEYEVICH, VASILY IVANOVICH (1832-1910), Russian legal historian. Sergeyevich was graduated from the law faculty of Moscow University in 1857. After spending several years in Germany with Bluntschli, Zopfl and others he returned to the university to lecture on constitutional law. Since his interest centered increasingly upon Russian history, he was appointed in 1872 to the chair of history of Russian law at St. Petersburg University, where he remained for the rest of his life. In general outlook a positivist who disliked historical theories adapted from German philosophy, he excelled in the keen juridical analysis of legal sources; in this sense he may justly be called a Russian Fustel de Coulanges. His treatment of static elements was original and convincing, but his handling of the dynamic aspects of the historical process was far less effective. While he was opposed to the dominant Kluchevsky school and had no organized following of his own, his work together with that of certain other St. Petersburg professors led to the formation of the Petersburg school of Russian historiography.

Sergeyevich made distinct contributions to the study of both Kievan and Muscovite Russia. Drawing largely upon chronicles, he showed that the accepted notion of "one Russia" traceable to Karamzin is scarcely applicable to the pre-Moscow period. At the same time he was the first to establish the organizational scheme of the popular assemblies (*veche*), which was common to all principalities of ancient Russia, and to stress the exceptional importance for the Kiev period of contractual elements in the relations among the prince, his armed followers (*druzshina*) and the popular assembly. He opposed the "clan theory" of princely succession, engaging in a vigorous controversy with Soloviev and others of its exponents, in which he displayed unusual polemical gifts. For the Moscow period he investigated the legal status of the various social classes; Sergeyevich traced the growth of Muscovy to the expansion of the principality of Vladimir rather than to the activity of the Moscow princes and treated the Moscow land assemblies as incipient representative institutions comparable with those of France and England.

SERRA, ANTONIO, Italian economist of the seventeenth century. Little is known of Serra's life except that he was the author of *Breve trattato delle cause che possono far abbondare li regni d'oro et d'argento, dove non sono miniere con applicazione al Regno di Napoli* (Naples 1613), in which he refuted the widespread opinion expressed in Marcantonio de Santis' memorial that the much lamented scarcity of coin in the Kingdom of Naples was attributable to the high rate of exchange and concluded that the rate of exchange is the effect and the index of the balance of international payments, which alone regulates the international flow of money. Serra analyzed the component items of the balance of payments and, advancing beyond the traditional analysis in terms of exports and imports exclusively, included payments due from industries

operated abroad by nationals; furthermore he pointed out the importance of profits derived from intermediary commerce. He had a clear understanding of the way in which all transactions between various countries become inter-related directly or indirectly and in the course of liquidation through bills of exchange are compensated in money payments. Thus the only way to make money more abundant, Serra held, is to secure a favorable balance of international payments through the stimulation of the export of goods and services. The value of money depends entirely on its metallic content and not on arbitrary legislation. Serra was completely unaware of the influence of the volume of money on prices and through them upon the course of international commerce, and attributed the territorial division of industries entirely to physical-natural differences. Serra was perhaps the first to formulate the law of decreasing returns in agriculture, which he contrasted with that of constant and increasing returns obtaining in manufacturing industries.

SERVICE may be defined most generally as any act of an individual in so far as it contributes to the realization of the ends of other individuals. The universal existence of differentiation of the social functions of individuals makes mutual service an inexorable necessity of all life in society. Starting with the elementary biological differences of sex and age it becomes more important with the increasing complexities of social differentiation.

The theories of pure individualism attempted to account for the performance of these mutual services entirely as by-products of the pursuit of their enlightened self-interest by individuals to whom the needs and desires of others are only means to their own ends. But, however important this interlocking of interests may be, at-

tempts to interpret society in terms of it alone have definitely broken down. No such society has ever existed. On the contrary, all societies depend to a greater or less degree on the disinterested performance of service and maintain specific ethical sanctions of it, either as an end in itself or as contributory to some higher end even farther removed from self-interest.

Sociologically the principal kinds of service may be reduced to two main types. The one, limited in obligation to a particular group of persons, whether determined in extent by the objective situation, as by birth, or by personal choice, is yet undefined as to the limits of its actual content but rather left to the exigencies of need as manifested in changing situations. Its prototype in almost all societies is the family, with its sharing of the common vicissitudes of life, its distribution of its resources according to the needs of the members and of its burdens according to their respective ability to bear them. This is a type of relationship where the formula of altruism in the usual sense is scarcely applicable. It is not a sacrifice of the interests of some to those of others but rather a fusion of all into a single unit, a common interest in the maintenance and prosperity of the whole which forbids the segregation of individual interests even for purposes of their sacrifice. But while the extent of mutual obligation remains unspecified, it is still not necessarily unlimited but subject always to being superseded in a scale of values. And although not itself an explicit realization of specific ultimate values, it must be in relative conformity with them; otherwise deep seated conflicts will arise.

From the family as a nucleus this type of mutual service extends to all groups the members of which have a general and relatively undefined obligation of solidarity to one another, groups of friends, wider kinship groups, neighborhood groups and, on the largest scale, nations.

Contrasted with this type is that where the object of the service tends to be impersonal and indefinite, any one of a large, undefined category of persons, such as "consumers," while the content of the obligation becomes specific and limited to definite functions. It is this type which comes to dominate when differentiation proceeds so far that those benefiting from services and those performing them are no longer united in a close community of general interest and life but are to a high degree separated from one another. Here service tends to be thought of

as the function of an office held on behalf of the larger impersonal whole including both parties or as a profession or calling which, although not an office in an organization, has in fact a functional role on behalf of the whole.

In western society, at least until relatively recent times, the principal ethical sanctions of service have come from the social implications of Christianity in its various historical forms. The content of the Gospels was essentially religious and transcendental and by no means immediately the basis of a movement for social reform. But the peculiar combination of religious individualism, the absolute and equal valuation of every human soul in relation to God, and the universalism of brotherly love gave a basis for subsequent social teachings. In the early Christian communities men lived apart from the rest of the sinful world in communistic societies. It was a communism of consumption alone, not of production; its motives were indifference to worldly things on the one hand, brotherly love on the other. But such a simple state of affairs was not possible when hope of an immediate coming of the kingdom faded and Christianity spread to include all classes of society and finally became the state religion of the Roman Empire. Paul himself, through the doctrine of the role of the inscrutable will of God, opened the way for a purely otherworldly interpretation of religious equality and hence a recognition of the inequalities of this world as inevitable and even positively ordained. Society came to be thought of as an organic unity in which every task is a service to the whole and to God. But while the social system was accepted and submitted to, this was only at best as an opportunity for Christian service. The world itself remained wholly sinful and corrupt. The early church never developed a conception of a really Christian society.

This idea did not come into being until the Middle Ages, where it found its classic mediaeval formulation in Thomas Aquinas. Here the social world was thought of again as an organic unity, each status having a part in the whole and contributing, although unequally, to the religious end of the whole. The highest life was of course the purely religious one in the monastery, where a segregated class acquired merit for the rest of the society as well as themselves. But worldly occupations had their positive if relative and inferior religious merit in their own right, not merely, as in the early church, as an opportunity for brotherly love. Taken together they

were thought of as service of God and one's fellows in a system of the division of labor. The relatively personal and traditional character of most of the relationships of mediaeval society made it possible to conceive the whole in Christian terms as a system of mutual service, with a patriarchal element, for example, as between lord and serf and an egalitarian element as in the case of the relationship of craftsman and customer. The violence of feudal warfare was the most difficult thing to fit in; but, while in general interpreted merely as sin, in chivalry even it was brought within the Christian conception of service, to God above all, as in the crusades, and to other men (and of course women). Thus the mediaeval conception sanctioned primarily the first of the above types of service, that involving a personal relationship but without specific limits of content.

The Reformation brought another step in the secularization of the Christian idea of service, in that by abolishing monasticism it left only worldly callings as the fields of service and emphasized their conscientious performance as a religious duty. In the Lutheran branch the traditional and patriarchal elements remained uppermost and led to a conservative acceptance of things as they were and submission to authority, paralleled by the development of a conscientious devotion to duty, which bore fruits in the Prussian concept of duty in the service of the state.

It remained for Calvinism and the Protestant sects to emancipate the religious idea of service from patriarchalism and from traditionalism, by removing its indifference to the world, and to give its special sanction to rational work on individual responsibility for impersonal ends. This fitted in admirably with the individualistic economic developments of early modern times and has given an even stronger religious sanction to individual economic enterprise than the Thomist ethics gave to mediaeval traditionalism. By a process of secularization the original religious motivation has faded away and has tended to give place to a self-righteousness in the pursuit of self-interest often shading over into the hypocritical. What was originally conceived as disinterested service of God and one's fellows has become at best an end in itself, at worst sheer egoism covered by a thin veil of rationalization. Thus Lutheranism has provided a religious sanction to service of the impersonal and specific content type in the authoritarian state, while only Calvinism and the sects have given it for

the voluntary and individualistic contractual type of relationship.

Since the eighteenth century various purely secular doctrines of service have arisen to fill the gap left by the fading religious sanction. Rationalistic humanitarianism and social utilitarianism are perhaps the most widespread. They seem to lack the power of justifying to the individual a real submergence of his self-interest, which the transcendental basis has given to the ideals of service arising out of Christianity.

SERVITUDES. In the law of property the servitude is an interest involving limited use and enjoyment of a thing of which the general ownership is in another. In the Roman as well as the modern civil law servitudes are carefully defined and delimited. In English law, however, the term has a less exact meaning. Following the civil law its use is sometimes confined to the species of real property interests known as easements and profits; but often it is employed more loosely to include various "rights in the land of another." Moreover, while in English law the term servitudes is restricted almost exclusively to interests in land, in the civil law movables may be the subject of one form of servitude.

The civil law of servitudes in particular and to a considerable extent the corresponding English law have developed into a system with many technical refinements. While occasion is found in a rural society for such simple interests as rights of way or rights to drive or water cattle, yet it is only in a complex and urban civilization, where people live in crowds and uses of land are many and diverse, that there develops a complete system of rights of user apart from ownership and possession. Thus, although the classical system of servitudes, which developed under the Roman Empire, was brought to the attention of English lawyers—notably by the writings of Bracton in the thirteenth century—only an occasional decision of limited scope appears in the early reports. Some of the most important technical features of the English law of easements are quite recent, if indeed they can now be considered as thoroughly settled.

In the earlier Roman law the servitudes seem to have been largely an extension of the concept of natural rights; that is, of rights of enjoyment of property as against one's neighbors, such as the right to have a stream flow down to one's land without change or to discharge surface water on another's land or to have lateral support from a neighbor's soil. The identification of such rights, which are really only concomitants of property ownership, with servitudes is also found in modern continental law under the concept of natural servitudes and in English law as

natural easements. At an early date, however, a distinction was drawn by the Romans between two kinds of servitudes; this distinction has always been observed in ancient and modern civil law and has left some traces in the Anglo-American system. The two kinds are praedial, or real, servitudes and personal servitudes. The former, limited to interests in land, occurred when one parcel, called the servient estate, was bound to the exercise of privileges over or with regard to it for the benefit of another, or dominant, estate. The latter, which might bind either land or movables, existed not in favor of some other property but in favor of some person. From this difference in conception important results followed.

The praedial servitude was conceived of more as an attribute of the dominant land itself than as property of a person. Since it was intended for the benefit of the dominant estate, it could not be transferred without such estate. Inasmuch as one parcel had to be dominant, it followed also that there had to be two estates and hence two owners. An owner therefore could not have a servitude in his own land. Where it was not a creation of the law, as in the case of the natural servitude, it could be created as were other land interests, as by conveyance or by long enjoyment. In the earlier law at least it was created only to endure in perpetuity. It could be lost, however, by non-use, by abandonment, by destruction of the dominant or servient estate, by release or by union of dominant and servient estates in one owner. It passed on transfer of the dominant estate but not apart from it. It was indivisible. It could not impose an active duty. It had to be so used as to cause as little inconvenience to the servient estate as possible. It was an incorporeal right and hence technically capable not of being possessed but only of being used.

The praedial servitudes in turn were divided into two classes, rustic and urban. While the exact line of demarcation was uncertain, the better view is that urban servitudes were those which contemplated primarily a building on the dominant land, although some authority, per-

haps overexact, has it that they existed only in connection with buildings. All others were rustic. Thus the distinction had no connection with the rural or urban location of the estates. The oldest rustic servitudes were *iter, via, actus* and *aqueductus*; that is, those involving rights to walk, to ride, to drive cattle or to conduct water across the servient land. According to Anglo-American usage these would correspond to easements affording merely use of the land for specific purposes, while commons or profits—the right to draw water, to burn lime, to dig sand, to pasture cattle—were later additions in the Roman law.

Personal servitudes, on the other hand, were personal rights for the benefit of a particular individual. They terminated with his life and were not assignable by him. Such servitudes were few in number, the most important being usufruct; the others were derivatives or modifications of it. Usufruct was the right to enjoy a thing the property of which was vested in another and to take its fruits, but not to destroy it or fundamentally to alter its substance. The quasi-usufruct, however, applied to things which might be consumed in use. While it usually extended for life, the usufruct might be created for a fixed term; but even then it was terminated by the death of the holder. Where given to a corporation, its duration was limited under Justinian to one hundred years. Originally it was always created by legacy, and this remained the most usual method. It was divisible and might be terminated or lost in ways similar to those applicable to the praedial servitudes.

Although both types of the Roman law servitudes have been carried over into modern continental law, on the whole the praedial, or real, servitudes seem to have suffered less change than the personal servitudes. In early French law there was an estate of enjoyment of land for life which partook of the nature of the usufruct, although it approached ownership for life. But this interest ultimately gave way to the Roman theory, and at present both the perfect usufruct, where the substance cannot be altered, and the imperfect usufruct, where the thing itself is consumed, are recognized. A usufruct to other than natural persons is limited to thirty years, unlike the German law, in which it is unlimited. There has been considerable discussion among French jurists as to the utility of the term servitude as applied to the usufruct in view of the personal nature of the latter. The true, or real, servitude

has also long been recognized in French law, although in the early law it had not been sharply distinguished from various feudal customs. A peculiarity of the French law, however, is its method of creating a real servitude known as *par destination du père de famille*, whereby when an owner has established a mode of use affecting two parcels of land owned by him which would have been a servitude had each parcel been separately owned, a servitude comes into existence when they are separately inherited or conveyed.

The early Germanic law was largely one of local customs, which did not embody the complete Roman system of servitudes. Despite the fact of general reception of the Roman law in the fifteenth century, the German law of servitudes long exhibited more variations than other continental systems. Thus a servitude might exist without two separate owners; certain special forms of real servitude still followed local custom; and the personal servitudes were not restricted in type as under the Roman law. The present civil code, however, follows the Roman law more closely.

As Holmes has remarked, the English law of easements and profits owes much to the Roman model; but this was more true in its earlier period, when the influence of Bracton was strong. The English law developed rather under the influence of the remedies of the early assize of nuisance and the more modern action on the case, since to these actions the defense might be interposed of a claim of prescriptive right to do the acts objected to. In any event the common law easement, like the praedial servitude, is generally regarded as appurtenant to a particular, or dominant, tenement; it passes therewith, and its use is determined by the needs of the dominant estate—hence the term appurtenant easements. But the stricter divisions of the Roman law and the classification of the forms of easements do not appear in English law and the easement is viewed as a general right of user limited only by the needs of the dominant estate and by the terms of its creation.

A reaction against the Roman idea of personal servitudes is perhaps to be seen in the English attitude toward the easement in gross, or easement without a dominant estate, although this attitude is probably more directly due to the policy against uncertain and ill defined encumbrances on land titles. Modern writers now assert as settled English law the rule that there can be no easement in gross. But the meaning of

this rule is perhaps still not entirely clear, for it does not mean that an individual cannot have a right of way, but only that the interest is viewed as a contract and not as a property right and thus is subject to limitations as to transfer or enforceability.

In the United States the English law of easements and profits is in general followed, although some differences have developed. Thus in England there is a doctrine of ancient lights; namely, that an owner may have an implied or prescriptive easement of light to the windows of his house. In the United States, however, this is viewed as a burden upon the development of realty and is not upheld. On the other hand, it is now accepted law in the United States that the easement in gross will be recognized as a property interest. There still remains a sharp conflict of opinion as to its assignability. Some American authorities favor assignability on the ground that the interest is indistinguishable from general property rights. The greater number tend to rule against it, following the policy inherited from the English law against upholding clogs on title. Such rights as easements in gross may often be of little value to the holder and be practically forgotten by him. Upon his death the ownership often cannot be traced, and the marketability of the servient estate is impaired. Since an interest of sufficient value to justify assignability may usually be construed as something more than an easement, the rule of non-assignability, although in theory arbitrary, may have practical utility.

Technical rules also apply to the so-called profits of Anglo-American law. A profit, or more accurately a profit *à prendre*, is a privilege and a power of appropriating the product of land. In this category of interests there was the privilege of pasturing cattle in common with others on the servient land, which was traditionally of great importance, while powers of extracting various mineral products from land for sale are now valuable in coal, oil and gas regions. A profit may be held either in gross or as appurtenant to a dominant estate, and a profit in gross is recognized even in England. One ancient and technical rule is that upon a transfer of a dominant estate a profit cannot be surcharged or the servient estate made responsive to the needs of a larger dominant estate, under penalty of loss of the entire profit.

Since English servitudes originated in part as defenses to claims of nuisance, prescriptive rights in the use of one's own property have

always been important. If a person has operated a factory for the prescriptive period—usually twenty years under Anglo-American law—in such a way as to cause a particular nuisance, at the end of that period an easement is acquired as against the neighboring owner to carry it on perpetually in the same way. In general servitudes may be acquired by prescription or by deed and they may be lost in ways similar to those of the Roman law: by release, abandonment, adverse possession, destruction and merger.

The English antipathy to the easement in gross is reinforced by a principle announced by the English judges that new and novel forms of easements will not be recognized [Hill *v.* Tupper, 2 H. & C. 121 (1863)]. This has been criticized as a restriction upon the development of landholdings and the newer uses of land. It is doubtful, however, whether it goes so far. It is rather an expression of the policy already mentioned, whereby the free alienability of land is favored. It does, however, conflict with another cherished policy—that of allowing an owner to develop his property as he sees fit. Many of the technical rules in this and other branches of property law are an attempt to work out a wise compromise between the two. Recognition of all sorts of servitudes may eventually harm the landowning class by subjecting realty to various indefinite interests of little positive value and of great potential detriment as clogs on marketability. On the other hand, excessive restriction may likewise prevent the owner from desirable uses of his property. A policy which does not recognize as permanent transferable interests those of slight utility, while supporting others of more substantial character, has at least a pragmatic justification. It is significant that the English Law of Property Act of 1925, which made revolutionary changes in the law of property, left the law of easements unaltered.

In addition to the easement and the profit, the two property rights most nearly akin to the Roman servitudes, Anglo-American law recognizes several similar types of interests involving use of land owned by another. The most important of these are real property licenses, covenants running with the land and equitable restrictions on the use of property. The license involves a privilege to do acts upon another's land. Where not given pursuant to some agreement, express or implied, it is held always to be revocable by the grantor at any time. It is therefore a very slight interest, hardly to be con-

sidered a definite property right. When it is created by legally enforceable agreement, it amounts in substance to an easement of limited character according to the terms of its creation. A problem of some difficulty arises, however, as to whether a limited privilege to do acts on the land of another is subject to the rules applicable to conveyances of land and thus should be regarded as invalid, except as a revocable privilege, unless made by a deed or by express written contract. The theater ticket is an example of such a limited privilege. Notwithstanding some confusion in the cases it would seem that the problem should be disposed of on the basis of contract rather than property and that the interest should be considered valid and irrevocable according to its implied terms even without a formal deed. Another problem arises where a privilege to make extensive changes on another's land has been acted upon with considerable expense by the license holder. Some cases in the United States hold that thereafter it cannot be revoked, although the more usual rule is that permanent property rights cannot be acquired so casually.

Covenants running with the land differ from easements in that they may impose active duties on the servient owner. Traditionally there has been hesitation to consider such covenants as passing with land; and in England it is now well settled that, except as to covenants in leases controlled by a statute of the time of Henry VIII, the burden of active covenants does not run with the transfer of the servient estate. In New York the same rule has been announced subject to some exceptions, such as covenants to repair fences. In general in the United States the running of such covenants is permitted upon compliance with various technical requirements as to the language of the deed or as to privity of estate between the parties. The rules also apply to the running of the benefit of such covenants where held as appurtenant to some dominant estate.

The law of equitable restrictions on land—termed also equitable easements or equitable servitudes—developed as a result of the action of equity in granting an injunction against violation of the terms contained in a deed providing for a limited use of property. Such restrictions have been found exceedingly useful in modern realty developments. They include provisions for building only houses of specified value on the servient estate, against the conduct of objectionable businesses upon it, restricting building to a specified distance from the street and the

like. They represent probably the most striking modern development of the law of servitudes, for much of urban property is now sold on the basis of such covenants. In fact the entire law on this subject is now in process of growth and expansion.

The interest known as rent is not usually described as a servitude, although the long term, or ground, rent customary in certain American cities and calling for the payment of a recurring charge is similar in many respects. Recently some writers have tended to speak of certain agreements affecting chattels as servitudes. Agreements of this type are those of manufacturers with wholesalers to restrict the retail sale price of their product. Such usage, however, is more a convenient designation than an actual extension of realty law to chattel interests.

It is sometimes thought that, unlike the Roman law, the Anglo-American law of servitudes is not one which is growing and developing. This may be doubted. The modern conception of the Roman law is gained from a view of it over several centuries, while the tendency is to think of the Anglo-American law as it is at the moment and with perhaps undue emphasis on its policy against novel property encumbrances. But the equitable servitude alone is striking proof that it has shown itself capable of adjustment to changing needs of property ownership.

SETTLEMENTS, SOCIAL. See SOCIAL SETTLEMENTS.

SEWALL, MAY WRIGHT (1844-1920), American feminist. A graduate of Northwestern University and for several years a teacher in the schools of Michigan and Indiana, May Wright became identified with the cause of feminism through her interest in the higher education of women. Three years after her marriage in 1880 to Theodore Lovett Sewall she assisted her husband in establishing a girls' classical school in Indianapolis, one of the first institutions in the middle west to prepare girls for college on the same basis as boys. During the years she served as principal of this school Mrs. Sewall became an active promoter of women's clubs as a means of furthering educational, social and cultural reforms. She participated in the organization of collegiate alumnae associations and local and national woman suffrage groups and was one of the founders of the National and International Councils of Women (1888) and of the General Federation of Women's Clubs (1890). In 1893 she was made chairman of the organization committee for the World's Congress of Representa-

tive Women at the World's Fair in Chicago and later she edited *A Historical Résumé* (2 vols. Chicago 1894) of the congress. In 1900 she was delegated by President McKinley to represent the women of the United States at the international congresses of the Paris Exposition.

Mrs. Sewall was the author of the chapter "Indiana" in the third volume of *History of Woman Suffrage* (edited by E. C. Stanton, S. B. Anthony, M. J. Gage, and I. H. Harper, 6 vols., New York 1881-1922); of *Neither Dead nor Sleeping* (Indianapolis 1920), a work on spiritualism; and of several pamphlets and addresses dealing with education, peace and various aspects of the woman's movement. In 1915 she was actively associated with the International Conference of Women Workers to Promote Permanent Peace held in connection with the Panama-Pacific Exposition at San Francisco, and she compiled a record of the conference under the title *Women, World War and Permanent Peace* (San Francisco 1916).

A fluent speaker and an able organizer, Mrs. Sewall left her impress on the woman's movement chiefly through her ability to launch and effectively to direct group effort in behalf of the political and social reforms advocated by feminist leaders. During the closing years of the nineteenth and the early part of the twentieth century she was the driving force in the formation of women's clubs through which woman suffrage derived a large measure of its support.

GLADYS MEYERAND

SEWARD, WILLIAM HENRY (1801-72), American statesman. Seward entered New York politics as an anti-Mason and then passed over to the Whigs, closely associating himself with Thurlow Weed. From 1839 to 1842 he was governor of New York state and supported a far reaching program of internal improvements and public education. As a United States senator during the 1850's Seward took an advanced position against slavery. He was a prominent opponent of compromise in the debates of 1850, attacked the Kansas-Nebraska bill and in 1858 at Rochester declared that an "irrepressible conflict" existed between North and South. He had joined the Republican party in 1855, but despite the fact that he was its outstanding leader he failed to receive the presidential nomination in

1860 because of political considerations. He was made secretary of state by Lincoln; and faced with secession he advocated a strenuous foreign policy to unify the country.

In his conduct of relations with Great Britain Seward showed great skill. He wrote a masterly note surrendering the Confederate commissioners Mason and Slidell, thereby making a necessary concession and yet conciliating public opinion at home. He steadily protested British action where it seemed to savor of unneutral conduct, as in the case of the *Alabama* and the Confederate rams being built in the Laird yards. His attitude with regard to France was no less adroit and firm. He stoutly rejected all suggestion of mediation. When the French intervened in Mexico, setting the archduke Maximilian on the Mexican throne, he protested, but only mildly, until the end of the war. He then consistently raised his tone, forced France to agree to withdrawal within a specified time limit and in the popular mind vindicated the Monroe Doctrine. In this matter he resisted much pressure for direct intervention in Mexican affairs. Seward was always a convinced expansionist. He acquired Alaska from Russia in 1867 for \$7,200,000 and negotiated a treaty for the purchase of the Danish West Indies, which, however, failed of ratification in the Senate. In domestic questions Seward was a moderate. He opposed emancipation until after a northern victory, favored a generous policy toward the South and supported President Johnson against the Radical Republicans.

SEX EDUCATION AND SEX ETHICS. The widespread acceptance of the idea that young human beings need sex instruction is connected with the biological fact that in the human species there is a strong hereditary drive toward sexual functioning but no instinctive mechanism for control or regulation of sexual impulses. If the

latter were limited strictly to reproduction and instinctively managed toward that biological end, as is true of animals, with the possible exception of some of the higher primates, sex education would be unnecessary. But there is no such limitation. On the contrary, it seems probable to biologists that during the evolutionary process mankind acquired conscious control and memory associations regarding things sexual, thus making possible and desirable pleasure motives more or less independent of the reproductive cycle. This development of sexual gratification as an end in itself has led to many of the complicated problems of sex and has made it necessary for society to devise some means of controlling the sexual impulse. Since control must be based on intelligent choice, young persons can be expected to manage their inherited sex impulses within the limits of health and social requirements only when they have been instructed by parents and teachers.

Sex education is now commonly understood to include all educational measures which in any way prepare human beings, especially during childhood and adolescence, to deal with life situations and social relationships directly or indirectly arising out of the sex instinct. Such a broad general definition covers not only the modern movement for organized sex education of young persons in homes and schools but applies also to the more or less unorganized instruction which in primitive societies and in civilized life from ancient to modern times has been given, under the auspices of the family, the tribe or religious institutions. It is probable that there has been some kind of sex education as long as young people have been instructed in various matters of conduct approved by the group or the community of which they were a part. The simplest formal sex instruction under public or tribal auspices is that often included in the pubertal initiation of youths into manhood. Included in the prescribed ceremonies and curriculum of the initiation in many primitive societies is a certain amount of instruction regarding the physical and social aspects of sex as they are understood and approved by the tribe to which the novice belongs.

In all times and on all levels of human culture instruction in matters of sex has been closely bound up with the social mores and the prevailing codes of ethics applied to sex conduct. In the development of these codes religion has of course been a dominant factor. Whether through primitive magico-religious ritual, pagan eroti-

cism, Hebrew regulation, early Christian asceticism, Puritan repression, Catholic latitude or modern liberalism, religion has borne a close relationship to the sex attitudes and practices which have been characteristic of different people at different periods. Religious leaders moreover have for the most part given implicit if not overt recognition to the manifestations of the sex instinct and have sought to regulate or control these manifestations through the imposition of moral or religious sanctions. Modern sex education with its varying method and content can thus be more easily understood in the light of the ethical concepts out of which it has grown and by which its development has been conditioned. Among western peoples the acceptance of the principle of monogamy has been reflected in a general approval of the ethical code that regards as good and socially desirable the limitation of sexual functioning to monogamic marriage approved by church or state or both. This code of sex ethics, generally accepted in principle although not always in individual practice, appears to have been based chiefly on pragmatic experience and ecclesiastical dictation. So far as monogamy is concerned, it is not out of harmony with the biological nature of human beings, but biology has no scientific evidence for or against monogamic sex ethics. The facts relating to monogamy are in two groups: first, there are almost equal numbers of the two sexes, a fact which suggests why some form of monogamic marriage has always prevailed and why in no large ethnological group has there been universal polygamy; second, a natural propensity for paired and extended companionship (a comrade impulse) appears to operate in many animals and in mankind. These biological tendencies toward monogamy have no obvious bearing on premarital and extramarital promiscuity. As an example, social anthropologists have observed that there are in Melanesia some monogamic tribes whose sex ethics permit general promiscuity in childhood and youth, while other related tribes have extremely strict codes for the regulation of sexual conduct.

In occidental civilization until recent times the most important agency for the guidance of individuals in sex ethics has been the church. Not only has conduct along sexual lines been more or less clearly suggested in many religious books in common use, but also it has long been the task of religious leaders to attempt to maintain in their communities certain ideals and to

indoctrinate the children and youths under their influence. This indirect sex education had enormous influence so long as the churches swayed the masses of the people; but leaders of the sex education movement have recognized that religious sanctions have lost much of their power in modern times and that sex ethics presented solely on the authority of the church fails to appeal to large numbers of young men and women. In addition to the declining influence of religion social and economic changes have been important factors in the modern development of sex ethics and sex education. The disappearance of certain tabus and restrictions with respect to sex, the impact of increasing scientific knowledge in overcoming religious and social prejudices, the rapid industrialization and urbanization of society since the eighteenth century, the larger freedom accorded to women, are among the phenomena whose emergence has brought the problem of sex into new focus.

The movement for organized sex education which has been extending rapidly in America and Europe during the past thirty years had its origin in the world wide medical attack on the venereal diseases. In the last quarter of the nineteenth century there was accumulated a mass of scientific knowledge regarding the causes, prevalence, disastrous physical effects and social results of gonorrhoea and syphilis. National and international medical conferences in Europe between 1900 and 1905 resulted in the organization of societies which, while aimed primarily at combating venereal disease by medical and sanitary measures, recognized that the spread of venereal germs was chiefly due to sexual promiscuity, especially prostitution. Hence the attack on the problem became social as well as medico-sanitary, an emphasis that was reflected in the official name, Society of Sanitary and Moral Prophylaxis, adopted both in France and in the United States, and in the use for many years of the term "social diseases" as a synonym for venereal diseases. The extent to which ignorance was a factor in the spread of venereal disease led to a recognition of the necessity of sex education for both children and adults. At first the proposed teaching concerning sexual matters was directly aimed at preventing the spread of venereal disease by hygienic advice and by warning against promiscuity. Gradually, however, the scope of the movement was broadened through the participation of individuals and organizations interested not only in the control of prostitution and in the eradication

of venereal disease but in the wider problems of social welfare. In the United States and England the influence of such individuals and organizations was so great that the majority of the national societies for combating venereal diseases have been reorganized as social hygiene associations in which direct emphasis on disease is only a part of the program and education dealing with every aspect of sex is prominent.

In Germany social reformers and leaders of the women's movement were chiefly responsible early in the present century for the formation of the *Deutscher Bund für Mutterschutz und Sexualreform*, an organization devoted to the protection of unmarried mothers and their children, to the overcoming of sex injustices and the reform of the institution of marriage. Similarly in other countries the late nineteenth and the early twentieth century witnessed the breakdown of old prejudices and tabus with respect to sex and a growing tendency on the part of educators and social and religious leaders to promote sex enlightenment based on a scientific understanding of the biological, hygienic, psychological and social implications of sex both in the life of the individual and in family and group relationships.

The pioneer work in broadening the original medical program of sex education, which was aimed at disease control, may be credited to America. Among the delegates to the 1902 international conference in Brussels which gave the inspiration and program for a chain of national societies against the venereal disease peril was an American physician, Dr. Prince Albert Morrow. In 1904 he submitted to the Medical Society of the County of New York plans for the organization of an American society whose object should be to limit "the spread of diseases which have their origin in the Social evil." This led to the organization of the American Society for Sanitary and Moral Prophylaxis (1905), the American Federation for Sex Hygiene (1910) and the eventual merging of several societies with related interests into the American Social Hygiene Association (1914). In its original usage social hygiene included a wide range of health and social matters relating to the welfare of society in general. For example, in France the national department centralizing health and welfare, the *Office National d'Hygiène Sociale*, has divisions devoted to germ diseases, mental hygiene, nutrition, housing, public health nursing, social service, social insurance, charities, health education, social health and sanitation. In

America such an inclusive interpretation of social hygiene was rejected because much of its content was already classified and well developed under other auspices. Instead social hygiene was accepted as the designation for the movement to promote social health. With emphasis on the family as a biological and social unit the American Social Hygiene Association purposed to give special attention to those phases of social health which in their essential nature are sexual and which had not been dealt with adequately by previous medical, social and educational agencies. Under its leadership in the United States and with the cooperation of the state and national departments of health as well as other private organizations social hygiene measures (medical, legal, protective and educational) have been directed toward a large group of health and welfare problems (physical, mental and social) which have their origin in the phenomena of sex. This stressing of the sex centered problems of social health under the banner of social hygiene has been so widely accepted in America and most of Europe that the original use of the term social hygiene to include all matters which relate to the health or welfare of society in general has become largely obsolete.

Systematic sex education for both children and adults has from the first occupied an important place in the social hygiene movement. In support of its program the cooperation of parents and educators has been enlisted as well as that of physicians, religious leaders, social workers, criminologists and others concerned with related problems of public health, juvenile delinquency, recreation and community welfare. Sex education in America for many years stressed the common evil results of mismanaged sex instincts, such as personal ill health, illegitimacy, promiscuity and venereal disease. This attack on the negative side has been considerably modified, except in certain professional courses for adults, and there is increased emphasis on education based on an understanding of sex in its relation to the individual and the family and directed toward successful marriage and parenthood. Leaders of the movement are in practically unanimous agreement that sex education should set in bold relief the normal, healthful and aesthetic aspects of sex and should touch physical and mental abnormality, vicious social conditions and disease only in so far as it seems necessary to warn youth regarding the dangerous pitfalls connected with sex. Extensive

knowledge of sex pathology—physical, mental or social—has no place in modern programs for sex education.

The chief opportunity and responsibility for sex instruction of children before high school age rests on the home, in which there is opportunity for progressive hygienic care, guidance and example as well as simple instruction or admonition regarding personal sex habits. Adequate training for parents to this end is increasingly occupying the attention of educators and of parents themselves. Under the auspices of the parent education, the nursery school and the child study movements considerable progress has been made in recent years in furnishing guidance for sex training in the home. By means of lectures, printed matter and discussions women's clubs and parent-teacher organizations are also assisting in preparing parents to give their children early sex guidance.

It is a generally accepted proposition that the best foundation for sex education in the schools is in biological sciences. General knowledge concerning reproduction provides a scientific attitude and background for social problems of sex. Moreover, while such studies do not function directly in determining sex conduct, they may be so organized as to draw attention to the relation between health habits and sex. The task of building on biological knowledge the individual's ideals of socialized sex conduct belongs to sex ethics, which should aim to teach the guiding principles underlying socially approved sex relations. In this connection courses in the social sciences, in home economics and home making, in general literature, in health or physical education, afford a logical means for the consideration of subject matter relating to sex in its bearing on personal and family life. In some sections of the country the early practise of including sex instruction in a general course entitled "character education" or "sex character education" still persists. Except in professional schools of medicine, nursing, education or theology the present tendency in secondary and higher schools is to integrate sex teaching in the general academic program rather than to set it apart as a special course of study.

Sex education in the United States is not limited to schools and colleges. Churches, the Young Men's Christian Association, the Young Women's Christian Association and other religious associations for young people, lodges and fraternities, the National Council of Women, the Women's Christian Temperance Union, the

General Federation of Women's Clubs and numerous other private and professional groups are active participants in the movement, not only through the formulation of definite programs of sex education but through the dissemination of literature on various aspects of sex and social hygiene and through a concerted effort by means of propaganda to combat the influence of unwholesome books and periodicals, motion pictures and commercialized entertainment tending to give undue prominence to sensational or morbid aspects of sex.

Certain phases of social hygiene indirectly related to sex education have become the concern of special groups, chief among which are the societies organized to combat prostitution considered as a social evil in itself apart from venereal disease. In the United States the American Social Hygiene Association has absorbed most of these organizations and promotes their programs through its departments of legal and protective measures. In Europe such societies have been especially active in the long extended campaign against the evils of the licensing system permitted by most governments. Other agencies which are carrying on effective programs of research or education with reference to sex problems are the League of Nations, which sponsors a committee on international traffic in women and children, the World League for Sexual Reform, the Association for Moral and Social Hygiene, the Health Division of the League of Red Cross Societies and various birth control and eugenics societies as well as organizations concerned with the protection of women and children. At the Third International Conference for Sexual Reform held in London in 1929 it was proposed to set up an international bureau of sex education for the purpose of giving information on how to spread methods and knowledge of scientific sex education.

In addition to the United States the chief centers for social hygiene and sex education in the world today are Canada, England, France, Czechoslovakia and Germany. In all these countries there are under various names national societies for social hygiene, which take the lead in educational activities. The programs and curricula recommended for sex education of young persons are similar to those described for the United States. All begin with biological facts regarding reproduction in animals, plants and humans as a basis for understanding human social relations. All teach a limited amount of sex hygiene, including information on venereal

disease. All stand for sex ethics based on the ideal of monogamic family life and emphasize the study of social problems as a preparation for marriage and parenthood.

The breakdown of conventional standards of sex ethics and sex education in time of social and economic upheaval is nowhere better exemplified than in Soviet Russia. The revolution of 1917 resulted in the complete elimination of old ethical sanctions and religious attitudes with respect to sex. In their place has come a rational program of sex education launched under government auspices. Frank sex teaching designed to meet the needs of all ages is disseminated not only through the schools but by every device of modern propaganda including lectures, posters, books, pamphlets and periodicals, radio, traveling exhibits and demonstrations. In the schools simple lessons in nature study and biology are followed by lectures on the anatomy and physiology of sex organs and on general sex hygiene. For adults there are institutes giving instruction in the prenatal and postnatal care of infants, in the treatment and prevention of venereal disease and in birth control and other specialized sex problems. An unusual feature of the program is the institution of public trials for sexual offenses. Instead of seeking to divert attention from such trials, the authorities invite it for the purpose of answering questions and supplying information to all who are interested. Leaders of the movement in Soviet Russia endeavor to differentiate between sex education which includes merely the giving of information and sex training which stresses the formation of habits conducive to hygienic living; both emphases are aimed at an intelligent understanding of and protection of all life processes.

Probably the greatest good that has come from the sex education movement is not from the content of more or less formal outlines for study in schools and other institutions so much as from the wholesome and scientific atmosphere that has been thrown around sex. The past thirty years have witnessed in the United States and Europe an enormous advance in the development of a scientific attitude toward sex as a major factor in life. Whether or not sex instruction is incorporated into official educational programs, its importance has been permanently established. Moreover a growing awareness of the social significance of sex has brought about the elimination of tabus and repressive measures with which discussion or study of sex was formerly surrounded and has resulted in an increas-

ing emphasis on factors leading to the understanding and control of the sex impulse.

SEX ETHICS. See SEX EDUCATION AND SEX ETHICS.

SEYDEL, MAX VON (1846-1901), German jurist. After completing his academic training Seydel entered the Bavarian public service in 1872; he resigned in 1881 to become professor of general, German and Bavarian public law in Munich, where he remained until his death. A very prolific writer on juridical, political and statistical matters, Seydel was a rigid and precise thinker. He served as associate editor of several publications, including the *Annalen des Deutschen Reichs* (1881-1900), *Kritische Vierteljahrsschrift für Gesetzgebung und Rechtswissenschaft* (1881-1901) and *Handbuch des öffentlichen Rechts der Gegenwart* (1892-1901)

Seydel is best known in connection with the sharp controversy concerning the fundamental nature of the German Empire under the Bismarckian constitution. In a challenging investigation of "Der Bundesstaatsbegriff" in *Zeitschrift für die gesamte Staatswissenschaft* (vol. xxviii, 1872, p. 185-256) he applied to the German constitution the view of John C. Calhoun that "Sovereignty is an entire thing;—to divide, is,—to destroy it." The idea of the *Bundesstaat*, as developed especially by G. Waitz (who also drew upon studies of the American constitution), G. Meyer and A. Haenel, he attacked as logically inconsistent with the essentially indivisible and unlimited nature of sovereignty. Seydel held that there can be only unitary states or *Staatenbunde*, alliances between sovereign states which do not thereby renounce their sovereignty; Germany, like the United States and Switzerland, was of the latter type. His advocacy of this point of view made Seydel the leading advocate of states' rights in Germany. The *Kommentar zur Verfassungsurkunde für das Deutsche Reich* (Würzburg 1873, 2nd ed. 1897) was an attempt to justify his application of the theory of indivisible sovereignty to Germany. The spirited controversy led to a clear victory for Seydel's opponents, but he exerted an immense influence upon the theory of sovereignty in federalism. The dispute influenced the discussion of the *Reich-Länder* problem in Germany after the World War. Seydel's attack upon

the concept of the juristic personality of the state and his view that sovereignty is the personal attribute of the ruler remain important for modern discussions of sovereignty.

SHĀFI'Ī, MUHAMMAD IBN IDRĪS AL- (767-820), Moslem jurist. Al-Shāfi'ī studied in Mecca with Mālik ibn-Anas and later lived in Bagdad and Cairo; accordingly his legal theories fit into two periods, an Iraqi and an Egyptian.

Al-Shāfi'ī was the founder of the Shafite school of law. His work consisted chiefly in mediating between the traditional and the individual tendencies of the period and in systematizing Islamic law (*q v*). He placed the latter upon a scientific basis and was concerned not only with case decisions or occasional argumentation, but also with the establishment of fundamental principles of jurisprudence and legal methodology. He attempted to relate the legal maxims and individual decisions in an integral system and to reconcile the logical contradictions which might arise from their consequences. He accomplished his purpose chiefly through argument by analogy (*qiyās*), a method which he did not initiate but which he developed and used scientifically. Analogies might be drawn, according to al-Shāfi'ī, from certain fixed sources. These, he held, were the Koran, the Sunna, which he defined as the practises of the prophet, and the *ijmā'*, which he was the first clearly to establish as the agreement of the majority of Moslem people on any legal question. His classification of legal sources was accepted by all the orthodox schools of Moslem law.

Al-Shāfi'ī wrote in dialogue form, arguing

with anonymous opponents. Most of his writings, which cover a vast amount of legal material, were collected under the title *Kstüb al-umm*.

SHAFTESBURY, FIRST EARL OF, ANTHONY ASHLEY COOPER (1621-83), British statesman. Shaftesbury was the most influential of the group of politicians who in the reign of Charles II founded the English parliamentary party system. Under Charles I and the Commonwealth he took a moderate position and was one of the leaders who brought about the Restoration. Charles II appointed him a privy councillor and later lord chancellor; but as the king's policy of subservience to France and of favor to the English Catholics took shape, Shaftesbury left his service and became leader of an active opposition. Those opposing the king were at that time known as the "Country" as contrasted with the "Court" party, although neither had as yet any coherence. Shaftesbury became president of the Green Ribbon Club, a group of nobles and others opposed to the king's policy who met regularly in the King's Head Tavern. Here they held debates, planned action in Parliament and wove a network of political influence in London and the country. They were the nucleus of the Whigs, the first regular political party in English history. In three successive parliamentary elections from 1678 to 1681 they secured a majority but failed to carry their measures against the king's opposition. When in 1679 the king postponed for a year the meeting of a Parliament already elected, Shaftesbury and others of his party sent in numerous petitions urging the king to assemble Parliament immediately. Others sent in addresses stating their abhorrence of thus bringing pressure to bear upon the king. The two parties were thereupon dubbed Petitioners and Abhorers; subsequently these parties became known as Whigs and Tories.

The persistent but futile efforts of the Whigs in these parliaments to exclude the Catholic duke of York from the throne aroused such strong feeling among the Tories that the Whig leaders feared for their lives. Shaftesbury entered with others into a plot for a general insur-

rection. Upon its discovery in 1682 he fled to Holland, where he died the following year. Dryden's three poems *The Medal*, *Absalom and Achitophel* and *Albion and Albanius* satirized Shaftesbury.

EDWARD P. CHEYNEY

SHAFTESBURY, THIRD EARL OF, ANTHONY ASHLEY COOPER (1671-1713), British philosopher. Shaftesbury was educated under the supervision of John Locke. He resided at various times on the continent, becoming intimate in Holland with the journalist Le Clerc and with Bayle, the French refugee skeptic. Shaftesbury's precocious *Inquiry concerning Virtue* appeared in 1699, his *Sensus communis; Essay on the Freedom of Wit and Humour* and the *Moralists* in 1709. These works, carefully revised, along with additional essays appeared anonymously in 1711 as *Characteristics of Men, Manners, Opinions, Times* (3 vols., London).

Shaftesbury was the most important of the deists. He believed in a benevolent God, whose orderly universe has no place for miracles which "mangle and disfigure Nature." He differed from both Locke and Hobbes, teaching that moral sanctions are not based on arbitrary law, even Scriptural, or on the hope of rewards and punishments. The sense of right and wrong is found by "looking into ourselves." He severed morality from religion, asserting with Bayle that the atheist is as likely to be virtuous as the theist. His optimistic deism, a revived benevolent stoicism, was strongly social; philosophy, he held, was the "study of happiness" in its most general applications.

His influence was widespread. Pope's *Essay on Man* is a metrical restatement of Shaftesbury's philosophical position, possibly mediated by Bolingbroke. In Scotland Hutcheson espoused his moral conception of the "greatest happiness for the greatest number" and passed it on to Adam Smith. Eleven English editions of the *Characteristics* appeared during the century. Shaftesbury's writings were widely read in France, Diderot translating the *Inquiry*. They soon appeared in German. Such thinkers as Leibniz, Lessing, Mendelssohn and Wieland found his conception of morals stimulating. To Herder his philosophy was a "new-born Hel-

lenism." The German interest in Shaftesbury remained keen after the decline of his direct influence in England.

SHAFTESBURY, SEVENTH EARL OF, ANTHONY ASHLEY COOPER (1801-85), English social reformer. After an unhappy childhood and an education at Harrow and Oxford, he entered the House of Commons in 1826. Two years later he was a junior minister. In 1832 Michael Sadler, the leader in Parliament of the movement for factory reform, lost his seat at the general election, being defeated by Macaulay. Shaftesbury, who was then Lord Ashley, was invited to take his place. From that time until he went to the House of Lords on the death of his father in 1851, he devoted himself in the House of Commons to the interests of the workers. In 1842 Shaftesbury carried an act to take women and young children out of the mines. In 1847 Parliament passed the Ten Hours Act for workers in the mills. Shaftesbury was out of Parliament at the time, for he had resigned his seat on his conversion to Peel's policy for repealing the corn laws, but the chief credit for this success was rightly given to his patient advocacy. Other causes that enlisted his active sympathy were housing reform (he was the author of two acts) and the rescue of the little children who were employed to sweep chimneys. To these crusades he sacrificed his political ambitions, refusing high political office. He had administrative experience as a member of the Board of Health from 1848 to 1854, and as a lunacy commissioner from 1828 to his death. From 1834 he was chairman of the latter body. An active philanthropist, he gave up a great deal of time to the Ragged

Schools, to helping prisoners, and to all forms of benevolent effort. As a strong Evangelical, he took an active part in opposing both the High Church and the Broad Church movements of his time. He inherited from his father a large estate, in a deplorably neglected condition, and he was greatly embarrassed by his troubles as a landlord. Shaftesbury occupied a unique position, for he did more than any single man to give a new tone on social questions to the upper class world of his time. He was an isolated figure; his narrow views on religion kept him from full cooperation with others who shared his social sympathies, but his character and his perseverance made him one of the constructive forces of his age.

SHANG YANG (Wei Yang or Kung-sun Yang) (c. 380-338 B.C.), Chinese statesman and political theorist. Born in the state of Wei, Shang went in 361 B.C. to the neighboring state of Ch'in, where he soon won the favor of its ruler, Duke Hsiao. In 359 he proposed important changes in the law, which virtually abolished the privileges of the nobility and made military merit the sole basis for distinction. Agriculture and weaving were to be the only occupations for the people, who were organized into groups of fives and tens, all the members of the group being jointly responsible for one another's conduct. Shang Yang's name is associated with other widespread administrative reforms and with changes in land tenure and taxation, which he perhaps initiated. His foreign policy was characterized by extreme belligerence. He attacked his former country, Wei, and succeeded in annexing large territories and was rewarded in 340 by the grant of the principality of Shang. Through his reforms, however, he had incurred the hatred not only of the nobility but also of the crown prince. When the latter succeeded his father in 338, Shang Yang's authority was at an end, and he was killed after a desperate attempt at rebellion. The policy which he inaugurated, however,

had a great and lasting influence. The administration of Ch'in remained highly centralized and bureaucratic instead of feudalistic, and it followed the foreign policy outlined by Shang Yang, resulting in the overthrow of all the other feudal states and the foundation of the Ch'in Empire in the third century B.C.

There is a book ascribed to Shang Yang, known as *The Book of Lord Shang* (tr. into English by J. J. L. Duyvendak, London 1928). It is one of the classics of the so-called "school of law," the group of thinkers who stressed the importance of government by law, as opposed to the Confucian ideal of government by "moral virtue." Doubtless Shang Yang himself had nothing to do with the authorship of this work, which is a compilation of later date, probably the third century B.C. The extant book is a mixture of old fragments and later forgeries. In part, however, it represents the oldest phase of the development of the school of law and probably expresses the ideas of the statesman for whom it was named. Its doctrine is extremely harsh; war and agriculture are the only occupations allowed to the people and cultural activities, which are termed parasitic, are to be eliminated. This anticultural tendency bears a certain kinship with Taoism, from which, however, it differs widely in its practical application. The central idea of the political theory expounded in *The Book of Lord Shang* is the necessity for creating a strong government; the strength of a government is relative to the weakness of the people and is insured by a strict rule of law. In the fourth and third centuries B.C., when China underwent a period of terrific upheaval, in which feudalism was finally uprooted, these ideas were undoubtedly influential and helped to formulate the conception of a state.

J. J. L. DUUVENDAK

Consult "Introduction" to J. J. L. Duyvendak's translation of *The Book of Lord Shang*, p. 1-159; Forke, A., *Geschichte der alten chinesischen Philosophie*, Hamburg Universitat, Abhandlungen aus dem Gebiet der Auslandskunde, vol. xxv (Hamburg 1927) p. 450-61; Wu, Kuo-Cheng, *Ancient Chinese Political Theories* (Shanghai 1928) ch. vii; Liang Chi-Chao, *History of Chinese Political Thought during the Early Ts'in Period*, tr. from Chinese by L. SHATTUCK, LEMUEL (1793-1859), American statistician. Shattuck was first a school teacher and later a bookseller and publisher. In preparing a history of Concord, Massachusetts, he found the registers in that and other Massa-

chusetts towns very imperfect and took a prominent part in persuading the state legislature to establish a system of registering births, marriages and deaths. Some years later the registration act of 1842 was revised under the influence of a report of a legislative committee of which Shattuck was chairman. The improved Massachusetts registration system, based largely on that of England, was later extended to all the other states.

In order to obtain detailed census data needed in the interpretation of registration statistics Shattuck persuaded the Boston Common Council to take a census of the city. The reputation of the Boston census of 1845 carried out under Shattuck's direction was so great that he was subsequently called to Washington, where he did more than anyone else to bring the federal census of 1850 up to the highest standard prevailing in Europe. He had introduced the Boston report by a competent interpretation of the tables, a practise which was imitated and has since been maintained in Washington.

In 1849 Shattuck was appointed chairman of a commission to make a sanitary survey of Massachusetts. The comprehensive report which he submitted displayed amazing farsightedness, but it was not acted upon for nearly twenty years. It was responsible nevertheless for the creation in 1869 of the Massachusetts State Board of Health, another administrative innovation which has been copied by other states.

Shattuck followed closely the progress of European population statistics, which were advancing with great rapidity in the years after 1830, probably corresponded with several of the leaders in that movement and introduced into the United States via Massachusetts or adapted to American conditions several of the most important European methods. No American contributed as much as he toward raising the population statistics of the United States from the very low level at which they stood in 1840. Shattuck's interests in vital statistics were continued by his better known but less seminal fellow townsman, Edward Jarvis (*q.v.*).

SHAW, ANNA HOWARD (1847-1919), American feminist and leader of the woman suffrage movement. Born in England and brought to

Massachusetts at the age of four, Anna Howard Shaw early became inured to the pioneer hardships of life in northern Michigan, where her family eventually removed. An unusual gift of oratory enabled her to secure a lay preaching license in the Methodist Episcopal church, and despite financial obstacles and parental opposition she determined to become a minister. By school teaching and free lance preaching she earned enough money to attend Albion College and later Boston University Theological School. Upon her graduation from the latter in 1878 she became pastor of a Cape Cod church. Undaunted by the refusal of her own denomination to grant her ordination because of her sex, she applied to the Methodist Protestant church, in which after considerable controversy she was ordained—the first woman to be so recognized by the denomination. Her lively humanitarian interests led her to take up the study of medicine in conjunction with preaching, and in 1885 she received the degree of doctor of medicine from Boston Medical School.

Both the ministry and medicine served, however, merely as a background for her activity in the woman's movement which was to occupy the remainder of her life. Her growing reputation as a speaker on temperance and social reform led the Massachusetts Woman Suffrage Association to invite her to join its staff as a lecturer and organizer, an offer which she accepted in 1885 after resigning her pastorate. Although Dr. Shaw was not a suffrage pioneer in the same sense as Susan B. Anthony, whose close friend and coworker she became, her contribution to the political enfranchisement of American women was no less important. Remarkable eloquence coupled with a logical mind, a large fund of humor, tolerance and common sense enabled her to win hostile audiences to the cause she championed; while her ability as an executive, an organizer and a political strategist was reflected in the rapid progress made by the National American Woman Suffrage Association during the years she served as its president (1904-15). Under her administration membership increased from 17,000 to 200,000 and eight states were added to the suffrage roster. Always an opponent of militant methods, Dr. Shaw by her speeches, her writings and her personal influence was able to dissipate much of the public opposition to suffrage agitation and to gain for the movement a large measure of the support which was to culminate in ratification of the national amendment shortly after her death. As

a lecturer she traveled throughout the United States and in Europe, where she was active in promoting international suffrage organizations. Her influence as a leader of American women was recognized by President Wilson, who in 1917 selected her for the important post of chairman of the women's section of the Council of National Defense.

GLADYS MEYFRAND

Consult. Shaw, Anna Howard, *The Story of a Pioneer* (New York 1915), *The History of Woman Suffrage*, ed. by E. C. Stanton and others, 6 vols. (New York 1881-1922), especially vols. iv-vi, Ford, D. M., "Anna Howard Shaw Physician and Pioneer" in *Englishwoman*, vol. xlvii (1920) 210-18, Bennett, Helen C., *American Women in Civic Work* (New York 1915) p. 231-52.

SHAW, LEMUEL (1781-1861), American jurist. Shaw was graduated from Harvard in 1800 and admitted to the Massachusetts bar four years later. He achieved distinction in the practice of commercial law and was an outstanding member of the state legislature. From 1820 to 1860 he served as chief justice of the Massachusetts Supreme Court; during this period he fought the popular election of judges and was instrumental in preserving an appointed judiciary in Massachusetts. His career on the bench proved Shaw to be not only a strong judge, able to resist popular pressure, but a great jurist who left an indelible impression upon American law.

The years of his judicial service coincided with the transformation of Massachusetts from an agricultural to an industrial community; and Shaw's peculiar genius lay in his ability to adapt the principles of the common law, developed in a feudal era, to the needs of an industrial, urban civilization. Justice Holmes has said of him: "Few have lived who were his equals in their understanding of the grounds of public policy to which all laws must ultimately be referred" (*The Common Law*, Boston 1881, p. 106). Mere private interest, Shaw felt, must yield to the public interest embodied in the drive for industrial expansion; as industrialism spread, courts throughout the country turned to his decisions for the solution of new problems. Perhaps his most important contribution was his development of railway law. In *Norway Plains Company v. Boston and Maine Railroad Co.* [67 Mass. 263 (1854)] he ruled that the liability of a railway for freight ceases when the goods have been delivered to a station, a decision which has been followed in most states. In *Commonwealth v. Temple* [80 Mass. 69 (1859)] he

settled the conflict between the rights of street railways and other vehicles with regard to the use of the highways. His ruling in *Lombard v. Stearns* [53 Mass. 60 (1849)], that a water company was under an obligation to serve the public, was important for the modern law of public utilities which had just begun to develop.

In questions of social policy Shaw was a conservative; and when interests of business conflicted with those of the workers, he resurrected the fellow servant rule [*Farwell v. Boston and Worcester R. R. Co.*, 45 Mass. 49 (1842)], holding that when an employee was injured by the negligence of another employee the company which they both served was not liable, a doctrine which has proved a heavy burden for American workmen. Nevertheless, Shaw understood the forces in the nascent struggle between capital and labor; in *Commonwealth v. Hunt* [45 Mass. 111 (1842)] he handed down the first liberal decision in the United States on labor disputes, which stated that a combination of workers is not illegal if its activities are carried on by fair means, even though they tend to impoverish others, and that peaceable coercion may be used to effect a lawful object.

SHCHAPOV, AFANASY PROKOPIEVICH (1830-76), Russian historian. Shchapov's mother was of Buryat origin and his father a deacon in a Siberian village church. Even at his graduation from the Kazan theological academy he displayed an original approach to Russian history, but his propeasant and antibureaucratic sentiments limited his academic career to three years of teaching at Kazan. From 1861 to 1864 he lived in St. Petersburg in close contact with radical litterateurs. Later he was banished to Irkutsk, where he developed an active interest in Siberian regional problems.

Shchapov's work as a historian may be divided into three periods. He began by studying the Russian church schism, which he was the first to consider a social and political phenomenon rather than a quarrel over matters of ritual. He believed that in its early stages it was a form of protest of the lower clergy against the autoc-

racy of the patriarch Nikon and in its development since Peter the Great a manifestation of mass resistance to Europeanization fostered by the state. This interpretation was adopted by many historians and even influenced the tactics of certain revolutionary groups.

In the second period Shchapov concentrated on general historical trends. In opposing the traditional viewpoint of political and juristic historiography he insisted that attention should be centered upon the people and the social formations which arise independently of the state. He formulated a colonization-territory-federation theory of Russian history which has been confirmed by later investigations, particularly of nineteenth century Siberia. According to this theory the people spread thinly over the vast virgin spaces of the Russian plain early formed small self-governing units, which gradually came to embrace whole districts and later large topographic regions, such as river basins. There followed an era of dissension and struggle among the independent territories, succeeded after the "period of troubles" by an informal federation, which constituted the real basis of the state.

In his third period, which Shchapov passed in Siberia under conditions unfavorable to creative work, he disavowed this theory. Influenced by Buckle and the current fashion for natural science, he now maintained that the historical process was essentially an interaction between nature and human nature. The environment in which the Russians lived and the fact that, except for Byzantium, they were out of touch with advanced civilizations, accounted for the low level of intellectual development; stimulation was afforded only by cultural borrowing from the West after the beginning of the eighteenth century.

In the course of a short lifetime Shchapov evolved thus from a Slavophile into a populist and later into a westernist. The direct and indirect influence of his ideas was considerable, but interest in his work was dormant until the revolution. At present he is hailed by one school as a forerunner of the Eurasian approach and by another as a typically peasant historian predisposed to naturalistic materialism.

K. KOCHAROVSKY

Works: *Sochinemya*, 3 vols. (St. Petersburg 1906-08), with a biographical essay by G. A. Luchinsky.

SHCHERBATOV, PRINCE MIKHAIL MIKHAYLOVICH (1733-90), Russian historian and essayist. Shcherbatov inherited large landed

estates in central Russia. In 1767 he was elected by the nobility of his county to the commission for the drafting of a new code; one of its most active members, he defended zealously the privileges enjoyed by his class. Later he entered government service, which brought him into contact with current economic problems and with the functioning of the central and local administration. Although he had received no formal education, he was one of the most widely read persons in Russia and a prolific writer and translator; his large library was particularly rich in contemporary French tracts on philosophy and politics.

Shcherbatov's most ambitious work is the history of Russia to 1610, a subject in which he became interested through his acquaintance with the historian and archivist G. F. Muller. Naively rationalist in approach, it reduces the historical process to leadership by the chosen few who are actuated by ordinary human motives, among which self-interest predominates. It is uncritical, hastily put together and defective particularly as regards historical ethnography and geography; nevertheless, it marks a distinct advance in Russian historiography in that it represents the first extensive use of archive documents in addition to chronicles. The more interesting of Shcherbatov's other works, which include the first statistical description of Russia after the manner of Achenwall, are a semi-historical essay on the decline of morals, which he related to the urbanization evoked by the reforms of Peter the Great, and a utopian description of "the land of Ophir." In the latter he commented sharply on contemporary Russia and sketched the picture of a model country, for which he obviously drew upon western writers, particularly Montesquieu. Shcherbatov's ideal state encompasses many incompatible features. It is a secular monarchy in which the church functions as a moral police and the state intervenes when necessary in religious life. The authority of the monarch is absolute, but he rules in accordance with the law and shares with the aristocracy responsibility for important decisions. A number of advisory bodies represent the other classes except the peasants, all of whom as serfs are under complete control of the nobility, the only class permitted to own land and serfs. The utopia is characteristic of Shcherbatov's outlook, which combined a certain measure of political and religious liberalism with an unswerving devotion to the interests of the feudal nobility and a nostalgic longing for

the supposedly patriarchal simplicity of pre-Petrine Russia.

SHELLEY, PERCY BYSSHE (1792-1822), English poet. Shelley has written a few lines safely enshrined above dispute in the anthologies. The bulk of his writing and the example of his life, however, are even today subject to varied cross currents of contention. For Shelley was the perfect romantic revolutionist. Descended from a long line of Sussex country gentlemen, educated at Eton and at Oxford, he lived a life almost exactly contrary to that marked out for him by his blood and breeding. He became a philosophical anarchist, a pacifist, a feminist, a radical agitator, an atheist, a proponent of free love, a friend of oppressed nationalities and of exploited wage slaves, a vegetarian and a poet—in short, a defier of most nineteenth century English conventions. Yet his philistine baiting was amazingly free from self-consciousness and pose, and his most shocking ideas, incest, for example, were uniformly expressed in the most ethically satisfying abstractions, frequently in very lovely verse. Shelley's political and social writings are less important for the social scientist than the history of his reputation. *Queen Mab* (1813) is a not very poetical paraphrase of the *Enquiry concerning Political Justice* of the poet's father-in-law, William Godwin. The *Philosophical View of Reform*, an unfinished pamphlet not published until 1920, is interesting chiefly for the glimpses it gives of the Sussex squire Shelley might have been. For on the whole this is a moderate pamphlet, advocating universal suffrage only after universal education has had a chance to work, insisting on the value of English political traditions, espousing revolution only if there is an un-English re-

fusal to admit reform. Other pamphlets are the products of his brief career as an agitator: *The Necessity of Atheism* (1811), *An Address to the Irish People* (1812), *A Letter to Lord Ellenborough* (1812). Much of Shelley's poetry has a political bearing: songs of freedom, like *Hellas* (1822); outbursts against cruelty and oppression, like the *Masque of Anarchy* (written in 1819, first published in 1832); above all, poems like *Prometheus Unbound* (1820) and the *Revolt of Islam* (1817) with their mystic faith in an effortless overthrow of tyranny, their passionate devotion to passive resistance.

Shelley's name has continued to have a political and moral meaning for three main groups. To authoritarian conservatives like the late Irving Babbitt he is one of the most useful examples of the antisocial consequences of romantic individualism; and even to Matthew Arnold, Shelley was an unsuccessful rebel against inevitable decencies. To most respectable middle class Anglo-Saxons, Shelley the idealist poet, Shelley of the noble aspirations, has managed to live down the Shelley whose life was a scandal. His revolutionary activities have been conveniently forgotten, his rebellion smothered in the vicarious enjoyment of his poetry. Finally, to a third group, Shelley is still a trumpeter leading to battle, an example to those who wish to overthrow this bourgeois civilization, a prophet and a seer who, had he survived, would have become a leader of the proletarian revolt. Marx himself said that though Byron in maturity would have forsaken the cause of revolution, Shelley would have gone on from radicalism to socialism.

W., *Shelley and the Unromantics* (London 1924).

SHEPSTONE, SIR THEOPHILUS (1817-93), British South African statesman. Shepstone, the son of a Wesleyan missionary, was born in England and at the age of three was taken by his parents to South Africa. His fluency in native dialects led to his appointment as interpreter to the colonial forces during the

frontier wars. On the annexation of Natal in 1845 he was made diplomatic agent to the native tribes and later secretary for native affairs. His great work was done during the three decades 1845-75. He may fairly be called the founder of systematic native policy in British Africa. The cardinal points of his program were the provision of "locations" for native occupation, the full recognition of native law, the proclamation of the head of the government as "Supreme Chief of the Native Population" and the utilization of the tribal system as a cheap and effective form of administration. Although he was the founder of the system of "indirect rule" in southern Africa, it is more than doubtful whether Shepstone had any real faith in it. As has often happened in the history of British colonial policy, he was driven by the exigencies of circumstances to adopt an empirical line of action, which others subsequently rationalized into a universal principle. The greater part of his policy has been accepted by the Union of South Africa under the terms of the Native Administration Act of 1927, and his views have had an important part in molding the native policy of Southern Rhodesia.

Knighthood in 1876, Shepstone played the leading role in the drama which culminated in the annexation of the Transvaal to the British Empire in April, 1877. His conduct in connection with this episode has, however, been the subject of acute controversy. As the first administrator of the Transvaal under the new regime his role was not entirely successful, and after 1879 he retired from public life.

SHERIFF. The sheriff is the most important officer of a county, although in England his status is below that of the lord lieutenant, who is the military representative of the king. The office of sheriff is very ancient; Maitland has aptly remarked that the history of justice and police in England might well be written around the theme of the sheriff's "decline and fall."

The ultimate origin of the office is to be found in those king's reeves who watched over royal interests in the towns of the ninth century. By the end of that century the king's reeve acquired judicial as well as financial functions, and early

in the tenth century he became a shire instead of a town official. By the end of the Anglo-Saxon period he had supplanted the ealdorman as the effective head of the shire, and soon after the Norman Conquest his powers touched their zenith. The financial, judicial and administrative importance of the office, added to the personal influence of the great landowners who normally filled it, constituted a serious menace to the crown as well as a source of oppression to the subject. A long struggle ensued in which various devices were employed to curb the overmighty sheriff. In order to reduce his military power royal castles were removed from his control; attempts were made to transfer some of his judicial powers to county justices; elected coroners were expected to act as a check upon the sheriff; and men drawn from the official class were gradually substituted for the baronial sheriff, who was typical of the Norman age. Eyres and occasional inquests gave opportunities for investigation of complaints, and the enforced personal accounting every year at the Exchequer established the vital principle that the sheriff was a servant of the crown and not an independent magnate. In Magna Carta the barons secured further reforms, notably that sheriffs should no longer hold, but only "keep" pleas of the crown. The sale of the office which was common under the Norman kings gradually ceased and with it one of the greatest incentives to extortion. In the middle of the thirteenth century there were attempts to make the office annual and to exclude reelection, and with the exception of a few counties where the shrievalty had become hereditary these were successful. During the fourteenth century several attempts were made to put the office on an elective basis, but the scheme aroused little enthusiasm and it soon became settled that sheriffs should be nominated in the Exchequer.

Among the most ancient duties of the sheriff is that of conserving the peace and suppressing disorder with the help of the *posse comitatus*. Until the development of the office of lord lieutenant in the sixteenth century he was also the head of the military forces of the shire. His duty of receiving writs, summoning juries and executing judgments is as old as the common law itself and remains the most important part of his work. The sheriff still collects certain types of revenue related to legal matters and formerly handled considerable sums arising out of the crown's feudal dues, but the newer types of direct taxation have been managed from their

inception by separate commissioners. The sheriff was presiding officer (although hardly a judge) of the old county court and twice a year in every hundred within the county held special sessions called tourns. His present duties in connection with parliamentary elections are a relic of his position in the old county court, where elections formerly took place. All these duties are carried out in practise by undersheriffs and bailiffs, against whom frequent complaints were made during the Middle Ages. The sheriff, however, was and still is personally responsible for their misdeeds in accordance with a statute of 1285 which established in this connection the rule of *respondet superior*. It has been a constant requirement for the office that the candidate have sufficient lands to answer both to the king and to the people.

It is significant that the decline of the local jurisdictions during the fourteenth century was met in England by the development of the new justices of the peace instead of by the restoration of the judicial powers of the sheriff. His real authority therefore continued to decline although his social importance was maintained. At present sheriffs are governed by the Sheriffs Act, 1887. They are nominated in an assembly of high officers of state which represents the old court of Exchequer and are appointed by the king, who pricks their names on a roll. They are entitled to a variety of fees, which in practise go to the undersheriff, who is usually a solicitor and does the legal work of the office, but the social obligations traditionally attached to the shrievalty are so costly that only the wealthier county landowners can afford to accept it. The act of 1887 requires each sheriff to maintain a deputy sheriff resident in London to accept the writs and other orders of the central courts. The high sheriff confines himself to the ceremonial duties of receiving the judges of assize and similar functions.

The city of London presents a special case. Henry I granted the citizens the right of electing two sheriffs, who served both for the city and for Middlesex, but they later became subordinated to the lord mayor. Since 1385 no one can become lord mayor without having first served as sheriff. The duties are purely ceremonial, the legal work being done by the "secondary." For some centuries the sheriffs of London held a court which was especially concerned with the affairs of foreign merchants.

In Scotland the sheriff is an officer of very great importance, for the historical factors which

frustrated the development of the office in England were absent north of the border. The present powers of the Scottish shirevalty deserve careful attention, for in Scotland alone were the full potentialities of the office realized. First introduced in the reigns of Alexander I and David I in the twelfth century and extended by Edward I at the end of the thirteenth century, the sheriff only slowly became associated with the county. The office became hereditary (until 1748) and the holders successfully competed for jurisdiction with regalities (private franchises) and the episcopal commissary courts. The sheriff is not merely the nominal conservator of the peace but also the superintendent of the county police force. His local governmental powers are varied and extensive, while his court has wide civil and criminal jurisdiction equivalent to that of the English county court, quarter sessions and petty sessions and recorder. There are now fifteen sheriffs for thirty counties, each sheriff being assisted by a sheriff substitute, who is likewise a lawyer of standing. The numerous administrative inquiries into matters of local government which in England are committed to officials sent down from London are carried out in Scotland by the sheriff. Both sheriff and sheriff substitute are appointed and paid by the crown and hold office for life. The sheriff substitute usually sits as a summary court, the sheriff sitting with a jury; an appeal may lie from the substitute to the sheriff and thence to the court of session or court of judicatory.

The office of sheriff was introduced into America as part of the county organization. In New England this was a slow development, for local government centered at first in the towns; farther south, however, where larger units became the rule, the sheriff rapidly became the leader of his county. Appointment was generally by the governor, but as early as 1705 it had become elective in Pennsylvania. The practise spread slowly throughout the country and all sheriffs are now elected except those in Rhode Island, where they are appointed by the legislature. The term is often for two years, sometimes more, and in some states there are provisions against immediate although not subsequent reelection. The duties remain those which have been traditionally connected with the office for the past seven centuries or more. The sheriff is the conservator of the peace and may call out the *posse comitatus* to suppress disorder. He executes a variety of precepts from the courts, especially for the summoning of juries and the

execution of judgments by distress and sale. There are further miscellaneous duties, such as supervising elections, keeping jails, executing criminals and (in the south) collecting taxes. Payment is commonly by fees, to which a salary is sometimes added, and in a few instances the emoluments reach a very high figure; sometimes there is a definite salary. In rural communities and under pioneer conditions it is inevitable that the sheriff should become powerful and election to the office be keenly contested; criminal and liquor interests in particular strive to secure the election of a complaisant candidate.

So ancient an office is ill adapted in its present form to contemporary conditions in the United States. The elective principle is out of place in an office which carries no political functions; nor is there any rational coordination between the sheriff, who is the traditional head of the county, and the boards and commissions which actually administer many of the affairs of the modern county; moreover, since his duty is the enforcement of state law, it has been urged that he should be a state and not a local official. His ancient powers of quelling disorder by means of the primitive *posse comitatus* have aroused much criticism. Since he has no police force under his command, he takes no part in the maintenance of order except in grave emergencies which will inevitably require more qualities of coolness and firmness than can reasonably be expected of a sheriff and his undisciplined posse, whose conduct in such circumstances is apt to be somewhat rash. Particularly in areas where labor relations are strained the sheriff has heavy responsibilities which it has been argued should be transferred to some form of state police. The tax gathering duties (in some states) and the functions of jailer might likewise be transferred, leaving the ancient duties of assisting the procedure of the courts and executing their judgments in the hands of a state appointed sheriff whose position should be essentially that of a minister of the courts.

SHEVCHENKO, TARAS (1814-61), Ukrainian poet. Shevchenko was born in the province of Kiev of serf parentage. Through his exceptional talent for drawing he became known to Brullov of the St Petersburg Art Academy, who together with the Russian poet Zhukovsky raised the money necessary to buy Shevchenko's freedom in 1838. Shevchenko's first volume of poems, *Kobzar* (The Bard, St. Petersburg 1840), brought him immediate fame. In 1847 he was arrested on the charge of belonging to a secret political society, the Brotherhood of Saints Cyril and Methodius, sentenced to penal military servitude in central Asia and forbidden to write or draw. Following Alexander II's amnesty in 1857 he returned to St. Petersburg and became professor of engraving in the Academy of Art.

Shevchenko's poetical works were of the greatest importance for the Ukrainian national movement both in Russia and in Austria. He was not only the bard of the heroic past, recalling the half forgotten national traditions of the Ukrainian Cossacks, but the inspired prophet of a new social and political order. Influenced by French utopian socialism and the Polish revolutionary movement and himself an admirer of Herzen, Shevchenko hated political oppression and slavery and in his poems inveighed against them passionately. The Brotherhood of Saints Cyril and Methodius had as its immediate aim the propaganda for the abolition of the serfdom, and Shevchenko's poetical work brought this final moral blow to this institution. Whereas at the beginning of his poetical career

he saw the chief enemy of the Ukrainian liberties in the Polish landowners in the Ukraine with their social as well as national and religious oppression of the population, later on he directed his invectives against the power that swallowed up both Poland and the Ukraine, Russian czarism. It is in the absolutism of the Russian czars, chiefly in the persons of Peter I, Catherine II and Nicholas I, that Shevchenko now found the principal cause of all the sufferings of his native country. His *Kobzar* became during the poet's lifetime a sort of bible in verse for all Ukrainians. His memory is the object of a special cult among Ukrainians all over the world and his grave has become a national Ukrainian shrine.

D. DOROSHENKO

Works: Poeme vidannya tvoriv (Complete edition of works), 5 vols (Leipzig 1918-19), of the complete edition, in 6 vols., undertaken by the Ukrainian Academy of Sciences, vols 1-III (Kiev 1927-31) have appeared so far, *Six Lyrics from the Rutheman*, tr. by E. L. Voynich (London 1911).

SHINASI, IBRAHIM (c. 1826-71), Turkish publicist. After receiving a primary education Shinasi became a clerk in the Department of Artillery at the age of sixteen. In his spare time he learned Arabic, Persian and French and he was one of the first students to be sent to France by the Turkish government for further study. He studied public finance at the request of the government but devoted most of his attention to philology and literature. In Paris he came into contact with the leading French intellectuals, including Lamartine, and was profoundly impressed by western cultural achievements. After about five years abroad he returned to Constantinople and was appointed a member of the Ministry of Public Instruction and of the new Imperial Academy of Science and Literature. He resigned from his position in 1859 and from that time devoted himself to journalism and linguistic reform.

Shinasi was the first of the group of reformers who created the modern era in Turkish language, literature and thought. A thoroughgoing idealist, who despised and kept aloof from politics, he abjured all worldly pleasures in order to concentrate his energies upon his chosen

tasks. He believed that the first requisite for a modernized Turkey was a simple and common means of expression, and by his efforts literary Turkish was transformed from an artificial medium of the educated class into a popular language suited to the new national literature. Through his translations and journals moreover he introduced western culture to the Turkish reading public. In 1860 Shinasi established the first unofficial Turkish newspaper, *Terdjumân-i ahvâl* (The interpreter of events). Six months later he founded the biweekly *Tasvîr-i efkâr* (Thought), the purpose of which was to assimilate Turkish intellectual life to that of the west; it was a journal of popular instruction containing translations of western writers, scientific articles and studies of western as compared with Turkish institutions. In both periodicals the new literary language was employed. Shinasi also published the first Turkish translations of French poems, *Extraits de poésies et de prose traduits en vers du français en turc* (Constantinople 1859, 2nd ed. Ramazân 1870), which brought modern influences to bear upon native poetry. Shinasi was himself a poet and the author of the first Turkish comedy. For many years he worked on an exhaustive dictionary, still unpublished, of the Turkish language.

SHINTO means the "way of the gods" or of the spirits and covers the native religions of the Japanese, including the national cult, regional worship and popular beliefs. The Japanese people, in spite of its composite formation, was early brought under the rule of a predominant tribe who worshiped the sun goddess as its ancestral and tutelary deity; and the local or clan deities were gradually brought under the hegemony of this goddess. The whole religion had never been organized, however, before its contact with Confucianism and Buddhism, the name itself being a Sino-Japanese term created to distinguish Shinto from the alien religions which became popular in Japan in the fifth and sixth centuries of the Christian era. The reduction into writing of the Shinto legends dates from the eighth century and the compilation of

its rituals from the tenth, although some materials contained in them indicate their earlier origin.

The composite nature of Shinto makes it difficult to characterize. As a religion it is polytheistic with strongly animistic traits, since its belief amounts to worshipping any being or thing believed to be endowed with divine or spiritual power. Its pantheon is indefinite and unlimited; the personification of the deities is vague in most cases and distinction is seldom made between a divine being and a thing possessed by a spirit. Moreover the relative supremacy of one deity or another has always been influenced by political and social vicissitudes. The supremacy of the sun goddess (Amaterasu) was enhanced by the growth of the power of the ruling family, but the predominance of many a clan or local deity often obliterated the unifying tendency of worship. Even today a local sanctuary of a new deity may suddenly grow to eminence or a deity may change its character. But the general tendency has been toward the supremacy of the sun goddess, which is now strengthened by the achievement of national unity under the imperial rule and by the government's policy of basing the sovereignty of the emperor upon her worship.

From this aspect Shinto is a state cult, identified with the court observances of the ruling family as well as with the nationalization of the local worship. The modern official interpretation is that Shinto is not a religion but a national cult which consists of reverencing imperial ancestors, national heroes and community shrines. Under this interpretation the Shinto sanctuaries are regarded as national institutions and their priests as state functionaries, while the popular beliefs and the private worship of Shinto deities are considered a matter of individual choice. To carry out this convention the government authorities try to distinguish between reverence and worship, between a state cult and religious practices. Similarly a painstaking effort is made to show that the enforcement of this national cult is compatible with the freedom of conscience guaranteed in the constitution. Nevertheless, the attempt to establish Shinto as the state cult is practically equivalent to instituting a religion of patriotism which centers its belief in the divine origin of the sovereign and centers its practise in reverencing the local shrine as a community center.

Shinto ideas find another expression in ecclesiastical organizations, which are designated as

“sectarian Shinto” in contradistinction to the state cult. These bodies represent various shadings of popular beliefs ranging from mere occult practises to almost monotheistic beliefs. Some of the latter are manifestations of the popular theism which has arisen from time to time, chiefly in reaction to the overintricate teachings of Buddhism; as such they may be called expressions of the native spirit and classed as Shinto sects, although they are not necessarily connected with the official cult. Some of them are remarkable for their fervent religious attitude, shown in a developing missionary spirit and in a claim that their beliefs have the character of a universal rather than a national religion. The foremost among them is the *Tenri-kyo*, or religion of heavenly reason, which bears some similarity to Christian Science.

The composite nature of Shinto and the meaning of its influence upon the national life of Japan cannot well be understood apart from its historical background. When Buddhism entered Japan in the sixth century, Japanese civilization was still at a low point. The overwhelming influence of Buddhism as a religion and a civilizing force pervaded almost all aspects of national life. In the course of two centuries the Shinto worship was enfolded within Buddhism, the theory being that the Shinto deities were only lateral manifestations of the Buddhist noumena; and in practise nearly all Shinto sanctuaries were presided over by Buddhist priests. This combination was called the *Ryōbu-Shintō*, or two-sided Shinto, and continued to rule the religious life of the nation until the revolution of 1868, when under the influence of the revival of nationalist and imperialist sentiment the malcontent Shintoists seized the opportunity to “purify” Shinto. Even under the sway of Buddhism the native spirit had always asserted itself, chiefly in the court ceremonies and in the worship of the local shrines. Accordingly Shinto retained its ceremonial ritual, although it yielded a large part of its more religious vitality to Buddhism. In general during more than ten centuries of syncretistic Shinto the people applied to the Shinto deities for aid in this world, both in national and in individual affairs, while depending upon Buddhism in regard to the life beyond. The combination was a kind of division of spheres of influence, and the people were, and still are to some extent, followers of the two religions at the same time. Thus the present official interpretation that Shinto is not a religion is partly justified by the historical facts, the

religion of patriotism being largely a secular affair separated from purely religious matters.

Attempts were made from time to time, however, to free Shinto from its bondage, reinforcements being taken from Confucianism, Taoism and even Christianity, although in disguise. But the chief basis of such efforts is the preservation of the Shinto conception of the divine origin of the sovereign and the divine descent of the whole Japanese people. At every national crisis, such as the Mongol invasion in the thirteenth century, the dynastic division in the fourteenth, the fear of foreign invasions in the nineteenth, the rise of patriotic ardor has been accompanied by a revival of Shinto ideas, pointing to the restoration of the ideal past of the “age of the gods” and implying the exclusion of foreign culture and beliefs. This claim for the pure, or ancient, Shinto was the chief force in carrying out its “purification” after 1868 and consequently in establishing Shinto as the national cult. The present situation has resulted from making Shinto independent of Buddhism, although the former is not entirely antagonistic to the latter.

It remains questionable, however, whether Christians or Buddhists, who deny divinity to any other deity beside their own, can accept the distinction between “reverence” and “worship” and admit the official interpretation of Shinto. There has been strain on several occasions, but the situation is not so acute as outsiders might imagine. Nevertheless, the problem remains and its solution is still to be awaited.

SHIPBUILDING. Modern shipbuilding is a finishing and assembling industry in that much of the material used comes to it in the shape of semimanufactured articles. It does not purchase the steel, copper and wood out of which the vessel is constructed; on the other hand, it does consume many products of allied and associated

industries, such as windlasses, winches, steering gears, pumps, electrical machinery and installations, furniture and fittings and the like. The most important class of material purchased, however, consists of iron and steel plates and shapes; and because shipbuilding is absolutely dependent upon such supplies, it is sometimes regarded as a branch of the heavy iron and steel industry. A second important characteristic of shipbuilding is the specialized nature of the product. In the fabrication of a modern vessel much of the equipment required is useless for any other industrial purpose. There is therefore little opportunity for the average shipyard to stabilize its activity by means of diversification of product.

Since all countries possessing navigable rivers or accessible ports contribute to the demand for ships, it is natural that shipbuilding should be widely scattered geographically. Thus during 1932, which was a year of severe depression in the industry, 307 vessels aggregating 726,591 tons gross were launched throughout the world, and nineteen countries were responsible for the bulk of construction. In prosperous years even more countries engaged in shipbuilding. Nevertheless, the greater part of the industry is concentrated in a few countries. In 1932, for example, out of the total of 726,591 gross tonnage launched, five countries were responsible for more than 75 percent of world construction, as follows: Great Britain and Ireland, 187,794 tons gross (25.9 percent); United States, 143,559 tons gross (19.7 percent); France, 89,310 tons gross (12.3 percent); Germany, 80,799 tons gross (11.1 percent); Japan, 54,422 tons gross (7.5 percent). Indeed during the ten years 1923-32, approximately half of the total gross tonnage launched was constructed in Great Britain and Ireland alone.

When measured by the usual criteria, the shipbuilding industry is smaller than might be expected, even in the countries which build most of the ships. In Great Britain and Ireland the number of insured workers employed in the industry in 1930 was only 204,720, while in the United States in 1929 only 55,089 wage earners were so engaged. In each country the industry is carried on in several hundred establishments, so that if the few large companies are omitted, the size of the average establishment in terms of workers employed, capital invested and aggregate value of output is comparatively small.

As long as ships were constructed of wood, the geographical distribution of the industry de-

pendent upon the availability of adequate supplies of appropriate kinds of timber and of naval stores. From the end of the Middle Ages until the eighteenth century these necessary raw materials were available in the Baltic region and along the northwestern coasts of Europe generally, with the result that England, Holland and Scandinavia were able to attain supremacy in shipbuilding. But the growth of population and the developing economic activity of the older countries tended to encroach upon the supplies of standing timber, with the result that toward the end of the eighteenth century North America, and particularly the English colonies, rose to prominence in shipbuilding. On the North Atlantic seaboard there was at hand a complete assortment of all the necessary materials: white oak for frames, yellow pine for planking, ash and locust for fastenings and tall white pine for masts and spars. Pitch, resin and other naval stores were likewise plentiful, copper therefore being almost the only material which had to be imported. Moreover, since the average vessel was still comparatively small, the investment in a shipyard was not unduly great, so that the industry grew apace. By the time of the American Revolution some 400 vessels were being launched annually with an aggregate tonnage in excess of 20,000.

When iron and, somewhat later, steel came to replace wood as the basic material for shipbuilding, those older countries which had already developed important iron and steel industries were once more at an advantage. But the adoption of the new materials was slow. An iron boat had been launched as early as 1777, but iron vessels did not become common until the third quarter of the nineteenth century. Similarly, although Robert Fulton had operated a steamboat in 1807, it was not until 1893 that the gross tonnage of steam vessels throughout the world exceeded that of sailing ships. Change was rapid, however, during the latter years of the nineteenth century and the first decade of the twentieth; by 1914 sailing ships had become decidedly rare, while wooden vessels had disappeared almost entirely.

These advances in the structure and propulsion of ships exercised a profound effect upon the shipbuilding industry. As regards geographical distribution Great Britain soon attained supremacy as a result of the great development and high technical skill of its steel and machine industries; and by 1893 it was producing 81.6 percent of the tonnage launched throughout the world. As the heavy industries emerged in

France and Germany, important shipbuilding plants were set up in each of these countries, particularly in the latter. The annual output of tonnage rose steadily, but the continuing importance of Great Britain is shown by the fact that it was still responsible for 60 per cent of the tonnage launched during the decade before 1914.

Within the industry also change was evident. In the first place, the use of iron and steel fostered that relationship with the heavy industries which is so characteristic of modern shipbuilding. Secondly, the increase in the size of ships made it necessary to provide larger and more elaborate shipbuilding facilities at the cost of greater capital investment. Thirdly, the improvements in marine engineering and the growing variety of auxiliary equipment required on a modern vessel, such as refrigeration, pumping and the like, tended to make the shipbuilding industry even more complex and to necessitate the use of more elaborate plants and the employment of more highly skilled personnel. The increasing importance of naval construction during the two decades preceding 1914 succeeded in intensifying the processes of change. From 1907 to 1913 warship tonnage accounted for over 13 per cent of the activity of British shipyards; an even higher grade of equipment and skilled labor was required for warships than for the construction of merchant vessels.

With the outbreak of the World War in 1914 shipbuilding acquired a new importance. The destruction of vessels at a time when increasing quantities of tonnage were needed for war purposes caused a demand for shipping which overtaxed the capacity of existing yards. New yards were developed rapidly, and in order to lighten the burden upon the steel industry and to shorten the period of ship fabrication experiments were made with wooden and concrete vessels. These, however, were less successful than those which aimed at the standardization of the various parts which enter into the building of a ship as well as their production in large quantities at places far away from the shipyard. Shipbuilding became an assembling process to a degree which previously would not have been considered possible.

This development of the industry occurred in all important shipbuilding countries except Germany, but it was particularly marked in the United States after its entry into the war. Under the auspices of the newly created United States Shipping Board and its subsidiary, the Emer-

gency Fleet Corporation, the shipbuilding capacity of the country increased phenomenally. In April, 1917, there were in the United States 37 steel shipyards with 162 ways and 24 wood shipyards with 72 ways, making a total of 234 ways. By November, 1918, there were 223 yards with a total of 1099 ways, more than three times the number of shipways in the rest of the world. Of these 40 per cent were for the building of steel vessels. The effect of this expansion of the industry in the United States and elsewhere is indicated in Table I.

As a result in the post-war period there has been a very considerable surplus of building capacity over actual requirements for vessels. While this situation has been aggravated by the depression which commenced in 1929, the decline in the shipbuilding industry had set in long before the general economic crisis, as is evidenced in Table II.

Because of the high mobility of ships and the fact that the requirements of all nations as to types of vessels are substantially similar, one of the most important results of the development of excess shipbuilding capacity has been the accentuation of international competition. On the whole Great Britain has maintained its relative position in the world, selling to foreign owners 19.8 per cent of the tonnage launched during 1927-30 as compared with 21.9 per cent during the years 1910-13. Germany, however, has invaded the British market on at least one occasion, while Sweden has developed substantial exports of certain types of marine engines. It is interesting to note that international rivalries in shipbuilding have not led to tariff increases except in France, Spain and Jugoslavia, although marine engines have been subjected to additional duties in several countries.

An important aspect of the international

problem of shipbuilding has been the existence of varying construction costs in the different countries. Any detailed comparison of costs is a difficult task, since the actual cost of building a ship in any particular shipyard depends among other things upon the price of material at the plant, the wage scales of various classes of workers engaged in the undertaking, the efficiency of labor, the climatic conditions, the degree to which hand labor is replaced by machinery and the dependence of the yard upon outside sources for machinery, auxiliaries and equipment. In the leading countries there is a tendency toward substantial equality in regard to most of these factors, although there is considerable divergence among individual shipyards. There is, however, a wider variation in the rates of wages paid to shipyard workers than is warranted by differences in efficiency; for example, labor costs tend to be particularly high in the United States and comparatively low in continental Europe. England occupies an intermediate position. Since labor is highly skilled and relatively well paid, this difference may have an appreciable effect upon the cost of a vessel. Except in Italy and perhaps also in Germany the post-war depression has also intensified competition among shipyards in each of the important producing countries.

Shipbuilders have made various attempts to limit competition among themselves. Since the development and operation of trade associations and cartels have not met with much success, the industry has given considerable attention to the elimination of superfluous shipyards. In the United Kingdom in 1930 there was set up the National Shipbuilders' Security, Ltd., to purchase and dismantle obsolete and redundant yards, dispose of their equipment and resell the sites with restrictions against their use for ship-

building. Funds were provided by the shipbuilding companies subscribing to the agreement, and during its first three years the enterprise was able to purchase yards involving 71 ways and with an annual capacity of 500,000 tons gross. Other recent developments have been the amalgamation of shipbuilding companies and the introduction of economies in management, such as the widespread application of cost accounting and the increasing tendency to replace skilled labor by machinery. While the processes of rationalization have not yet progressed very far, as is evidenced by the fact that in the United Kingdom each person employed in the industry produced 9.8 tons gross during 1930 as compared with 9.2 tons in 1923, these are steadily being extended and give promise of further developments.

By virtue of its special characteristics the shipbuilding industry suffers from very violent cyclical fluctuations. In the first place, the unit product in the shipbuilding industry is both large and expensive. Before the war the minimum period of time required for the construction of a cargo steamer of 7500 tons gross, without trimmings of any kind, was seven months. This period has not been greatly reduced and, in the case of the larger and more elaborate vessels of the present day, considerably more time is necessary. The average period of construction is approximately twelve months. It is clear therefore that in shipbuilding there is no continuity of supply, such as is to be found, for example, in the cotton goods industry. A short delay in the placing of a ship on the stocks means unemployment on a substantial scale of both capital equipment and labor. Secondly, the product as well as the building plant is highly specialized, so that a temporary loss of orders in one direction cannot be neutralized, as in most other

industries, by a successful search for orders in other directions. Thirdly, the industry is at the mercy of marked fluctuations in the demand for its product. Since the life of a ship is usually twenty years, it follows that if ocean traffic over a given period is constant and sufficient to maintain 1000 ships in full employment, an annual output of 50 ships will be required to keep up the efficiency of the fleet. If traffic then grows by 5 percent, the immediate demand for vessels will increase to 100 (50 for replacement and 50 to meet increased needs), and a further increase of 5 percent in traffic during the following year would raise the demand to 150 vessels. If the traffic then ceased to advance but remained constant at the higher level, the demand for new additional ships would disappear and the replacement demand would fall to 55 ships a year. Thus a violent decline in the activity of the shipbuilding industry might occur even when the volume of water borne traffic showed no diminution.

These fluctuations affect the volume of activity and the price of vessels, both of which naturally are reflected in declining profits. While the situation depicted in Table III is abnormal,

sudden diminution in the replacement demand for vessels causes a substantial drop in the volume of production. It must be noted moreover that during the years following 1922 the position of the industry was rendered more difficult by the limitation of naval armaments. One factor has emerged, however, on the side of stability. With the increasing size of shipping combines there has been a tendency on their part to acquire control of shipyards or to establish a community of interest with them. Through these methods the building programs of the combines can be planned efficiently and economically; but this development has affected only a few of the shipbuilding plants.

It is clear that the financial structure of the industry and the problems incidental to it are governed primarily by the heavy investment required and the wide variation in profits. While some enterprises still maintain the partnership form, most of them are incorporated. In any case in all but the largest enterprises little capital can safely be raised by bonds or debentures. Indeed, even in the case of large enterprises which also produce a variety of other goods, it is dangerous to rely upon long or short term borrowing, as has been indicated by recent re-constructions and liquidations among some of the largest shipbuilding firms. Moreover in addition to heavy fixed investments large sums of working capital are required to cover expenditures during the period that must elapse between the laying down of the keel and the receipt of payments from the prospective owner.

In order to aid the industry the governments of various countries have granted financial assistance to shipbuilders and to prospective ship-owners with a view to increasing the volume of shipbuilding activity and, incidentally, augmenting the earnings of the shipyards. The British government, under the Trade Facilities acts of 1921-26, guaranteed the interest on loans floated for the purpose of undertaking work which would provide employment for home labor. Out of total guaranties amounting to £74,000,000, £22,000,000 was allocated to the construction of some 110 ships for the account of 26 British and 9 foreign shipping companies. Similarly the United States government, under the Jones-White Act of 1928, created a construction loan fund to make loans at low rates of interest for the purpose of financing shipbuilding. Up to the end of 1931 loans aggregating \$151,000,000 had been authorized for the construction of 60 vessels and the reconditioning of 23 others. All

Source: *Lloyd's Register of Shipping, 1933-34*, 2 vols (London 1933) vol II, p. 1110 for tonnage, *Fairplay*, vol cxxvi (1933) 79 for price of new cargo steamer, Chamber of Shipping of the United Kingdom, *Annual Report, 1932-33* (London 1933) p. 135 for index of freight rates.

since the decline in the post-war period is greater than that in the immediate pre-war years, such a decline usually follows any war involving maritime powers. The excess of capacity tends to depress the price sharply; at the same time the

borrowers were required to be American citizens or corporations; and although a rate of $5\frac{1}{4}$ percent was fixed in contracts for vessels operating entirely in the domestic trade, various rates, some as low as $\frac{1}{4}$ or $\frac{3}{8}$ of 1 percent, although generally above $2\frac{1}{2}$ percent, were set when the vessels were to be used in foreign trade.

To the extent to which such plans make possible the payment of larger sums to the shipbuilder as each stage of construction is completed, there is a tendency to reduce the working capital needed by the builder. Other methods of financing the sale of ships have also been developed to meet this problem, most of them involving a series of term payments by the owner secured by a mortgage of the vessel, although some financing is done in London on the basis of bills of exchange discounted with the commercial banks on the implicit understanding that the bills will be renewed at maturity if a part of the debt is paid. Where working capital is ample, the shipbuilding company may itself finance the sale, holding a mortgage on the vessel and receiving partial payments at stipulated dates. More frequently, however, especially in Europe, the whole transaction is handled by a ship mortgage bank, which obtains the necessary funds through the sale of ship mortgage bonds. In the United States a similar policy has been followed for some years in regard to the Great Lakes vessels; it is of interest to note also that the larger finance companies have already undertaken, in several cases, to finance the construction and purchase of vessels on a similar plan.

While by 1934 shipbuilding had not yet recovered from the post-war depression, there were signs of improving conditions in most of the leading countries. The industry's future, however, remains dependent largely upon two factors. In the first place, a substantial increase in the physical volume of world trade is necessary to produce an expansion of shipbuilding activity. No imaginable economies in production costs can restore the industry as a whole to prosperity without such expansion. Secondly, the geographical distribution of the industry is tending to be influenced more and more by political factors. In view of the fact that shipping is of vital importance to all nations dependent upon sea borne commerce, it is increasingly being urged in these countries that the shipbuilding industry merits public support as an arm of the national defense. This attitude helps to explain the recent activity in the shipyards of the United States, France and Italy. If it continues to re-

ceive support, it is not unreasonable to expect that shipbuilding will be more widely scattered than in the immediate pre-war years, and that no country will again enjoy the outstanding supremacy that Great Britain held during that period.

SHIPPING. From the dawn of history man has been acquainted with the use of ships, and the earliest records show that curiosity and the spirit of adventure have responded to the challenge of the sea. The art of navigation probably arose on interior waterways; but when man learned how to construct something that could readily be floated, propelled and steered, he ventured out upon the sea in quest of food and riches. Less than 30 percent of the superficial area of the earth is land, much of it being di-

vided by ocean highways. Even where land masses comprise a continuous area, the relative cheapness of water transportation often makes commerce by sea more desirable than that by overland routes.

Shipping as a business enterprise evolved with the development of industrial technique, the expansion of commerce and the growth of political and social organization. For a long time it was a phase of regular mercantile operation, combined in its earlier stages with a large amount of piracy and other predatory activities. The merchant whose trade extended overseas usually owned the craft which carried his products. Commercial expansion both in ancient and in mediæval times was closely associated with the rise of city-states, whose chief economic interest was the handling and transportation of goods moving between remotely located regions or settlements. In these states water craft constituted a large part of the community's working capital and were therefore more or less regulated by governmental authority in the interest of the proper conservation of this capital.

Shipping as a carrying industry, distinct from purely mercantile operations, is essentially modern. Merchant vessels in both ancient and mediæval times often carried for parties other than their owners or operators. In local trade the common carrier occasionally put in an appearance. It was not, however, until commerce had expanded sufficiently to insure substantial and fairly regular traffic between centers remote from one another that shipping became an organized industry apart from the buying and selling of goods. Connected with this segregation was the rise of what is called line service. The first ocean carriers engaged solely in the transportation business were tramps; that is, vessels which followed no fixed routes but sailed wherever traffic seemed likely. The sailing of vessels over definite routes with regular time schedules developed between ports whose commerce had become active and steady. This line service in transoceanic trade is hardly more than a century old and for several decades was limited in scope.

Any treatment of shipping as an industrial and social influence requires consideration of the floating equipment, which constitutes a large part of the capital of the concerns engaged in this form of transportation. Such consideration covers, first, a broad classification of commercial vessels; second, a brief mention of other vessels engaged in various auxiliary services; third, a discussion of the evolution of the mer-

chant ship from the primitive dugout to the modern ocean liner; and, fourth, the general character, with respect to kind and construction of vessels, of the present day world merchant marine.

Commercial vessels may be divided roughly into three classes: self-propelling ships, including steamers and motor boats; sailing vessels, or vessels dependent upon ocean winds; and unrigged craft, whose movement is determined by human or animal power acting from shore or by tugs or towboats operating on the same waterway. The first constitute the bulk of the world's ocean tonnage today. Steamers and motor boats, however, are recent arrivals in the field of ocean transportation. The sailing vessel has rapidly been declining as a vehicle of transportation, but until late in the nineteenth century it was the outstanding ship of commerce. Today it operates for the most part as a tramp, carrying various kinds of bulky, low priced freight. Unrigged craft comprise coal boats and barges, often owned by mining companies or organizations handling raw or crude products. They usually operate on rivers and lakes and for short distances along the coast.

Vessels may be classified also according to the flag flown and manner of documentation. Each ocean carrier flies its national flag and is documented at some port within the political jurisdiction represented by that flag. In the United States documentation takes one of three forms: if the vessel is engaged in foreign commerce it is "registered"; if engaged in domestic trade it is "enrolled"; if it weighs less than twenty gross tons it is "licensed." Conditions with reference to documentation are prescribed by the laws of the country whose flag is flown.

Besides the vessels used directly as carriers there are boats employed in various auxiliary services. Tugs and towboats are employed in hauling barges, flats and other unrigged craft and in guiding or hauling ocean vessels in and out of harbor. In this service they are usually owned by companies distinct from those of the carriers. Tenders, used to transport passengers and freight between the vessel and the shore, also are operated in harbor service where large ocean steamers cannot dock. In a somewhat similar way the ferry performs a local service in carrying traffic across bays and rivers. Other floating equipment of an auxiliary nature includes scows and boats employed in saving lives and salvaging vessels. War vessels constitute a distinct group of water craft, but merchant

vessels are sometimes built under the direction of admiralty, or naval, authorities in order that they may serve a nation as auxiliary cruisers in time of war. The owners of such vessels, however, are usually recipients of some form of shipping subsidy from the government.

The growth of the shipping industry has been reflected to a considerable degree in the evolution of the ship of commerce. This vehicle apparently evolved out of the primitive dugout, which has been called the parent of modern boats and has been traced back to the late stone age. Its use seems to have been common among the old Swiss lake dwellers. The coracle of the ancient Celts, which consisted of wicker frames covered with skins, and the bark canoe, represented a later stage in boat development.

The transition from these early forms to the ship proper—from boats capable of rendering only local service to vessels which could sail on relatively long trading voyages—was achieved in prehistoric times. Recorded history rings up the curtain on seagoing vessels, equipped with sails as well as oars, having rudimentary steering gear in the form of paddles and able to make long voyages with cargoes and passengers. While throughout the centuries many changes took place in the construction and manipulation of ships, no transformation of a revolutionary nature occurred until the application of steam as a means of propulsion about the beginning of the nineteenth century.

Some of the earliest representations of vessels large enough to be called ships have been found in Egypt. Vessels of considerable size operated on the Nile as early as the building of the pyramids. Some were propelled by as many as twenty-six oars on each side and steered from the rear by four or five paddles in addition. The greatest seafaring people of ancient times, however, were the Phoenicians. From the meager information available, mainly in Assyrian and Greek sources, they seem to have employed craft similar to the boats used by the Egyptians. Before Nebuchadnezzar began his famous thirteen-year siege of Tyre the Phoenician merchant ships were traversing the whole Mediterranean, even extending their voyages into the Atlantic. The mention by Herodotus of the circumnavigation of Africa about 604 B.C., a feat whose authenticity was formerly questioned but is now generally admitted, is evidence of the great progress made by this people in the art of navigation.

Greeks and Romans made greater advances in

their war craft than in their trading ships. While the Greeks early developed into a commercial people, between the Homeric period and the Roman ascendancy the principal change in their merchant vessels was only an increase in size. The Greek trading vessel, as represented on vases dating from the seventh century B.C., was a broad, tublike ship, apparently built for transporting a considerable amount of freight. This form was in striking contrast to pirate vessels and warships, which were usually long and narrow and had beaklike bows finished off with the head of some sea monster.

In size of merchant craft the Romans surpassed the Greeks. The former were not a mercantile people; but the demands of a large and growing home population during the later years of the republic and the early period of imperial rule necessitated the shipment of much grain and other supplies from Africa and western Asia. The great corn ships bringing supplies to the capital were, according to the Roman writer Lucian, as much as 180 feet in length, 45 feet in beam and 44 feet in depth. These carriers were sailing vessels, not oar propelled craft, the sails being square and carried on three masts.

The transition from ancient to mediaeval civilization was accompanied by some reduction in the size of ships. The early Norse vessels, which were probably more seaworthy than most of the ships of antiquity, were of sturdy build and capable of navigating the stormy waters of the North Sea and the North Atlantic. The Mediterranean war galley was the most notable ship of the early Middle Ages. It was a long, single banked vessel propelled by oars but provided also with sails. The larger merchant vessels in the Mediterranean tended to assume the galley form, although they utilized wind power rather than oars wherever conditions favored. This form survived with some modifications in the merchant fleets of the Venetians and Genoese. Mediaeval ships showed no fundamental change in shipbuilding technique. There was some tendency for the oar propelled carrier to disappear from the high seas, although naval vessels still adhered to the use of oars. The rudder displaced steering paddles and the hull was formed for easier manipulation as well as for greater speed.

The principal changes exhibited by modern ships were the following: the complete elimination of oar propulsion in the case of both merchant craft and naval vessels; numerous improvements in the form of the hull, in the

number and height of masts and in the adjustments of sails; the use of chain pumps; the weighing of anchors by means of capstan and long cables; the adoption of the mariner's compass, the astrolabe and other navigating instruments; and, most significant of all, the rapid development of self-propulsion by steam and motor power with an accompanying improvement in the materials of construction.

Toward the close of the Middle Ages the caravel was being developed. This vessel was a sailer of comparatively light build which carried three or four masts and was partly square rigged and partly lateen rigged. The poop and fore-castle were high. The caravel figured prominently in the great geographical discoveries of the late fifteenth century; two of Columbus' ships as well as those used by Vasco da Gama on his first voyage around the Cape of Good Hope were of this type.

In the north the sailing vessel was assuming its modern form. The high poop and fore-castle, characteristic of the ships of Spain, Portugal and other south European countries, were abandoned; the Dutch, English and French vessels of the seventeenth and eighteenth centuries showed a general increase in size. By the time steam power was beginning to be applied to water transportation, the larger sailing ships, especially those of the French, had attained a length of 200 feet and a beam of 55 feet.

The middle of the nineteenth century marked the rise of the clipper ship, which was a prominent feature of the American merchant marine during the 1840's and 1850's. A square rigged vessel ranging in size from about 500 to over 3000 gross tons, the clipper's great length in proportion to beam (its greatest breadth was well aft of the bow) enabled it to attain high speed with relatively light rigging.

After the close of the American Civil War the sailing vessel was rapidly supplanted by the steamer, although it still survives as a carrier of certain kinds of bulk freight. The square rigged sailer was soon displaced by the schooner, which, it may be noted, had been built as early as 1713. The schooner is the typical sailing vessel of today and in its present form is distinctly an American product.

The development of steam and motor vessels represents the most revolutionary change in the technique of shipbuilding and ship operation within historic times. In little more than a century these self-propelled craft have advanced from an experimental means of transportation

on interior waterways to become the ships of commerce. Some of the more important phases of steamship (including motor ship) development have been the following: the application of steam as a propelling force in vessel movement; the gradual displacement of paddle wheels by screw propellers; great improvements in marine engines and boilers; the use of iron and later steel for building material; great increase in the size of ships; and the shift from the coal burning to the oil burning steamer. To these may be added another, the employment of internal combustion engines for propulsion.

The first successful demonstration of the practicability of using steam power to propel ships is generally ascribed to Robert Fulton, whose steamer, the *Clermont*, in 1807 ran from New York to Albany in thirty-two hours. In 1819 the *Savannah* made its well known transatlantic voyage from Savannah, Georgia, to Liverpool, employing steam power part of the way; and in 1833 the *Royal William* crossed the Atlantic all the way under steam. The first ocean steamers retained masts, yards and sails in order to supplement steam power with wind power whenever it was necessary or feasible.

The substitution of the screw propeller for the paddle wheel is associated with the names of the Englishman Francis P. Smith and the Swede John Ericsson, the screw propeller's first successful introduction being made in the 1830's. Twin screws came into common use about 1880. Today the larger liners have at least two propellers, while many have three or four.

In the development of the marine engine, engines of the side lever type with upright cylinders were followed by engines with oscillating cylinders, compound engines having triple and quadruple expansion, reciprocating marine engines and finally turbine engines. Marine boilers exhibited a somewhat similar progress, developing from the flat sided and box shaped boiler to the elaborate cylindrical boilers with internal furnaces, which began to be used about 1868.

From an economic standpoint the change from wood to metal construction was of great importance, for this made possible the building of the great liners of today. Iron began to be used extensively in shipbuilding about the middle of the nineteenth century, although there is a record of the launching of an iron boat on the river Foss in Yorkshire, England, as early as 1777. After 1870 steel came to displace iron for shipbuilding purposes; at present the bulk of the world's merchant marine is steel constructed.

A change of like economic import has been the adoption in recent decades of oil as fuel in the place of coal. This has had the effect of greatly extending the steaming radius of vessels, increasing the space available for freight and passenger traffic and materially reducing labor costs. The use of the internal combustion engine has progressed markedly since the World War. For the operation, however, of the larger liners the turbine engine is still preferred. Table 1 indicates to what extent the steel constructed, power driven vessel has become the ship of commerce of modern times.

TABLE I

NUMBER AND GROSS TONNAGE OF VESSELS OF 100 TONS AND UPWARDS IN THE WORLD, 1933, BY KIND OF POWER AND MATERIAL OF CONSTRUCTION

| | NUMBER OF VESSELS | GROSS TONNAGE |
|-----------------------------------|-------------------|-------------------|
| Steamers | | |
| Steel | 22,388 | 55,400,008 |
| Iron | 1,323 | 683,850 |
| Wood and composite | 1,141 | 343,274 |
| Total | 24,852 | 56,427,132 |
| Motor ships | | |
| Steel | 3,413 | 9,927,459 |
| Iron | 57 | 21,413 |
| Wood and composite | 1,193 | 251,520 |
| Total | 4,663 | 10,200,392 |
| Sailing Vessels and Barges | | |
| Steel | 632 | 517,426 |
| Iron | 91 | 72,508 |
| Wood and composite | 1,462 | 702,727 |
| Total | 2,185 | 1,292,661 |
| Grand total | 31,700 | 67,920,185 |

Source: *Lloyd's Register of Shipping, 1933-34*, 2 vols. (London 1933) vol. II, p. 1100-01

The ocean vessels of today have a much greater size and speed than did their predecessors

of the early nineteenth century. From ancient times to the opening years of the last century only the exceptionally large vessel exceeded 150 feet in length and over 1000 gross tons in size. At present a freight carrier of 5000 to 7500 gross tons is considered moderate in size, and the large transatlantic passenger liners are from 800 to over 900 feet long and range from 45,000 to nearly 60,000 gross tons. In 1934 the Cunard Steam Ship Company, Ltd., resumed work, which had been halted by the economic depression, on a vessel which is to be 73,000 gross tons. A century ago a speed of 12 knots was achieved by only the fastest vessels sailing under favorable weather conditions. Today this rate is slow for ordinary freighters. In August, 1933, the Italian steamer *Rex* made a run from Gibraltar to New York at an average speed of 28.92 knots and this despite fog and adverse winds. Table II shows the comparative size of well known steamers over the period 1840-1921.

The modern operation of the shipping service is the result of an evolution extending over centuries, and many of its aspects are unintelligible without some reference to their historical origins. The beliefs, for example, that trade follows the flag and that the flag flown from the mast of a ship is an agent in the development of a nation's commerce are almost universal. In large measure, however, these ideas are a survival of the periods when shipping was a phase of commerce rather than a distinct carrying industry and when the association of political authority and commercial interest was extremely close.

The utilization of waterways as avenues of commerce has characterized all peoples living

TABLE II

SIZE OF STEAMERS, 1840-1921

| NAME OF STEAMER | DATE OF COMPLETION | LENGTH OF DECK (feet) | BREADTH (feet) | GROSS TONNAGE |
|------------------------|--------------------|-----------------------|----------------|---------------|
| Britannia | 1840 | 215.0 | 34.33 | 1,139 |
| Asia | 1850 | 285.0 | 40.70 | 2,402 |
| Persia | 1855 | 385.0 | 45.25 | 3,309 |
| Great Eastern | 1859 | 692.0 | 83.00 | 18,915 |
| City of Paris | 1866 | 398.0 | 41.00 | 3,081 |
| City of Berlin | 1875 | 489.0 | 45.00 | 5,491 |
| Teutonic | 1890 | 585.0 | 57.80 | 9,984 |
| Oceanic | 1899 | 704.0 | 68.00 | 17,274 |
| Lusitania | 1906 | 700.0 | 88.00 | 32,000 |
| Olympic | 1911 | 883.0 | 92.50 | 46,359 |
| Imperator | 1913 | 900.0 | 98.00 | 51,000 |
| Vaterland (Leviathan*) | 1914 | 907.6 | 100.30 | 59,957* |
| Bismarck (Majestic*) | 1921 | 915.5 | 100.10 | 56,551 |

* The *Vaterland* (*Leviathan*) and the *Bismarck* (*Majestic*) were originally designed for service in the German merchant marine; the latter was not completed until after the close of the World War. Both vessels were taken over and renamed by the Allied and Associated Powers, the United States taking the *Vaterland* and Great Britain the *Bismarck*. The original gross tonnage of the *Leviathan* was increased from 54,282 to 59,957.

on navigable streams, lakes or seas. A large part of the ocean carrying trade of the world, however, has been in the hands of nations possessing few natural resources and occupying a seacoast area of limited extent. The Phoenicians rather than the Egyptians were the great carriers on the Mediterranean in the centuries preceding the rise of Greek and Roman civilizations. The merchants of such city-states as Athens, Corinth, Antioch and Carthage figured more prominently in the sea trade of later antiquity than did their Roman contemporaries. In mediæval times too Venice, Genoa and the towns of the Hanseatic League controlled the greater part of the oversea commerce of Europe. Even today countries like Norway, Japan and Holland, with little fertile land and inconsequential mineral resources, have been conspicuous in maritime achievements. Capital in such places naturally seeks the readily available fields of industrial activity.

The first people to develop an extensive merchant marine were the Phoenicians, whose activities reached their height at the beginning of the heroic age of Greece (1000 to 800 B.C.) and who as late as 600 B.C. still dominated the trade of the eastern Mediterranean. The Greeks fell heir to the Phoenician commerce of the eastern Mediterranean, while Carthage, a Phoenician colony, captured the western area. Miletus, on the Asia Minor coast, was the first Greek city to achieve commercial prominence in seafaring enterprises. Later other Hellenic cities, among them Megara, Athens, Corinth, Syracuse, Antioch and Alexandria, became centers of an extensive oversea trade, and Carthage continued to occupy an important maritime role until its final overthrow in 146 B.C. During the Roman political ascendancy the Mediterranean became virtually a Roman lake. Roman merchants in some instances operated vessels of considerable size, but most of their merchant shipping was owned by Greeks and Syrians.

Ancient ships were the property of individual merchants or groups of merchants. A common form of business organization was the participation association. Here the individual trader who did not wish to assume the entire risk of his enterprise entered upon a contract under which part of the capital was borrowed from another person, whose liability in the event of loss was specifically limited but whose profit in case of success was usually a fixed proportion of the total. This type of organization, which bears some analogy to certain forms of modern

limited partnerships, was often resorted to for single ventures.

From the fourth to the eleventh century there was a considerable decline in European commerce. In the eastern Mediterranean trade flourished largely under the protection of the Byzantine Empire. The rise of the Saracens was followed by an appreciable development of commercial activity in western Asia and the eastern Mediterranean. On the other hand, in northern and western Europe maritime commerce consisted for the most part of piratical expeditions.

The expansion of commerce during the latter half of the Middle Ages is closely associated with the growth of such communities as Venice, Genoa, Pisa and the towns of the Hanseatic League, of which Lubeck, Hamburg and Bremen were the most important. All these communities, like their great predecessors in the ancient world, became in a sense city-states, either being entirely independent of any external political control or possessing a large measure of autonomy. Their trade by sea was "active," that is, traffic was carried in vessels owned by citizens, while their trading stations, or factories in foreign countries, were similarly owned or controlled.

Mediæval shipping reached its most advanced development at Venice. As early as the time of Justinian the Venetians had received some recognition as a seafaring people, for both Belisarius and Narses had sought their aid in the transportation of troops and supplies in the wars with the Goths. From the close of the fourth crusade in 1204 to the end of the fifteenth century Venice virtually dominated the sea trade of the Mediterranean; in the eastern part particularly it had a practical monopoly of trade with the Orient. This was made possible by its control of several strategic stations and colonies in western Asia and northern Africa as well as by special privileges granted to Venetian merchants at leading seaports elsewhere in the region.

Shortly after 1300 Venetian vessels were regularly carrying wares to northwestern Europe. For about two centuries this commerce was subject to strict regulation by the Venetian state in order that it might be kept in the hands of home merchants and the property involved protected. Each season the Venetian senate voted the number of galleys needed, auctioned off to merchants the right to freight them and as a rule prohibited separate voyages. The vessels making up the Venetian merchant fleet were

largely oar propelled and each galley carried a force of archers for protection against pirates or other enemies.

In the north oversea commerce during the late mediaeval period was largely under the control of German merchants living in cities located near enough to the North and Baltic seas to be seaports. In order to secure protection against piracy and to obtain trading privileges for their members in foreign ports these towns organized the Hanseatic League. The league reached the height of its power with the Treaty of Stralsund in 1370, when it included over seventy-seven cities. Its last official meeting was held at Lubeck in 1669, when five cities were represented. The geographical discoveries of the fifteenth and sixteenth centuries and the rise of political and economic nationalism revolutionized the shipping situation. Maritime activity became more and more conspicuous on the all water routes between western European ports and the Orient and between Europe and the New World. The city-states, dominated by their commercial oligarchies, were forced to give way to newly rising nations with appreciable land areas and concentrated political authority.

The shipping industry of the Middle Ages, like that of ancient times, was a phase of commerce. In both periods it received its most advanced expression in municipalities located on navigable waterways near the open sea. At these centers the main economic interest was oversea commerce. Business organization and, to a very large extent, political policy were shaped with a view to securing trade monopoly or at least distinct trading advantages for citizens over outside competitors.

The organization of the shipping industry in modern times has been characterized by the following developments: the survival, in an age of growing nationalism, of efforts by the state to safeguard shipping interests against foreign competition; the gradual segregation of shipping from purely mercantile functions; the establishment of services over definite routes with regular sailings, coupled with a recognized distinction between line and tramp operation; the growth of joint stock and incorporated companies and of shipping conferences and consolidations; and the emergence of industrial fleets.

The decline of the city-state and the rise of larger political and social units changed the scope but not the fundamental purpose of trade regulation. Commerce continued to be regulated, but in the real or supposed interests of

social groups larger or more inclusive than the mercantile associations which governed the dominant trading towns of earlier times. Political authority was concerned less with specific trade codes than with the shaping of general policies designed to enhance national power and prestige. Oversea commerce therefore was encouraged not merely for the purpose of enriching a merchant class but also in order to increase the sovereign's revenue and lay the foundation of an oversea empire. The shipping industry was a crucial factor in carrying out the spirit of the navigation laws, and hence protective measures were generally instituted for its development.

The emergence of Portugal and Spain as important political entities in the fifteenth and sixteenth centuries was marked by a rapid expansion of their shipping activity. Portuguese merchants, after the voyage of Vasco da Gama, established an extensive commercial empire in India and the East Indies, but it collapsed before the end of a century. Meanwhile Spain was exploiting the newly discovered gold and silver mines of Mexico and Peru, and in this development the famous treasure ships of Spain played a conspicuous role. In the case of both Portugal and Spain vessels were owned by individual merchants or mercantile companies, but they were given naval protection, occasionally financial aid and always legislative safeguards against foreign competition. The Dutch and the English followed a similar exclusive policy, as did other nations although on a smaller scale.

One aim of the mercantilistic policies of the time was to safeguard national shipping as a connecting link between the home country and interests and possessions abroad. The legislation designed to maintain this bond has changed in form since the seventeenth and eighteenth centuries, but its functions are still performed by modern ship subsidies and other shipping aids. Several of the leading merchant marine countries of the world reserve their coastwise and interior waterway trade to vessels flying the national flag; in the United States the carrying trade with most of the country's outlying possessions is also thus reserved. Of the total American merchant marine about 60 percent engages exclusively in commerce of this character.

The emergence of shipping as a business, distinct from mercantile activities, was gradual and took place in different regions at widely varying dates. By the seventeenth century European coastwise vessels were already occasionally engaged in a regular carrying trade, while in

the next century the practise of chartering ocean vessels for purely transportation services was fairly common. These developments came out of the need for efficient carrying agencies in a period of rapidly expanding commerce. Other influences were the industrial revolution, with its increasing volume of commodities offered for transportation, and the appearance of large mercantile organizations with no merchant fleets of their own. The operation of ocean vessels thus became a separate business, and today the bulk of the world's ocean freight is transported by concerns engaged in carrying for others.

The rise of common carriers was soon followed by a gradual segregation of line from tramp traffic. The early ocean carriers were mainly tramps, but as commerce developed efforts were put forth to secure regular sailings between important ports. The first transatlantic line was the Black Ball Line, established in 1816, which operated a fleet of sailing vessels between New York and Liverpool. A second line between the same ports was started in 1822. These early lines, known as packet lines, had regular sailing dates, carried mail and high grade packet freight and usually had accommodations for passengers. After 1850 the ocean steamer rapidly supplanted the sailing vessel in the line service. Following improvements in marine engines and boilers the larger steamers became practically independent of weather conditions, with the result that shippers came to find the new self-propelling vessels more reliable than those dependent upon wind power. Today the sailing vessel has ceased to be a liner.

The tramp still carries a large part of the world's ocean freight. Ordinarily a vessel of moderate size and average draft and speed, it is built for maximum economy and freight capacity. Because it operates over various routes at irregular intervals, the provision of expensive permanent docks and wharves and of offices and freight soliciting agencies is unnecessary. The freight carried is usually of a heavy, bulky nature and is comparatively low in value. An elaborate ship brokerage service at the leading ports of the world keeps shipowners and operators informed concerning the demand for vessel space.

Modern shipping organization also has undergone radical transformations. In ancient and mediaeval times vessels were owned by individuals or ordinary partnerships, and group control, wherever it existed, was generally administered in the interest of merchants as individuals. The appearance of large commercial

companies during the fifteenth, sixteenth and seventeenth centuries was a feature of the early modern era. These concerns at first were "regulated" companies, essentially associations of individuals, who received charters from their several governments giving them exclusive privileges for carrying on trade between their home countries and certain foreign lands. The members gained or lost as individuals. These mercantile associations, which often possessed joint ownership in terminal properties and sometimes in ships, gradually evolved into joint stock companies. The joint stock company at common law is treated as a partnership, but from the viewpoint of economic function it acts as a unit in much the same way as the corporation. The English East India Company began as a regulated company and definitely adopted the joint stock company principle only after it had been in existence for some twelve years.

The merchant trader, it may be noted, continued to exist long after the rise of the joint stock company. In the United States, for example, Elias Hasket Derby of Salem, Massachusetts, and Stephen Girard of Philadelphia, Pennsylvania, were prominent figures in merchant shipping in the years following the American Revolution. In the growing differentiation, however, of the shipping business from merchandising the old merchant trader, where he still clung to his ships, became a shipowner pure and simple. Today he survives as the individual owner of tramp vessels.

The increasing complexity of modern commerce, with its demands for promptness, cheapness and regularity of service, has favored the development of joint stock companies and corporations. These forms, especially the latter, have obvious advantages where a large amount of capital is necessary for efficient and cheap service and where stability is required for the carrying out of long range business policies. Passenger and freight liners for the most part have ceased to be the property of individuals. They are owned and operated by security issuing corporations, whose control often extends over several lines or routes. Table III gives the names, nationality and number of vessels of the more important shipping companies in the world today.

Probably because competition is nowhere more active than in ocean transportation, efforts have been made to limit competition; these have taken two forms, the development of shipping conferences and the organization of consolida-

tions. Shipping conferences are associations for the regulation of traffic and the formulation of rate policies among lines serving the same ports or regions and handling the same or similar kinds of traffic. Tramp steamers as a general rule do not participate in conferences. Arrangements among lines may be simple rate agreements or elaborate pooling devices. Ordinarily a line company is a member of more than one shipping conference. Outside of the American trade, shipping conferences endeavor to control rate agreements by use of the so-called deferred rebate, which is a periodical return to shippers

who patronize only conference lines of a part of the net freight payments, usually 10 percent. Shipping conferences, although they exercise a form of price control, are legal in the United States if they receive the approval of the United States Shipping Board. The board itself, when engaged directly in the shipping business, has been a member of several conferences. Deferred rebates, however, were declared illegal by the Shipping Act of 1916.

First appearing in the last decades of the nineteenth century, line conferences were almost universal by 1909. Although some of them were disrupted during the World War, they resumed operations at its close, so that by the 1930's they were again to be found in almost every region important to international trade. The larger conferences are formal organizations in which the lines included are represented by delegates who meet regularly. There are permanent officers and permanent and special committees, and machinery has usually been set up for the settlement of disputes among conference members. The good faith of each member of a conference is in many instances guaranteed by a deposit of a stipulated sum, which is forfeited if agreements are violated or new services are established that interfere with the interests of the conference lines. Different conference lines are not infrequently interrelated by agreements concerning traffic and rates.

Conference agreements may apply to all the traffic of member companies or to any part or parts of such traffic. Line companies have also in some cases confined their conferences to a few kinds of traffic. Before the restriction of immigration to the United States there even existed traffic pools for the distribution of steerage passengers among several of the leading transoceanic line companies. Generally speaking, conferences composed of line companies have rate understandings covering all or the greater part of the traffic handled by the lines represented. Conference lines operating between the United States and foreign countries and between the Atlantic coast and the Pacific coast through the Panama Canal have agreements with reference to practically all freight which they handle; passenger traffic is subject to separate conference agreements.

The following are some of the more important conferences governing freight rates and practices in connection with the commerce of the United States on export and import trade routes.

(1) From North Atlantic ports to the United

Kingdom; continental Europe; west coast of Italy; Adriatic, Black Sea and Levant; West Africa; South Africa; Australia. (2) From Atlantic and gulf ports to West Indies; east coast of Colombia; Brazil; Plata River, west coast of Mexico; Central and South America; Far East. (3) From gulf ports to Mediterranean ports, to Havana and to other foreign ports. (4) From Pacific coast ports to Far East; Australasia; west coast of South America; Caribbean seaports; east coast of South America; United Kingdom; continental Europe and Scandinavia. (5) To New York from Le Havre, Honfleur, Bordeaux and Southampton (cargo of French origin); Antwerp, Rotterdam, Le Havre, Honfleur and Southampton (cargo of Swiss origin). (6) To North Atlantic ports from Levant ports. (7) To Atlantic coast ports from Hamburg-Bremen and from Antwerp. (8) To Atlantic and Gulf ports from United Kingdom; Brazil; West Indies; west coast of South America; Japan; China; Philippine Islands. (9) To Pacific coast ports from Japan; South China, Straits Settlements, Federated Malay States, Java and Ceylon; Philippine Islands; Calcutta; west coast of South America; Scandinavian, Baltic, German, Dutch, Belgian and French ports.

Consolidations in the form of both mergers and holding companies have appeared in the line service. Intercorporate relations have made the actual control of certain companies much more widespread than published figures for direct operation would indicate. How powerful great mergers had become in the years before the depression beginning in 1929 is revealed by the following records of three British and one American company.

The Royal Mail Steam Packet Company (in 1932 reorganized as the Royal Mail Lines, Ltd.), a British company, was established by royal charter in 1839. In 1930 it owned and operated directly a fleet of 31 vessels; including the vessels of the Royal Mail Steam Packet Meat Transports, Ltd., a subsidiary concern, it owned over 40 vessels aggregating 370,232 gross registered tons. It had also a controlling interest in the Pacific Steam Navigation Company, Nelson Steam Navigation Company, Ltd., David Mac-Iver and Company, Ltd., and the White Star Line, Ltd., which had been organized to take over the Oceanic Steam Navigation Company, Ltd., and several smaller companies. The gross tonnage of the fleets of these associated companies and their subsidiaries was 2,304,709. The Royal Mail was thus controlling 2,674,941 gross

tons of water craft whose operations extended throughout the commercial world. The authorized capital stock of the company amounted to £25,000,000, of which £8,800,000 had been issued and paid up by the end of 1928. In addition there were outstanding against the company £1,400,000 in first debentures and £5,100,000 in other debentures.

The Peninsular and Oriental Steam Navigation Company, also a British line, was incorporated by royal charter in 1840. Beginning with 1910 the company acquired extensive interests in various steamship companies, notably the Blue Anchor Line, Ltd., the British India Steam Navigation Company, Ltd., the New Zealand Shipping Company, Ltd., and the Union Steamship Company of New Zealand, Ltd. Through these and other holdings the P. & O. controlled a large part of the vessel tonnage of the Orient. Its own vessels in 1930 aggregated 567,147 gross tons and those of the British India Steam Navigation Company, Ltd., added another 754,784 gross tons. In all this company controlled a fleet of 354 ocean steamers with a gross tonnage of 2,217,724. The authorized capital stock of the company was £7,649,853, of which £7,632,518 had been issued and paid up by the end of 1928. In addition there was outstanding £8,487,560, consisting of three varieties of debentures.

The Cunard Steam Ship Company, Ltd., a British company which had its origins in the early days of steam, was organized in its present form in 1878. The company controlled the Commonwealth and Dominion Line, Ltd. (in the Australasian service), the American Levant Line, Ltd., the Anchor Line, Ltd., and the Thomas and Jno. Brocklebank, Ltd. The total gross tonnage owned or controlled in 1930 was 990,811. The authorized share capital amounted to £8,100,020, of which £8,070,261 was outstanding; there were also £4,210,000 and \$2,500,000 in debentures and gold notes.

The International Mercantile Marine Company, an American company, was incorporated in 1893 as the International Navigation Company and took its present name in 1902 when J. P. Morgan and Company reorganized and expanded it. The following companies were controlled by the combination in 1930: International Navigation Company, Ltd. (British), Red Star Line (Belgian), Atlantic Transport Company, Ltd. (British), Atlantic Transport Company of West Virginia (American), Frederick Leyland and Company, Ltd. (British). These companies in 1928 owned 52 vessels aggregating

462,096 gross tons: in 1927, before the Oceanic Steam Navigation Company, Ltd. (White Star Line), had been sold to the Royal Mail Steam Packet Company, the International Mercantile Marine Company controlled the operations of over 1,000,000 gross tons of shipping engaged in more than fifty distinct services. The outstanding stock in 1928 was \$101,596,800 out of \$120,000,000 authorized; in addition there were bonds amounting to \$24,130,000. In 1931 the International Mercantile Marine Company obtained control of the Roosevelt Steamship Company, Inc.; in 1932 the United States Lines Company, Inc., was also acquired.

These four organizations before the depression controlled the operations of approximately 6,335,000 gross tons of shipping. Their aggregate outstanding securities, both ownership and long term credit, amounted to nearly \$341,000,000, so that their capitalization was about \$60 per gross ton. The Royal Mail, the P. & O. and the Cunard companies paid moderate or high dividends on their ordinary or deferred shares during the post-war years. The International Mercantile Marine paid no dividend on its common stock and paid on its preferred stock only during the World War and the years immediately following.

The presence of shipping conferences and consolidations does not seem to have had any material effect on the general trend of ocean freight rates, for the long time movements of charter rates in the tramp service have closely paralleled those of line rates. But conferences and consolidations have been effective in reducing short time variations, with the result that line rates do not show the violent fluctuations characteristic of the daily quotations for charter rates.

The rise of industrial fleets is a recent phenomenon and has been brought about by conditions similar to those which led certain business concerns in the United States to build and own the railroad freight cars which carried their products. Some commodities shipped in large amounts could be handled more economically in specialized vehicles, the coal car, tank car and refrigerator car being well known examples of these. Among water carriers usually owned by industrial companies are coal barges, iron ore vessels and tank steamers. Coal mining companies, in both the United States and Europe, own directly or indirectly coal boats and barges. The ore carrier, a familiar sight on the Great Lakes, is generally the property of a steel com-

pany making its own pig iron. Tank steamers are commonly owned or controlled by large oil refining concerns.

Several large coal mining companies in the United States have coal boats and barges on the Atlantic coast and on the upper Mississippi and Ohio rivers. On the Great Lakes the Pittsburgh Steamship Company, which is owned by the United States Steel Corporation, operates a fleet of 86 ore carrying vessels. The Standard Transportation Company, Ltd., of Hong Kong and the Standard Shipping Company of the United States operate oil fleets in the interest of the Socony Vacuum Corporation, which controls the stock of both concerns. The British Tanker Company, Ltd., owns 85 tankers of 780,000 dead weight tons and most of these are chartered to the Anglo-Persian Oil Company, Ltd. All the shares of the British Tanker Company, Ltd., aggregating £4,000,000, are held by the Anglo-Persian Company, Ltd.

There is at present no tendency for railroads and other land carriers to combine with ocean carriers for the purpose of forming a common land and water transportation system, although at one time such combinations were fairly common. The Chesapeake and Ohio Railway formerly operated a shipping line from Newport News to London and Liverpool, while the American Line, in 1902 made a part of the International Mercantile Marine Company, was once controlled by the Pennsylvania Railroad. In 1900 the Southern Pacific Company secured a controlling share of the stock of the Pacific Mail Steamship Company, which ran vessels across the Pacific and between San Francisco and Panama. The Great Northern Railway Company organized the Great Northern Steamship Company for service between Puget Sound and the Orient. In 1914 it was estimated that in the United States the railroads owned or controlled 209 vessels of 589,561 gross tons engaged in regular line traffic.

Since 1914 this situation has been changed; old amalgamations have been severed and no new ones formed. There are fundamental differences between rail and water transportation. Ocean freight rates are less stable than rail rates, making the development of through routing policies for a combined land and water transportation system difficult. Furthermore the leading transoceanic lines, especially on the Atlantic, had taken fairly definite form before railroads had become sufficiently strong to branch out and develop any ocean carrying business. Poli-

cal influences also operated to prevent common ownership and control. The principle of equitable treatment of all water lines by railroads and the application of antitrust laws made the operation of such combinations difficult.

Railway control of water carriers, however, is a prominent feature of the transportation system of Canada. The Canadian Pacific Steamships, Ltd., which is an operating organization controlling the movements of several large steamers engaged in the transoceanic service on both the Atlantic and the Pacific, is owned by the Canadian Pacific Railway Company. Other vessels, operating for the most part in local coastwise service, are also owned by the same railroad. The Canadian Pacific Railway is unique among the railways of the world in this development.

The World War had certain significant effects on the shipping industry. During the course of the struggle a large part of the world's merchant marine was requisitioned for war purposes, while there was widespread destruction of mercantile shipping by German submarines. In the case of Great Britain alone losses due to submarine sinkings were put at 7,759,000 gross tons, or 38 percent of the British tonnage in June, 1914. As a result and also because of mounting construction costs several governments were compelled to go into the business of shipbuilding and operation. With the close of the war, however, governments found it im-

possible to dispose of their newly created fleets at prices which would meet a reasonable part of the costs, so that they were kept in the shipping business for a number of years. This was particularly true of the United States, which during the latter part of the war period was building the bulk of the world's newly constructed vessels. As late as July 1, 1932, the United States government still owned 362 ships aggregating 2,088,864 gross tons.

The establishment of a socialist republic in Russia following the October revolution of 1917 led to government ownership and operation of the Russian mercantile fleets. While the Russian merchant marine has always been small, the Sovtorgflot (Soviet Mercantile Fleet) has shown marked growth in recent years. The ships of the Sovtorgflot are divided into five units and directed from district head offices as follows: the Baltic Fleet from Leningrad, the Northern Fleet from Archangel, the Black Sea Fleet (the most important) from Odessa, the Sea-of-Azov Fleet from Rostov-on-Don and the Far Eastern Fleet from Vladivostok.

Table IV indicates the number and gross tonnage of ships of 100 tons and upward in the principal maritime countries of the world for the years 1900, 1914, 1920 and 1933. It will be observed that while Germany as a mercantile power ranked third in 1900 and second in 1914, in 1920 it was to be found among the minor countries. This was largely due to the trans-

ference under the Peace of Versailles of the greater part of the country's shipping to the Allied and Associated Powers as well as to the extraordinary wartime shipbuilding activities of other nations. By 1932, however, Germany was once more among the leading merchant marine countries. The progress of Japan over the period 1900-32 is particularly noteworthy, as is also the recovery of Norway since 1920 from the havoc inflicted on its fleets by submarine sinkings and the interference of the war with the country's trade.

The position of the United States was materially changed by the war. While the United States occupied second place among maritime nations in 1900 and third place in 1914, this was to a considerable extent due to a very large tonnage engaged only in coastwise and inland service ("enrolled" tonnage). On the basis of shipping in foreign trade alone ("registered" tonnage) in 1914, for example, the United States ranked below the United Kingdom, Germany, Norway, France and Japan. The country's shipbuilding activity during the war as well as its share of the German merchant marine raised it to second place in 1920 in both total and "registered" tonnage, a position which it continued to hold a decade later despite a serious decline in that part of the fleet engaged in foreign trade. The United Kingdom (later Great Britain and Ireland), while suffering heavily during the war, continued to maintain its premier position as mistress of the seas. Although a smaller proportion of the world's shipping than in pre-war years was flying the British flag, the proportion was still great. If oversea dominions are included, the British Empire in the 1930's controls approximately one third of all the shipping of 100 tons and over in the world.

SHORT BALLOT MOVEMENT. The electoral systems of various countries differ among other things in the number of decisions or choices which the individual voter is called upon to make on any particular election day. In this respect the voter bears the heaviest burden in the United States. In other countries he often votes on only a single office and seldom on more than a few. In the United States it was formerly not uncommon for a single election to deal with more than fifty offices; this situation still prevails in some places. The short ballot movement, most active in the second decade of the present century, has been concerned with the alleviation of this burden and its resultant evils.

There are at least two reasons why longer ballots have been used in the United States than in any other country. The first is to be found in the political philosophy which holds that a truly democratic governmental system requires that all important public offices shall be filled by popular election. This principle has been pressed to an extreme in the United States, where the new offices created to meet the growing tasks of government in general and of urban government in particular were almost invariably made elective. The method of popular election is not only used to select the major executive and legislative officers in all fields of government,

national, state and local, but is widely employed in the states and municipalities to fill judicial offices as well as to choose relatively unimportant administrative officials. Judges, prosecuting attorneys and even court clerks are elected by the people in many states. Heads of state administrative departments, such as auditors, treasurers and superintendents of education, are in some instances chosen by the same method. In counties, cities, towns and townships in all parts of the country administrative posts, even of minor consequence, are also elective. This involves a wide departure from the principle, considered axiomatic by political scientists, that only public officials whose posts are conspicuous and whose work is of a policy determining nature should be chosen by popular vote. Good governmental practise requires that all those officials whose functions are essentially routine or technical should be selected by appointment.

A second reason for the long ballot in the United States may be found in the common practise of holding national, state and local elections on the same day. At one time this was the practise everywhere. During recent years the tendency has been to scatter these elections, but a combination of state and local elections or of congressional and state elections is still common in many parts of the country.

Students of American government in the early years of the twentieth century pointed out serious consequences in connection with the use of the long ballot. It is exceedingly difficult for most voters to form an intelligent opinion concerning the merits of all of the candidates. The average voter will ordinarily not familiarize himself with the names and qualifications of more than a dozen at most. Accordingly the bulk of electoral interest is concentrated upon the more conspicuous offices. Those voters who are not frightened away from the polls by the burden imposed on them by the long ballot necessarily pay little or no attention to the less important offices. Thus unfit candidates are frequently chosen in the lower ranges of the ballot. Moreover the practise of submitting to popular election the choice of so many officials tends to make the business of nominations too intricate for popular participation, so that the preliminary selections drift into the hands of small political groups. In addition the fact that so many officials are elective and theoretically responsible only to the people diffuses official responsibility and makes it easy for officials to

shift any blame for misgovernment to other officials.

In the endeavor to provide a remedy for public apathy, blind voting and manipulated nominations the short ballot movement was inaugurated. It took definite form with the organization in 1909 of the National Short Ballot Organization. Woodrow Wilson, its president, termed the short ballot "the key to the whole problem of the restoration of popular government." The organization set forth as the "short ballot principle" that only offices important enough to attract and deserve public examination should be elective and that very few offices should be filled by election at one time. The principle was adopted by political scientists and by many public officials and was incorporated in the platform of the Progressive party in 1912. It became closely linked with the general movement for centralizing government responsibility by decreasing the number and lengthening the term of elective offices, simplifying governmental administrative organization and eliminating second chambers in state and municipal legislatures. In municipal government the organization advocated commission and commission manager forms of government as the most direct means of shortening the municipal ballot. In 1921 the National Short Ballot Organization consolidated with the National Municipal League.

The movement has achieved considerable success, especially in state government. Various plans of administrative centralization have reduced the number of elective state officials. The development of the strong mayor and especially of the city manager form of municipal government has resulted in a decrease in the number of elective municipal officers. On the other hand, relatively little progress has been made in county government.

Opposition to the transfer of public officials from the elective to the appointive class is usually based on the contention that such action relaxes the control of the people over their public representatives and hence is a step in the direction of autocracy. It is also argued that by extending the range of the appointing power a few high officials are given the opportunity to build up a political machine and thereby to entrench themselves in office. Despite this opposition the ballot is being slowly but steadily shortened throughout the United States so far as the number of elective offices is concerned.

The gains, however, have been partially offset

by the spread of the initiative and referendum, which results in placing various questions on the ballot for the voters to decide. In some instances as many as thirty or forty questions have been submitted at a single election. To the extent that names of candidates are replaced by lists of questions the short ballot has once more become lengthened and blind voting is given new encouragement, for voters are no more likely to inform themselves on minor questions than on minor candidates. Only issues of major importance should be submitted to a decision by popular vote.

At present the short ballot movement is attracting less interest. This is partly because many of its aims have already been achieved. The multiplication of elective offices has been checked and their number reduced. In recent years the attention of reformers has been concentrated more upon the improvement of routine administration than upon changes in the machinery of election. The movement for a shorter ballot has become merged in the wider campaign for a general simplification of state and local government as well as for better business methods in the public service.

C., *Political Parties and Electoral Problems* (3rd ed. New York 1933) p. 463-72.

SHORT HOURS MOVEMENT. The movement for the progressive reduction of working hours has been carried on in the main by organized labor. In certain countries, however, it was philanthropists and humanitarians who supplied the impetus, particularly with regard to legislative reduction of the hours of labor of child workers. Indeed this phase, although it is now part of the general program of labor organizations, still receives a considerable portion of its support and leadership from non-working class elements, especially in countries where for various reasons no stable labor movement has as yet been built up. Similarly in the struggle to regulate by legislation the duration of labor of working women humanitarian and social reform elements have played a significant part. In

Short Ballot Movement—Short Hours Movement 45

these two phases of the movement the arguments for the reduction of labor on humanitarian and social health grounds have the greatest appeal and receive principal emphasis; and the chief type of regulation sought has been governmental legislation.

Even in the more general movement for the reduction of hours of adult as well as child workers there have been periods and instances in which the initiative for the movement has come from non-working class elements. Thus among the most important proponents of the shorter working day in early nineteenth century England was Robert Owen, who felt that this step would serve the interests of both society and the employer. Owen, a successful factory owner, reduced the hours of work of his employees and then advocated a general voluntary adoption of this practise by industrialists. On the basis of his experiment he argued that the reduction of hours would not affect output, as the added rest would make the worker more efficient, although there would have to be a rise in wages sufficient to compensate for the reduced hours, the actual labor costs of production would not be increased. Moreover every element in society would benefit in other measurable economic forms, for the improved health and morals of the workers would lead to a continual diminution of the poor rates. This attitude has been characteristic of certain "welfare capitalists," especially in periods of expanding markets and comparative shortage of labor. Owen's arguments had no effect on the manufacturers of his time, however, and he turned from voluntary employers' action to legislative regulation of both child and adult labor. It was not from the industrial employers that the humanitarians and welfare capitalists of Owen's day received support but rather from certain conservative anti-industrialists who saw in the results of the methods of the upstart manufacturing class both a political and a social menace.

After the repeal of the combination acts working class associations arose in the 1830's, considerably influenced by the more revolutionary phase of Owenism, which sought a reorganization of society. The ten-hour strikes, which in some cases met with success, were in part motivated by the belief that the large masses of workers would be attracted to a movement for shorter hours.

In the United States, on the other hand, it was the trade unions which took the initial step in the short hours movement. As early as 1791 a

Philadelphia union of carpenters agitated for a shorter working day. But the trade union movement was based on craft rather than on broad industrial organization, relied not on legislation but on bargaining power and economic action and was motivated not by the concept of revolution or by the argument of better citizenship, which was not voiced in the United States until the 1830's, but by job scarcity and the belief that the reduction of the excessive hours of work would lead to a wider distribution of employment opportunities. This motivation, which also dominated the shorter hours movement in England in the 1850's, was a reflection of the consciousness of limited opportunity and thus apparently was in direct contradiction to the production argument of Owen, which in subsequent periods of industrial prosperity gained acceptance among trade unionists.

After the 1860's, although the various trade unions in the United States and England won a series of local concessions by strikes and collective bargaining, utilizing the arguments of citizenship rights and distribution of employment, the revolutionary approach reappeared with the rise of the political labor movement. In the United States, it is true, the shorter hours movement in the 1860's was influenced largely by the gentle revolutionism of Ira Steward, who held that through a reduction of hours profits could finally be eliminated. His belief in the "golden law of wages"—that wages depend on the standard of living and not vice versa—led him to argue that increased leisure through reduced working hours would serve as the pivotal point in raising the standard of living. The shortening of the working day would mean that the worker would demand more pay or refuse employment, so that by constant reduction the employer's income would shrink to the point where industry could no longer be operated at a profit, and a transition could then be made from the capitalist system to one based on voluntary producers' cooperation. The movement inspired by Steward was not without effects in legislation for public employees and in trade union action. But its primary belief in an expanding society with the workers in an advantageous bargaining position was dispelled by the economic crisis of 1873.

By the 1880's, however, even the United States was affected by the revolutionary program of the First International, which stressed a universal eight-hour day not as an automatic means for the supplanting of the capitalist sys-

tern but as a rallying point for mass workers' organization and strikes, whose strength would lead ultimately to the attainment of the other demands of the workers. This revolutionary approach was introduced into the United States mainly by the anarchists, who saw the eight-hour movement as a prelude to a general strike, but also by the trade unions with the exception of the Knights of Labor. After the Haymarket riot, it was decided instead to start with a nation wide movement in one trade after another, beginning with the best organized and most strategically situated groups. The carpenters chosen in 1890 for this purpose met with only partial success; in 1894 the bituminous miners staged a nation wide walkout which despite its failure laid the basis for the more successful strike of 1897.

In England and on the continent, however, the movement in the 1880's was conducted along general revolutionary as well as national industrial lines. The Social Democratic Federation of England used the demand for the eight-hour day as an agitational device. And at the close of the decade a fresh impetus was provided through the rise of the "new unionism" among the dock workers and general laborers, who, after a long and bitter strike, succeeded in reducing their hours from twelve to eight. When the Socialist International issued a call for demonstrations on May Day, 1890, for the eight-hour day, there was in Germany despite the suppressive legislation still prevailing a wide response precipitating the Hamburg lockout which laid the basis for a unified trade union movement. In London it was estimated that almost 250,000 people participated in the demonstration. Similar demonstrations were held in other countries, and the socialist agitation for shorter hours finally affected czarist Russia in the widespread strike movements of 1896 and 1905. Indeed it was a strike for reduction of hours which inaugurated the general uprising of 1905. One of the first acts of the Soviet government in 1918 was the introduction of the universal eight-hour day, which has since been reduced to a seven-hour day.

Before the World War, although the demand undoubtedly had a stimulating effect on labor movements all over the world, the universal eight-hour day was nowhere achieved except in Australia; elsewhere it was won in certain well organized trades as the result of trade union action. It was enacted into law, however, in the period of the war, in Germany, Austria and France. In the Germanic countries it was part of

the republican governmental program, especially in the days of Social Democratic control; in France, after a long period of labor legislation introduced mainly to curb revolutionary activity and rarely enforced, the eight-hour day came as the culmination of a series of changes in the relations between the labor movement and the government. In England the struggle took place mainly on the economic front. In the United States, although in some localities in certain organized trades, like the building and garment industries, working hours had been reduced to forty per week, the mass of unorganized labor with the exception of white collar workers had not won the eight-hour day or the Saturday half holiday. In the steel industry the evils of the twelve-hour day, one of the causes of the unsuccessful strike of 1919, were removed in part only after agitation by the Federal Council of Churches in 1923. For reasons which apply to all types of labor legislation in the United States the movement made little headway on the legislative front, except for groups such as women, public employees and workers in industries with special health hazards.

During the years of comparative prosperity organized labor in the United States and to some extent elsewhere once more revived the argument that increased per capita production, ascribed in part to technological improvements and in part to the increasing skill of the workers, justified a reduction in hours, since it would involve no loss in productive capacity. This argument has been attacked in revolutionary writings on the ground that increasing productive capacity would benefit the workers only in a socialist state and also because it implied "class collaboration" in the economic field. With the onset of the current depression in 1929 trade unions turned again to the argument of better distributed employment opportunities, although they opposed the "share the work" movement of certain employers, whose policy of spreading employment involved reduced wages. It is this argument of the trade unions, combined with the emphasis on the necessity of purchasing power, which has on the whole motivated the recent governmental policy of setting hours, in some instances as low as thirty-five per week, in many of the codes under the National Industrial Recovery Act.

Whatever its basic motivation or method of achievement, the short hours movement has in fact attained some of the goals set for it by labor, both revolutionary and reformist. The demand

for shorter hours has had a strong appeal in a period of rising costs of living as the most permanent gain to be obtained; and it is in fact integrally related with wage gains, since in all instances in which it has resulted from trade union action it has led to a rise in wages for the group as a whole. Whatever the rationale of the movement in various periods, its dominant impetus has always come from the basic concept of the rights of workers as producers and as members of society.

SICKEL, THEODOR (1826-1908), German historian. Sickel, the son of an Evangelical pastor, studied theology first at Halle and then at Berlin, where he came under the influence of Karl Lachmann. As a result of his connections with the young Hegelian and liberal circles during the Revolution of 1848 he found it advisable

to leave Prussia. He went to Paris in 1850, where he established contacts with the École des Chartes. He was commissioned by the French ministry of instruction to visit various archive depositories, and in this connection he traveled to Vienna. It was about this time (1855) that the Institut für Oesterreichische Geschichtsforschung, dedicated to the advancement of Austrian history, was being opened. In 1856 Sickel was appointed professor of historical auxiliary sciences, including palaeography, diplomatic and chronology, at the University of Vienna and at the institute. The extraordinary importance of his scientific, pedagogic and organizational achievements soon made him the central figure at the institute, and he served as director from 1869 to 1891. As a result of his activities the original scope of the institute was extended to make it an institution for the study of mediaeval palaeography, diplomatic and chronology. The legal historian Heinrich Brunner, the former director of the state museums in Berlin, Otto von Falke, the general director of the *Monumenta Germaniae historica*, Paul Kehr, and most of the contemporary Austrian mediaeval and modern historians were pupils of Sickel, either directly or indirectly, as members of the institute.

Sickel's scientific importance consists in the fact that he applied to the documents of the Middle Ages the method of philological criticism used by Lachmann for the literary sources of antiquity and Middle High German poetry. Thus Sickel paved the way for the successful utilization of these sources for political, but above all for legal, economic and constitutional history. His work as an organizer was also of considerable importance. When Pope Leo XIII made the Vatican archives accessible to scholars, Sickel was instrumental in inducing the Austrian government to establish the Istituto Austriaco di Studi Storici at Rome, which he directed from 1891 to 1902. At this institute the historical auxiliary sciences were applied also to modern history.

SIDGWICK, HENRY (1838-1900), English philosopher. Sidgwick, who was trained in classics and mathematics at Trinity College, Cambridge, soon turned to the study of practical philosophy (moral, political and economic). During his forty-five years of residence in Cambridge he exerted a deep influence upon both the development of university policy and the growth of philosophical studies. He played a large part in the movement for the abolition of university tests which made subscription to the articles of the Church of England necessary for full membership in the university. He helped to promote the foundation of Newnham College for women and he was one of the protagonists in the cause of the admission of women to full university rights. He served for many years on the general board of studies of the university and from 1890 to 1898 was a member of the Council of the Senate, the mainspring of university policy. But his chief concern was with the Moral Sciences Tripos, the philosophical curriculum of the university, which had been founded in 1851 and which was made a qualification for a degree in 1860. He examined for it and lectured for it; and from 1883 to 1900 as Knightbridge professor of moral philosophy he was intimately concerned with its development. He had many distinguished pupils, among them Lord Balfour and Bertrand Russell, and he left the impress of a subtle, balanced, exact and cautious mind on his pupils and on the Cambridge curriculum.

In contradistinction to his contemporary at Oxford T. H. Green, who based his philosophy on Plato and Aristotle and the German idealists, Sidgwick built upon English utilitarianism. He was opposed to any form of transcendental philosophy; and he followed English traditions of common sense and prudent realism. In his ethics he sought to reconcile Mill's utilitarianism with the philosophy of conscience and the moral imperative which had been preached by Butler and Kant. In his economics he added his own good sense and his own profound interest in social questions to the doctrines of classical po-

litical economy. In his politics he brought a study of reality and a balance of judgment to bear on the tradition of Bentham and Mill. Perhaps the influence of his personality was deeper in his lifetime than that of his writings has been on the subsequent development of ideas; but he remains one of the foremost representatives of Cambridge thought in the latter half of the nineteenth century.

ERNEST BARKER

Important works: The Methods of Ethics (London 1874, 7th ed 1901), *The Principles of Political Economy* (London 1883, 3rd ed. 1901); *The Elements of Politics* (London 1891).

SIDIS, BORIS (1867-1923), American psychopathologist. Sidis was born in Russia, came to New York in 1887 as a poor immigrant and prepared himself for college. At Harvard he attracted the favorable attention of William James, whose strong admirer he became and remained. He served as associate psychologist and psychopathologist of the Pathological Institute of the New York State Hospitals from 1896 to 1901 and was director of the Psychopathological Hospital and Psychopathological Laboratory of the New York Infirmary for Women and Children from 1901 to 1904. For five years he practised psychiatry around Boston and in 1908 he received the degree of doctor of medicine from Harvard Medical School. The following year he established the Sidis Psychotherapeutic Institute in Portsmouth, New Hampshire, where he remained until his death. During his professional career he wrote sixteen works, chiefly on phases of abnormal and social psychology. He served also for a time as editor of *Archives of Neurology and Psychopathology* and was associate editor of the *Journal of Abnormal and Social Psychology* from its foundation.

Sidis was a pioneer in the United States in the scientific study of subconscious behavior. Strongly opposed to conventional psychoanalytic theory, he sought to emphasize rather the viewpoint of environment and social psychology. He repudiated the inheritance theory of the origin of mental diseases, tracing them back for the most part to environmental conditioning in childhood. He had little use for the eugenic theory of selection. His employment of the hypnotic technique, his professional reticence, his unswerving intellectual honesty, which some-

times led him to unsparing criticisms, and his preference for the clinical as opposed to the experimental method of research (a preference traceable to James' influence) prevented his securing the academic recognition he deserved. Only one psychological journal has reviewed his theories. Sidis was one of the first to show that abnormal behavior uses the same individual mechanisms as normal behavior and differs only in social pattern. He emphasized the importance of the study of the subconscious for sociology, especially in crowd behavior, holding that man is social because he is suggestible. Fear and suggestion he considered as the chief bases of social life. He agreed with Claparède in regarding sleep as a protective rather than as a recuperative phenomenon. His theory of laughter, whereby he maintained that the risible is always the unconventional, also was sociological rather than psychological.

SIDNEY, ALGERNON (1622-83), English republican and political theorist. Although his father was earl of Leicester, Sidney took the parliamentary side in the civil war, sat in the Commons, urged the deposition—but not the trial—of Charles I, protested Cromwell's expulsion of the Rump and lived in retirement until the latter's death. The Restoration made exile seem desirable, and he remained abroad until 1677. On his return he reentered politics and, although he failed of election to Parliament, did much to organize opposition to Charles II. He was arrested as a sequel to the Rye House Plot and after a trial which, fully reported, became

one of the important documents of eighteenth century republicanism was condemned for treason and beheaded. One of the charges against him was that he had written a book proving kingship unlawful. This was the *Discourses concerning Government*, then simply in manuscript and first published, probably by Toland, in 1698. The book was hardly treasonous. Most of it was a massive refutation of Filmer—and about on Filmer's plane. Filmer's theory of patriarchal rule, for instance, was shown false in its Biblical application, because the first earthly king was Nimrod, "sixth son of Cush the son of Ham, Noah's younger and accursed son," instead of, as divine right would seem to require, a descendant in the eldest male line. Yet there was also a good deal of straightforward republican theory on parliamentary supremacy, the delegation of magisterial power by the people, the advantages of "mixed" governments and so on. The book, although less clear and coherent than Locke's political writings, served along with the latter's as an inspiration to English Whigs and as one of the chief arsenals from which the American revolutionary writers drew their arguments. But Sidney's life, trial and martyrdom probably had greater influence on republicanism in America and in France than his actual writings. In French literary societies he was, with Franklin, Washington, Voltaire and Rousseau, one of the few moderns whose bust was thought worthy of a place alongside that of Brutus. In America many a patriot who had never read the *Discourses* appealed to Sidney's memory as a symbol of defiance to tyrants. Sidney's own republicanism was of an aristocratic cast; he was neither politically nor economically a leveler. In his lack of interest in religion as in other ways he anticipated the temper of the eighteenth century.

SIEMENS, (ERNST) WERNER VON (1816-92), German industrialist and inventor. Siemens was the founder of the electrical manufacturing industry. The most catholic of industrialists in his interests, he combined successfully the business man with the natural scientist, technician and inventor. Originally an army officer, he organized in 1847 in partnership with Halske, a mechanic, the telegraph construction firm of

Siemens und Halske. The growth of the firm was definitely related to Siemens' technoscientific research work and his many inventions and discoveries. At first occupied only with the manufacture of a dial telegraph invented by Siemens, the firm rapidly developed into a producer of large technical equipment, including the apparatus for telegraph networks in Germany, Russia and India and for transatlantic cables. With Siemens' discovery of the electrodynamic principle and his invention of the dynamo in 1866 the firm expanded into the field of heavy current equipment. He demonstrated the first electric railway and contributed to the development of the electric light, the telephone and electro-chemistry. In his business activity Siemens stressed quality, not price, the supremacy of collective economic interests over private ones. He recognized the trend toward mass production and deliberately prepared the market for the acceptance of standardized mass machine products. His financial policy was to resist outside control of his business and to defend the unlimited autonomy of the industrialist—a policy maintained even after the concern became a stock company in 1892. By the time of Siemens' death the firm was Germany's leading electrical manufacturing enterprise, employed 3500 workers and had branch plants in Russia and England. After the World War it was still under family control, employing a maximum of 137,000 workers in its domestic and foreign branches.

Siemens was one of the founders of the German Progressive party (later the National Liberal party), the political expression of the large industrialists. He was an unswerving opponent of strikes, which he considered harmful to employers and employees as well as to the community. In 1891 he introduced the 8½-hour day, at a time when 10 hours and more constituted the standard working day in Germany. Before the adoption of legislation to this effect, he established a system of profit sharing and a fund for pensions and widows. These reforms, calculated to develop a stable and efficient working force, Siemens considered "healthy egoism"—cultivation of the workers in the interests of the factory owner himself. "Reform," he said, "raises the productive capacity of an enterprise," and he advocated reform only as long as it did so. This sums up both the justification and limitation of paternalistic reform.

SIÉYÈS, ABBÉ JOSEPH EMMANUEL (1748-1836), French statesman and political writer. Siéyès was born at Fréjus. Until his fortieth year he was virtually unknown save to his fellow ecclesiastics and a small circle of *philosophes*, but in 1789 he gained a renown which clung to him long after his popularity and influence had waned and political reverses had driven him into retirement and exile. Forced to pursue an ecclesiastical career against his wishes and ordained a priest in 1773, Siéyès remained in the church, at least nominally, until the later revolution. In the decade and a half immediately preceding the events of the revolution he subscribed in ever increasing measure to the regnant views of the *philosophes*, and on the basis of his faith in rationalism, natural law, human progress and perfectibility he built a comprehensive political and social system. His possession of a fully elaborated scheme of reform stood him in good stead in the exciting years of 1788-89, and early in the latter year he found himself popular and famous virtually overnight. This he owed to the publication of four pamphlets, in particular to that masterpiece of polemical writing, *Qu'est-ce que le tiers-état?* (Paris 1789, new ed. 1822). Here he raised demands which were applauded to the echo throughout France—demands for a declaration of rights and a written constitution, for the establishment of a system of representative government, for the separation of the legislative power from the executive.

The third estate of Paris elected him to the Estates General, where he at once played a decisive role in creating the National Assembly. His immense reputation and his membership in the first three committees on the constitution enabled him to impress the essentials of his political and social scheme on the completed constitution of 1791. The peak of his influence was reached in the summer of 1790, and his active political career ended definitely with the coup

of Brumaire in 1799, which his scheming made possible. Although a member of the National Convention (1792-95) and of the Council of Five Hundred (1795-99) and one of the five directors (1799) he played no real part in the events covered by those years. In that period, when not in deliberate retirement, he executed policies not of his making and enunciated views, on popular education, universal military training, the relations of church and state, foreign policy, which link him definitely with the pronounced nationalist spirit of the age.

G., *Sieyès, His Life and His Nationalism*, Columbia University, Studies in History, Economics and Public Law, no. 362 (New York 1932), Sainte-Beuve, C. A., *Causeries du lundi*, 15 vols. (new ed. Paris 1857-62) vol. v, p. 189-216.

SIGHELE, SCIPIO (1868-1913), Italian sociologist. A disciple of Enrico Ferri, Sighele achieved fame as a young man through his *La folla delinquente* (Turin 1892; 5th ed. as *Delitti della folla*, 1923). This was followed by numerous other works on sociology and especially criminology as well as by psychological and literary essays on such questions as love, feminine psychology and the crisis of infancy, which brought him wide renown as a publicist.

Developing an idea which he credited to Ferri, Sighele pointed out the difference between the psychology of the people, or social psychology, the foundation of sociology, and collective psychology, the study of temporary aggregates, particularly the unorganized and heterogeneous, like crowds. In *Delitti della folla* he clarified the phenomenon of suggestion by the ringleaders, its effect upon the crowd and the consequent reaction upon the former. The fact that man is agitated by the suggestion of a tumultuous crowd, he held, implies lessened psychical control and therefore ought to be taken into account as a circumstance minimizing penal responsibility, a thesis which has attained legal application, as in article 62, section 3, of the Italian Penal Code of 1930. Continuing to study joint crime in general and criminal society in particular in *La coppia criminale* (Turin 1893, 3rd ed. 1909), Sighele distinguished in any pair of criminals an individual who dominates (*incube*) and an individual who follows (*succube*). In his *Delinquenza settaria* (Milan 1897; new ed. as *Morale privata e morale politica*, 1913) he pointed out the difference between private and public morality and the inferiority of the latter.

In accordance with his psychological premises Sighele attacked not democracy but parliamentarism. He was an early advocate of Italian nationalism, which he conceived as an energetic patriotism, but he left the nationalist movement about 1912 when he thought that it assumed a reactionary and antidemocratic position. He was accustomed to spend much time in his native Trentino, which was then outside the boundaries of Italy; for his nationalist propaganda, especially effective among young people, he was expelled from Austria in 1912.

SIGMAN, MORRIS (1881-1931), American Jewish labor leader. Born in a Rumanian village, Sigman after a year in London came to New York in 1903. Here he organized a unit of cloak makers which joined first with DeLeon's Socialist Trade and Labor Alliance and later became a unit of the Industrial Workers of the World. The injection of political issues, however, led Sigman to affiliate with the International Ladies' Garment Workers' Union. Although he later became a Socialist, he fought attempts on the part of any political party to dominate union affairs. As manager of the New York joint board of cloak makers, then the most important unit in the national union, of which he was also an officer (1910-15), he led the successful strikes of 1910 and 1914 and introduced internal reforms and trade union benefits. Indicted on a charge of murder in connection with the 1910 strike, he spent several months in jail but was acquitted. Upon his return to the managership of the cloak makers' board in 1917 his militant leadership led to the strengthening of union forces and the scrapping of the vicious piecework system. His continual struggle against bureaucratic and selfish craft interests, which resulted in his resignation in 1921, led the progressive elements within the union to call on him to take the international presidency in 1923. Sigman's struggle first against Communist party domination of the union, which led to the dis-

astrous strike of 1926, and later against dual unionism for a while completely overshadowed recognition of his fight against reactionary right wing elements, against high salaries for officials and in favor of a more aggressive campaign among women and Negro workers as well as his sound program for economic reorganization of the industry. When in 1929 certain reactionary elements to some extent regained their hold on the union membership, Sigman resigned his position. After having returned to the shop as a rank and file worker he died in 1931 in New York. The policies which Sigman advocated have now become the accepted program for the union, which has recently regained and strengthened its position.

SILK INDUSTRY. The most beautiful and highly prized of all materials used in the making of clothing, silk is also the strongest fiber known to man. With all its skill science has never been able to produce a thread as strong, elastic and durable. Because of its fineness, strength and luster as well as its receptivity to rich and delicate dyes silk has enabled the weaver and embroiderer to produce the most elaborate ornamental designs and has added considerably to the wealth of the decorative arts. Its products play an important part not only in daily life as articles of dress but also in the progress of medical and electrical sciences. During the World War it was found indispensable for the production of war supplies, such as cartridge bags, balloons, parachutes and the like. Because of its high price silk was originally beyond the reach of all but a small number of purchasers; its use has since been extended by the economies of modern high speed power looms and by its intermixture with less expensive fibers. While it is the most valuable for its properties, raw silk constitutes only 1 percent of the total world production of all textile fibers; cotton, hemp, wool and rayon account for 64, 23, 9 and 3 percent respectively.

Silk culture is apparently of Chinese origin and dates back for many centuries. The empress Si-Ling-Chi, wife of the emperor Hoang-Ti of China, is said to have originated the silk industry about 2700 B.C. A voluminous ancient literature testifies not only to the antiquity but to the importance of Chinese sericulture and the care

and attention bestowed on it by royal and noble families. It gave employment to multitudes of people and profoundly influenced secular and religious customs. Although the Chinese kept silk culture a profound secret for several centuries, the knowledge spread gradually to other countries. About 199 A.D. it was carried to Japan by Koma-O, a Chinese subject. Later through the influx of Chinese and Korean immigrants and the encouragement given by successive emperors it was firmly established in Japan. About the fourth century the art of producing silk was well known in India and in central Asia, where it appears to have been introduced overland from China. There is evidence that silks were imported into the Mediterranean countries before 400 B.C. At that time of course there was no direct trade between the Mediterranean and China. The Romans bought their silks from the Persians, who in turn got them from northern India. Rome tried to limit the use of silk, but the effort failed; wealthy citizens even buried their dead in silk robes. In addition to the high price of silks in China the fact that all silks were imported over thousands of miles of difficult and dangerous caravan routes made them extravagances even for emperors. Persians held a monopoly of this lucrative trade, and silk importations caused a heavy drain on the gold of Rome for many years. Later on the silk trade changed its channel and the sea route over the Indian Ocean became popular. Alexandria became the central distribution point for southern Europe. At the beginning of the sixth century A.D. the emperor Justinian imposed heavy duties on silks in order to check their inflow into the Roman Empire. Moreover in the sixth century Justinian engaged in wars with the Persians and thus cut off that source of silk supply. At that time no one, on pain of death, was allowed to export silkworm eggs from China. In the middle of the sixth century, however, two Nestorian monks bribed by Justinian succeeded in bringing eggs and all necessary information about silk culture from China. Justinian held a monopoly of the trade and encouraged the extension of the industry. Nevertheless, silk culture spread but slowly from Constantinople throughout Greece. The conquering Arabs after the seventh century introduced it to Algeria and Morocco. As late as 1146 there was apparently no silk produced in Europe outside of the Greek Empire except by the Saracens in Sicily and southern Spain. The successful introduction of silk into the rest of southern Europe was largely the result of several

minor wars and of the crusades. In 1146 Roger, the first Norman king of Sicily, waged a war against the Greek Empire and during its progress carried off a large number of silk raisers and weavers to Palermo in Sicily. In a similar manner the Venetians in 1203 through their victories over the Greek Empire acquired a number of the best silk districts of Greece. From Venice the industry spread throughout Italy, which reaped a rich harvest from this industrial and commercial development and became famous for its beautiful woven silks. Silk goods developed a rare artistic quality and were worn exclusively by the nobles and wealthy merchants. The guilds of silk weavers played an important part in the commercial and political activities of the Italian city-states.

Although in early periods several attempts had been made to develop a silk industry in France, it was Henry IV who really established sericulture in 1603. Colbert, in line with the mercantilist policy of other European countries, encouraged the development of silk culture, and the textures of Lyons and Tours became famous. The industry was, however, hard hit by the revocation of the Edict of Nantes in 1685. This drove some 400,000 Huguenots from France, many thousands of whom were engaged in the production and weaving of silk. Many settled in other countries, notably England, Switzerland and Germany, where they gave a tremendous impetus to the growth of silk manufacture. At the beginning of the nineteenth century the invention of the Jacquard loom provided a new stimulus for the silk industry of France and especially for that of Lyons, the main center of manufacture.

The manufacture of silk seems to have existed in England as early as 1363, when it is mentioned in an act of Parliament. There was a guild of silk throwsters at Spitalfields in 1562. The influx of Flemish weavers about 1585 gave a powerful stimulus to English silk manufacture. As the demand for raw silk increased, James I tried to establish a native silk culture, but with little success. This demand for raw silk, however, was supplied by the East India Company, which then monopolized silk culture in Bengal. Later the influx of the Huguenot weavers finally established the industry, which during the fifteenth century was favored by absolute prohibition of the import of silk goods. Another important event in this connection was the erection of a silk throwing mill at Derby by Lombe about 1718, which made it possible for England to

compete with the industry in foreign countries. This development was strengthened by the easing of the protective system in 1824. But the commercial treaty with France in 1860, which completely abolished the duty on silk goods, proved disastrous to the English silk industry, and with the opening of the Suez Canal in 1869 the center of the silk market was moved from London to Lyons.

The eighteenth century was marked by epoch making inventions for improved textile production. They signaled the real beginning of the factory system and ushered in the industrial revolution. The Jacquard loom was the most important for the silk industry and was followed by the mechanization of other silk manufacturing processes. It must be remembered, however, that since silk required much more delicate handling than either cotton or wool, most of the textile inventions were in use in the cotton mills some twenty years before it was found feasible to apply them to silk.

In 1623 James I tried to encourage the production of raw silk in the North American colonies, especially in Virginia and Georgia, but with little success. In the beginning of the nineteenth century silk culture was revived in the United States. From 1836 to 1839 there was a silk boom, called the *Morus Multicaulis* speculation. For a time it seemed as though the whole country were turning to silk culture. Then suddenly the boom collapsed, although interest did not completely disappear. In addition to the encouragement to the development of sericulture by both federal and state governments in the form of bounties and appropriations, many individuals and associations were organized to this end. In the 1860's the raising of silkworms was introduced into California, which was found to have a suitable climate. It soon became apparent that both the soil and the climate of many parts of the country were favorable to the production of a superior quality of silk. But economic conditions prevented the establishment of the industry on a profitable basis. Tobacco in Virginia and cotton in Georgia were more profitable than silk culture. Moreover the fact that labor costs are much greater than in Japan, China or Italy has made wide scale silk cultivation impracticable in the United States. After having failed in the raising of cocoons the American people turned their attention to the manufacture of silk goods. The great development in this field was accelerated by the high protective tariff policy. At present the United States is the

largest silk manufacturing country in the world, producing silk goods and rayon amounting to over \$700,000,000 in 1929.

There are three main sources from which the consuming markets of the world now receive their supplies of raw silk (Table 1). The most

important source is the Far East, particularly Japan, China and India. Japan and China are now the principal suppliers of the world's requirements of raw silk. India has lost its former position of importance because of the prevalence of various diseases among the silkworms. The second important source is Europe, where Italy is the chief silk producing country with France a poor second. Russia, Austria, Hungary and Spain are also producers of raw silk, but the supplies from these countries do not play a very important part in the world's silk market. The third source is Asia Minor and the Levant, but these sections of the world have receded in significance in recent years.

Since the total production of raw silk in Asia is an unknown quantity, export figures have been used in Table 1. It is estimated, however, that in 1929-30 70 percent of the Japanese production and 45 percent of the total Chinese production were exported, indicating crops of 33,957,000 pounds and 44,440,000 pounds respectively. In the same year Italy exported 65 percent of its production, while France imported 96 percent of its consumption requirements. The total world production of raw silk in 1929-30 amounted to 153,488,000 pounds, about 50 percent being consumed in America and about 60 percent produced in Japan.

Since the 1870's there has been both a rapid

increase in output and a shift in production supremacy from Europe to the Far East. In 1871-75 the oriental production constituted 54 percent, while in 1929-30 it accounted for 85 percent of the world total. Three factors seem to have contributed to the decline of European silk production: the spread of mulberry tree parasites and silkworm diseases; the higher wages and more attractive work in manufacturing plants; and the emigration of many silk workers. Above all, the higher wages paid to the silk workers made it difficult to compete with oriental countries. In the beginning of the last century China was the main exporting country, with Japan and India in second and third place respectively. In the first decade of the present century, however, Japanese exports surpassed those of China. This lead was increased, and finally in 1930-31 Japanese exports constituted 66 percent of the total silk estimated as available for consumption in America and Europe.

In line with the policy of creating its own independent sources of raw materials for the textile industry the Soviet Union has made the cultivation of silk part of its planned economic program. State and collective silkworm farms have been established, with silk mills erected close by. In 1931 the Soviet Union produced 860 metric tons of raw silk, double the pre-war figure. The entire Soviet consumption of silk is now supplied from domestic sources; before the World War Russia imported 80 percent of its silk; in addition 123 tons of raw silk were exported in 1931 as well as a large amount of mulberry tree seed, which was formerly imported. A central institute of sericulture in Moscow is given over to the scientific study of the industry's problems and to the training of lecturers and experimenters.

For a time the raw silk industry was threatened with extermination in France and Italy, where beginning in 1853 the pebrine disease spread through the silk districts killing the worms. The French and the Italian producers finally turned to Japan for healthy stock to rebuild their industry. In 1875 the method discovered by Pasteur of controlling the pebrine disease was in general use, and thereafter importation of eggs ceased. Developed for the production of eggs, the Japanese silk industry now had to find other means of maintenance. At this time the United States was importing an inferior quality of Chinese raw silk; Japan thereupon set out to produce raw silk which would meet American needs. As a result Japanese exports of

raw silk to the United States increased by leaps and bounds (Table II); this country absorbed 95

percent of Japan's silk exports in 1930. Total American imports of silk in 1929 were valued at \$32,300,000, whereas the yearly average in 1910-14 was \$79,500,000. Imports from Japan increased not only absolutely but also in relation to those from other countries. Before the World War Italy supplied about 10 percent of American imports, China 20 percent and Japan 60 percent; in 1930 the respective proportions were 4 percent, 16 percent and 79 percent.

The silk industry plays an extremely important part in the economic life of Japan. Over 2,000,000 farmers, or about 40 percent of the total number of farmers, are engaged in sericulture, employing about 600,000 farm hands. In 1932 mulberry plantations covered about 1,612,594 acres, about 30 percent of the total cultivated area of Japan, excluding rice fields. About 500,000 operatives are engaged in the silk reeling industry, constituting about 20 percent of all the factory workers. The commanding position which Japan now occupies in the world's silk industry depends in part upon a climate favorable to the mulberry and to the cocoon and in part upon cheap labor. While China has as favorable a climate and much cheaper labor, Japan has secured the virtual monopoly of the silk trade through efforts of the government and of producers to improve quality. Raw silk constitutes from 30 to 40 percent of the export trade of Japan and over 95 percent of it goes to the United States. Dependent upon one commodity and one market, the economic stability of the nation is endangered. Largely because of the rapid growth of sericulture there has been difficulty of recent years in disposing of the raw silk crop at profitable prices; this has led the government to introduce measures for price stabilization, but not limitation of production.

Two dangers threaten the raw silk trade of

Japan: the rapid development of rayon and the growth of the silk industry in China. In 1919 the world consumption of rayon was estimated at about 44,500,000 pounds; in 1931 it was 468,000,000 pounds, over a tenfold increase in twelve years. A few years ago rayon had only a limited use because of its inferior quality. This has since been improved. At present more-over durability and tensile strength are of less importance because of the rapidity with which present day fashions change. In addition to the relative cheapness of rayon in comparison with silk the fact that its price is not subject to marked fluctuations has contributed to its increased utilization in recent years. In spite of the enormous rise in the use of rayon for silk the amount of silk consumed has likewise increased, although not so rapidly as in former years. The reasons for this growth are principally the fall in the price of raw silk, progress in productive technique and higher standards of living. It is now impossible for prices of silk to rise to high peaks in periods of low supply, since buyers may turn to rayon. In the past rayon affected cotton goods more than silk. But since the depression which set in after 1929 the lower price and improved quality of rayon have made serious incursions into the silk trade. Reduction of the cost of silk production is considered the most effective way of meeting this competition. The improvement of silkworm eggs, the industrialization of cocoon raising, the utilization of by-products and similar measures of rationalization are being seriously considered and to a certain extent introduced, especially in Japan.

During the first half of the nineteenth century the largest raw silk market was London. The opening of the Suez Canal in 1869, however, shifted the center of the silk market from London to Lyons. In 1867 the China line of the Pacific Mail Steamship Company was opened, and two years later the Union Pacific Railroad was completed. These new transportation facilities made it possible for the United States to import raw silk directly from the Orient. New York has since become the world's largest silk market.

The gap between the American manufacturer and the Japanese silk grower is spanned by a highly organized system of marketing. The farmer sells his cocoons to the reeler, who ordinarily is financed by *tonya*, or commission merchants, in Yokohama or Kobe. The reeler pays a high rate of interest and is obliged to ship raw silk in return for the money advanced. In man-

instances the amount of the loan is such that the creditor virtually controls the sale of the raw silk. The farmer is at the mercy of the reeler in the same way that the reeler is at the mercy of *tonya*. Cooperative associations have been formed for the purpose of selling raw silk and of financing the farmers, and some progress has been made in this direction. The exporter in Yokohama buys raw silk from *tonya* and sells it to the importer in New York, who in turn sells it to the manufacturer directly or through a dealer or broker. The basis for quotations for raw silk is a bale in Yokohama and Kobe, a pound in New York and a kilogram in Europe. The weight of a bale differs in silk producing centers: in Japan and Shanghai, 133½ pounds, Europe 222½ pounds and Canton 106½ pounds. Both in Yokohama and in New York there are exchanges for raw silk transactions. Raw silk is sold for cash in Europe as well as in every market of the world. Long credits extended in the New York market are often considered the cause of overproduction and consequent business failures.

The price of silk varies widely from year to year. The fluctuation of raw silk prices, however, arises from the nature of the demand for and supply of raw silk. Raw silk production is greatly influenced by changes in weather, while the demand for silk goods is largely subject to changes in fashion. In recent years prices of raw silk have been relatively stable chiefly as a result of stabilization in production by development of a summer and an autumn crop, improvement in systematic cocoon transactions among farmers, modifications of the Yokohama exchange, development of the rayon industry and better knowledge of the market on the part of American manufacturers and Japanese reelers.

Sericulture is a small household industry all over the world, carried on by farmers and their families. It has never succeeded on a large scale because of the care and attention required. Not much machinery can be used in silk raising. Generally four or five members of a family participate in the production of cocoons; this united labor force increases the output of the produce and allows the head of the family to engage in other agricultural work. Its great economic advantage lies in the utilization of any surplus labor in the family.

In Italy and France silk culture is subsidiary to fruit raising and other forms of farming. In Japan it is second only to rice growing. In each country sericulture is concentrated in particular

districts where favorable climatic and economic conditions prevail. The most important requirement today in the culture of silk is abundance of cheap labor; and in this respect Japan and China have a decided advantage over France and Italy. Moreover in the Orient much more than in Europe the entire cocoon output is produced as a secondary farming occupation. Any income above the cost of eggs and the rent of the mulberry land is considered as profit. The labor of the farmer's wife and children is not included in the costs.

Before the beginning of the nineteenth century the reeling of silk was a widely scattered industry; it had no proper organization and was more or less confused with other agricultural occupations. In the beginning of the nineteenth century reeling by individual unit began to disappear in France and Italy and the new system of modern filature was begun. Although reeling has become very largely a factory industry, the manufacturing process is a comparatively simple mechanical one requiring little power and no complicated machinery. The special skill of the filature operators and the extreme deftness of their treatment of the delicate fiber have become an important factor in the development of the internal organization of the industry. In the Orient raw silk is manufactured either with power reeling machines or with hand reeling apparatus. In Japan the first modern factory was established in 1872. Today over 90 percent of the reeling in Japan is by power driven reels in factories.

Realizing the inadvisability of relying on one country for such an important material as raw silk American manufacturers have sought other sources to insure a steady supply of the raw material. India, Latin America, the Levant and China are considered to have possibilities in this direction. Among these China is regarded as the most promising. In China sericulture is as important a part of the economic life of the farmer as it is in Japan, but it yields a smaller return largely because of unsettled political conditions; lack of an organized market for the export of raw silk; and the conservatism of the Chinese, which militates against application of progressive and scientific methods. American manufacturers have recently endeavored to develop Chinese sericulture with the cooperation of native producers. Their activities are concentrated on the elimination of silkworm disease, the establishment of sericulture in suitable regions, the founding of sericultural schools and the

extension of power reeling in factories. There are ample possibilities for the development of the silk industry in China with its large areas suitable for the cultivation of the mulberry and its quantities of cheap labor. The Chinese product is being improved and exports to the United States are increasing. But progress along this line must inevitably be slow, depending as it does upon the speed with which the Chinese adopt modern scientific methods.

SILVER. From time immemorial silver has been treasured by man as ornament and store of wealth. Its popularity has been confined to no one race or continent, for its natural qualities are universally appreciated. As a store of value it is used chiefly in Asia. Almost all countries employ it in the form of coin. In the arts its chief use is in the chemical industries, particularly photographic film manufacture.

Historically silver has been bound up with the development of mining, commerce and exploration. It was a most important source of wealth in the ancient world, especially in Greece and Spain. Along with copper, silver was a valued product of the renaissance of mining in the late mediaeval and early modern periods, particularly in south Germany and Spain. Both the

monetary uses of silver and its influence—with mining in general—on the forms of capitalist organization contributed greatly to the commercial expansion of the sixteenth and seventeenth centuries, facilitated by the influx of silver (and gold) from the New World.

As money silver has been used continuously for centuries. It was the chief European form of coinage from the end of the Middle Ages to the second half of the nineteenth century. Today it is China's standard measure of value, but in most occidental countries the "white metal" for decades has been subordinate to gold. In England silver yielded first place to gold as long ago as 1816, but general abandonment of silver as standard metal did not set in until after the Franco-Prussian War. The early 1870's witnessed the break up of bimetalism, as one country after another closed its mints to the free coinage of silver. The important discoveries of gold in California and Australia about the middle of the century made gold more plentiful and thus disturbed the market ratio of silver and gold. Silver tended to disappear from circulation. Later new silver mines were discovered and the silver question came into being. Unification of Germany's currency with the creation of the empire was an important factor in the decline of silver, for following the war of 1870-71 Germany used the French indemnity to set up the gold standard and followed with large sales of demonetized silver during the next three decades. The United States in 1873 closed the mints to free coinage of silver. A few years later, when mining and agrarian interests demanded "easy money," it purchased silver and coined standard dollars in quantity from 1878 to 1893; but it never remonetized the metal. In the Latin countries silver coinage was restricted in 1874 and in Holland and Italy in 1875. In 1877 the Latin Union closed the mints completely to silver. Other countries followed and the remainder of the century saw the rapid spread of the gold standard; even India abandoned free coinage of silver permanently in 1893. There had been frequent international negotiations and conferences looking toward the reestablishment of bimetalism, but all such efforts failed. In the United States William Jennings Bryan's defeat on the issue of greater silver coinage in 1896, soon followed by the Alaska gold discoveries, constituted the last important effort in this direction for many years.

The progressive abandonment of silver, accompanied by frequent sales of demonetized

coin, caused the price to decline after 1873 and particularly from 1890 to 1902. During the World War it rose rapidly, but it dropped sharply in 1920-21 and again in 1930-32. In contrast to the fluctuations of its price silver's value in relation to other commodities showed a more uniform trend, consistently downward. In the United States the purchasing power of silver definitely began to decline in 1890 and with interruptions continued to shrink until 1933.

Silver is mined mainly in the western hemisphere. The leading producing countries, with their estimated 1933 production, are as follows: Mexico, 69,100,000 troy ounces; United States, 21,400,000; Canada, 15,400,000; South America (chiefly Peru and Bolivia), 13,500,000; other countries, 43,600,000. Although the United States accounts for less than 15 percent of the total of 163,000,000 ounces, American capital controls an estimated 66 percent of the world's mine output and 73 percent of the refinery output of silver.

In addition to new production there is marketed each year a certain amount of old silver obtained from melted coin, ornaments and the like. These other supplies are irregular in amount. Thus in 1932 and 1933 the Soviet Union sold an estimated 57,000,000 ounces, and since 1926 the British Indian Treasury has disposed of no less than 205,000,000 ounces, obtained from melted rupee coins. Demonetized silver from all sources sold by Europe, French Indo-China and British India from 1920 to 1933 aggregated over 650,000,000 ounces.

The production of silver, unlike that of other commodities, cannot respond closely to price changes because about three quarters of the amount mined is produced in conjunction with lead, copper, zinc and other metals. Not much more than one quarter of the world's output is from silver ores with 80 percent or more silver content; almost one third is produced from ores with not more than 20 percent of their value in recoverable silver. When these base metals increase in output, silver is mined with little regard to its market price. For this reason control of silver production is hardly feasible, and price regulation through such control is no solution when the price declines. Another factor affecting the price is China's balance of payments. Since silver is China's standard money, anything which tends to make the international value of Chinese money rise or fall has a precisely similar effect on the price of silver. Thus, for example, if China's *yuan* declines, a New York arbitrageur

can profitably buy Chinese exchange, simultaneously sell silver futures in New York, then convert the Chinese exchange into bullion, bring it to New York and, by using it as "delivery" against his forward sale, realize a profit. Operations such as this will soon end the disalignment caused by the original drop in silver. Hence silver and Chinese exchange move in close accord, and control of the one implies control of the other.

Usually most of the silver marketed finds its way to Asia. In 1933, however, American agitation for governmental purchases, the conclusion at London of an agreement whereby leading producing countries were to withdraw their own production from the market over a four-year period and other factors all resulted in heavy speculative accumulations of the metal. By March, 1934, 200,000,000 ounces were estimated to be warehoused in New York alone. Some of this rapidly amassed silver naturally had to come from old supplies, including Chinese stocks; thus in 1933 for the first time since 1917 China became a net exporter of the metal.

The distribution of the demand for silver varies from year to year. The following percentages represent the absorption of world supply in 1930, here cited as typical of recent times: India, 30; China, 39; industries in the United States, Canada and Great Britain, 11; coinage and other uses, 20. China's consumption supplied both its monetary needs and the demand for a medium for saving, the Chinese hoarding the metal in the forms of bullion, coin and often ornaments. India's demand is primarily for hoarding, particularly in the form of articles of personal adornment. Any requirement of additional silver as a circulating medium can at present be supplied by the reserves of the Indian Treasury.

The most recent period of silver agitation dates from 1930, when as a result of the world wide business depression the price of silver depreciated rapidly. There is very strong evidence that the shrinkage in Chinese demand for silver—a most important factor in the price—was a result of reduced foreign purchases of Chinese exports. Accordingly Chinese oversea funds available for silver purchases fell, and the regular movement of silver to China slowed down. Meanwhile continued large sales of demonetized silver by the governments of India, Indo-China and other countries after 1926 contributed to its price decline. Silver looked for new markets.

Persons interested in the metal urged that it be used more extensively as currency, at least as subsidiary metal. As the depression deepened, its use as a basic metal was advocated. The principal arguments advanced were that the decline of silver meant a proportionate drop in oriental purchasing power and that a gold shortage confronted the world, causing depression; such shortage was to be remedied by a broadening of the currency base through the addition of silver. Subscribing to one or the other of these arguments were various groups not directly concerned with silver production. Many interested merely in exporting goods to China felt that the purchasing power argument was a sound one. Others supported the silver thesis in one form or another on general principles, as an inflationary step. Throughout the period 1930-33 there was active agitation in the Congress of the United States, the chief protagonists being various senators from Rocky Mountain states producing silver, influential men occupying key committee posts. Their views accordingly received wide circulation and encountered little opposition. For long, domestic action to aid silver seemed unobtainable; an international silver conference was therefore urged and money to send delegates eventually appropriated. But European nations were apathetic, for they produced very little silver and held it impractical to attempt control of the price of a metal whose output could not be regulated.

This was the situation when, toward the end of 1932, preparations were initiated for an international economic conference at London. In accepting the invitation to the conference the United States government stipulated that silver be placed on the agenda. Thus at London Senator Pittman of Nevada, one of the American delegates and chairman of the Senate Committee on Foreign Relations, successfully obtained an agreement with seven foreign governments. The main provision was that the governments of five leading producing countries during a four-year period should buy 35,000,000 ounces of silver per year and keep it off the market. The American share was 24,421,410 ounces per year. Pursuant to this agreement President Roosevelt on December 21, 1933, proclaimed ratification and opened the mints to the entire American output for four years on a basis which would yield to producers 64.64 cents per ounce, or about 50 percent above the prevailing market price. In addition all the delegations at the London conference subscribed to a general reso-

lution on silver but made no specific commitments.

That silver has a direct bearing on the external purchasing power of a silver exporting country like Mexico is self-evident. China's case is different. Because China's monetary unit is a weight of silver and appreciates on the world market whenever silver does, the argument has often been made that to increase the price of silver is to augment China's purchasing power abroad. However, a nation's purchasing power is not inherent in the purchasing power of its medium of exchange. So long as China on net balance imports silver which it must necessarily pay for out of the proceeds of goods and services sold to foreigners, silver is the thing bought, not the thing bought with; and "higher silver" means that China can afford to buy less of it. On the other hand, when the price of silver is rapidly raised to such an extent that silver can be exported from China profitably, China's ability to purchase goods abroad is to that extent enhanced. Chinese observers hold, however, that such a movement has an undesirable deflationary effect on the domestic market, since it reduces China's monetary stock. Careful examination of Chinese trade figures fails to bear out the contention that a declining price of silver caused the drop in Chinese imports; rather the reverse. Moreover restoration of the trade of China and all so-called silver using countries to predepression levels would still play but a very small part in restoring world trade as a whole to its predepression volume.

Considerable misunderstanding prevails regarding the portion of the commercial world using silver as standard of value. Such territory includes only China, Hongkong, Macao and Manchuria. India, Mexico and South America are excluded, despite an extensive use of subsidiary silver coinage. To call these silver using countries in connection with the purchasing power argument is erroneous. Indeed one of the largest silver using countries is the United States itself.

As to the supposed need for adopting silver-gold bimetalism, or symmetallism, so as to broaden the monetary base, the necessity for such action would seem to depend upon proof of inadequacy of the world's existing gold stock. Such inadequacy has never been self-evident. At any rate, the recent devaluation of currencies in most countries cannot but have relieved the need for more metallic reserves for a long time to come.

So long as the economic depression continues in severity, agitation for more extensive use of silver as currency seems likely to continue in the United States and Mexico; and should it be prolonged, some additional success for the movement may be expected. Greater employment of silver as subsidiary currency has indeed commenced in various countries; also some governments permit inclusion of silver in the monetary reserves. That this use of silver will expand moderately with the passage of time seems not unlikely.

ŠIMÁČEK, FRANTIŠEK (1834-85), Czech cooperative leader and journalist. During his student days in Prague Šimáček published anonymously several articles advocating economic action, especially through cooperative associations, as a solution of some of the problems confronting the Czech nation. During the period of Austrian absolutism under Bach he founded in 1857 *Posel z Prahy* (The herald of Prague), a periodical in which he carried on energetic propaganda for the establishment of credit societies on the Schulze-Delitzsch model. His appeal met with a quick response in artisan circles, and the first Czech credit society was created in 1858 at Vlašim in central Bohemia by the shoemaker Jan Platenik. Although this cooperative society was not legalized until 1860, it served immediately as the pattern for others, so that by 1863 Šimáček estimated that there were 52 credit societies in Bohemia and Moravia; and by 1874 the number in Bohemia alone was 307, of which 226 were Czech and 81 German. This growth was all the more remarkable in the light of the oppressive measures of the Austrian government and the Viennese bank crisis of 1873.

Šimáček's contribution was singularly important both to the cooperative movement and to Czech independence. Not only did the credit societies, in the absence of any national credit institutions, fulfil a necessary function, but economic mutual help was the first field in which the struggle of the Czech nation for independence found self-expression. When in 1863 Šimáček transformed his periodical into a weekly political and social review, it became the vehicle for the propaganda of Kampelík, founder of the first rural cooperative banks in Bohemia, and for information regarding consumers' cooperatives in other countries. According to Šimáček the most vital function of cooperative effort was the restoration to labor of those essential rights of which it had been deprived by capitalism. Šimáček was twice imprisoned by the Austrian government, in 1861 and again in 1868; but he continued his activities until 1882, when he established a private publishing firm.

V. TOTOMIANZ

SIMMEL, GEORG (1858-1918), German philosopher and sociologist. As is clearly evidenced in his most important philosophical work, *Lebensanschauung; Vier metaphysische Kapitel* (Munich 1918, 2nd ed. 1922), Simmel is to be grouped with the "philosophy of life" (*Lebensphilosophie*) school. It was in connection with his general philosophy and more particularly with his epistemology that his sociological views were evolved. In his early *Die Probleme der Geschichtsphilosophie* (Leipzig 1892, 5th ed. Munich 1923) he took the position that such general concepts as progress, general welfare, freedom and society, which were being used by philosophers of the period, were from an epistemological point of view inadequate. For the unity of the object which all these concepts take for granted does not as a matter of fact exist: it is merely an illusion attributable to a lack of proper dissection. Such a dissection of complex phenomena constituted for Simmel a prerequisite of scientific knowledge.

According to Simmel this is particularly true in the case of the concept of society and in the realm of social reality, each of which must be reduced to its individual components. The individual alone is real: neither society nor group is imbued with genuine unity. The true essence of society or group consists in that interworking of individuals which is able to invest its regularity and comparative homogeneity with the semblance of real unity. Although Simmel occasionally referred to such facts as the independent life of the group or the objective spirit, he never allowed himself to be influenced by them in his conception as a whole. To a much greater extent he expresses an outspoken individualistic point of view, in which he was followed by the school of German sociologists, typified by von Wiese; while others, as, for example, Spann and Vierkandt, represent the universalistic approach.

In both his *Soziologie* (Leipzig 1908, 2nd ed. 1922; ch. iii tr. by A. W. Small in *American Journal of Sociology*, vol. ii, 1896-97, p. 167-89, 392-415) and his *Grundfragen der Soziologie* (Berlin 1917) Simmel maintained that of all the various types of problems with which the discipline has to deal the most important is "formal" sociology or, in other words, the theory of the "forms" of association. From the heterogeneous stuff of social life it is possible to isolate certain elementary and invariable forms of this type, such as subjection, prestige, grant, contract and competition. In a series of separate essays

Simmel treats a number of such forms, illustrating each with a wealth of examples drawn from the most varied periods and cultures. Inasmuch, however, as he failed to make due allowance for the fact that general concepts vary in accordance with particular historical complexes, his "sociological" writings tend merely to pile up examples without really digesting them and therefore often seem amateurish in character. This tendency has not been without its effect on later German sociology, the development of which until recently was deeply influenced by the formalistic system.

In his *Philosophie des Geldes* (Leipzig 1900) Simmel attributes the peculiarities of the capitalist way of life—which in company with Sombart, Scheler and Hammacher he identifies primarily with rationalism and individualism—to the nature of money; that is, of the modern money economy. In thus deriving the spirit of modern culture from the form of the economic system he seems to be lending countenance to historical materialism. But as a matter of fact his work is a refutation of such a philosophy, since for him the ultimate source of all spirit is to be traced to the general peculiarities of ways of thinking and standards of living, which are the real determinants of the economic system no less than of spiritual culture.

SIMON, JULES (1814-96), French statesman. At the time of his election in 1848 as deputy to the Constituent Assembly, Simon was professor of philosophy at the Sorbonne; but three years later as a result of his protest against the coup d'état of December 2 he was forced to resign his chair. During the ensuing decade he wrote and published a number of works on ethics, political theory and social science, notably *La liberté* (2 vols., Paris 1859) and *L'ouvrière* (Paris 1861). Dedicated to the principles of liberal republicanism, he was a consistent champion of

liberty, whether in the political field, where he identified it with parliamentarism; in the religious field, where it implied for him toleration of all cults; or in the economic and social field, where it was synonymous with free trade. He was an opponent of socialism, attacking all state intervention except in the interests of women and children or of free, compulsory education. He served without interruption as deputy from 1863 to 1875, when he became a senator for life. Following the collapse of the empire he was made a member of the national defense government and under Thiers was appointed minister. In 1876 he assumed the presidency of the Conseil d'État, but he was dismissed on May 16 by MacMahon, who sought to form a conservative ministry. For a number of years he was one of the republican leaders; but when Jules Ferry introduced a measure to exclude the Jesuits from the educational system, Simon successfully opposed it on grounds of religious liberty. During the remainder of his political career he aligned himself with the Catholic and conservative groups, without, however, abandoning his moderate republican principles. In 1890 he served as head of the French delegation to the Berlin Conference, where he was received with considerable acclaim. As member of the French Academy, as permanent secretary of the Académie des Sciences Morales et Politiques and as contributor to a number of reviews both in France and abroad Simon continued until the end of his life to enjoy international prestige.

GEORGES WEILL

Consult: Sèché, Léon, *Jules Simon, sa vie et son oeuvre* (Paris 1887), and *Jules Simon, ses dernières années* (Paris 1903); Picot, Georges, *Notices historiques*, 2 vols. (Paris 1907) vol. 1, p. 1-48, Soltau, Roger H., *French Political Thought in the Nineteenth Century* (London 1931) p. 258-61.

SIMON, SIR JOHN (1816-1904), English pathologist and sanitarian. After having studied medicine at St. Thomas's Hospital and having served as senior assistant surgeon and lecturer on pathology at King's College Hospital, Simon was appointed surgeon at St. Thomas's, retaining this position until 1876, when he was made consulting surgeon and governor of the hospital. Simon lectured on pathology with distinction and made two significant contributions to this science in essays on the thymus and thyroid glands. His chief accomplishment, however, was inaugurated by his appointment as medical officer of health of London in 1848, the second appointment of its kind in England, Liverpool

having established such an office a year earlier. When a general board for England and Wales was set up in 1855, Simon was placed at the helm as chief medical officer and he continued in this post until 1876.

Simon ranks with Chadwick as a founder of the modern public health movement. More persuasive than the latter, he developed during his twenty-eight years of official service the legal and administrative basis of state medicine. His annual reports, the chief of which were later collected as *Public Health Reports* (London 1887), are marked by sympathy for the suffering and a broad and statesmanlike vision of remedial public policies; and his classic in the early history of public health, *English Sanitary Institutions* (London 1890, 2nd ed. 1897), exerted wide influence on public health practise and legislation. Simon was especially active in his advocacy of sanitary measures to prevent the spread of cholera and other epidemic diseases, and his important international inquiry on the efficacy of vaccination was in a large measure responsible for the British compulsory vaccination laws. He must be credited also with having initiated pioneer studies in industrial diseases resulting from metal poisoning.

SINCLAIR, SIR JOHN (1754-1835), British politician and agricultural administrator. Sinclair's amazing energy and self-confidence, which were directed toward organization rather than invention, enabled him to carry through to a successful conclusion projects conceived on a grand scale and to encourage others to undertake tasks which they might otherwise have regarded as impracticable. He began by developing his own estates of 100,000 acres in Caithness county, Scotland, where he built roads, enclosed fields and introduced the cultivation of turnips and grasses. He also planted trees extensively and established a herring fishery at Wick. In 1791 he founded the British Wool Society, which, on the basis of its examination of the quality of various wools produced under different conditions, was responsible for popularizing the Cheviot breed of sheep.

Sinclair's greatest achievement was the *Statistical Account of Scotland*, published at Edinburgh in twenty-one volumes between 1791 and 1799. With the cooperation of the local ministers

Sinclair had a questionnaire filled out for each parish containing replies to one hundred and sixty inquiries grouped under the four heads of geography and natural history, population, productions, and miscellaneous subjects. While the result was not a uniformly reliable statistical document, it was of immense value at a time when governmental census reports were unknown.

In 1793 Sinclair persuaded Pitt to set up by royal charter the Board of Agriculture, actually a society but with the status of a semi-official body because it received an annual Exchequer grant of £3000. He was its first president, serving in this capacity from 1793 to 1798 and again from 1806 to 1813. Arthur Young was the board's secretary from its inception until 1820. The board collected statistical and other information, promoted scientific research and disseminated knowledge, all with the object of stimulating and improving British agriculture. Thus it agitated for the compulsory commutation of tithes and the enclosure of waste lands; it established an experimental farm and organized the first British agricultural show; and it encouraged Joseph Elkington's work on drainage, Sir Humphry Davy's studies in agricultural chemistry, J. L. McAdam, the road maker, and Andrew Meikle, the inventor of the threshing machine. Sinclair wanted to undertake a parish survey of England, but the objection to the use of the clergy for this purpose caused him to make his study on the basis of counties and with the assistance of leading residents. Upon his retirement in 1813 the Board of Agriculture began to decline; it ceased to exist in 1822. Sinclair was active in financial affairs and wrote a standard work, *The History of the Public Revenue of the British Empire* (3 vols., London 1785-90; 3rd ed. 1803-04).

Consult: Sinclair, John, *Memoirs of the Life and Works of the Late Right Honourable Sir John Sinclair, Bart.*, 2 vols. (Edinburgh 1837), Smiles, Samuel, *Self-Help* (new ed. London 1866) p. 376-81; Macdonald, William, *Makers of Modern Agriculture* (London 1913) ch. iv; Floud, Francis L. C., *The Ministry of Agriculture and Fisheries* (London 1927) p. 2-9.

SINEY, JOHN (1831-80), American labor leader. Siney was born in Ireland, passed his youth in England and emigrated to the United

States in 1863. His union career began in 1867, during a strike of anthracite miners, which was followed by the organization of the Miners' and Laborers' Benevolent Association, of which Siney became president the following year. After the disintegration of the American Miners' Association (1861-68), the first national union of bituminous miners in the United States, he advocated the formation of a union to include both bituminous and anthracite miners and in 1873 organized the Miners' National Association, of which he was elected president. The new union survived the panic of 1873 and by 1875 had 347 locals and over 35,000 members in all the coal mining areas of the United States. From the outset this union was organized on an industrial basis. Although Siney's contemporaries rated him as "the best known man in the ranks of organized labor . . . universally liked and respected by all labor organizations," his own followers, who constituted only a minority in some districts, were impatient with his emphasis on businesslike bargaining, conciliation and, if necessary, arbitration—a policy which had won him the support of Mark Hanna, then the largest operator in the Tuscarawas valley of Ohio—and by acting in sympathy with striking non-unionists often violated the wage agreements which he had negotiated. Siney himself was indicted with another union organizer in 1875 for conspiracy and inciting to riot on the evidence of coal company detectives, and despite his acquittal the trial brought about the disintegration of the association in 1876. Thereafter Siney lived in retirement. Nevertheless, the principles and methods which he advocated for the structure and spirit of the organization and for its mode of procedure were brought to fruition in the final organization of the coal miners of the United States.

ARTHUR E. SUFFERN

Consult: Roy, Andrew, *A History of the Coal Miners of the United States* (Columbus, Ohio 1903) chs. xiii-xv, Suffern, Arthur E., *Conciliation and Arbitration in the Coal Industry of America* (Boston 1915) p. 7-15.

SINGER, PAUL (1844-1911), German socialist leader. Singer came of a Jewish bourgeois family. After completing his studies at the *Realschule* he became a merchant and in 1869 established a factory for ladies' coats. An ardent adherent of democracy, he finally joined the Social Democratic party and was elected to the Reichstag in 1884. In 1887 he became a member of the central committee for the Social Democratic

party and in 1890 was made its chairman. He also was a member of the praesidium of the international socialist congresses at Brussels, Zurich, London and Paris and in 1890 became a member of the International Socialist Bureau at Brussels.

Paul Singer's name is most intimately linked with the beginnings of the German Social Democratic party in the period of persecution and proscription under the antisocialist Law. Like many of the exiles, he became one of the outstanding party leaders after the rescinding of the suppressive legislation. The frequent references to his capitalistic antecedents in no way prejudiced his popularity, which undoubtedly was attributable to the fact that both in appearance and in speech he personified the typical respectable citizen of Berlin and as such made a great impression on the workers of that city. For the wage earners of Berlin were more petty bourgeois in their outlook than is generally assumed. Skilled workers, who with certain groups of the petty bourgeoisie accounted for a majority of party supporters, were hardly distinguishable in their manner of living from the members of the lower middle classes, and even in times of struggle and political tension a man like Singer could win more sympathy than intellectuals who appealed only to principles.

Singer's most significant talent was his ability as an organizer. His most important activities therefore were carried on behind the scenes. Despite his close intimacy with the uncompromising August Bebel he was always realistic, practical and amenable to compromise. His influence rested to an unusual degree upon the confidence of the masses of Social Democratic voters, although he lacked the force of oratory and positive thought upon which August Bebel's power of leadership was based. In the later controversies regarding party principles Singer sided with the moderate realists. He was never revolutionary in character or in outlook.

SINGLE TAX is the term generally applied to the proposal for collecting all tax revenue from a levy on the value of land and other natural resources. Although the plan was earlier put forward by certain writers as a means of fiscal convenience, necessity or justice, for the last fifty years it has been identified chiefly with a

philosophy of social reform. The concept from which the device springs, that the earth is the heritage of mankind and should be enjoyed in common, is necessarily ubiquitous and has given rise to innumerable partial anticipations of the doctrine as recently developed. Suggestions of this thought and sometimes of its sequel are to be found in the Bible, the advocacies of church fathers and the acts of ancient Chinese emperors. The first connected reasoning upon the subject was that of John Locke in the late seventeenth century. Locke may be said to have supplied two important elements which figure in the later discussion: a theory of natural rights and as a corollary the contention that the only justifiable property claim is that resulting from personal labor. His recommendation did not go beyond eliminating the speculative holding of land.

The physiocrats, or *économistes*, of prerevolutionary France derived something from Cantillon but more from the decadence of their country. They witnessed mercantilism gone wrong: a profligate court was living at the expense of a peasantry burdened by many and onerous taxes; encouragement of industry was confined to luxuries; internal and external trade were entangled in vexatious duties; population, especially on the land, was declining. Agriculture to the physiocrats was the only source of wealth, and upon its *produit net* should be imposed the *impôt unique*. The physiocrats sought to absorb only a third of economic rent in taxes, thus leaving private ownership of land undisturbed; considering industry and commerce as unproductive, they were not positively solicitous for these branches, their proposal being inspired by fiscal rather than by ethical motives. If the single tax idea may be regarded as more continuous than it was, the service of the physiocrats consisted in centering attention with much spirit upon land and liberty.

The classical economists—Smith with unconscious accuracy and Ricardo with perfect perception and emphasis—supplied the formula, in the differential theory of rent, which permitted James and John Stuart Mill to draw the conclusion that land value was a peculiarly eligible source of public revenue. These latter, however, proposing the taking in taxes of only the future unearned increment, were too circumspect to invest their advocacy with logical and startling completeness. Other scattered writers anticipated in most respects, but all of them with some gaps, the proposals of Henry George.

Thomas Spence, a self-taught Newcastle workman, delivered in 1775 a blunt lecture (published in London 1793 as *The Real Rights of Man*) in which he advocated the collection by parishes of a single tax on rent; he understood better than some how this would liberate labor and enterprise. William Ogilvie, a professor in King's College, Aberdeen, published his *Essay on the Right of Property in Land* anonymously (Aberdeen 1781); this best articulated of the early expositions suffers in effect from the compromises which the author devised. Thomas Paine's *Agrarian Justice* (Paris 1797) declared that so long as private property in land was permitted, want beside wealth was the cost of progress, and so urged the absorption of ground rent for social purposes. Patrick Edward Dove (*The Theory of Human Progression*, London 1850), a Scottish landlord turned scholar, was a generation earlier on all fours with Henry George, including his high ethical objectives. Gerrit Smith in the United States House of Representatives in 1854 opposed alienation of public lands with the philosophy but without the practical proposals of the single tax; Edwin Burgess, a Wisconsin tailor, published letters in a local newspaper (1859-60) which embodied the essentials of the scheme later developed. Others deserve mention—Herbert Spencer, Charles Bray, Marx and the German advocates of *Bodenreform*.

In the hands of Henry George (*qv*), a San Francisco journalist, the single tax became an exhaustive analysis, an inclusive social philosophy and a resounding crusade. The origin and substantial development of George's thought lay not in the works of previous writers but in his keen observation of the changes in economic conditions in California between his arrival in 1858 and the completion of his *Progress and Poverty* (San Francisco 1879). Free and rich natural resources enjoyed by a sparse population had resulted in high wages and high interest; later, profligate grants of land to railroads, active private land speculation and increasing immigration witnessed the narrowing of opportunities to labor and capital; finally, the depression of the 1870's brought to this recent frontier the unemployment and bankruptcy familiar in older communities. George possessed three faculties which above others were responsible for the modern single tax movement; they were the power of inductive inference, the capacity for patient analysis and the gift of persuasive and eloquent exposition. The first was illustrated in

his paper "What the Railroad Will Bring Us" (in *Overland Monthly*, vol i, 1868, p. 297-306) and *Our Land and Land Policy* (San Francisco 1871), in which he laid the basis for his future work by showing that private property in land was the wedge which pried part of the population into affluence and depressed another part into pauperism. At this stage George knew next to nothing of economic writings. In *Progress and Poverty* he turned, with his essential views already formed, to the classical economists; the confirmation of his opinions which he found here, particularly in the Ricardian law of rent, spurred him to a revision of economic theory which should bring all of the principles of distribution into harmony with the rent concept. In his view private property in land confined interest and wages to marginal gains, while landlords—non-producers—reaped the benefits of social advance. Labor and enterprise should be freed of incubus and community created value returned to the community by a single tax amounting to the whole or practically the whole of economic rent. Free trade was a necessary corollary. *Progress and Poverty* was both an analysis and a standing appeal to mankind, but after its publication George entered more especially upon the propagandist period of his career, which was to continue to the end. In addition to raising up loyal followers in America, through lectures, the Anti-Poverty Society, his weekly *Standard* and campaigns in 1886 and 1897 for mayor of New York City, he made repeated trips to the British Isles, whither he was preceded by a wide distribution of *Progress and Poverty* and where he greatly augmented the existing active discussion of land reform. He lectured in Australia and New Zealand. More copies of *Progress and Poverty* have been circulated—several million, mainly in cheap editions—than of any other economic work, not to speak of George's many other writings.

George's influence in favor of all democratic movements was as wide and deep as it is insusceptible of precise calculation. The very specific and, to many workers, indirect character of his reform proposal made him acceptable as a candidate of the labor unions in New York only so long as compromise did not break down into factional hostilities, which occurred in little more than a year (1887). George's influence upon socialism, particularly in England, was not only inspirational but in good part formative. His work made a sensation at a time when that of Marx, although launched earlier, was known

to few. The young Fabian Society, which gave British socialism its characteristic turn, owed its beginning and much of its maturer development to George's fierce indictment of predatory land-ownership.

Efforts to embody the single tax in practise, despite repeated and intelligent work of adherents in many lands, have met with slight reward. Partial successes, however, have been scored not only in thinly settled regions first encountering the land monopolist but in old countries where the landed interest has been entrenched for centuries. The largest number of favorable acts has been obtained in Australasia, where the principles of separate valuation of land and improvements, a discriminatory land tax on absentee owners and the drawing of local revenue mainly or wholly from land taxes are widely accepted. Sydney with a population of a million relies entirely for its revenue upon a single tax on land values, and many smaller municipalities do the same. All land in the Australian capital district of Canberra is leased from the government at its economic rent. The four western provinces of Canada have in varying degree sought by taxation to discourage land speculation and have required villages, towns and cities to reduce assessments on improvements to 50 or 60 percent of their value. Several cities, including Vancouver and Victoria, which had exempted all improvements, in consequence of extraordinary revenue needs during the World War, partially restored the old taxes. In Great Britain social as opposed to merely fiscal objectives have been frankly avowed. The Finance Act of 1910, the result of Lloyd George's budget of the year before, imposed land value increment taxes (20 percent maximum), taxes on undeveloped land and upon mineral rights and provided for a new valuation of all the land in the United Kingdom. At the end of a decade of public debate these measures were repealed. The Finance Act of 1931, however, following Snowden's budget, included a tax of a penny in the pound on the unimproved capital value of land but with important exemptions; the tax was to become effective in the financial year 1933-34, but its operation was suspended by the national government and the tax was subsequently repealed.

In the United States unsuccessful attempts were made in Colorado, Oregon, California, Washington and Missouri to secure constitutional amendments permitting exemption of improvements and taxation of land values. At

intervals in the last twenty-five years some exemption of improvements and a small increment tax have been hotly discussed in New York City, but to no effect. In Pittsburgh and Scranton, Pennsylvania, as the result of a gradual process two thirds of the revenue comes from land values and one third from improvements. The United States has ten of the fifteen enclaves which practise as close an approximation of the single tax as national and state taxation will permit. Denmark by acts of 1922 and 1926 has a national tax on the value of unimproved land and local taxation of land at rates higher than those on improvements. In Germany, which has had a long history of land tax reform, local increment taxes, beginning in Frankfort in 1904, were repealed by a too complicated imperial increment tax in 1911; this soon proved unworkable and the local and state increment taxes were restored. Despite an "unearned increment" clause in the Weimar constitution Anhalt is the only state with such a tax.

The adequacy of ground rents as a general thing to supply needed public revenue seems to be established. Many single taxers, including Henry George, have believed they would yield a surplus. Several sources of revenue, not now classified as ground rents, are properly such; chief of these are franchises to railways, pipe lines and radio. Critics arguing that land values only, taken in taxes, would prove insufficient in times of emergency have frequently forgotten that the absorption of economic rent by the treasury would have an effect in diminishing economic insecurity.

Space limits must confine critical appraisal of the single tax as a philosophy of social reform to a few points. Its proponents in directing attention to predatory wealth have performed a service beyond the content of their specific advocacy. The common reliance of single taxers upon the premise of natural rights is not necessary to their argument, which may be sustained by appeals to social expediency. The right of society to socially created value, of which economic rent is one expression, is not to be denied. However, the other distributive shares of interest and profit ought not to be excluded from discriminatory taxation until it can be shown more convincingly than has been done that they derive from land monopoly.

SINKING FUND The term sinking fund covers a variety of forms of debt retirement. It achieved prominence after 1688 with the appearance of large long term public debts incurred during the wars of William of Orange. The first sinking funds were established after the Peace of Utrecht (1713-14), when Great Britain created three permanent funds, the Aggregate, General and South Sea funds, the revenues of which were attached to the interest on the public debt. A fourth fund, known as the Walpole-Stanhope Sinking Fund, was made up of the surpluses remaining after the charges upon the other three had been satisfied [General Fund Act, 3 Geo. I, c. 7 (1716)]. Thus through early practise the sinking fund came to mean a group of revenues regularly and exclusively applied to the principal of the public debt and definitely derived from budget surplus. It was cumulative, since as the debt was retired the surplus from the three funds increased. The Walpole-Stanhope Sinking Fund did not prove very successful; there was "amortization" of debt by further

loans during periods of deficit, and genuine surpluses were not applied to debt liquidation. In the course of time the fund was almost entirely diverted from its original purpose of debt retirement.

The renewed rise in public indebtedness as a result of frequent wars continued, however, to maintain public interest in the efficacy of sinking funds as a means of debt retirement. In 1772 Dr. Richard Price offered his popular plan, which involved a permanent annual sinking fund to be used to buy public debt. This debt was to be kept "alive" by continuation of the interest payments to the sinking fund, and these interest payments were to be used to purchase more public debt. The "magic wand" of compound interest would rapidly reduce the debt, even though the initial fund was small. Pitt put the Price plan into operation in 1786 (26 Geo. 3, c. 31) by combining the revenues attached to the four permanent funds into a "consolidated funds" and by creating a special Board of Commissioners of the Sinking Fund, which received an initial fund of £1,000,000. At first the interest on the debt was paid from budget surpluses, but gradually the optimism concerning the magical powers of the sinking fund led to deficits. Before long it was pointed out that only a surplus could "sink" the debt. Gallatin, Robert Hamilton, Ricardo and finally Grenville successively demonstrated that the compound interest feature would not make possible the actual payment of the debt with borrowed money. The essential fallacy in Price's theory lay in the assumption that the public debt is productive property, i.e. that it adds to the net income of a country. In 1829 the old sinking fund, which reverted to the simple practise of appropriating budget surpluses, replaced the Pitt sinking fund. For a time, however, the latter had strengthened government credit. It possessed psychological advantage, partly because it introduced the principle of debt management by a special governmental body.

Out of this experience came also the conception of the sinking fund as a plan for as well as a means of retiring public debt. A plan of debt retirement might include any one or several of the principles of retirement worked out through this century of English practise, such as the cumulative principle, the attachment of special revenues, the payment of a definite yearly sum, the payment of anticipated but indefinite surplus. In practise sinking funds have tended to combine these principles as exemplified in the

experiences of the leading nations in the years following the World War. Thus the United States Victory Loan Sinking Fund is proportional and cumulative, following the precedent of 1862, since it amounts to 2.5 percent of the aggregate amount of bonds and notes outstanding on July 1, 1920, and the interest that would have been payable on the bonds redeemed. In the post-war period it has been the practise to consolidate numerous special sinking funds and to set up definite rates of retirement in lieu of indefinite budget surplus. The sinking funds of Great Britain, Germany and the United States are cumulative; that of France is not. The French sinking fund differs also in that it is attached to special revenues. Great Britain and France retain the practise of special management of the sinking fund. On the whole the history of sinking funds shows no agreement as to the best combination of amortization principles or as to the proper speed of amortization.

The theory and practise of sinking funds have been extended to private business, where the sinking fund is essentially a fund accumulated to meet an ultimate liability. When used in connection with depreciation, as in mining enterprises, it consists of charging each year a sum that would, if invested annually at a certain rate, cover the amount of the depreciation. Sinking funds are usually created to prevent misuse of assets and to extinguish future liabilities. The term sinking fund is sometimes loosely used to mean any kind of systematic accumulation of money. The sinking fund may be considered by accountants as either a debit or a credit item. It may be derived from profits or surplus, and in the latter case it is properly spoken of as a sinking fund reserve. In this light it takes the character of a liquid fund to meet contingencies as well as a fund set aside to meet an anticipated liability. The sinking fund when considered as a sum of invested money available for a future liability is essentially a method of amortization. The distinguishing features of this method are unequal times of distribution of debt retirement and investment of retirement funds. The sinking fund method is frequently contrasted with the serial bond and annuity methods.

It is not an uncommon practise for corporations issuing bonds to establish for their payment a sinking fund to be accumulated out of income. The funds may be invested in the bonds issued or, although the procedure is ill advised, in other bonds. If invested in the bonds issued, it is customary for the bonds purchased to be

kept alive. Sinking funds are sometimes turned over to trustees, in which case they are not assets of the company either legally or equitably. Debt contracts in many cases may require the corporation to make payments to a trustee, a measure which recalls the occasional separate management of public sinking funds.

As a rule the sinking fund method has been used more frequently among private corporations than among municipalities. The price of sinking fund bonds has been raised by the popularity of this method as well as by the purchase of bonds for the sinking fund which this device involves. Before the years 1914-24 sinking fund bonds were employed by railroads more commonly than by industrials and public utilities, but at the end of this period the situation was reversed. About 50 percent of public utility bonds now contain sinking fund provisions. The experience of the railroads, however, shows that sinking fund bonds are scarcely more secure than other types.

Mathematical analysis has demonstrated that the sinking fund is a more expensive method of debt payment than the serial bond or annuity methods, as measured by the total interest paid. But such analysis has led to confusion, beginning with the case of Price's sinking fund. If the greater "psychological costs" of the larger immediate payments under the serial bond method are taken into account, it can easily be argued that the sinking fund method, if properly managed, is no more costly than the serial bond method.

The sinking fund method may be attacked on the ground that it is seldom properly managed, especially when used by local governments. Most authorities on municipal bonds favor the serial type of retirement. It is charged that the sinking fund involves additional expense for the administrative department; it seldom receives the expert financial management it requires; the funds may be invested in bonds that cannot be liquidated; there may be misappropriation of funds; finally, the fund may be raided easily. Some writers have stated that the simplest methods of retirement are the safest, and that the serial bond provides the maximum of security with the least cost. For these reasons, beginning with Massachusetts in 1913, about half of the states in the United States have made compulsory the use of either serial or amortization bonds.

There is, however, a place for the sinking fund or for a flexible method of allowing unequal

times of debt payment. The uncertain character of public revenues interferes with the compulsory features involved in serial bonds. Furthermore the retirement of large amounts of debt requires an adjustment of the burden involved to capacity to pay. Mathematical estimation of the amount of interest to be paid throws light neither upon the capacity to pay nor upon the burden of payment. It is conceivable that the payment of the principal and interest of the debt may not be an economic burden, no matter how burden is defined. The national income may actually be increased. The sinking fund method allows the establishment of a plan of retirement adjusted to the totality of economic conditions and not arbitrarily based upon an overrefined and narrowly abstract analysis of mathematical and alleged psychological factors. For national governments the sinking fund, conceived as a plan of debt retirement, is still justly popular. Were the management of local debt properly taken out of local hands, the serial bond method would have less significance. Moreover a rigid mathematical system of debt retirement precludes any adequate use of debt payment to adjust the volume of credit to the volume of production.

SINN FEIN. See IRISH QUESTION.

SISMONDI, JEAN CHARLES LÉONARD SIMONDE DE (1773-1842), Swiss economist, historian, historian of literature and publicist. Sismondi, a Genevan descended from an old French family, emigrated to England in 1793 and to Tuscany the following year but in 1800 settled in his native city, where from 1809 on he lectured at the Academy of Geneva on ancient and literary history and economics. His development, particularly as historian and historian of literature, was profoundly influenced by his friendship with Madame de Stael and by the prominent personalities whom he met in her cosmopolitan salon at Coppet.

Through his *Histoire des républiques italiennes au moyen âge* Sismondi was the first to awaken general interest in the mediaeval history of Italy. But while he was a pioneer in the reclamation of the Middle Ages from the contempt of the eighteenth century rationalists, he shared the tendency of the latter to use history for didactic purposes: he wrote his history of the Italian towns as an anti-Bonapartist republican who wished to remind an enslaved nation of its glorious past. He was one of the first to understand that the liberation of the mediaeval Italian cities enabled them to take precedence in the development of a bourgeois society. His descriptions of currency, trade, manufactures, agriculture and the role of productive capital often reveal technical precision, although he had little inkling of the interdependence between politics and economic drives. His subsequent *Histoire des Français* without transcending the limitations of the earlier work won recognition as the earliest comprehensive survey of the subject based on original research and as a suggestive synthesis of varied currents particularly in the mediaeval period.

As author of *De la littérature du midi de l'Europe*, a revision of his lectures on the evolution of Arabian, Provençal, Italian, Spanish and Portuguese literature, Sismondi became co-founder with Madame de Stael of the "philosophy of literature," which paved the way for the sociological approach to the subject. Just as his investigations of the mediaeval history of Italy had convinced him that national character was determined by social and political institutions rather than by racial or climatic peculiarities, so he now presented literature as the natural if sometimes belated reflection of the same forces. His use of the comparative method enabled him to show the universal parallelism in the stages of intellectual development of differ-

ent nations and his defense of national art smoothed the path of romanticism especially in France.

Sismondi's general political outlook, as represented, for instance, by *Études sur les constitutions des peuples libres* (Paris 1836), was liberal but anti-Rousseauistic and antidemocratic. Believing that both the proletariat and the lower middle classes were not yet ready for democracy, he offered an apology for the privileges of minorities, particularly of the urban bourgeoisie and the intellectuals, whom he regarded not only as the progressive elements but as the representatives of national tradition.

Although in his earliest economic writings, *Tableau de l'agriculture toscane* (Geneva 1801) and *De la richesse commerciale* (2 vols., Geneva 1803), he had defended Smithian liberalism and popularized it before J. B. Say, his *Nouveaux principes d'économie politique* (2 vols., Paris 1819; 2nd ed. 1827), which reflects his observation of the economic crisis during his second trip to England (1818-19), constitutes a devastating criticism of the basic axioms upon which the classical economists built their idealized and static conception of capitalism. He showed clearly the untenability of the doctrine that competition always tends to establish an equilibrium between production and consumption. More specifically he emphasized that general crises, or gluts, are not only possible—a fact denied by the classical economists, although they admitted the possibility of partial gluts arising from an occasional disproportion between individual branches of industry—but an inevitable periodic concomitant of the prevailing economic structure. The direct cause of such crises he found in underconsumption on the part of the working classes, whose purchasing power is insufficient to absorb the annual national output. The second inherent characteristic of capitalism overlooked by the classical economists was the necessity of continuous expansion and conquest of new outlets, resulting from the restriction of the internal market. While Sismondi was incorrect in limiting demand to consumers' demand and in other aspects of his argument, the essential validity of his conclusions makes him the scientific discoverer of capitalistic dynamics.

The deeper cause of underconsumption, that is, of the simultaneous decline in income and increase in the volume of production, Sismondi attributed to the fact that in a capitalistic society the extent and direction of economic activity are

determined by exchange value, which by reason of the unevenness of technological advance within each branch of production is in a constant state of flux. The only possible basis for a harmonious and stable adjustment is the social need measured in terms of the quantity of useful commodities. Since the latter has no determining effect in a capitalistic system, Sismondi denied categorically the possibility of regulating economic activity in such a system. His various reform proposals, including his demand for public protection of workers, were consciously advanced merely as palliatives, which he realized could not correct the evils inherent in the existing order.

Among his contemporaries Sismondi was recognized chiefly as historian and historian of literature and subsequently fell into oblivion, except in Italy, where his work as a national historian influenced the spiritual revival during the Risorgimento. After 1850 the protagonists of social reform, frequently exaggerating Sismondi's really limited faith in reform measures, rediscovered him and hailed him as a precursor. Today he is famous especially as a theorist of crises, whose ideas were taken over not only by his contemporaries Malthus and Rodbertus but under the disguise of Marxist terminology by such socialists as Heinrich Cunow, L. Boudin, Karl Kautsky and Rosa Luxemburg. Since the outbreak of the present world crisis this underconsumption theory, which Lenin justly attacked as non-Marxist, has become the official doctrine of numerous socialist parties and trade unions in Europe and America.

SKARBK, COUNT FRYDERYK FLOR-JAN (1792-1866), Polish economist Skarbek studied at Warsaw and Paris and obtained private instruction in economics from Camille Saint-Aubin and Piotr Maleszewski. After his return to Poland he divided his time between official administrative work and writing on economic subjects. In 1818 he was called to the chair of political economy at the University of Warsaw, where he taught with great success until the closing of the institution by the Russian authorities after the collapse of the Polish insurrection in 1831. He then returned to public life, held various administrative posts and took a prominent role in the organization and direction of numerous institutions of public welfare. His literary legacy includes besides several works on economics, which established his reputation as the foremost Polish economist of his period, a number of studies in the field of history, criminology, statistics and general social reform.

While Skarbek regarded himself as a follower and interpreter of the classical school of economics, he departed from its teachings in a number of significant respects. Even in his early writings he drew a sharp distinction between theoretical economics, which has for its purpose the discovery of universal principles on the nature and source of the wealth of nations, and applied economics, in which the general principles should be modified in accordance with the geographical location, degree of economic development and other peculiarities of the respective nations. By introducing thus the viewpoint of historical relativism he limited considerably the principle of universalism implied in classical teachings, and by emphasizing the influence of national characteristics on economic development he further qualified the individualistic approach of classical doctrine. His treatment of the theory of circulation of commodities, division of labor, population, distribution of the national dividend and of wages is marked by

independence of thought and in many respects anticipates subsequent contributions to economic doctrine.

K. KRZCZKOWSKI

SKARGA POWĘSKI, PIOTR (1536-1612), Polish theologian and preacher. Skarga played a role similar to that of Bossuet in France. In a troubled epoch he defended Catholicism, both in tract and in sermon, against the Reformation and the monarchy against the republicanism advocated by the nobility. He regarded the state as the city of God, this view, essentially Augustinian, led him to ascribe to his nation an almost messianic role and made him a precursor of the Polish political romanticism of the first half of the nineteenth century. Skarga saw in Catholicism the foundation of the state and attacked Protestantism as the source not only of religious but also of political anarchy. His political ideas, essentially religious, contributed far more than the victory of Catholicism to the moral unity of the Polish state. He opposed to earthly wisdom, which makes for sedition, discord and loss of patriotism, divine wisdom with its command of discipline, love and moral integrity and asserted the supremacy of the ecclesiastical power over the secular rulers. In the name of this theocratic system Skarga defended the peasants against serfdom and intervened in favor of the burghers, who had been deprived of the privileges they had enjoyed during the Middle Ages; he warned his countrymen that continuation of oppressive laws and of social injustice would spell the ruin of the state. The order of Jesuits, of which Skarga was a member, continued the campaign,

although they suppressed those passages in Skarga's works which were too offensive to the nobility. In his sermons Skarga displayed a mastery of language which is unsurpassed in the history of Polish literature. It was this fact which contributed enormously to the spread of his authority not only among the Poles but also among the Ruthenians and Lithuanians, who formed large minorities in the Polish kingdom.

SKIDMORE, THOMAS (d. 1832), American agrarian. Skidmore is known almost entirely for his one book, *The Rights of Man to Property, Being a Proposition to Make It Equal among the Adults of the Present Generation* (New York 1829). His thought owed much to Thomas Paine, Robert Owen and perhaps to Thomas Spence and William Thompson, although parts of his advocacy bear evidence of originality. He stated forcefully his objection to exploitation of the working class by the rich and proposed as a remedy, in New York state, a constitutional convention which should abolish all debts and all claims to property, provide for an inventory of wealth and census of population and prepare the way for a general auction in which each bidder would have equal purchasing power. He went on to set up elaborate precautions against subsequent concentration of wealth, including abolition of inheritance and prohibition of monopoly in any form.

For less than a year, beginning in the spring of 1829, Skidmore, himself a mechanic, led the wage earners' faction in the new Working Men's party in New York. While upholding the ten-hour day, he tried to secure the workers' political support for his scheme of wealth redistribution. The party obtained more than a third of the votes in the fall election and sent an assembly-

man to Albany, Skidmore himself barely failing of election. The criticism leveled at Skidmore's agrarianism, coupled with his dogmatism and personal impatience, soon weakened his influence; and Robert Dale Owen, Frances Wright and Robert L. Jennings told off the majority of his following in a demand for universal free education in guardian schools. Skidmore attempted unsuccessfully to restore himself to influence by publishing with Alexander Ming a daily paper, the *Friend of Equal Rights*. Like other reformers of limited training he dissipated his energies in blue printing his future society.

SKINNER, JOHN STUART (1788-1851), American agricultural journalist. Skinner was the descendant of a landed proprietor in Maryland. His love of rural life and his deep interest in farm problems led him to abandon law and public service in favor of agricultural journalism. On April 2, 1819, he began the publication of the *American Farmer*, the first agricultural paper in the United States devoted almost exclusively to the farmer and his problems. In 1834 the paper passed into other hands, but five years later Skinner regained control, which he retained until 1845. Meanwhile he served as editor of the *American Turf Register and Sporting Magazine* and the *American Silk Society and Rural Economist*, in connection with which he did considerable writing on farm problems. In 1845 he became associated with Greeley and McElrath of the New York *Tribune* in the publication of the *Farmer's Library and Monthly Journal of Agriculture*. From 1848 until his death he edited *The Plough, the Loom, and the Anvil*, probably the most notable achievement in agricultural journalism prior to the Civil War.

The underlying motives of Skinner's journalistic endeavor were the improvement of the soil, the coordination of agriculture and industry and the elevation of the life and character of the farmer. He presented the most authoritative material he could gather on agricultural economy; he edited for publication in the United States several standard foreign works; he wrote numerous special articles and treatises; and he collaborated with other writers in the preparation of the *Farmers' Barn Book* (Philadelphia

1850). He was a pioneer in agricultural journalism in the United States, the educational possibilities of which came to be recognized by his successors in the establishment of farm journals during the later nineteenth century.

PRIMITIVE. Although nowhere in primitive societies have human beings been subject to the gross exploitation characteristic of slavery among culturally advanced peoples, there has existed in many regions the ownership of persons outside of family relations whereby the owners control the lives of their slaves, often sanction their use in ritual sacrifice and frequently subject them to compulsory labor. Such slavery has been a characteristic aspect of native African life except for the area south of the Zambesi. It is unknown among the primitive peoples of Australia; it has been confined to a few islands in Oceania; while it has been a general feature of the social organization of the Malay Archipelago. Absent with one possible exception in central Asia and Siberia, it has prevailed among a considerable number of aboriginal tribes of Indo-China and of India. In North America it developed only along the Pacific coast from Bering Strait to the northern boundary of California, and it appears to have had but a scattered distribution in Central and South America.

There are wide variations in the behavior sanctioned in the relations between master and slaves and in the privileges accorded the latter in primitive societies; these differences depend largely on the general economic, political and religious setting in which the institution functions. Custom usually deters the owners from depriving their slaves of all rights and from treating them with extreme cruelty; in many primitive communities the life of the slaves differs but little from that of the freemen. Debtor slaves are almost invariably treated with more consideration than are foreign slaves obtained by capture and trade. It is frequently difficult, particularly in Africa, where an ex-

tremely diversified range of attitudes toward slaves prevails, to distinguish with any precision between such categories as slaves, serfs, subjects, submerged classes and low castes.

The incidence of compulsory labor in slavery is determined largely by the nature of the economic pursuits and the degree of cultural development. In primitive nomadic hunting tribes, which are small, barely self-subsisting units whose members are closely related by birth and marriage, the development of such slavery is precluded by the scarcity of food, the lack of regularity of labor and of differentiation in occupational functions other than that between the sexes, and the absence of numbers adequate to maintain regulative powers which would make possible repression and coercion. Contrary to the theory that the practise of appropriating the services of slaves was derived from the analogous appropriation of the labor of domesticated animals, and that therefore slavery originated and was a characteristic institution among pastoral peoples, the fact is that it was actually rare among them because of the low demand for labor. The practise has been current only among the flourishing pastoral tribes in northwest and northeast Africa and among a few tribes in the Caucasus and Arabia, while the pastoral nomads of Siberia, central Asia, India and south Africa have not had slaves. On the other hand, slavery has developed most markedly among agricultural tribes where habitation is settled, where there is a demand for labor coupled with a relatively plentiful food supply and flourishing trade. Such conditions, however, have not always given rise to slavery.

The distinctive nature of slavery in primitive societies may best be clarified by illustrations of its functioning in different areas. The non-

agricultural tribes on the northwest coast of America which had developed the institution lived in settled communities in relatively large numbers and derived their abundant food supply from salmon fishing in addition to hunting. Captives, who in other parts of North America where the social life was more democratic became equals of the tribal members through marriage and adoption, were in this region permitted to mate only with one another, and their descendants usually remained slaves. Although they often participated in other economic activities, they were as a rule compelled to perform menial tasks and to function for the most part as bearers of burdens. Their social and political status was generally lowly and they were commonly excluded from active participation in ceremonial functions. Slaves were sometimes traded or given away as gifts; the master could kill them at will just as he could destroy other property as a means of displaying his wealth. Among the Kwakiutl there are accounts of the killing of slaves to provide food for the members of the cannibal society; and among the Tlingit slaves were killed and buried under the house posts when a new house was being erected.

This widespread use of captives to provide for ceremonial needs has been pronounced in some of the head hunting districts of Melanesia. In contrast to their inferior status on the northwest coast of America, these captives, who are characterized by many writers as slaves, have not been subject to the attitude of derogation ordinarily associated with the institution of slavery, nor have they been taken or maintained for purposes of compulsory service. They might marry the women of their captors, perform important religious functions and even rise to positions of importance in political life. They have, however, been regarded as "heads" which might be utilized when needed to satisfy immediate ceremonial purposes. They thus may be considered property of the captors subject to their will and may be designated slaves in this sense.

In Africa the indigenous primitive institution of slavery was conditioned by the impact of the world slave traffic, as is shown by the fact that intertribal trade in kidnaped slaves has been developed most extensively in areas where there were slave raids for the European market. Besides the purchase of men and women from other villages with the express purpose of enslaving them and the subjugation of prisoners of war or persons received as a form of tribute from

a defeated foreign power, the practise of voluntary and involuntary servitude as security for debt subject to redemption appears to have been developed more extensively in Africa than elsewhere. In certain localities persons enslaved as punishment for crime might also as a rule be redeemed.

BERNHARD J. STERN

ANCIENT. Slavery existed as a constant factor in the social and economic life of the Near East and Europe throughout the entire period of ancient history, differing greatly in intensity and effects according to time and place. Its validity as a system of labor was never seriously questioned. No attempt to abolish it was made by any ancient government. Nor did any ancient religious body, even Christianity, challenge the right of its believers to own slaves. Greek political philosophy discussed the institution of slavery, but only as to whether it was a condition grounded in natural law or made by man. Ancient slavery differed fundamentally from modern slavery in that the problem of race entered into it but slightly and only in theoretical discussion. Because of its essential differences as a social institution and the differences in the attitude toward it the subject cannot be approached successfully from the abolitionistic-moralistic point of view of the nineteenth century. To the ancient mind slavery was a fixed and accepted element of life, and no moral problem was involved.

That slavery already was established as a recognized institution in the Sumerian culture of the Babylonian area in the fourth millennium B.C. may be confidently assumed from the fragments of Sumerian legislation upon slaves which date from the first half of the third millennium. The old Sumerian ideograph for slave means "male of foreign land," indicating that the source of slavery was war and its prisoners. The Sumerian legislation which is now extant includes the requirement of mere restitution of a slave or payment of a definite sum by one who harbors a runaway slave, the possibility of protest by the slave against his own sale and the enforcement of sale in case a slave protests his master's rights over him. The numerous paragraphs dealing with slaves in the Code of Hammurabi about 2100 B.C. reflect a more sophisticated economic life based upon a more general use of money as interest bearing capital and a social system far more self-conscious and stringent in its social classifications. The treatment

of slaves was much harsher than under the old patriarchal master and slave relation characteristic of the previous Sumerian period. The chief sources of slavery were captivity in war, purchase abroad, bondage as a result of unpaid debts (sale of wife and children to meet unfulfilled obligations) and inheritance of slave status from slave parents. No convincing estimate can be made of the relative numbers of the free and the slave, but it is certain that the number of freeholds and the use of free labor in agriculture were always striking elements in Babylonian life. A tendency to exaggerate slave numbers may be checked by the observation that about 517 B.C., in the neo-Babylonian period, the head of the banking house of Egibi Sons left only ninety-six slaves when he died. This may be regarded as the upper limit owned by the richest individuals as opposed to the royal households and wealthy temple organizations. The Hammurabi legislation granted rights to slaves in considerable degree: the right of intermarriage with free women, the right to engage in business and to acquire property, and protection of slave concubines when they had given birth to children. But these protective rights looked to the slave as property and economic asset rather than as human being. The danger of generalization may be illustrated by the fact that the Hittite Code, applying to Asia Minor and northern Syria in the late second millennium, in contrast with the Hammurabi Code, regarded the slave as human being rather than as chattel. Under the Babylonian conditions, which are in general applicable to the Semitic world of that time, release from slavery might occur by manumission, by adoption of the slave and by self-purchase. The Hebrew legislation added to these methods release of a slave of Hebrew origin after six years of service and manumission because of maltreatment leading to permanent injury, the last provision applying to foreign born slaves as well as to those of Hebrew birth. Economic conditions prevailing in Palestine suggest that the use of slaves in that area was on a more restricted scale than in Babylonia.

In Egypt under the pharaohs slavery certainly existed from the earliest dynastic period, the number of slaves probably increasing during the period of the empire (c. 1600-c. 1000 B.C.). But royal ownership of the agricultural land in the Nile valley, combined with a teeming and industrious population under strict regimentation by the state, produced an economic situation which was unsuitable to the development of slavery

upon a comprehensive and significant scale. Throughout the entire history of Egypt in antiquity—under its native rulers, under the Macedonian Ptolemies and under Roman imperial rule—agricultural slavery never was able to find a strong foothold. The numbers of captives recorded as resulting from the raids of Thutmose III (1501-1447 B.C.) and from his many campaigns into Syria are surprisingly meager: from Nubia 134 and 36 in two different years; from Syria a total of 8000. Debtor bondage existed until abrogated by Pharaoh Bocchoris (Bakenraneh, about 718-712 B.C.). The reasons for this action are unknown; but it may be regarded as another proof of the comparative insignificance of slavery as an economic force in that country.

The origins of slavery in the Greek area are not ascertainable. In the period from about 1200 to 800 B.C., as depicted in the Homeric poems, slave owning was fully recognized as an element in private ownership of property. It was also the expected fate of captives in war. The largest number of slaves accorded to the household organizations of the most powerful chieftains was fifty. Despite casual raiding, which included slaves in the booty taken, there was as yet no organized slave traffic. No word for slave dealer appears in Homer. Women slaves were used in household services, with the customary accompaniment of concubinage, and in the household industry of weaving. Males appear in small numbers in agriculture but not in the handicrafts, which then supplied strictly local markets. The entire picture is one of a society using slaves only in limited degree. Treatment by the masters was notably kind. Conversely the attitude of the slaves was one of trust and loyalty, even of marked affection.

In the period from 800 to 600 B.C. three events, in their conjunction and interplay, created the set of conditions which became typical of the city-states of the Greek world and later of the urbanized culture of the Roman Empire. These were: widespread colonization of the Black Sea and Mediterranean coasts by Greeks; invention of coinage in the precious metals; and the development of handicraft industries centering in large towns, with the possibility of sale of the hand factory output throughout the extensive market of the Mediterranean coast and its hinterlands. During the sixth century and much more strongly in the fifth and fourth centuries these conditions gave an increasing impetus to the demand for slaves and shifted the emphasis and importance of slave employment

in the progressive parts of the Greek world from household and agricultural services to the handicrafts. In those states which were based upon a system of helotage, such as Sparta and Thessaly, and in the backward states of western Greece the old type of limited and simple slavery remained unchanged. A law passed by Solon at Athens in 594 B.C. abolished the right of mortgage for debt of the person of the debtor or his wife or of the persons of his children. This law, copied widely although not universally in the Greek world of independent city-states, removed the least important of the sources of slave supply. The constant warfare among the Greek city-states was the most fruitful source of slaves, with purchase from the peripheral non-Greek peoples and kidnaping and sale by organized piracy as additional methods of meeting the demand. Despite the enormous figures given by ancient writers for the slave population at Athens in the fourth century B.C. it is improbable that the slaves in that city-state, which offers one of the outstanding examples of slave employment in the handicrafts, ever reached a total of one half of the free population. Authentic contemporary evidence regarding labor employed in the building of the temple of Erechtheus at Athens in the fifth century gives the following proportion of free men and slaves: Athenian citizens 20; free aliens (metics) 35; slaves 16. The ratio of slaves employed was in this instance 22.5 percent. The six hundred slaves owned by the Athenian Hipponicus and the thousand slaves of the rich Athenian general Nicias, both living in 430 B.C., must be regarded as exceptional. The method employed by these two wealthy slave owners of using their slaves as capital investment, leasing them out to those who operated the silver mines at Laurium or to owners of small handicraft shops, is typical. The figures given above suffice to emphasize the importance of slaves in the industrial labor market in those parts of the Greek and Roman world which adopted the Greek industrial system. The view that ancient society was based upon slavery is, however, quite incorrect as a generalization.

According to the Greek laws the slave was a property, hence a legal object. He could be sold or mortgaged or his services leased. He was also, however, regarded as a legal subject—a man as well as a thing. At Athens capable slaves might under given authority carry on business in behalf of their owners or engage in commerce independently, with the right to make binding contracts. In commercial trials slaves custom-

arily testified without use of the *bastinado*. In general slave status was not regarded in the Greek city-states as degrading, nor was the social and legal treatment of the slave particularly harsh. The road out of slavery into freedom, through manumission as a reward granted for faithful service, or through self-purchase was as easy as the many hazards of life which led into it. There were many slaves who "lived apart," with a social life of their own, paying to their owners a definite amount of their earnings. Slaves were admitted to participation in the popular Orphic mysteries and to social clubs, which also included free members. Instances are known in which these clubs helped to make up by loan the sum required for the purchase of freedom for a slave member. Because of the exclusive nature of ancient Greek citizenship and its essential implication that military service was both an obligation and a right of the privileged citizen class, slaves were not permitted as a rule to take part as combatants in war on land or as oarsmen on battleships. When crises and dire necessity required such use of slaves, it was always regarded as remarkable; and the general principle of exclusive citizen right in this respect was maintained by granting freedom to the slaves who were enrolled for service. This general rule applies throughout Greek and Roman history. There is no question that Greek political philosophy of the fourth century B.C. (Plato, Xenophon, Aristotle) adopted a derogatory and contemptuous attitude toward manual labor, exemplified by the use of the term "banausic trades"; but there is little evidence that this contempt was due to the widespread use of slaves. It is more probably explained by considerations of the compulsory military service resting upon citizens and the lowering of physical fitness brought about by manual toil (Xenophon) or upon the theory of pettiness of spirit, unbefitting the ideal citizen, which is engendered by trade haggling (Plato).

A new type of slavery was introduced in antiquity by the Carthaginians and by the Romans after their conquest of the peninsular section of Italy in 272 B.C. It was characterized by the use of slave gangs on a large scale in agricultural production and in ranching. In Roman Italy from 200 B.C. to the time of Augustus Caesar its methods were brutal and its results brutalizing. In north Africa the merchant nobility of Carthage owned many slaves, some employed in household service, others in industry, notably in naval construction; but their large plantations

also were worked by slaves, the trade in slaves being a part of their active commerce in the western Mediterranean.

The little that is known of slavery in the early Roman Republic indicates that it was of the mild type characteristic of household and small farm employment on a limited scale. The change in slave conditions occurred through a combination of circumstances. The Roman state in its conquest of Italy in the fourth century B.C. customarily retained some part of the conquered territory as state domain. This public domain was rented, preferably in large holdings, to wealthy men among the Roman citizens and Italian allies. Out of this system grew the great *latifundia* of a thousand acres or more which became typical of Etruria and of southern Italy in the second century B.C. The long period of the Carthaginian wars (264-241 and 218-201 B.C.) called into the naval and land campaigns a large element of the able bodied small farmers of Italy, both of the citizen classes and of the Italian allies. To meet the dearth of available native farm labor caused by military service the owners and renters of large estates made use of the captives taken in the constant wars of the third and second centuries and sold as slaves. In 262 B.C. after the capture of Agragas (Agrigentum) in Sicily 25,000 prisoners were sold; after the recapture of Tarentum in Italy in 209 B.C. 30,000 persons were sold. When the Roman state in the second century was advancing into Macedonia, Greece and Asia Minor and extending its sway over Spain, the numbers of slaves placed upon the market increased. In 167 B.C. by order of the Roman Senate 150,000 persons were taken in the towns of Epirus in one day. At the end of the second century the island of Delos became a veritable slave market, in which 10,000 slaves might change hands in a single day. Both demand and supply grew. Under the bitter exploitation and general mismanagement of the provinces by Rome in the period from 110 to 67 B.C. organized piracy upon a large scale thrived upon kidnaping and the sale of its victims to meet the demand of the west for slaves. The heartlessness of this western system of plantation and ranch slavery is fully borne out by the record of uprisings, from the intermittent outbreaks of rural slaves in Sicily and Italy in 200 B.C. to the final dangerous revolt of the slaves of Italy led by the Thracian Spartacus in 73-71 B.C.

The organization of the Roman Empire brought an end to the period of the exploitation

of the provinces and established within the boundaries of the empire the *pax romana*. The endless supply of cheap slaves through the sale of war captives dwindled, and with the decrease in slave supply there came a gradual return to tenantry and leasing on the share system. Coincident with this change appears the encouragement of slave marriages in the west and the rearing of house born slaves (*vernae*) with its humanizing influence upon the master's behavior.

The growth of a new public attitude toward the slave class in the west, reflected in a series of legislative enactments by the Roman emperors, is part of a general spiritual change, the sources of which are difficult to trace. Neither stoicism nor Christianity was a primary or direct agency in the application of the new spirit to slavery, since both fully accepted it as a working economic and social institution. Believing that there would be no spiritual differentiation between bond and free, both stoic and Christian were indifferent to slavery although advocating humane treatment for slaves, in the one case as members of the fraternity of mankind, in the other as children of God.

Although statistical proof is out of the question, it may be assumed that the effects of slavery upon population numbers in antiquity were consistently counter to increase. The problem of its reaction upon public morals and standards of living cannot be solved by a general condemnation of slavery per se. The slave system of antiquity was a part of a general labor system. Except for the two hundred year period of western plantation slavery, free and slave labor customarily worked side by side with little actual differentiation in respect to wages or treatment.

WILLIAM LINN WESTERMANN

MEDIAEVAL. In western Europe, the Byzantine Empire and the Moslem lands mediaeval slavery took its cue from the later and more humane codes and practises to which the ancient world returned after the decline of the gang slavery of the Roman plantations. For centuries after Valentinian's edict of 377 A.D. forbidding the sale of rural *servi* separately from the land it is difficult in many cases to distinguish the condition of these people from that of the coloni. The word slave, a variant of Slav, gradually came into use from about the eighth century because of the number of captives from Slavic tribes. Dealers also bought Germans and Gallo-

Romans, Verdun being one of the great centers of the trade with the Mediterranean.

In a letter of about 600 freeing two church slaves Pope Gregory the Great repeated the ancient belief that manumission was a good act. Centuries before the Christian era the Jews had been warned (*Jeremiah* xxxiv: 8-16) of the Lord's displeasure because they enslaved their own people, a point specifically recalled by another famous manumission document of the twelfth century from the Abbey of Saint-Père at Chartres. The third Levantine "book religion," Moslemism, was to be equally clear as to the piety of releasing those of its own faith from bondage. Gregory's remark that nature had created men free in the beginning and the *ius gentium* had substituted slavery (*quos ab initio natura liberos protulit et ius gentium iugo substituit servitutis*) was good pagan philosophy, to be repeated almost word for word by Rousseau in the eighteenth century; but this part of Pope Gregory's statement must be read in its theological context. The redemption from bondage provided by Christ's sacrifice was for the benefit of those who embraced Christianity, and even in these cases manumission was not the right of the slave but a pious and commendable act on the part of the master. There was a growing agitation against the sale of Christians, especially abroad and most especially to Jews, Saracens and barbarians. But slavery itself continued to exist in every Christian country throughout the Middle Ages and the church made no attempt to abolish it. Indeed it did not free its own slaves. For generations the German clergy connived at the export of Slavonic people by Jewish merchants to Moslem countries.

Slavery and the slave trade declined materially and generally in western Europe for at least four centuries from about 900 to 1300. The supply of "barbarian" and "infidel" captives decreased. Serfdom was better adapted to the crude and non-commercial agriculture of central and northern Europe. Even house slavery must have been reduced through manumission and the substitution of dues and corvées from half free peasants. In Mediterranean Europe the colonate became standardized as serfdom rather than slavery, under the influence of Lombards and Normans during the period before these Germans became thoroughly Latinized and began to revive Roman jurisprudence. Slavery was also ill adapted to the commercial and industrial life of the Italian towns, furnishers of the vast transalpine regions, at a time when European

civilization was rapidly expanding to the limits of the continent.

It is hard to date the definite increase in slavery toward the end of the European Middle Ages. Refugees and captives multiplied with the new Asiatic invasions of eastern Europe and the Near East which began in earnest in the thirteenth century. Venetian and Genoese slave traders bought Circassians, Armenians, Syrians, Bulgarians and Serbs from the Turks, for sale principally in the Mediterranean countries. The Spanish advance against the Moors provided many captives. House slaves were in demand in the Mediterranean trading towns after these became large and wealthy. Part of this market was supplied with Sudanese, brought across the Sahara to the Barbary ports. This trade had been large for centuries, but the bulk of it always went to Moslem countries. The Portuguese reached the Guine coast in the fifteenth century and began to divert this ancient traffic to the sea near its source. The military successes of the Ottoman Turks aided the revival of slavery. Standard accounts assert that at least fifty thousand people were sold as slaves after the fall of Constantinople in 1453. It is common but hardly permissible to classify the Moslemized and privileged Janissaries as slaves on the grounds that they were obtained by levies of Christian children for three centuries after about 1326 and were not allowed to marry until 1566.

The late mediaeval combination of rising national spirit with religious militancy and intolerance made for increased numbers of captives. In 1452 Pope Nicholas v empowered the king of Portugal to despoil and sell into slavery all Moslems, heathen and other foes of Christ. A hundred Moorish slaves sent to Pope Innocent VIII in 1488 by Ferdinand the Catholic were distributed among the cardinals and other notables. Baptized Jews who associated with the unconverted were liable to enslavement. This was also the penalty for a variety of crimes, including conspiracy, high treason, wife abduction, soothsaying, inability to restore stolen property and the sale of arms to Moslems during the offensive wars called crusades. "Foes of Christ" was sometimes broadly interpreted. Pope Gregory XI excommunicated the Florentines in 1376, ordering their enslavement wherever found. Women slaves were sold cheap in Rome after the fall of Capua in 1501.

Being valuable, slaves secured their freedom for valuable considerations or out of the piety of masters, which might be stimulated by the hope

of reward in another world. The church slave admitted to holy orders might have to purchase the privilege or have it purchased for him by his fellow villagers. If he left the church or married, he could be reclaimed as a slave. As in ancient manumissions it was common to continue certain rights and obligations. For example, the church generally excluded the freed slaves of private masters from holy orders until evidence was produced that no *obsequium* remained, especially the right to reclaim the freedman for testifying against his former master or showing him disrespect. Too much independence on the part of ordained former church slaves could be guarded against by the threat of return to their former condition. A church slave freed to become a private person generally had to see that his former bond service was rendered. Sometimes he paid a stiff sum, in annual instalments or all at once. He could not buy property from relatives still in the church or summon anybody to court within the chapter except by its consent. If a freeman married the daughter of a church slave, he generally became a slave himself together with the children of the marriage; but he might avoid this by payments during his lifetime and the surrender of his property to the church at his death. Slave marriages were not generally solemnized by the clergy unless the master consented, for such a ceremony might be presented as evidence of freedom.

It is often asserted at the present time that private slaves were better off than church slaves, largely on the ground that the former had a better chance at manumission. Whether this is suitable evidence depends upon the point of view. The bishop or other administrator within a perpetual institution was not as free as the private master to follow any natural lenience at the expense of property rights in special cases. Sometimes a bishop was forbidden to free church slaves without payment from private funds and the freedmen were required to give evidence of their new status to one or more successors to the bishop conferring freedom. As a rule children of unions between freeman and slave took the status of the mother, but there were many exceptions, as in England. Since slavery was chiefly a personal and household relationship after the rise of feudalism and serfdom, it seems safe to assume that both the best and the worst conditions were to be found under private masters.

Slavery in the Moslem world had few special characteristics. Household slaves rather than

field slaves were the rule. Because of the organization of family and household eunuchs were much more common in oriental societies. Emasculation was increasingly discouraged in Christian Europe and forbidden in some states but not entirely abolished. Like Christianity, Islam tolerated slavery and encouraged the enslavement of enemies; but the freeing of a Moslem slave was regarded as a pious act. Debt slavery and the sale of children into slavery by destitute parents were less common and more distinctly against the law than in Christendom. Prisoners of war and descendants of people already captives made up the bulk of the slave population. Young female slaves were often the concubines of their masters, with a special and stable situation in the family if sons were born. A slave could be freed by will, even by a clearly expressed verbal will. As in Christendom, he could be liberated by a contract to meet precise and regular payments. Such a contract might be almost the exact equivalent of the Roman *peculium* arrangement, save that the unfree Moslem could enter into a contract under which he could not be sold if he lived up to its terms during the period in which he was earning the price of his freedom. To forgive him part of this price was a pious and meritorious act. As in Rome or in mediaeval Christendom, manumission generally made a person merely a freedman for the time being, owing obligations similar to the *obsequium*. Moslem slavery during the European Middle Ages is not to be judged by the slave trade. The terrible journey across the Sahara was probably not as bad as the "middle passage" of later times. Organized Barbary corsair activities, by renegades originally of many nations and faiths, belong mostly to modern times; and the hope of tribute was responsible for many of the worst features. The most hideous aspect of the trade in Sudanese was probably the making of eunuchs. The operation was performed in the Sudan before the caravan trip, and about one out of ten survived. Once these valuable slaves had reached the Mediterranean, they were generally well treated. Of course the eunuch is a familiar figure in the history of the ancient Near East, of the Roman and Byzantine empires and even of Christian western Europe—the practise he represents was not originally Moslem in any sense.

The tendency to ignore the widespread existence of slavery in the Middle Ages may be attributed largely to the obsession of many philosophers and historians that history records a

reasonably consistent advance from unfreedom to freedom. This explains the uncritical rejoicings over the rise of serfdom. On the whole slavery has been associated with higher types of economic organization than serfdom and probably with social conditions at least as civilized and humanitarian.

MELVIN M. KNIGHT

MODERN. General. Although throughout the modern period various earlier types of domestic and patriarchal slavery have persisted in many regions of the world, the most significant and dynamic development of the institution has taken place in connection with the establishment and spread of the plantation economy in the Americas and with the transportation and sale of African Negroes. Around the middle of the fifteenth century the traffic in slaves from the interior of Africa, which since the rise of the Moslem power had been monopolized by overland Arab traders, began to be diverted by the Portuguese sea captains of Prince Henry the Navigator. In the course of their voyages of exploration along the west African coast they returned, first with Moorish captives and after 1444, the date of the first shipload of Senegalese blacks to arrive in Portugal, with Negro slaves from the various native tribes which they encountered. The development of this new oversea, as opposed to overland, trade in African Negroes was stimulated by the fact that slaves were in demand in Portugal as domestics and stevedores and to a far greater degree as agricultural laborers, especially in the southern sections of the country, where the wars against the Moors had helped to deplete the population. Furthermore, as Portuguese dominions expanded into the East Indies and South America, natives of these regions were sent in considerable numbers as slaves to the home country and to different parts of the empire. By the middle of the sixteenth century the inhabitants of the Algarve were largely Ethiopian, and even as far north as Lisbon blacks outnumbered whites. There was no marked color line, and the blood of the two races mingled freely, resulting eventually in Negroid physical characteristics in the Portuguese nation. African slaves were being sold in Spain soon after their introduction into Portugal, and although they apparently were not used to any extent in agriculture, the institution was soon established. Even the pious Queen Isabella favored it as offering salvation to the bondmen through contact with Christianity.

It was the discovery of America, however, which opened the new era in the history of slavery. In every colony sooner or later the essential prerequisite of prosperity became the capacity to furnish some commodity or commodities which people elsewhere would buy at a price greater than the costs of production and delivery. Staple products for sale in Europe were found in tobacco, rice, indigo, cotton and sugar cane, products which invited large scale production, by the use of gang labor, for the sake of large scale earnings. Wage labor was seldom available, for where there is opportunity to work for oneself few are willing to go into the employ of others, and it became necessary to resort to unfree labor.

Slavery in the Hispanic colonies of the New World was at first limited to the aborigines and was resorted to by Columbus. Although in the subsequent period, under the influence of the clergy, slavery as a formal institution was generally frowned on by the authorities in Spain, natives were forced to work in fields and mines under the oppressive forms of serfdom known as *repartimiento* and *encomienda* (see NATIVE POLICY, section on LATIN AMERICA). Long before the close of the colonial era most of the natives of the West Indies had been wiped out by harsh treatment or by European diseases. The aborigines were deprived of their liberty on the ground that otherwise they would flee to the forests and mountains and could not be taught the "true faith." Recognizing this difficulty, the Spanish sovereigns permitted the colonists to force the Indians to work; but they stipulated that the laborers must be treated humanely, paid for their labor and taught the Christian gospel. The royal mandates were, however, largely ignored, in spite of the efforts of Bartolomé de Las Casas and other members of the clergy to protect the Indians. Moreover on the pretext of suppressing rebellion or cannibalism extensive slave raids were undertaken first against neighboring islands in the West Indies and along the continental coasts and then, throughout the colonial era and to some degree even in the following century, in the frontier regions of the colonies on the mainland. Chattel slavery thus became common and supplied skilled craftsmen as well as domestic and agricultural workers.

Indian slavery began in Brazil with captives taken by the Portuguese on the coasts in their conflicts with the aborigines. Before long slave hunting had become an important and lucrative occupation, especially in the south and west,

where the mameluke inhabitants of the captivity of São Paulo raided the Jesuit missions and carried off their aboriginal inhabitants, largely Guaraniá. The Paulistas sold their captives for the most part in the coastal settlements, where they were used on the sugar and cotton plantations. The Indians of the lower Amazon basin were likewise enslaved on a large scale and forced to work in the tobacco plantations of Pará. Early roused by the high mortality of the natives under their oppressive taskmasters, the Jesuits became their champions at the Portuguese court and sought constantly to protect them. Although various royal decrees were issued to govern their treatment and to place them under the care of a council of missions, the greed of the white plantation owners and the remoteness from the scene of the royal officials prevented any considerable improvement in the lot of the native bondmen.

With the passage of time, however, Indian slavery proper was reduced to a position of relative insignificance through the large scale introduction of Negroes. The first Africans were landed in the New World about the year 1510, before Las Casas began seriously to champion the aborigines. His subsequent suggestion, which he later regretted, that blacks be brought in in sufficient numbers to save the natives from slavery, unquestionably accelerated importations from Africa. Furthermore it was found that Negroes made far better bondmen than did the wild aborigines, who were restless in captivity and died in greater numbers under the hardships it imposed. The arrangement also suited the needs of the royal hacienda, which taxed importations of Negroes while it derived tribute from many of the theoretically free Indians. The large scale importations into Brazil were the result of similar considerations.

Most of the African slaves were used as domestic servants, agricultural laborers and stevedores or in other unskilled occupations; but many expert craftsmen were found among them. The work to which they were put was determined in part by the ethnographic group from which the slaves had been drawn. Those from the Slave Coast tribes were commonly good natured and docile and were in demand as field hands. The Koromantes of the Gold Coast, who were noted for faithfulness, were desirable as servants. The Senegalese, the most intelligent of all of the slave types, were sought for high class domestic work and also for training in the crafts. The natives of the Congo and Angola, on

the other hand, because of their dulness of wits, were used largely for gang labor.

Although they were introduced into all the colonies, the Negroes apparently did not thrive in the highlands, and the aborigines generally continued to toil in the mines and to share in the coarser work connected with the trades. But in the sugar growing West Indies and the Spanish Main black slavery became established on a large scale; and after many of the islands and neighboring areas passed into French, English or Dutch control the blacks continued to increase, forming a large majority of the population in several of the islands. In Brazil they were in especial demand in the northern plantations, where by the close of the seventeenth century they outnumbered the whites twenty to one. The opening of the mines in the eighteenth century brought large numbers farther south, a movement which continued with the growth of the coffee plantations in the late colonial era and the independent period.

It was not until the eighteenth century, when plantation production had spread into many areas, that the Atlantic slave trade became the most profitable branch of maritime activity. The trade with Brazil was in the hands of Portuguese or Brazilians throughout the period of the traffic; but the Spanish Indies were supplied by foreigners who were granted special concessions (*see ASIENITO*). The Dutch, French and English organized private slave trading companies and carved out spheres of influence on the African coast. In the eighteenth century the British, endowed with the *asiento* privilege, held the primacy in the trade. From the latter Liverpool drew its first great prosperity, and in this prosperity every part of western Europe and America shared.

The typical voyage of the slave traders was triangular. The first leg was from the home port to Guinea with a cargo of trade goods, including a heavy supply of rum if the ship had sailed from New England. On the coast of Africa this cargo was bartered for blacks, brought by their fellows from the interior to the coast. If the supply was abundant, the Negroes were thrust as thick as they could lie between the decks of the vessels or upon shelving. The second leg, the "middle passage," was the transatlantic run, which although it was swift, thanks to the trade wind, was wretched enough for the befuddled and bewildered victims. At American destinations they were either sold by sundry quick dealers or put into stockades to be retailed on demand. The

ship was then laden with sugar and molasses or with rice or tobacco for the third leg homeward, bearing money or bills of exchange to make up the difference between the proceeds of the slave sales and the purchase price of the cargo of plantation produce.

Of the millions of blacks who crossed the sea by far the greater number were sold in the West Indies and Brazil. This may be attributed not merely to the larger scale on which the tropical plantations operated and to the absence of competing white labor but also to the heavy mortality, particularly among the young.

In Africa the Negroes were taken from ten thousand hamlets; in America they were sold helter skelter among ten thousand purchasers. Their native languages were generally of no use; their crafts and creeds were primitive (although there were some Moslems) and of no service. Under coercion, whether harsh or mild, they had to learn a new technique of labor and the rudiments of the master's language. They were forced at least to compromise with his requirements as to conduct and in certain of the colonies were under some pressure to embrace his religion. Some resisted and were destroyed. In Brazil suicides, usually by drowning, were common. Another refuge for the unhappy and discouraged was flight, escape was most successful on the continents, where there were vast hinterlands, jungles and forests. Runaways in Brazil at times escaped capture through strong organization. During the war of the Brazilians to expel the Dutch in the seventeenth century slaves from the Pernambuco region deserted their masters in great numbers and set up communities in the jungle. One of these, the confederation of Palmares, numbering 8000 to 10,000 inhabitants, resisted conquest for nearly a half century. The great majority of slaves acquiesced in their condition in a perfunctory manner, but a substantial number even of imported Negroes became affectionate, loyal and painstaking servants. Those who were born in America, having no tribal memories to lament, were likely to offer less resistance to the system into which they were bred; and with each new generation acceptance became more and more a matter of course.

The system, however, continued always to chafe many of the slaves. Although in the Hispanic parts of America slave revolts seem to have been of rare occurrence and little feared, in the French, English and Dutch possessions as in the United States the white element lived in almost constant dread of servile uprisings. This differ-

ence is probably to be explained by the fact that on the whole the position of the slaves was much less unhappy and hopeless in Spanish America and in Brazil than in other parts of the New World. Whereas in the British possessions the Anglican church was as a rule wholly indifferent to their spiritual needs and the Moravian and Methodist missionaries began to work among them only in the eighteenth century, in the Roman Catholic countries the black man was regarded as an object of salvation. The clergy were the best friends of the helpless slave; they made efforts to have infants baptized and encouraged marriage among the adults, although masters generally preferred the customary loose unions, since the marriage tie of the Roman church was a handicap when slaves were to be sold. In Brazil and—presumably to a lesser extent—in Spanish America the slaves met for evening prayers with the master's family. Perhaps of equal influence in the Hispanic colonies was the absence of distinct racial prejudice, which permitted the free Negro to rise high in the social scale and prevented opposition to manumission or even laws prohibiting it, such as existed in many parts of the southern United States. By precept and example many of the Roman clergy encouraged voluntary manumission, as did also law and custom. Faithful nurses were often freed when their charges no longer needed them. In Brazil slave mothers at times asked white persons to serve as sponsors for their infants at baptism, and granting of this request carried with it a tacit promise to see that the child was liberated. In Brazil likewise law or custom stipulated that a slave woman who had borne ten children should be manumitted. Throughout Hispanic America, if a slave could furnish his master with his legal purchase price, the master was bound to accept the money and give him his certificate of liberation. Money for purchasing freedom was as a rule earned during the rest days, which generally included most of Sunday as well as the saints' days and other holy days.

In the Portuguese, Spanish and French colonies the autocratic system of government served to lessen local control over legislation regarding slaves and their treatment. In the British possessions, on the other hand, the slave codes during most of the period were entirely of local origin and manifested a marked tendency to variation and to change, particularly after the abolitionist agitation had begun to attract attention to their harshness. Like the codes in the

United States, the legislation everywhere aimed to benefit the white master and to restrain the bondman. The codes were rather laxly enforced, however, especially in the Hispanic sections, and the slaves really fared better than the laws permitted. In the Portuguese and Spanish colonies the public authorities cooperated in disciplining and restraining incorrigible blacks, employing for this purpose the slave whipping post and the slave jail. But nowhere was serious precaution taken to protect the bondman from his master; for, as in the United States, the assumption was that the property rights of the master in the slave would save the latter from serious harm. Consequently slaves were at times subjected to ferocious cruelty and even met death at the hands of white men.

Everywhere mingling of blood between slave women and white men was common. The children took the unfree status of the mother but in many cases were manumitted by the father. Apparently the only serious effort to prevent such relationships was that of Louis XIV, who decreed freedom for the mother as well as her half breed child in cases where the guilty master was unmarried. In the French colonies this decree resulted chiefly in the rise of a class of mulatto freedmen, who by reason of their education and wealth aroused the jealousy of the whites. The resulting race prejudice helps to explain the fact that the slaves in the French colonies (especially Saint-Domingue) fared worse than those in the Hispanic regions, despite the Catholicism of the French and the *code noir* of Louis XIV (1685). As in the United States, slave quarters in the other regions of the New World were commonly huts grouped at the rear of the master's residence. Their food consisted mostly of starches, such as maize or farina; but on the plantations Negroes were given bits of land on which they could raise chickens and pigs, fruits and vegetables. The favorite amusements were dancing, singing and playing on primitive musical instruments of African origin.

In lands of European culture the movement against slavery, which began in the eighteenth century in an attack upon the slave trade, was largely the result of the rising spirit of democracy and the recognition that the inherent evils of the system (see PLANTATION) affected the slaveholding element as well as the bondmen. The French Revolution was unquestionably the most important single factor making for abolition. Directly to it may be attributed the uprising in Saint-Domingue, which resulted in the establishment

of the black Republic of Haiti; it was responsible also, but somewhat more indirectly, for abolition in most of the Spanish American republics. In the Brazilian Empire, next to the United States the largest occidental slaveholding country, the great dependence of the coffee planters upon slave labor was the chief cause for the prolongation of the institution, and the most potent single impulse toward abolition came from the Civil War and emancipation in the United States. The Law of 1888, decreeing the total elimination of slavery, was the immediate cause of the downfall of the empire in the following year.

The antislavery movement turned its attention also to the various forms of slavery which had persisted in the Moslem countries, in the Orient and among the more primitive peoples. Although the predominance of a domestic and patriarchal type of slavery has made the system relatively mild in these areas, they have nevertheless proved particularly resistant to western moral and religious codes. An outstanding target of the reformers has been the east African and Red Sea trade, which remained after the Atlantic trade was checked and survives in a limited degree today. The leaders of the movement came to the conclusion that they could abolish the slave trade only by introducing Christianity and western civilization into Africa and by destroying the market through doing away with slavery itself. Such ideas provided an important pretext for the partition of Africa. In the abolition of slavery the British have been especially active; remembering, however, the disorganization caused by compulsory emancipation in the West Indies, they have been content with abolishing the legal status and in this respect have been followed by the other nations. In India this step was taken in 1843 and slavery began to disappear in the period after 1857, when railroad building supplied an outlet for labor.

Action on an international scale against slavery dates from the early period of the attack on the Atlantic slave trade. The Brussels Act of 1809, in which eighteen states participated, furnished the decisive move in the outlawry of such traffic. The convention of Saint-Germain of 1919 pledged its signatories to endeavor to secure the complete suppression of slavery in all its forms, including forced labor, pseudo-adoption, forced concubinage and debt slavery, and of the slave trade by land and sea. In 1926 another convention, prepared under the auspices of the League of Nations, bound the signatories

to suppress the slave trade and to bring about complete abolition as soon as possible. This convention was ratified by thirty-eight states. In 1932 it was assumed by the League of Nations Committee of Experts on Slavery that legal recognition existed only in central Asia and Tibet (although authoritative information was lacking), Arabia and Abyssinia; in the last named state the trade has been prohibited and freedom upon the death of the master and for children born after a certain date has been decreed.

Antislavery propagandists estimate the number of slaves existing today as at least 5,000,000. In China the purchase and ownership of children, particularly of young girls, for household service is still common under the guise of adoption. In Abyssinia perhaps one fifth of the population consists of slaves, and there are also numerous serfs. The institution there is ancient, the life of the Christian church is bound up with it, and the large Moslem population likewise supports it. In some cases the slaves work in agriculture, especially on the lands of the powerful chiefs in the south and southwest, but in the main they are domestics. Upon these slaves public officials, and even common soldiers, rely for their economic support and social prestige. The supply is recruited by raids upon the non-Abyssinian populations, even into neighboring territories. Suppression is difficult because of the limited power of the emperor. In Arabia similar conditions prevail. Among the aborigines in Liberia domestic slavery, especially of women, is widespread. Although the government has outlawed slavery, it has countenanced the African custom of pledging persons, usually children, for the debt of a relative. The pledge is salable. The Americo-Liberians have taken such pawns. High officials have been accused of forcibly shipping natives to the plantations of Fernando Po, and the practise is said to be scarcely distinguishable from the slave trade. The Portuguese have been charged with similar action with respect to shipments from Angola to São Thomé and Príncipe.

MARY WILHELMINE WILLIAMS

United States. In the North American colonies enslavement of Indian captives was sometimes resorted to, but they proved to be unwilling servants, prone to flee to their tribes if not to kill their masters. As a means of removing them to a safer distance from their tribes Indian slaves were frequently shipped to distant colonies, as,

for example, from New England to the West Indies; but on the whole Indians played a minor role in the establishment of slavery. Indentured white servants from the British Isles and Europe were for some decades the main source of slave labor in Virginia, Maryland and Pennsylvania; but as experience revealed the superior adaptability and cheapness of Negro slaves, they were gradually replaced in all the plantation colonies. In these respects the sixteenth and seventeenth centuries were experimental; it was not until the eighteenth that the slave trade became the most profitable branch of maritime activity.

From the first intrusion of the blacks into a community the whites had assumed, whether by custom or by law, the functions of authority. At the time when the first parcel of slaves was imported into Virginia in 1619, there was no statute concerning Negroes, and for several decades the situation remained unchanged. Gradually, however, by a slow succession of laws, which served also as a model for neighboring colonies, the presence of slaves was recognized and a code elaborated to define their status both as persons and as property. Meanwhile Barbados, the oldest English colony in the tropical belt, evolved a more stringent code, which was copied by South Carolina and other Anglo-American jurisdictions in the sugar and cotton latitudes. In the Spanish and French colonies, including Louisiana, the codes were milder than in the neighboring English colonies, having been decreed by distant monarchs free from pressures arising out of local circumstances. The dominant purpose, however, even in the Spanish and French colonies was the promotion of the prosperity and the safeguarding of the security of the white population.

In early Virginia the enslavement of the blacks had been rationalized on the grounds of their paganism. But race quickly replaced religion as the basis of differentiation, and the law prescribed that every Negro be presumed to be a slave unless he could individually show title to freedom. By analogy with livestock the children born in the colony took the status of their mothers. This bracketed virtually all the mulattoes and quadroons along with the blacks in the slave category and the Negro caste.

As the ratios of colored to white began shortly to increase in the plantation colonies and sporadic insurrections began to break out, the laws of police were repeatedly stiffened with a view to providing complete restraint of slaves at every turn. They were forbidden to possess arms or

drums, to travel the highways or be out of their premises at night without written passes or white escort, to congregate for any purpose in the absence of whites or to resist any white person's exercise of authority. For a routine of surveillance the citizens were embodied into patrols to traverse their countrysides periodically by night. These laws, passed in anticipation of emergency, involved slaveholders and other citizens in heavier duties than as a rule they were willing to discharge. In normal times of quiet and confidence, the control was much more casual and easy going than the statutes would imply. In the colonies northward of Maryland, where the growing season was too short for the plantation system to flourish and where only a small number of Negroes had been imported for domestic and incidental service, the slave codes were much less elaborate and the social concern with any race problem was less acute. In these colonies the status of the Negroes might be changed with little disturbance to the prevailing order.

In the movement for American independence the doctrine that all men are entitled to liberty was not merely used as a campaign cry but was incorporated into the bills of rights which several states, including Massachusetts, attached to their first constitutions. Shortly afterwards this clause was declared by the Massachusetts judiciary to invalidate slave property. By 1804 all the other northern states had disestablished slavery by statutes which prescribed freedom, upon their attaining specified adult ages, for children born thereafter. In Maryland and Virginia similar proposals were defeated by the prevailing fear that industrial paralysis and social chaos would ensue. Farther southward no citizen of prominence made antislavery proposals of any sort. The main concrete result of liberal preachments in the South was a large number of private manumissions by quail ridden proprietors.

The French Revolution, following fairly close upon the American, was more thoroughly committed to the inherent rights of man; and in due time the Jacobins applied their ideology to the slave situation existing in the French colonies. When in Santo Domingo (soon renamed Haiti) the white colonists resisted the enfranchisement of the colored population, the mulattoes and blacks, acting separately, rebelled and drove out such of the whites as they did not massacre. Eventually the blacks conquered the mulattoes as well and established a barbaric independent

government. These occurrences around the end of the eighteenth century helped to produce a conservative reaction in the United States, where in the meantime Whitney's invention of the cotton gin had opened the way to a vast extension of the plantation area.

In the federal constitution, although the word slavery was avoided, the institution was recognized and to a certain degree safeguarded. Slaves, at a three-fifths ratio, were to be included in reckoning the apportionment of congressional representation among the states; interstate recovery of runaway slaves was not to be prevented by state laws; and Congress was not to prohibit slave importations prior to 1808. As this deadline drew near Congress, with little intersectional dissension, forbade further imports. At the same time Parliament prohibited slave trading under the British flag; and thereafter both the British and American governments took the lead in establishing an international outlawry of the maritime slave trade. Among the American states meanwhile slave imports had been permitted only by Georgia until 1798 and by South Carolina after 1803.

The rapid opening of the western cotton belt after 1815 created a great regional demand for plantation labor, which could be supplied only from the older slave states. Many migrating proprietors took their own slaves to the new country, and many prospering settlers bought recruits in the market. A long distance domestic slave trade was rapidly developed, with Virginia as the chief area of supply and New Orleans as the main center of distribution. Slave prices, which had been relatively stable as long as Africa was available as a reservoir of recruits, now became subject to sharp inflation and depression. The pivotal market category of slaves was that of prime field hands. These were able bodied men between eighteen and thirty years of age, on the threshold of maximum earnings for a maximum span of years. A newborn male pickanunny was a palpable addition to his master's assets, rating at about one tenth of prime for his period and region. Given a healthy and robust body, the slave's value grew with every year of his childhood and youth, not because of the investment represented by his food and clothing but because of the approach of the time when the value of his service would probably exceed the cost of his maintenance. If he were given special training as an artisan, a butler or a foreman, he was capable of attaining a higher value than if he became a mere field

hand; and his attainment of maximum rating would be deferred until perhaps his middle twenties, when his training would be virtually complete. After the age of thirty in the case of field hands—or perhaps thirty-five in the case of specialists—the value of the slave would begin to decline, slowly at first, then more swiftly, then more slowly again. In his early fifties he would be worth about one half of prime; in his middle sixties he might rate at zero or less, because of the probability that his future labor would not compensate for the cost of his maintenance until death. Girls and women at the several ages usually brought about three fourths of the price paid for boys and men. A fertile woman usually commanded no higher price than a barren one, since the prospective increment of pickaninnies was offset by the loss of the woman's service during pregnancy and suckling and by the possible loss of either mother or infant during childbirth.

For industrial purposes the primary category was "full hands." These comprised all men in full physique and such women as were able to do standard service, whether in the plow gang or in the hoe gang. Other women along with boys and elderly men might have a fractional rating as three-fourths, one-half or one-fourth hands.

Thus a three-fourths woman and her one-fourth child might be set to "chop" a cotton furrow, leapingfrogging one another to keep abreast of the gang without undue fatigue. Any slave might continue to rate as a full hand for many years after ceasing to be prime.

There are just enough records extant to permit the plotting of the accompanying chart (reprinted from Phillips, Ulrich B., *Life and Labor in the Old South*, Little, Brown & Co., Boston 1929, p. 177), which exhibits the course of prime field hand prices in four markets during the six decades of the nineteenth century. The number of slaves sold in any year seems to have been only 1 or 2 or possibly 5 percent of the gross, in contrast with a stock exchange regime in which it is not unknown for the whole share capital of a company to be turned over in a single day. In the chart of the slave price curves the peaks are usually sharp and simultaneous and are separated by fairly broad troughs. This suggests that the price tended to remain on industrial rather than speculative levels, except for brief periods of special enthusiasm. The crash which came just after 1860 is fully explained by the fact that the very basis of slave property was on the point of being destroyed; but the downward course in this instance was

obscured statistically by the plunge of Confederate currency at that time.

A good many slaves were hired out by the year. On such a basis able bodied men were in special demand by tobacco factories, ironworks and railroad builders. The wages current, which were additional to the cost of food, clothing, shelter and medication, ranged parallel to those of free labor. These wages bore a fairly definite relation to the capital values. In fact capital values depended mainly upon potential wage rates. In Virginia the price of a prime field hand tended to be about eight years' purchase of his labor and in Louisiana about six years' purchase. This did not imply an expectation of death in six or eight years' time but was due in part to the familiar economic practise of discounting probable future earnings, together with the chances of truancy, crippling or illness as well as of death.

As a rule the variation of slave prices as between the lowest and highest markets amounted to some 20 percent. This created an opportunity for the long distance traders, who moved their merchandise by diverse routes. From the Chesapeake to New Orleans they moved their charges mostly by ocean highway around Florida. After crossing the mountains, usually from the Potomac, they used river boats on the Ohio and Mississippi to Memphis, Vicksburg and thereabouts. From Virginia to Georgia, Alabama or eastern Mississippi there would be a trudge of a coffee overland, with perhaps a bit of peddling along the way. In the 1850's the Central Georgia Railroad operated a sleeping car for Negroes—a facility which it has not afforded since. Recruits for Texas went mainly by sailing lanes from New Orleans or Mobile or around Florida. Whatever their destination, slaves flowed by much the same channels as the free migrants and as a rule in their company. The destination had to be reached in good order if a profit were to be made, and sale had to be fairly quick in order to guard against excessive board bills and to keep the trader's capital fluid. For local dealings any merchant might act on commission, although his services were not indispensable, as buyers and sellers often negotiated without an intermediary. Sometimes in fact a slave mediated in his own behalf, bearing a written authority to find a purchaser for himself. The results of this traffic included some anguish of dislocation, personal and regional, and some improvement in the adjustment of labor to management and local resources.

Migrating slaveholders often took pains to register the fact that they were moving to a new plantation and were not "dealers in human flesh" But the slave traders traveling by the same ship would exert virtually the same effect upon the statistics. Migrant proprietor and traveling dealer together succeeded during the course of a lifetime or two in transferring a multitude of slaves from one region to another, from one staple to another; and in particular they created the western cotton belt. In this region there were large tracts, perennially fertile and contrasting sharply with the lean and eroding Atlantic slope: the limestone lands of Alabama alluvium and loess along the Father of Waters and limestone again in Texas. If the Negroes had been a free peasantry, they might have trekked west in the course of generations; as slaves they went in droves in quick response to new opportunity seen by their masters. No effort of will was required of them, merely obedience.

To this extent slavery was conducive to efficiency, as may be shown by the prodigious increase of the cotton output from a few thousand pounds in 1790 to four million bales of four hundred pounds weight in 1859. As is evident from the chart, this increase produced gyrations in the cotton price. By the 1820's the price depression brought severe hardship to the eastern belt, provoking nullification of the tariff by South Carolina in 1832 in an effort to discover a means of relief. In the early 1840's a serious collapse put the price below the presumable cost of production in any region; and in the 1850's recovery reached but a moderate level. Nevertheless, by the middle of the century cotton— together with the other young staple, sugar— had come to employ and maintain more than three fourths of all the slaves engaged in field work within the United States.

About an equal number of white farmers and their wives and children were likewise engaged in cotton production, for this industry gave no pronounced advantage to units large or small. Its processes were simple; its routine was long but light; and its yield, man for man and mule for mule, was probably not very different whether produced by whites or blacks. The Negroes, being on plantations, as a rule tilled the best acres. These had been bought with the money or credit derived from cotton production by slave labor; and this labor, as already noted, had in itself involved a considerable outlay. The soil exhaustion so often blamed on the planta-

tion technique was in reality due to the terrain, the soil texture, the character of the rainfall and a frontier economy, not to the plantation system or to slavery. The blacks, under supervision, probably spread many more bushels of barnyard manure than the whites of the period, and they strewed many tons of guano at forty to fifty dollars per ton. The planters put much plant food into the ground; the run off of the rains took most of it down the hill, down the creek, "beyond recovery by any process of law." The farmers' hills likewise eroded but were seldom replenished. The net earning per bale tended at all times to be small. A farmer's crop, which seldom could exceed five bales, yielded a very lean livelihood. The planter's fifty to five hundred permitted ease and elegance, provided only his costs were kept within firm control.

The ratio of brain to brawn required in successful cotton growing could be supplied by the general run of planters. Some of them were eager students of seed strains, crop rotation and even of correct stance and movement in manual processes. Nor did they neglect to investigate the complex tasks of human management. Some of them put their experiments and observations into print; some made record in their diaries; and some communicated the fruits of their inquiries by letter or in copious conversation. Many planters of course were not systematic students of anything; nearly all farmers, equally of course, could be systematic students of nothing. With backs bent over the plow by day, they would hardly make record of results by night. There were no government bureaus to conduct experiments and comparisons. The planters alone could or did initiate improvements in method.

The tone in which the immense authority of the master was voiced might range from gruff to gracious. The slave's response might be cringing or resolute, aggrieved or nonchalant, quick or slow. In a tense moment a humorous remark might send a guffaw through the gang and relax the master's brow. Whereupon the foreman might break into a ballad chant, "Did tom tit sot on de top fence rayull," and the gang would join in with a six or eight-line refrain which might deal with anything in creation and had to be interlarded with a wealth of impromptu rigmarole. The tempo would be as fast as the gang would stand, its hoes rising and falling to the cadence; or again as slow as the master would tolerate. The foreman would chant "He wiggled, he sassy he 'itty bitty tavull," and again the gang

would give refrain. The tom-tit would cut many another caper, until: "In de cose of time he died an' went to heyull"—beyond resurrection—at least until another day. Now his pappy and his mammy, his uncle and his auntie would go their several ways from a crossroads and find adventures many. Finally 'possum an' 'coon, old reliables, might take the stage their wonders to perform. To stave off the untimely death of the protagonist any member of the gang might intervene with a special episode, giving notice of its conclusion with a line of inarticulate ululation. The master would long since have gone elsewhere on business or pleasure. At length the foreman would shout: "Wawtah boyee, heist yo heels! De brudderin' an' susterin' is gitt'n' dreffle dry," or upon hearing a bell or bugle from the steading: "Ladees an' ge'men, de time have come to pahtake of de good Lawd's provid'n'," viz. corn pone and bacon, turnip greens and pot liquor.

The slave was not often likely to suffer hurt. Overseers, "the cowhide fraternity" as one planter called them, tended to err on the side of severity; the masters themselves perhaps on that of lenity. Most plantations probably did not have overseers. The fear of punishment was a minimum stimulus as was known by all men. Many masters endeavored to replace or supplement it with a sense of loyalty, a pride of performance, a hope of reward. The degrees of success and failure were varied.

The violation of a slave woman was not a breach of the law but a mere trespass upon her master's property. She and her man could not legally marry. Marriage was a contract concerned mostly with the bequeathing of property; and slaves could hold no property and could make no contract. Some of the matings no doubt were dictated and were not always the worse for that. A few men were permitted to take wives on other plantations—"abroad wives," for short. Children in such a case were considered as their mother's offspring, the property of her master. The father and his master had no duties toward them or claims upon them. Some planters were quite averse to this practise, since it meant a traveler Saturday night, an absentee Sunday, a weary workman Monday and an unmated buck the rest of the week. A plantation had no bachelor bunk house; a large pickaninny crop was a necessity if the laborers were to be properly replaced through the years to come. In the main sex relations were normally peaceful.

But the actual conditions of life on the plan-

tation, which served as a rule to mitigate the letter of the slavery law, could hardly be known in England or the North. As a result a very different impression as to the nature of slavery prevailed among northerners and Englishmen. In the 1790's Wilberforce, Clarkson and Brougham began an agitation for the reform and eventual eradication of slavery in the British dominions. This bore fruit in a partially compensated emancipation by act of Parliament in 1833. Some of the British pamphlets, anticipating nearly everything ever said for abolition, procured American reprintings in the 1820's but barely produced a ripple. Meanwhile the struggle over Missouri's admission to the union had produced the beginnings of a portentous regional contest for power. In 1830 Garrison began his attacks on slavery. Some quick tempered southerners retorted with equal heat. A sprinkling of easterly zealots echoed Garrison. C. G. Finney, a revivalist preacher, and T. D. Weld, a systematic organizer, spread abolition through the Congregational churches of New York and Ohio. In Virginia Nat Turner, a slave preacher, led in 1831 an uprising which massacred some sixty victims. With one accord the slave states reenforced their laws by forbidding any person to teach the Negroes to read or to write.

A chain of antislavery societies began to bombard Congress with petitions regarding certain details of slavery. The two houses, to prevent the utter clogging of congressional business, adopted rules diverting these petitions and providing that they be handled much as all petitions are handled in our time. J Q Adams became "Old Man Eloquent" in defense of the "sacred right of petition," which was never really endangered. After some years of hot altercation the rules were discontinued. The mass of antislavery petitions thereupon shrank to small dimensions, and the great question of the territories took the right of way. This was never a valid question, inasmuch as the three and one half or four million slaves could not colonize either Utah or Kansas. Not only were the climates and crops of these territories antagonistic to slavery, but the migrations of all the whites of the north and the hordes pouring in from Europe foredoomed the institution in these regions.

A few southerners—James G. Birney, the Grimké sisters and Moncure Conway—were converted by the transcendental preaching and, moving north, joined in the propaganda. al-

though they had little to say that was distinctive. Eventually H. R. Helper, a North Carolinian who had gone to California in the gold stampede and afterwards moved to the north, issued his *The Impending Crisis of the South* (New York 1857), packed, as he said, with figures of arithmetic and rhetoric. He compared the regions as to wealth and production, and found the South wanting. In the per capita production of wheat, oats, rye, Indian corn and Irish potatoes he found free labor strongly superior to slave, whereupon he said, "Dare they ever think of cotton again?" He did not, nor of tobacco, rice, sugar or sweet potatoes. These would have proved his error. The Republican party endorsed the book and issued a group of his chapters as a campaign document.

In general the South became increasingly hostile to both abolition and free soil. In 1832 Professor Dew examined on behalf of Virginia the several plans offered from any quarter for discarding the "peculiar institution" and found them all unfeasible. His weighty pamphlet persuaded a multitude that nothing should be done. Alert defense of "southern rights" became the watchword everywhere, engendering a disposition to take up every challenge and to fight on every field.

On the celebrated seventh of March Webster urged the North not to insist upon reenacting a decree of the Almighty concerning New Mexico and Utah, and his advice prevailed. At the same time a more stringent law was enacted for the interstate rendition of fugitive slaves. Thereupon Webster was vituperated and most of the northern states enacted "personal liberty laws" to paralyze the federal statute. Vermont's law proclaimed the liberty of every person in that state and penalized any assertion that another was a slave.

Lincoln declared that the nation could not endure half slave and half free; that it must become all one or all the other. This was in part election rhetoric. There was no economic possibility of the extension of slavery through the North. Even in Kansas, after the great struggle over the principle, the census of 1860 enumerated a slave population of two persons. The nation had endured as it was for seventy years; the slaves were now diminishing sharply in relative ratio. There was no proposal that slavery be legitimated in any free state nor the slightest prospect of success if it were proposed. The North could wait and benefit by the trend of statistics with an eventual prospect of being able

to crush the South on occasion with only half an effort. The South could not wait. If it were to strike for independence, the stroke must be made quickly.

There were naturally some wild rationalizations: that slavery, far from being an unmitigated evil, was a positive good for both races; that it was sanctioned throughout the Scriptures as well as embedded in the constitution beyond the possibility of removal. Finally George Fitzhugh, casting about in the middle 1850's for some novel theory, said that slavery was the equivalent of Marxian socialism in that it distributed the goods of life (i.e. among the slaves) not according to capacity but according to need. In fact he commended slavery to the world at large, likening a plantation to one of Fourier's phalanxes. All this meant little. What did have meaning was that the South was resolving, as a pamphleteer of 1860 put it, that "The South alone, should govern the South. And African slavery should be controlled by those only, who are friendly to it." The purpose at hand was highly conservative—social security to the nth degree. The procedure followed led soon to its defeat.

In war time neither belligerent found much use for the Negroes. As had been foretold in the South, they did not rise in insurrection but remained peaceful and incommunicado on the plantations. Tradition says that very many were obsequious and solicitous to the end—faithful friends with perhaps a special care for the family silver when Sherman's "bummers" came. There is no ground for doubting the truth of such reports. The Confederate authorities impressed some for work on fortifications. The government, when about to collapse, took steps leading to the use of slaves among its armed forces. It was then too late for anything to come of this experiment. When a Federal force invaded a district, many slaves stole away to get freedom, whatever that might mean. Some thousands were set spading the mud, trying to dig a canal just beyond the range of the guns at Vicksburg. Other thousands, men, women and children, became camp followers. Many were recruited in two military units. Charles Francis Adams II records a low appraisal upon the performance of these units. Their presence put the Confederates into a perfect rage for slaughter, thus neutralizing the effect of the increment of force.

The regime championed by the planters and their neighbors was overthrown and the system shattered by its victorious enemies. Slavery's

overthrow in the United States was also its knell throughout the Americas.

SLAVEYKOV, PETKO RACHEV (1827-95), Bulgarian publicist and nationalist. Slaveykov taught in the national elementary schools and attained fame as a journalist and poet. From 1864 to 1876 he lived in Constantinople, at that time the center of Bulgarian cultural activities and of church politics. During this period he published a number of periodicals, a satirical journal *Gada* (Багрепе, 1863-67), *Makedoniya* (1866-72), *Shumosh* (Jest, 1873-74) and *Chitalshite* (Reading room, 1874).

Slaveykov represents two phases of Bulgarian nationalism, the movement marked by peaceful cultural propaganda and constructive effort and that characterized by a sharp revolutionary struggle for freedom. He formulated an evolutionary program based upon the theory that the nation's destiny was dependent not solely upon political conditions, as the revolutionary elements claimed, but essentially upon the Bulgarian people, whose cultural deficiencies constituted the greatest menace to a national revival. At the same time, however, Slaveykov advocated political liberation. An outstanding leader of the group which favored legal methods, he realized that the primary needs of the country, then dominated by the Greek church and by Greek culture, were national schools, a national press and literature and a revived national sentiment. Despite continuous persecution he worked tirelessly for these ends. His collections of folklore, his poems based upon this material, his journals and the Bulgarian translation of the Bible which he initiated were instrumental in reestablishing the vernacular as the literary tongue of the Bulgarians and in thus stimulating nationalism. His *Makedoniya* exerted a great influence upon various popular causes, including the struggle for a free Bulgarian church, an important step toward national freedom. His program for an independent church and for a thoroughly democratic settlement of the relations between church and state won him a wide following among the younger Bulgarians. He headed the pro-Russian as opposed to the Roman Catholic trend, and the structure of the existing Bulgarian exarchate rests essentially upon his ideas. After Bulgaria became a principality Slaveykov helped to or-

ganize the new government. He was one of the chief advocates of liberal and democratic principles both in his parliamentary activities and in his journals. He was the first president of the regular National Assembly and served also as minister of the interior.

JOSEF MATL

Works: Selections from Slaveykov's works (*Izbrani suchnemya*) have been edited by Pencho Slaveykov (Sofia 1905), and by Boyan Penev (Sofia 1927), with biographical introduction.

Consult Damiani, E., "Il primo poeta Bulgarico" in *Rivista di letteratura slave*, vol. II (1927) 1-22, Jocov, Boris, in *Blgarski pisatel*, ed. by M. Armandov, 6 vols. (Sofia 1929-30) vol. II, p. 105-72, Armandov, M., in *Uchislshten pregled*, vol. XXVI (1927) 1384-1416; *The Shade of the Balkans* (London 1904) p. 35-38.

SLEIDAN, JOHANN (c. 1506-56), German Protestant historian and politician. Sleidan received his education mainly in France, where he came into contact with the French political groups which were supporting the German Protestants against Charles v. He was commissioned by Francis I to negotiate with the Schmalkaldic League, and as representative of the city of Strasbourg at the Council of Trent he participated in the conversations designed to bring about an agreement between Catholics and Protestants. His diplomatic efforts to insure the existence of the German evangelical system led him to write his *De statu religionis et reipublicae Carolo Quinto Caesare commentarii* (Strasbourg 1555, new ed. by K. am Ende, 3 vols., Frankfurt 1785-86; tr. into English by J. Daus, London 1560), the most significant contemporary account of the German Reformation. Avoiding polemical discussion with the opponents of Protestantism, Sleidan presents a dispassionate and accurate chronological record of the course of events between the advent of Luther in 1517 and the meeting of the Diet of Augsburg in 1555. Most of the work is devoted to verbatim transcriptions of archive reports, speeches and extracts from books. Sleidan is interested chiefly in showing how the evangelical doctrine made its way despite all hindrances. Questions of doctrine, social conditions and piety as well as the leading personalities remain in the background. His attention is directed in the main to political relations and their significance for the Reformation and to the ecclesiastical events in England, France and Switzerland. Sleidan's work dominated the field of church history for several centuries, although he has been accused of a biased selection of source material. His

De quattuor summis imperiis (Strasbourg 1556; tr. into English by S. Wythers, London 1563) became a popular history textbook. Important also is his *Orationes duae: una ad Carolum Quintum Caesarem, altera ad Germaniae principes omnes ac ordines Imperii* (Strasbourg 1544, new ed. by E. Bohmer, Bibliothek des literarischen Vereins in Stuttgart, vol. cxlv, Tübingen 1879), in which he sought to persuade the emperor to abandon the "tyrannical" papacy and join the Reformation.

SLUMS, urban or rural, are areas planned primarily for residential use, where deteriorated, overcrowded, insanitary or unsafe structures jeopardize public welfare. The term is frequently misapplied to blighted districts of drab appearance where population losses have left vacant houses and property maintenance has been neglected; but while such areas may be slums in the making, they do not present either the difficult problems of reclamation or the anti-social consequences of the true slum. The term slum indeed is always relative. It connotes the worst structural and sanitary conditions and the most degraded occupancy, usually by the lowest income groups, of any given period.

Throughout the world slum areas exhibit certain characteristic features. Most urban slums are based on excessive overcrowding of land. Plots are subdivided into small areas, houses built back to back or separated by narrow chasms which make rooms dark and damp. Types of structure vary from the one-story shack to the large multifamily building; but always the houses are drab, unclean, in disrepair and often they are structurally unsound; many have walls which are buckling or broken through and window frames, sashes and doors out of plumb. What sanitary equipment exists is old, often defective and dirty even to the extreme of being obstructed and grossly insanitary. Often one spigot serves many families; the toilet is in the yard or court and on unsewered streets is usually of the old vault type. Garbage and rubbish accumulate in hallways, yards and alleys. Overcrowding is common, with a high percentage of families living in single rooms, in which they carry on all their household activities. Few mu-

nicipalities have been wholly free from such areas. They are found today not only in larger cities but also in an acute though restricted form in smaller towns and rural districts.

Slums are a universal phenomenon of communal living. Assyrian, Babylonian, Grecian and Roman towns all had their districts where the poor were housed in insubstantial buildings of mud, brick and frame, whole families living in one room and the tenements rising story upon story to shut off light and air circulation from the streets and rooms below. Mediaeval walled cities were also characterized by excessive land coverage, with dwellings huddled together and streets narrow, usually unpaved and filthy and so overhung by the timbered upper stories of the buildings that from the street level the sky could be seen only through a slotted opening. Even outside the city gates shacks with mud floors and thatched roofs were built in an ugly, insanitary mess. While the Renaissance brought improvements in architectural types for the wealthy and middle classes, the houses of the poor were practically unchanged. Congestion and lack of sanitation still led to periodic epidemics.

Modern slums date from the industrial revolution with its accompanying concentration of population. In England particularly the rapid growth of factory towns led to hasty building and shoddy construction. The characteristic structure was the row house, and land congestion took the form of back lot, court and alley buildings without street frontage or yard areas. Inadequate sewage facilities and room congestion appeared in aggravated form. On the continent, where industrial development appeared somewhat later, the concentration of population resulted in the erection of tall tenements of more substantial construction but brought about even more intensive occupancy.

The influences causing the breakdown of housing areas into slums fall into three general classes: economic, social and governmental. The most fundamental of the economic causes are those which raise the cost of housing beyond the capacity of most families to pay: excessive land values, high building material costs, high costs of construction financing, on the one side; and on the other low wage scales or intermittent employment, causing low annual income and forcing the poorest families to accept the slum home regardless of its location, equipment or size.

High land values, one of the anomalies of the

slum, are partly due to the intensive use which follows the conversion of one-family structures into multifamily dwellings. When houses and areas deteriorate until they fail to attract tenants capable of paying an income producing rent, owners subdivide dwellings into many suites and realize a gross rent which often exceeds that received from the former single family occupancy. Slum property may yield large profits. Other factors which affect land values are even more influential in the early stages of slum development. Frequently there is a high rental return from new and objectionable uses of structures in residential areas, which is reflected in appraisals and assessments and finally in sales prices.

High land costs are often to be attributed largely to governmental activity, such as faulty assessment and tax practises, especially those which make governmental revenues and not the equalization of land values the chief aim of a tax program. Assessment methods that place high values upon well constructed and maintained dwellings and allow reduced rates on structures which by virtue of their deterioration create tax burdens give a preferential consideration to owners of slum houses that helps to sustain values in areas which should have receded in value as they deteriorated. It is largely such sustained values which make the cost of slum clearance excessively high.

Contributing economic causes of slum development are management deficiencies resulting from "shoe string" ownership, the curtailment of expenses for repairs and upkeep during periods of industrial depression, excessive vacancies resulting from the violent swing from shortage to overproduction of new dwellings and exposing old substandard dwellings to the evils of vandalism. In short, the uncontrolled, unplanned real estate development of most cities encourages the wastage of old houses.

Of the social influences the most important are population movements. In the United States slums have flourished as a result of immigration, especially from the south and east of Europe, and of the northern migration of the Negro after the World War. Concentration of foreign speaking families into ghettos and the segregation of large colored populations help to make slum housing profitable and in some cities intensify its manifold dangers. Population movements within cities likewise encourage slum development. Residential areas deserted by their original occupants in the face of increased city business

and traffic, with former yards and gardens built up with back lot and alley houses, add to the slum territory. Other population movements have a reverse effect: an exodus of slum families for one reason or another may change a district from one with teeming overcrowded tenements to an area of deserted houses, vacant stores and vandalized buildings. But while certain features of the slum are affected by this process, it still exerts a detrimental influence.

The third group of causes for slum development are those inherent in faulty municipal practises. Back of the mistaken tax and assessment practises already mentioned is usually an inefficient administration which saddles the community with excessive operating costs. Such costs in turn mean high taxes and higher rents for all housing. Unwise governmental economies, on the other hand, responsible in part for the withholding of sewers, water mains, street lighting, paving, repairs, parks and playgrounds and other open spaces, cause districts to remain substandard. The possible gains from replanning of old areas are seldom realized. But the most serious consequences of governmental inefficiency appear in inadequate regulations for old dwellings, as, for example, the toleration of lower standards for dwellings converted to multiple occupancy than those enforced for new housing of similar types.

There is considerable statistical as well as inferential evidence of the serious antisocial consequences of slums. Low standards of public health, delinquency and dependency and industrial inefficiency are all more pronounced in such areas than among those with normal housing. Thus a study made by the United States Children's Bureau in 1917-18 of two New England cities showed an infant mortality rate almost three times as high in tenements occupied by 7 or more families as in one-family dwellings in one town, and in the other more than 40 percent higher in alley houses than in those with street frontage. In a Washington, D. C., study made in 1910 the general death rate in alley houses was found to be 30.09 per 1000, while in the street houses in the same district the rate was 17.56. Similar results have been brought out by studies in other countries, particularly England and Scotland. Injurious effects are likewise indicated in studies of the physical development of children. Dr. Arkle of Liverpool, England, in 1912 reported a difference of 9.5 inches in height and 23.4 pounds in weight between the boys fourteen years of

age attending the higher grade schools and those attending the poorest Council schools. The same stunted development is recorded in other researches. Out of a study of 50 backward children in the public schools of Chicago 43 came from unsafe and insanitary homes. More significant in indicating the load of subnormal families in slum areas is an analysis made in 1924 by the Philadelphia Housing Association from the records of social agencies treating families living in typical slum areas. Thus over a period of four years the social histories of 40 families living in one slum tenement showed 42 cases of crime, 17 dependent families, 112 cases of sickness, including 14 tuberculous and 51 hospital and contagious disease cases. Altogether 48 social and health agencies had worked on the problem of these families.

These data tend to show the mental, moral and physical distress of the slum population rather than to prove the ill effects of slums, for there are other provocative factors. The slum with its low rentals attracts many weaklings—those who are already undernourished, whose vitality and mentality are low and who are often disease carriers. Naturally they increase the load of subnormal persons and families living in such areas. This high concentration of defectives creates additional hazards for the more normal families in the slums and raises the rates of morbidity, mortality and delinquency of the entire slum area.

Where slum clearance has been effected and the population rehoused in sanitary homes, a sharp decline in morbidity and mortality as well as delinquency has resulted. An excellent example is that of Liverpool. Rotten slums in the heart of the city inhabited by casual dock workers were destroyed and the buildings replaced by new dwellings at low rentals. One clearance project restored 77 percent of its old population, another 99 percent. Yet among this same population after a short period in the new structures crime had decreased to less than 25 percent of its former incidence, death rates had dropped from 50 to 27 per 1000, tuberculosis from 4 to 1.9 per 1000 and other sickness correspondingly.

There is, further, statistical as well as presumptive evidence of the inevitable deleterious effect of slum living on conduct as well as on health. Overcrowding leads not only to disease but to child and adult delinquency. Clifford Shaw in 1930 in a survey of over 9000 delinquent boys in Chicago found that the highest ratio of delinquency moved progressively to-

ward congested districts—blighted and slum areas around the Loop, the stockyards and the steel mills. A similar broad association between delinquency and poverty areas was indicated by Burt's studies, made in 1916, of juvenile delinquency in London. Indeed it is not difficult to see how the slum with its unhealthful living conditions, overcrowding, lack of privacy and absence of play space would provide fertile ground for the growth of a powerful public opinion running counter to normal ethical and social standards and producing a high percentage of persons showing disrespect for, evasion of and disobedience to the law.

Equally detrimental to social welfare are the economic losses caused by slums. These are reflected chiefly in municipal finances. Tenement House Commissioner Post of New York stated at the beginning of that year that figures based on 1934 estimated expenditures by the city of New York showed that the cost of maintaining sanitation, police, fire and health protection was three times greater than the tax revenue derived from slum districts. When the stage of population loss sets in, there is a further decline in tax returns from slum areas. At the same time the demand for new homes in other areas resulting from such population shifts creates added governmental expenses—for new schools, fire and police stations as well as for sewers, water mains and other utilities—not compensated by the new values for tax purposes which such construction provides. In some cases the cost of these services is borne in part by abutting property but frequently it is distributed to the entire city. Unless there is concentrated land use, such as follows apartment construction, or the improvements are of costly character, the tax return shows a lower per capita earning than the per capita cost of operating the local government. An anomalous situation is created: population losses in the older areas decrease earnings from both public and private utilities; and population gains in the newer areas necessitate expenditures which do not yield tax returns equal to the pro rata share of government costs. If the older areas were rehabilitated for sanitary housing with the accessory uses of stores and work places, the necessity for the circumferential development of the city would be materially reduced and the gains to the municipality would be great.

Slums furthermore create losses for a community which are seldom recognized. The concentration of degenerated population types in-

creases the amount of work inefficiency due to the greater incidence of sickness, mental abnormalities, shiftlessness and poverty. Low earning capacity due to low wages and intermittent employment results in a low purchasing power. The large percentage of uncollectible debts increases the cost of goods; the consequent higher price deters their sale even further. Low consumption arising from small and irregular wages is intensified by abnormal marketing conditions, many small stores buying inferior goods in small quantities and at relatively high prices. The normal consumers' market which a population living under more favorable conditions would provide is absent in the slum, exerting thereby a deterrent influence upon the normal improvement of economic conditions of the general population.

Although slum problems have attracted much attention, it is difficult to point to any well balanced and comprehensive municipal or national program of slum prevention or slum clearance. New dwelling construction under governmental control or by subsidy must not be confused with slum clearance. The first has proceeded on an extensive scale, particularly in Europe; the second has hardly been attempted on any comprehensive scale. Thus, for example, Holland, most progressive as regards housing betterment, relies on preventive measures rather than on direct slum clearance. Since 1901 the government has provided credit for dwelling construction up to 100 percent of construction costs through loans and subsidies to cooperative building societies and city housing departments. Control of slums other than by competition with such new housing is by selective condemnation of unfit houses. But although thousands of houses have been built under government subsidy, a large percentage of insanitary houses reported by the Royal Institute of Engineers in 1854 are still occupied.

Other European programs for direct slum clearance exhibit a similar paucity of special legislation and of continuity of effort. There are building and sanitary codes, authorizations for condemnation and town planning regulations on the statute books of most countries, but there is a wide diversity in the use made of these powers. For example, little of any moment has been done in Norway, although in the last few years slum populations have been increasing. In Austria adequate authority for slum clearance exists only in Vienna as a result of the acts of 1929 and 1930. In Germany the scope of both the

pre-war and the post-war program falls far short of the need. In 1930 it was reported that about 10 percent of the urban population were living three to a room, and doubling up of families has increased in the last few years. True, unfit houses may be condemned to make way for recreation areas and open spaces and some valuable results have followed street widening, but in general legal power to expropriate has been unsatisfactory. The free cities of the Hanseatic League are an exception in this regard, but only in Hamburg and Berlin has comprehensive slum clearance been carried to completion.

In France an act of 1850 provided authority to effect improvements in insanitary houses, especially in connection with other public improvement programs; but it remained a dead letter until 1902 and by 1929 had been applied to only seven departments. In Paris it was first applied in 1926 and then for only a small area. Some progress has been made there in wiping out the "islets"—tuberculosis breeding centers—which were first brought to public attention in 1895; but expropriation compensation is proving a stumblingblock in the elimination of these centers of infection. The same inactivity appears in Italy. The Naples cholera epidemic led to the act of 1885, authorizing condemnation of unfit houses and the opening of streets; further authority to condemn unfit structures was granted in 1919. In Rome some slum areas were removed around the Forum and the capitol in connection with the preservation of historic sites. The most effective work was done in Rome and Milan in the removal of slum conditions on the city outskirts resulting from the migration of peasants from their fields to factory work after the World War. The government program included subsidies to families on condition that they would return to the soil; to owners of land where these new slums were erected, if they would replace them with better housing; and for new housing, including temporary hostels.

Contrasted with continental countries, slum clearance in Great Britain has been more generally practised. Statutory authority to condemn unfit houses and to regulate occupancy in the interest of public health dates back to the Shaftesbury acts of 1851. In the subsequent forty years a few million pounds were expended in slum clearance, with some success in such cities as London, Liverpool, Birmingham and Glasgow. The rather cumbersome legal machinery of the earlier legislation was simplified with the passage of the Housing of the Working Classes

Act in 1890 and still further liberalized in 1909 in the Housing of the Working Classes and Town Planning Act. Local authorities and public utility societies organized for housing purposes were allowed to borrow government funds on amortization loans. The latter act established control over density of housing in new areas and obliged local authorities to study housing conditions and to submit proposals for new housing to the Ministry of Health whenever a house famine was found or whenever any considerable number of houses were held unfit for occupancy. Slum clearance thus became the responsibility of local authorities aided by government funds. In 1919 direct control was assumed by the central government, and after 1925 the central government extended its participation in slum clearance by the issuance of grants to local governments in varying amounts for each person removed from slums to better housing. In 1933, however, as a result of budgetary difficulties the authority of the Ministry of Health to grant subsidies was revoked, although the responsibility of local authorities to supply houses if and when a house famine occurred remained in force and cheap credit to building societies was increased. England has sought to meet the slum problem by direct action: by condemnation and demolition of unfit houses either as separate units or en masse; by replanning and rebuilding on the cleared sites or adjacent sites or in other areas; by writing off a portion of the cost and operating under a lowered value figure, thus making possible lower and differential rents; by indirect and direct grants to public utility companies by local authorities and by the state through the Ministry of Health. But slum clearance has been pushed forward also by indirect means: building and health laws, building societies, rent control, town and regional planning, financing or subsidizing new housing, and unemployment insurance.

In the United States very little slum clearance as such has taken place. Slum blocks have been demolished to make way for public improvements and playgrounds, but slum clearance has not been attempted as a government function. Some states have set up state housing boards and authorized limited dividend companies to operate on slum clearance projects. In 1933 a federal housing authority was created and empowered to acquire slum property by eminent domain or otherwise and to erect new houses on the cleared sites at government expense. It had authority to write off a substantial portion

of the costs and establish rentals on the basis of the lowered values thus created, as was done in the Boundary Street area in London. By November, 1933, eight states had passed laws enabling municipalities to qualify for loans under federal authority—the Reconstruction Finance Corporation and the Public Works Administration.

The efforts thus far made to eliminate slums have been inspired more by an emotional and aesthetic revolt against their ugliness and the deprivations which they inflict than by an understanding of their consequences or a realization of the civic and economic burdens they create. The term slum clearance involves more than the demolition of old, insanitary structures in congested areas and the reconditioning of dwellings which might be able to stand for another decade or two. Any adequate program must take into account the average income of the present slum dweller and assure him of a new abode at a rent which he can afford to pay. Most slum clearance projects have merely provided new housing for higher income groups, sending the evicted inhabitants to surrounding slum areas. Thus, for instance, a report issued in 1933 by the Lavanburg Foundation of 386 families dispossessed by the Knickerbocker Village housing project in the notorious New York "lung block" showed that 86 percent moved to adjoining slums, being unable to take advantage of this slum clearance project. Only 7 families were able to pay the rents of the new houses. Thus the vicious circle proceeds, with land values of the new slum area further raised and real low cost housing made increasingly difficult.

There can be no guaranty against slums while a large group of wage earners have incomes so low that they must pay abnormal rents for sanitary dwellings. Similarly there can be few sanitary dwellings available to families of low income so long as construction and maintenance costs and land values make the erection of low cost houses impossible. Were these conditions satisfied, there would not then be any guaranty against slums until the public was educated to appreciate and apply the principles of hygienic occupancy. Granted these essential attainments, little attention would need to be paid to the slum heritage received from past generations, for slum houses would be eliminated through natural processes because they would be unprofitable. The essential point is that slum clearance cannot be comprehensive or prevention of slums be assured through the application of any single

measure of public control, be it through legislation for sanitary inspection, instruction in hygienic occupancy, the vacating or demolition of unfit houses, new low cost housing or expensive slum clearance. The problem is one of comprehensive community control over these and other predisposing and contributing causes in the creation and continuance of slums.

SMALL, ALBION WOODBURY (1854-1926), American sociologist. After graduating from Colby University Small studied at Newton Theological Institution, where he became interested in an academic career. While attending the universities of Leipsic and Berlin he came under the influence of Schmoller, Wagner and the movements centering around the Verein für Sozialpolitik. He taught history and political economy at Colby, of which, after finishing his graduate work at Johns Hopkins, he became president. When the University of Chicago was established in 1892 he became the head of the department of sociology and the first to hold a university chair in that subject. In this capacity he exercised an important influence upon the first generation of trained sociologists. He retained a lifelong interest in advancing the scientific level and the academic prestige of his subject. In this the *American Journal of Sociology*, which he edited from its beginning in 1895, was an effective instrument. He was active in the organization of the American Sociological Society and became its president in 1912-13. In 1922 he served as president of the Institut International de Sociologie.

Small was effective in mediating the results of European (especially German) thought and in challenging the provincial, separatist and dogmatic spirit of the older and academically respectable social science. He pioneered in the building up of a body of distinctively sociological literature and played a significant role in defining the scope of sociology as a science, in constructing its conceptual framework and in setting its problems. His original and searching critiques of method contributed to a more acute scientific self-consciousness in the separate social sciences, to a recognition of their essential unity and interrelations and to the effort to make them serviceable in practical affairs.

He traced the principal antecedents of sociology to the drive toward objectivity most evident among German historians since 1800 and to the cameralists, political scientists and economists. He minimized the influence of Comte and regarded Spencer as a deflecting

factor fortunately corrected by Ward. Having begun by regarding sociology as the unifying point of view which would coordinate and synthesize the disparate, inductively acquired knowledge of human experience, he later conceived of it as the science basic to and more general than the specialized studies of man. Toward the end of his career, as he saw concrete sociological research emerging, he envisaged sociology as a division of knowledge coordinate with the other social sciences, but commanding techniques for the understanding of human experience conceived as the group interrelations and interactions of men. Small held that while sociology must necessarily be a specialized and objective science, valid social science must eventually be a single, organized body of knowledge, which would be sterile unless it served not merely as the only possible intelligent basis for ethics but also as a means for the orderly improvement of social life. He was a critical and sympathetic student of Marx but advocated gradual, orderly and constitutional reform to bring private property and capitalism in harmony with a functional order based on service, justice and Christian ethics. The social group was for him the unit of analysis of the social process and the core of the organized interests. He advanced tentatively a sixfold classification of fundamental human interests. Their emergence, conflict and accommodation constituted the social process and provided a functional, dynamic and realistic, as contrasted with a structural, static and analytical, conception of society.

SMALL CLAIMS COURTS. One of the weakest points of the present system of administering justice in the United States has been the inability to provide justice in any real sense of the word for persons who have a case involving a very few dollars. Petty cases particularly have crowded the dockets of courts in large urban areas. Since it is almost as difficult to prove and reduce to judgment a claim for \$10 as for \$1000, it naturally follows that many claims for amounts varying from several dollars to \$50 are simply allowed to lapse because of the fact that to collect them or even attempt to collect them is usually far too expensive and complicated to be worth while.

From time to time the lower courts in many large cities of the United States have tried the experiment of so-called conciliation, or arbitration, courts, which although constantly growing in favor for the settlement of complicated commercial disputes still, generally speaking, provide too elaborate a procedure for the settlement of minor cases. As a result there has arisen a movement to establish so-called small claims courts. Although these courts, as established in many of the larger cities today, may justly be called courts of conciliation, they are really not tribunals for conciliation, or arbitration, but rather what their name implies: courts wherein persons with small claims may have them heard and decided with an expenditure of the minimum amount of time and money. Such courts may be either distinct entities or branches of the regular court organization, such as the municipal or district courts found in the large cities. Again they may be parts of a state wide system or be confined to particular localities. But whatever the form of organization it is essential that the proceedings be conducted without lawyers. Nevertheless, while procedural law may be cast aside, the rules of substantive law must be observed. In the last two decades considerable progress has been made in the establishment and administration of small claims courts.

In 1913 Kansas established separate courts known as small debtors' courts, whose jurisdiction is restricted to claims not exceeding \$20 in amount. Before filing an action the claimant must satisfy the judge not only that he has a good cause of action but that he cannot afford to employ counsel. The Kansas plan provides also that the judges do not necessarily have to be lawyers. Because of this fact and also because the whole system is too loose and informal, it is fundamentally unsound and not a success.

In Portland, Oregon, the small claims court, first established in 1915, is part of the District Court of Multnomah county. Small claims procedure has also since been provided in the justice's courts. The small claims branches have jurisdiction of all claims up to \$20. The procedure is informal in inception and trial; the filing fee is \$75 in the district court and \$1.00 in the justice's court. No attorneys are permitted. There is no doubt that this arrangement offers a cheap and ready way to litigate small amounts. It is unfortunate, however, that the jurisdictional limit is so low.

The Conciliation Division of the Municipal Court of Cleveland, which began to function in 1913, was established by rule of court. It is essentially a small claims court; its jurisdictional limit was at first fixed at \$35 but later was increased to \$50. While attorneys are not prohibited, their appearance is discouraged, and the procedure is informal. The success of this court has been great.

In the city of Chicago the Small Claims Court was established in 1916 by order of the chief justice of the Municipal Court. When the court was first established the jurisdictional limit was \$50, but this was later increased to \$200. While the pleadings are simple, all the rules of evidence are applied; and a litigant who does not have an attorney is therefore at a great disadvantage. As a result the court has not yet achieved the hoped for success and does not differ very materially from the usual district or municipal court found in every large city.

In 1920 the Municipal Court of Philadelphia created a special branch known as the Conciliation, Small Claims and Legal Aid Division. The latest of the municipal small claims courts to be established is that of New York City. They were created in 1934 by act of the state legislature as parts of the regular municipal courts. The jurisdictional limit was fixed at \$50 and the filing fee at \$1.25.

Massachusetts has a state wide system of small claims courts, which was established by legislative act in 1920. These are, however, branches of the regular municipal or district courts. The jurisdictional limit was originally set at \$35, but this was subsequently raised (strangely enough over the objection of several judges) to \$50, which limit still prevails. Lawyers are not prohibited but they seldom appear, and moreover the procedure is extremely simple. In general the judges administer the law in a very practical way.

The statistics of the Small Claims Branch of the Municipal Court of Boston show that the work of the court is increasing and that the public evidently appreciates the fact that it offers an easy and simple method of litigating minor cases. In 1929 the court tried 1397 cases and in 1931, 1421 cases. Plaintiffs' judgments amounted to \$18,694 in 1929 and to \$19,205 in 1931. Strangely enough the records of the court show that many more actions are entered in the last six months of each year than in the first. No explanation has ever been presented of this rather curious phenomenon. In the first six months of 1933 there were 604 new cases in the small claims courts and plaintiffs' judgments amounted to \$7977.

The idea of state wide systems of small claims courts as parts of municipal, district or justice's courts has spread rapidly. In addition to Oregon and Massachusetts such courts have been provided for in California, Idaho, Nevada, Oregon, South Dakota and Washington.

One weakness of the present system is that the filing fee in the small claims court is usually too high. While it is the total outlay necessary for a plaintiff, it constitutes an item of real importance to persons who are endeavoring to collect a claim of \$10 or thereabouts and undoubtedly deters many persons from applying to the court for relief. On the other hand, the provision in most of the state wide acts for the service of the notice of claim by registered mail is excellent. The discouragement of appeals as well as demands for jury trials by imposing heavy costs is also to be commended.

No more than in the higher courts does the rendition of judgment mean its collection. Defendants in small claims courts, moreover, are especially likely to be judgment proof. If a defendant has no tangible property which is subject to attachment, the plaintiff must again hale him before the court in an effort to ascertain what his resources are and if possible obtain a court order to satisfy his judgment. In Massachusetts a creditor who has an unsatisfied judgment has to spend at least \$5 and probably more to collect the amount due him in "supplementary process." Supplementary proceedings are frequently complicated and are best handled by an attorney. If a litigant needs a lawyer to help him collect a judgment secured in the small claims court, there is obviously still a flaw in the machinery. Unfortunately there are no figures available to show precisely how many plaintiffs' judgments are actually satisfied.

Just how high the jurisdiction of a small claims court should be in general is a matter which is still unsettled. It has been satisfactorily demonstrated that \$20 is too low and that \$200 is too high. Lawyers then inevitably make their appearance, since the claimants simply cannot imagine proceeding without them. An amount which would be too high in a sparsely settled community may be too low in a large city. For the larger communities \$50 to \$75 appears to be the most satisfactory limit.

The movement for small claims courts is bound to continue to make slow but steady progress. At present, however, popular attention is directed more to the delays and complications of jury trials than to the need for reform in cases affecting small litigants. But the ultimate goal of procedural reform must be to make possible the disposition of claims of all sorts in a speedy, sensible and inexpensive manner.

SMALL HOLDINGS. The characteristic which differentiates small holdings from other farming enterprises is not the actual area which they include, for this is relative and variable, but the fact that they draw their labor supply chiefly from the family or from a group living and functioning as a family. If outside workers are employed, they are usually attached to the domestic household as unmarried farm hands or maidservants. At the beginning of historical time, because of the importance of the family as the traditional unit of human society, the system of small holdings was in general the prevailing mode of agricultural organization. Not infrequently in earlier periods the family economy was supplemented by certain cooperative undertakings carried on jointly by the broader social group; although these most often took the form of common ownership of forest and meadowland, occasionally even tilling of the soil was pursued in common. But the displacement of small holdings by larger agricultural units functioning on the basis of slave or wage labor oc-

curred only at a rather advanced period and then only in comparatively restricted areas. It was in the Mediterranean basin of antiquity—in Egypt in the Ptolemaic period, in the Carthaginian Empire, in Italy following the Punic Wars and at a later date throughout most of the provinces of the Roman Empire—that the small holdings first tended to become crowded out or absorbed by large estates. Yet even after its introduction large scale enterprise was confined chiefly to the production of oil and wines, while the small holding continued to predominate in the cultivation of grain.

In the Middle Ages, as in antiquity, agricultural products were supplied almost exclusively by the labor of the farming families, although except in a few regions these families were never completely independent. Generally a manorial organization was superimposed upon the small holdings and the lords of the manor exacted dues and services from them in the form of produce or labor, in return relieving them of political and military obligations. Since the sixteenth century large scale production has been extended greatly both in England and on the European continent east of the Elbe. In 1913 only 16 percent of the land under cultivation in England and Wales consisted of farms of less than 50 acres. In eastern Germany a survey in 1907 showed that only 31 percent of the agricultural land in use was devoted to enterprises under 20 hectares, or 50 acres. In the rest of Germany, however, farms falling within the 20-hectare group comprised over half of all the arable soil and in the west and south from 65 to 90 percent. The proportion of small farms is about as great in Scandinavia and in Switzerland, where owner occupancy is predominant, and in France, Belgium, Holland and a great part of Italy, where a large percentage and sometimes a majority of them are operated by tenants. In Russia the complete effacement of the once widely extended large private estates by the agrarian revolution of 1917 and 1918 merely marked the climax of a tendency which had been in progress since the emancipation of the serfs in 1861 and which had been greatly accentuated by the agrarian reforms preceding the World War. The small holding had become the virtually universal unit of agricultural organization by 1929, when the Soviet government abruptly reversed the trend by inaugurating its present program of collectivization. Large estates and holdings suffered similarly in the other states of eastern Europe which felt the repercussions of the Russian

agrarian upheaval of 1917 and 1918. At present the family holding is almost the exclusive factor in the rural economy of these regions.

In the oversea territories which have been opened up since the sixteenth century the spread of small holdings has depended mainly upon the type of land policy pursued by the various states. In the northern part of the United States the small farm owned and operated by the family had become predominant without special governmental aid, but the fact that this type of agricultural organization was extended throughout the western lands was in large part the result of the Homestead Act of 1862. The small holding is especially common in the older regions, where stock raising is combined with agriculture; while in sections devoted entirely to wheat growing or grazing family farms are likely to consist of large holdings, and large scale enterprises employing great numbers of wage laborers are not unusual. In Argentina the distribution of newly opened up land on a basis similar to the North American homestead plan has been hampered by the manorial system inherited from the Spanish era. But while large private estates continue to prevail in this country, they have frequently been divided into smaller units and leased for agricultural purposes to tenants, recruited chiefly from Italian immigrants.

In general it may be said that the great progress which large scale agriculture, favored by political, economic and natural conditions, had been enabled to make throughout much of Europe was arrested by the middle of the nineteenth century. Until that period the operators of large holdings were generally able to carry out more rapidly and more successfully than the small farmers the changes involved in the scrapping of the old three-field system. In a comparatively short span of time, however, the operators of small holdings have succeeded in eliminating this disadvantage. Since 1850 they have challenged the large landowners in almost all regions and have made permanent gains, even when they have derived no particular support from the agricultural policy of the government.

The question of the relative advantages of large and small holdings has been the theme of much theoretical controversy and was discussed in economic literature as early as the mercantilistic period. The mercantilistic writers and statesmen were usually apologists and promoters of the small holdings, largely because they believed that such a system was more favorable to the growth of population. The physiocrats, on

the other hand, advocated large scale enterprise on the purely economic ground that it yielded a larger net profit. A similar view was taken by Arthur Young. Under Young's influence the German Albrecht Thaer declared large holdings to be necessary to the prosperity, strength and welfare of the state, although at a later date he came to recognize also the productive power of small holdings when they were operated by industrious and thrifty farmers. Adam Smith was a supporter of the small operator-owner, who knew every detail of his business and felt a personal attachment for it. But most of Smith's successors in England rejected the small for the large holding because of the higher market productivity of the latter.

It was Theodor von Bernhardt who turned attention to the more profound issues involved in the problem concerning the optimum size of agricultural holdings. Discarding both gross and net return as a criterion, he undertook to discover a more valid standard for measuring the relative advantages of large and small units. According to his conclusions, an excessive proportion of large scale enterprises was quite as dangerous as the inordinate preponderance of small farms, the decisive consideration being the effect of the size of the agricultural holdings upon the total national income. Since Bernhardt's time the overwhelming majority of economists, among whom Roscher and Buchenberger deserve especial mention, have accepted his view that a "sound admixture" should be the objective. Among contemporary economists Aereboe has laid special emphasis upon the efficiency of the individual as a factor conditioning the productivity of the agricultural plant. Sering stresses the peculiar vitality of the family as a functioning economic unit and insists that the superiority of the family holding seems only to increase with the progressive intensiveness of production. Although he does not recommend the abolition of large scale agriculture, he believes that in the long run the large estates cannot survive unless their operators are able to retain the role of leadership and by intelligence to compensate for the advantages which peasant economy derives from family solidarity. Hainisch reverts to the older position that the essential consideration is market productivity, in which "in all probability large holdings are far superior to small"; for him therefore any attempt to discourage large estates is fraught with extreme danger.

Marxian socialism originally accepted the

superiority of large scale enterprise in agriculture as well as in industry. The Erfurt Program of 1891 contains an explicit prophecy that modern technique will inevitably spell the decline of agricultural small holdings. This view, of which Karl Kautsky has been a noteworthy defender, was, however, rejected by the revisionist wing, which under the leadership of Eduard David drew a distinction between industry and organic production and asserted that small scale enterprise was generally preferable in the latter. The agrarian program adopted by the German Social Democrats at Kiel in 1927 was based upon the so-called "stationary theory" that the development of capitalism has no effect upon property relations or upon the size of holdings in the agricultural sphere and will not therefore lead to the annihilation of small farms; hence government must guarantee to the latter satisfactory living conditions.

The degree to which small holdings prevail and prosper is seldom determined solely by natural conditions. It is true of course that mountainous regions, where the arable fields are widely scattered, must be cultivated by small holdings, whereas heavy soil requiring a great deal of team and machine labor many times offers insuperable obstacles to the independent family. But even in these cases the human factor is of paramount importance. One of the essential bases for the vitality of family holdings is the fact that men generally apply themselves most eagerly and most persistently when they are conscious that the fruits of their labor will accrue to a small, closely integrated group controlled by paternal authority. An important and often decisive factor is the economic efficiency of the individuals involved: if ambitious, well trained men till a small holding, they will derive a greater return than an indifferent landowner or a large scale tenant who depends on the labor of slaves or unwilling wage earners.

The price structure also may serve as a stimulus to small holdings when it favors the commodities, especially cattle and animal products, which are the output primarily of such holdings. Low prices of fodder or of other supplies required by small holdings operate in the same direction. Another important factor is the price of land. Agricultural small holdings tend to use more man power and more capital per unit of land than does large scale agriculture, so that they have an economic advantage when there is no particular attraction drawing labor and capital away from agriculture. Hence they nor-

mally become more numerous with any increase of population not absorbed by industrial expansion or indeed with any flight of labor from industry. It is in periods of distress that the firm foundations upon which small holdings rest become most clearly apparent. The reduction of the standard of living meets with less resistance in their case than in that of wage earners; and, for the very reason that the total number of human beings employed on the small farms bulks so large, this fact is of considerable importance to the national economy as a whole. Herein lies the basic reason for their well known immunity to crises.

The progress of agricultural technique and mechanization, by facilitating the exploitation of extensive consolidated holdings, not infrequently leads to the decline of small holdings. This is especially true when the operators of the large estates, profiting by their superior ability to acquire information and to secure the necessary financing, are more prompt than the small farmers to utilize the improvements and the market opportunities. But a great number of the technical improvements in agriculture, such as methods of simplifying farmyard work and livestock husbandry, are also advantageous to family enterprises. On the other hand, small holdings can make comparatively little use of agricultural machinery; in many places it has been possible to increase the acreage cultivated by each farm and by this means to meet the problem without discarding the characteristics of the family holding. The cooperative ownership of machinery is a potential solution, but it is generally confronted by grave psychological obstacles.

Frequently, however, the dominance or decline of small holdings is determined not by economic forces but by political or other factors. Thus in Prussia and certain other states the powerful monarchs of the eighteenth century—a period of crucial importance for the subsequent course of development—were very successful in consolidating the position of the peasantry; while in England, Swedish Pomerania and Mecklenburg, where the landowning nobility were able to retain political control through the early centuries of the modern era, the independent small holdings were effectively crushed. Drives and purposes of a non-economic nature may likewise be detected in many of the small holdings movements of modern times.

These movements have been associated to a large extent with the revival of internal colonization or land settlement which got under way in

numerous European states during the last two decades of the nineteenth century, when emigration to oversea territories had begun to wane. In both Prussia and England a movement was initiated in the 1880's to break up some of the large agricultural holdings into small units. In Ireland and Finland emphasis was placed upon the working out of plans whereby tenants might be enabled to become owners of their holdings; the trend in Ireland thus diverged from the movement in England, where despite the agitation for peasant proprietorship, which had derived such great stimulus from J. S. Mill's *Principles of Political Economy*, almost all of the land distributed under the Small Holdings and Allotments Act of 1908 was leased to tenants rather than sold. The Scandinavian kingdoms around the turn of the century began systematically to encourage agricultural laborers' holdings, a policy which soon resulted in the establishment of small peasant farms. Hungary under the laws of 1894 and 1911 set up several thousand small holdings, while in Austria a similar law was drafted in 1914. The most momentous of all such movements, however, was the great Stolipin agrarian reform in Russia. Although the development of a more progressive peasantry by the abolition of the intermixed strip system and the land commune represented one of the main objectives of the reform program, Stolipin and his collaborators were animated not only by economic considerations but by the desire to place the social structure of czarist Russian on a new and more enduring basis. In the case of the Prussian and English land reforms social purposes were similarly intermingled with economic objectives. Both the Prussian policy of internal colonization and the retaliatory measures adopted in Poland served as weapons in the nationalistic struggle, despite the fact that the methods used were in no way contrary to traditional legal conceptions. Even when expropriation was resorted to, as in England and to a much slighter extent in Prussia, the owners were fully indemnified.

On the other hand, the drastic agrarian reforms which occurred in eastern Europe after 1918 were generally effected by wholesale confiscation, with little or entirely inadequate compensation—a ruthlessness inspired to no small degree by the fact that the upper strata of large landowners generally did not belong to the nationality which had acquired political sovereignty. In Greece and Bulgaria the essential problem confronting the government in the

post-war period was to provide new means of livelihood for nationals returning from exile. Germany also down to 1925 had to find support for refugees streaming back from Poland. In Germany, however, as well as in Austria, Hungary and Finland there was no expropriation without sufficient compensation. The same respect for the rights of the former landowners prevailed in Scandinavia, Holland and Great Britain, where with the exception of the Danish policy in northern Schleswig, which had a political basis, the agricultural reforms after the World War were motivated primarily by social and economic aims. The Dutch government has undertaken to promote settlement in the reclaimed areas of the Zuyder Zee. Norway has followed a similar plan, whereas in Germany only about 10 percent of the new farms set up since 1919 are located on swamp or waste land. With the recent derangement of the international economic structure the whole movement for agricultural colonization has assumed a new importance in the broad context of the national economy as a whole, since it has been widely regarded as a potential means of expanding domestic demand for industrial products and of assuring a greater measure of national self-sufficiency in the supply of food.

While the economic and political consequences of the pre-war and post-war policies cannot be definitely predicted, many observers think that the agricultural productivity of eastern Europe has been permanently injured by the decline of large scale enterprise. The outcome will probably depend upon the degree of ambition and efficiency which the owners of the new small holdings display. But, as British experience suggests, it is extremely difficult, if not impossible, to rebuild a strong native peasantry once it has been uprooted. In general the future of small holdings hinges upon the question as to whether or not the family has retained its vitality as a cooperative economic unit. If it has, and there are many reasons to believe that it has, progress in agricultural technique and mechanization may indeed lead to certain changes, but it will not result in any serious decline in small holdings. Technical and business training will enable their operators to take advantage of most of the improvements, and in the process the distribution of land traditionally associated with the small holding system will become adjusted to the demands of efficient production.

SMALL LOANS. Although generically the term small loans includes any lending of small sums, its reference has generally been restricted to the operations of agencies which specialize in making small loans, mainly to consumers. On the European continent small loans are supplied largely by pawnbrokers and by credit cooperatives. These forms of lending are known also in Great Britain, but the bulk of cash credit to consumers is provided by commercial moneylenders. In the United States, however, there

have developed, in addition to the general moneylender, the pawnbroker and the credit cooperative, several highly distinctive credit agencies peculiarly adapted to dealing with consumers; these are technically described as small loan institutions.

The specifically American institutions as well as the other agencies specializing in small lending have certain common characteristics. Their loan funds usually consist of invested capital rather than of deposits as in the case of the banks. Their security is neither so liquid nor in many cases so complete as that of banks. In most types of consumer lending repayment is by instalment. These characteristics indicate that the charges imposed by small loan agencies are higher than those demanded by standard banking institutions; for the risk may be greater or the investigation to minimize risk will be costly, the method of collection is relatively more expensive, and the return involved must be a tradesman's profit rather than a broker's fee as in the case of the bank.

The phenomenon of small loans is not of recent origin. Since the Renaissance at least there has always been a demand for credit in small amounts. This demand was limited at first to the artisan and commercial classes and was met largely by commercial pawnbrokers and pawnshops operated under public auspices. It was nurtured by the gradual decay of the guild system from the fifteenth to the seventeenth century and was intensified in the eighteenth by the industrial revolution. Only in the second half of the nineteenth century, however, did the small loan problem assume its modern aspects. Pressure for higher standards of living under conditions of fixed income and lack of social provision for emergency expenditures connected with illness, death and unemployment created an increasing demand for small consumer loans. At the same time the growing reliance upon credit in the normal conduct of business affairs left small scale business more dependent than before upon financing by non-banking institutions, for the banking system as it developed in the course of the eighteenth and nineteenth centuries was not prepared to grant credits in comparatively small amounts. It was about this time that credit cooperation came into its own in continental Europe. Although it emphasized credit for productive purposes, the credit cooperative together with the pawnshop appears to have achieved a fairly adequate solution of the small loan problem as manifested on the continent.

Little room was left for the commercial moneylender charging high rates except perhaps in a few large cities, where buying pawn tickets and lending by the day or week to struggling pedlars and street vendors offered lucrative opportunities.

In Great Britain, on the other hand, the commercial moneylender prospered, while the credit cooperative failed to take root despite legislative encouragement. The first enactment, passed in 1835, was designed to legalize and promote quasi-charitable loan funds for "the industrious classes." On condition that their rules of operation were certified by a procedure similar to that applicable to friendly societies, they were given special facilities for recovery of debts and were exempted from stamp taxes; their loans repayable in 40 or 50 weekly instalments were limited, however, to a maximum of £15, and the charges, deductible in advance, were restricted to 5 percent annually. The certified loan societies were established on a more secure footing under the law of 1840, which was made permanent in 1863; they were given virtually unlimited powers of recovery and allowed to charge 12 percent annually in addition to an inquiry fee not to exceed one shilling sixpence. This law is so broad that it covers not only purely benevolent societies and mutual societies but also commercial lenders seeking to take advantage of the unexampled facilities for the recovery of debts. The number of certified societies was never considerable and appears now to be steadily declining; of 122 societies in operation at the end of 1929 with an annual loan volume of less than £175,000, about 90 were located in London and the adjoining counties. Whereas the act of 1840 extends only to England and Wales, in 1876 the Treasury authorized registration under the Friendly Societies Act of loan societies also in Scotland and Ireland. Provision was made thereby for the registration of numerous money clubs throughout Great Britain as well as of deposit and loan systems attached to Scottish and Irish friendly societies. The loans of specially authorized societies, available to members only, are limited to a maximum of £50, are repayable in weekly instalments running over $3\frac{1}{2}$ or 4 years and are secured by two or three signatures. The abuse of the special authority by an unscrupulous group of promoters, indicative of the internal weakness of these societies, led to the withdrawal of the authority in 1917. At the end of 1929, however, 250 such societies with an annual loan volume of about £600,000 were still in

existence. Since 1893 cooperative lending societies have been permitted to exist under the Industrial and Provident Societies Act, but unless specifically exempted by the Board of Trade they are subject to the same regulations as commercial moneylenders. In 1929 there were 18 societies of this type, which during the year lent a total of about £130,000 to their members. Much more numerous than the registered societies are the informal savings and loan groups popular among working men; these, however, are for the most part very small and temporary organizations which divide their accumulations at the end of the year.

No single form of cooperative credit in Great Britain nor credit cooperation as a whole can be compared in volume of business or number of offices to commercial moneylending. Previously it was customary to distinguish several types of moneylenders: the big West End offices dealing with highly connected people who wished to anticipate their income or inheritance; the lenders in great provincial cities financing small or young business establishments which had no standing with conservative British banks; the general moneylenders who under a variety of disguises acquired a clientele among professional people, the clergy, farmers and shopkeepers in distress, government and bank employees; and the slum usurer catering to the working classes. At present, however, the only significant distinction is that between the general moneylender and the slum usurer, for the economic changes of the era following the World War have reduced the number of aristocratic borrowers and diminished the dependence of legitimate business upon non-banking credit.

The general moneylender will occasionally lend a large sum, but the vast majority of his loans are for sums under £100. They are advanced most frequently on a simple note of hand or bill of exchange, seldom with any signature other than that of the borrower and his spouse. The use of the bill of sale, corresponding to the American chattel mortgage, is not so extensive as might be expected, because it is not effective for sums less than £30 and it must state clearly the interest charged in terms of a percentage rate per annum. Since the attachment of workers' wages is prohibited in England and restricted in Scotland, wage assignments are practically unknown. The working class moneylender, who may be the plant foreman, a widow in the neighborhood or a storekeeper around the corner, lends sums counted in shillings from one

pay day to the next and seldom charges less than a penny in the shilling per week. The use of formal credit instruments is of course out of the question, and the enforcement of obligations is entirely a matter of extralegal pressure. For this reason legislative regulation of moneylending is of no consequence for this type of lender.

These legal restrictions were the natural consequence of the abuses and harsh practises which followed the repeal of the usury laws in 1854. Enactments relating to wage assignments and bills of sale in the 1870's and 1880's were followed in 1900 by the Moneylenders Act, which required the registration of lenders and gave to the courts the power to go behind the formal bargains to protect borrowers from undue hardship and exorbitant interest rates. This act, amended in 1911, was successful only in part: the requirement of registration was often evaded; moneylenders acted unethically in obtaining business and misused the judicial processes in enforcing their harsh contracts; and interest rates remained high, normally 60 to 100 percent a year, in addition to frequent fees, bonuses and penalties. The Moneylenders Act of 1927 seeks to eradicate these evils by requiring a license for each moneylending establishment based upon judicial investigation of applicants, by abolishing most types of advertising and circularizing for borrowers, by prescribing means of keeping the borrower informed about the loan, by enacting the method of computing interest and, although it does not fix a maximum interest rate, by presuming the interest to be excessive and the agreement subject to court intervention if the rate exceeds 48 percent a year.

In the United States commercial moneylending developed at a somewhat later date than in England; it is said to have been established as a separate business about 1875. In view of the difference in economic and political conditions its development followed quite distinct lines. Since there were few wealthy borrowers and numerous small banks were available to meet the demand for business credit, the emphasis from the outset was upon small consumers' loans. Because no restrictions were imposed upon the use of chattel mortgages and wage assignments, these became the predominant forms of security. The most obtrusive characteristic of American moneylending in the nineteenth century and the early years of the twentieth was its illegality, since with few exceptions American states failed to repeal the old usury laws, which

restricted lawful interest on loans to a maximum of 6, 8 or occasionally 10 percent per annum. While in some states the pawnbroking laws were liberal enough to permit a legitimate small loan business, most of the demand for small consumer credit had to seek an underground outlet; this it found in the "loan shark," the moneylender turned lawbreaker.

The loan shark is the offspring of two parents, the borrower's ignorance and traditional legislative policy. The borrower's ignorance is characterized by his failure to understand the concealment of a usurious interest rate or the harsh provisions for enforcement of the loan contract—such as confession of judgment, waiver of notice, appointment of the lender as borrower's attorney in fact and the provision for renewals on default, which further raises the interest rate. The limitation of interest by usury statutes not only bars the development of a lawful small loan business but encourages rates beyond those commercially profitable in order to compensate for the stigma of illegality and the fear of loss of interest or principal according to statute.

Although in the last quarter century certain types of lending at high interest were legalized, loan sharks still operate not only in the states which failed to liberalize the old usury restrictions but also in the other states where certain types of borrowers cannot profitably be accommodated by the lawful commercial lenders. Estimates indicate that even in recent years loan sharks granted annually about 15,000,000 loans amounting in the aggregate to some \$750,000,000 or \$1,000,000,000. This illicit business is so widespread as to permit chain organization: it has been said that as few as 11 lenders maintain 335 offices. The modern loan shark still uses chattel mortgages and to an even larger extent the additional security of wage assignments. But chattel mortgages are no longer confined mainly to household furnishings; automobiles are more popular. The automobile loan shark, calling his business "refinancing," exacts his high charges by means of bonuses, discounts, insurance fees, recording fees and the like; a delinquent borrower is further mulcted for "seizure" of "constable" fees and storage charges. Most of the present day wage assignments consist of "salary purchases," a means of evading certain legal restrictions and providing a vicarious semblance of legality. The lender "buys" a stipulated part of the borrower's accrued wages for a lesser amount. If he gives the borrower \$50 in ex-

change for the right to \$55 on the next pay day a fortnight later, the actual interest charge, although concealed, is 240 percent a year. The rates are commonly as high as 480 percent, and legal records testify to rates of 2600 percent a year.

The first organized effort to combat the loan sharks was the establishment of remedial loan societies. Capital was solicited by appeal to the public spirit of the contributors and upon the promise of dividends limited to 6 or 8 percent; and special charters were obtained from the state to permit lending at rates higher than the usury maxima. The movement did not really get under way until the 1890's, by 1909, when at the suggestion of the Russell Sage Foundation the National Federation of Remedial Loan Associations was formed, there were 15 such societies, 14 of which were located in large cities in the east and middle west. In 1915 the number of these societies reached a maximum of 38, but it was already recognized that limited dividends and public spirit could not supply enough capital to meet the increasing demand for consumers' credit. Distinct from the semiphilanthropic remedials are the charitable loan funds which grant interest free loans to the needy. The most highly developed of these organizations, founded in 1896 in New York, is the Hebrew Free Loan Society; similar although smaller societies exist in a number of large cities throughout the country.

Encouraging as was the success of the remedial in combating unconscionable pawnbrokers in some large cities, it failed to supply adequate capital to conquer the loan shark. This, it was recognized, could be accomplished only if a reasonably profitable interest rate were permitted to commercial lenders. To this end, however, the American states, unlike Great Britain, did not repeal the usury laws. Instead they made exceptions in favor of certain types of lenders and of lending techniques. These new lenders are of three principal sorts: personal finance companies, industrial banks and personal loan departments of commercial banks.

The personal finance business is founded largely upon the Uniform Small Loan Law, a type of enactment devised by the Russell Sage Foundation in 1916 after similar progressive legislation in New Jersey and Pennsylvania. The Uniform Law established two major principles, which had been emerging from the legislation of the previous decade, and buttressed them with machinery that would make them legally effective.

The first principle was the classification of loans according to size. By setting a limit of \$300 on the loans subject to special legislation the law was able to overcome constitutional difficulties and at the same time to afford protection to the small borrower. The second principle was to exempt from the operation of the ordinary usury laws any lender who would voluntarily submit to licensing and supervision by the state banking authorities; under these conditions he could charge interest of 3½ percent a month on unpaid balances. The law made a number of other provisions for the protection of the borrower and the public concerning many details of the lender's business. Violation of the act was a misdemeanor; and an overcharge voided the loan contract. The first draft of the Uniform Act has been modified on four occasions to make it more comprehensive. It is now a part of the law of 26 states, affecting more than two thirds of the country's population; some of these states, however, have changed details and do not allow so much as 3½ percent interest per month.

The type of lending which the Uniform Small Loan Law has developed is an ethical evolution of the type of lending formerly carried on by illegal lenders; in fact many of the personal finance companies were engaged in a similar type of lending before the law authorized it. Loans are made predominantly to families on the signature of both husband and wife, unsupported by comakers or endorsers. As ostensible security the lender requires, in cases covering 80 percent of the outstanding loans, a chattel mortgage on household goods and sometimes a wage assignment as well. The lender can foreclose the mortgage and demand that the borrower's employer pay the borrower's wages to him, according to the provisions of the local wage assignment law. In practise, however, the substantial companies seldom resort to such extreme measures; even at the sacrifice of some immediate collections they attempt to assist in keeping the borrower solvent. Collecting under a wage assignment may lead to the borrower's discharge from employment; foreclosure of the chattel mortgage seldom repays the amount of the loan. The lender therefore relies largely on the moral stability of the borrower, having first investigated his standing in the community, the duration of his employment and his general credit. Studies of personal finance companies in several states in 1930 and 1931 reveal that there was about 20 percent of total delinquency in the normal course of business, but that legal action

to enforce payment occurred in only .2 percent of the total annual volume of the loans.

Despite its comparatively late inception the personal finance business has developed enormous volume. Beginning with about \$8,250,000 in outstanding loans in 1916 small loan licensees reached an outstanding volume of over \$275,000,000 by 1931; this amount declined by about \$20,000,000 in 1932. In the latter year the total volume of loans granted by 3667 licensed offices was probably about \$480,000,000. Over a quarter of the total number of offices were operated by 28 chain companies, of which one company operated 263 and another 148 offices; the combined annual business of these two companies exceeded \$100,000,000. It is estimated that the average loan advanced by personal finance companies amounts to \$130 and that, while the maturity range is five to twenty months, the repayment is typically spread over somewhat more than a year. This figure probably does not take account of loans refunded because of the inability of the borrower to maintain the original schedule of repayments; the exact proportion of refunded loans is uncertain, but it is believed to be rather high, perhaps as much as a half of the total number of loans.

This phenomenal growth of the personal finance business has not failed to arouse opposition. A group of economists has attacked an interest rate as high as 42 percent a year, and the loan shark interests have made concerted efforts to reduce the legal rate and drive the legitimate lenders from the field. In a few states these campaigns have been successful: in 1930 New Jersey reduced its rate from 3 percent to 1½ percent, only to increase it in 1932 to 2½ percent because of the flight of capital. The defenders of the rate explain that the legal charge is a maximum, that a lower maximum would not supply adequate legitimate capital to meet the demands for credit, that competition will cut the rate (one of the two largest companies, for instance, has voluntarily reduced its rate to 2½ percent a month) and that the high legal rate does not result in undue net earnings. Figures on net earnings are, however, not completely trustworthy. One of the greatest contributing factors to the high rate of interest has been the prejudice in the mind of the investing public, precluding the loan companies from obtaining capital at regular market prices. Since the two largest companies are now listed on the New York Stock Exchange and have floated sizable issues of preferred stock and debentures at the usual

market rates, the cost of the loans to the consumer may ultimately be reduced. Yet it is safe to assume that loan funds will never cost the personal finance companies as little as they cost the commercial banks or even the industrial banks.

Industrial banks differ from personal finance companies in the nature and methods of their business. They lend not only their invested capital but also funds that are in effect deposited with them through the purchase of their investment certificates, on which they have been paying a return usually 1 percent above the savings bank rate. They never take chattel mortgages or wage assignments but secure their loans by endorsement of sureties—usually of two co-makers, one of whom at least is financially responsible—and to a lesser degree by real estate or collateral security. Industrial banks do not compute interest as a percentage rate on unpaid balances; instead they deduct the interest on the whole loan in advance, at the rate of \$6 or \$8 or occasionally as much as \$12 per \$100. In addition they usually charge an inquiry fee of \$2 per loan. Like other small loan agencies, however, they require repayment in instalments, weekly, semimonthly or monthly, usually running over a period of 10 months or 50 weeks. It is obvious that, even when the discount feature is disregarded, with repayment spread in equal instalments over the entire period of maturity the true cost of the loan to the borrower is about double the apparent rate; indeed it has been estimated that the usual charge of industrial banks amounts to 17 3 percent per annum.

The first and best known type of industrial bank is the Morris Plan company, originated in 1910 by Arthur H. Morris in Norfolk, Virginia. Morris Plan banks were established in great numbers during the post-war decade; in 1933 there were altogether 108 such institutions operating in 150 cities in 32 states. Despite the common name they do not constitute a chain under single ownership but rather a federation whose central units, the Industrial Finance Corporation and the Morris Plan Bankers' Association, render certain auxiliary services to the affiliated members. With a few exceptions the same is true of the smaller federated systems of industrial banks organized after the World War in imitation of the Morris Plan. The aggregate annual volume of loans by industrial banks is probably in the neighborhood of \$400,000,000; although they make loans up to \$500, their average loan is slightly above \$200. Notwith-

standing the claim that their method of lending is similar to that of commercial banks, they operate in 24 states under special laws and in 2 states under small loan laws; elsewhere they function under the unamended banking law or general corporation law in a manner that might with moderation be called extralegal. Recent legislative developments, particularly federal deposit insurance and its extension to mutual savings banks, tend to throw some doubt upon the ability of the majority of industrial banks to attract savings to the same extent as previously.

The ostensible success of the industrial banks has tempted commercial banks to afford comparable credit facilities. Although in individual instances personal loan departments were organized as early as 1923 or 1924 and loans on the "industrial plan" were made by a commercial bank in 1920, it was publicity associated with the National City Bank of New York in 1928 that established the scheme on a firm basis. The growth until 1931 was rapid. The number of banks with personal loan departments was 22 in 1928, 65 in 1929 and 141 in 1930; the annual volume of business was estimated at \$40,000,000 for 1929, \$150,000,000 for 1930 and \$320,000,000 for 1931, but in 1932 it declined to \$270,000,000. While the maximum loan in some banks is \$2000 and in most \$1000, the average loan in 1929-31 was little over \$250 and in 1932 about \$225.

The method of doing business in the personal loan departments is essentially the same as in industrial banks. Loans are made exclusively on comaker guaranties; interest, usually at 6 but sometimes at 8 percent, is discounted in advance; fees and investigation charges generally make the total preliminary charges higher than 8 percent; repayment in instalments, weekly, fortnightly or monthly spread over a year, and high fines for delay in payment increase the cost to the borrower. Almost half the banks, it seems, receive the instalment payments into a deposit account, on which interest is paid, thus reducing materially the real cost to the borrower. Even so the lowest net cost to the borrower is over 9 percent a year and the typical cost about 17 percent. There is naturally some question concerning the legality of such charges under the usury laws—and there are usury laws in 43 states. Notwithstanding these rates, there is considerable doubt about the profitableness of personal loan departments as such. During the first year, when loans totaling over \$16,500,000 were made to more than 50,000 borrowers, the personal loan
